*Among the more important articles in this Volume are the following:*

TEINDS.....	Sheriff J. M. IRVINE, K.C., LL.D.	VEDA.....	Professor EGGELING; Professor A. BERRIDALE KEITH.
TELEGRAPH.....	R. W. WEIGHTMAN.	VEGA; VELÁZQUEZ.....	JOHN ORMESBY.
TELEPHONE; TELESCOPE	Dr ALFRED DANIELL.	VEGETARIANISM.....	Dr JOSIAH OLDFIELD.
TEMPERANCE.....	Rt. Hon. LEIF JONES.	VENEZUELA.....	A. W. HIRST.
TEMPLE.....	Rev. J. SUTHERLAND, BLACK, LL.D.; Rev. Professor A. R. S. KENNEDY, D.D.	VICTORIA.....	A. W. JOSE.
TENANT.....	Sheriff J. M. IRVINE, K.C., LL.D.	VIRGIL.....	Dr J. W. MACKAIL.
TERMITES.....	Professor J. ARTHUR THOMSON.	VITAMINS.....	Professor W. D. HALLIBURTON.
TERTULLIAN.....	Rev. A. P. DAVIDSON.	VIVISECTION.....	Sir LESLIE MACKENZIE.
THACKERAY.....	Sir RICHMOND THACKERAY RITCHIE.	VOLE.....	Professor J. ARTHUR THOMSON.
THEATRE.....	Miss ENID ROSE.	VOLTAIRE.....	FRANCIS ESPINASSE.
THEOLOGY.....	Rev. Professor H. T. ANDREWS, D.D.	WALES—History... ..	Dr ALFRED DANIELL.
THEOSOPHY.....	Mrs ANNIE BESANT.	" —Lang. & Lit... ..	Professor Sir JOHN MORRIS-JONES.
THERAPEUTÆ.....	HERBERT LOEWE.	WALPOLE (HORACE)....	AUSTIN DOBSON.
THERMODYNAMICS.....	Dr CARILL G. KNOTT.	WARWICK; WARWICK- SHIRE.....	CHARLES NOWELL.
THOMSON, JAMES.....	FRANCIS WATT.	WASHINGTON (GEORGE).	Professor EDWARD CHANNING.
THOREAU.....	JOHN BURROUGHS.	WATER.....	Dr DANIELL; Sir THOMAS HUDSON BEARE.
THUCYDIDES.....	Professor J. B. JEYONS.	WEASEL; WOLF.....	Professor J. ARTHUR THOMSON.
TIDAL POWER.....	A. J. LIVERSEDGE.	WEAVING.....	Professor ROBERTS BEAUMONT.
TIDES.....	Professor JOSEPH PROUDMAN.	WEBER.....	H. WHITEHEAD.
TIMBER.....	W. S. JONES.	WEBSTER (DANIEL).....	J. P. LAMBERTON.
TIMOTHY AND TITUS....	Rev. Professor H. T. ANDREWS, D.D.	WEBSTER (JOHN).....	CHARLES W. BOYD.
TIN.....	Professor HENRY BRIGGS.	WEISMANN.....	EDWARD CLODD.
TITHE.....	Rev. WILLIAM C. TUTING, D.D.	WELDING.....	G. E. DRAYCOTT.
TITIAN.....	P. G. HAMERTON.	WELLINGTON.....	Lt.-Col. DUNLOP, R.A.
TOAD; TURKEY.....	Professor J. ARTHUR THOMSON.	WESLEY; WHITEFIELD.	Rev. JOHN TELFORD.
TONNAGE.....	J. R. BARNETT.	WESTERN AUSTRALIA... ..	A. W. JOSE.
TOTEMISM.....	ANDREW LANG; NORTHCOTE W. THOMAS.	WESTMINSTER.....	Rev. W. J. LOFTIE; C. O. OVINGTON.
TRACTION-ENGINES.....	Professor Sir THOMAS HUDSON BEARE.	WHEAT.....	Professor J. A. S. WATSON
TRADE MARKS.....	Sir ALEXANDER WOOD RENTON.	WHISKY.....	JOHN DEWAR & SONS.
TRADE UNIONS.....	Rt. Hon. J. RAMSAY MACDONALD	WHIST.....	HENRY JONES ('CAVENDISH').
TRANSUBSTANTIATION...	Rev. W. L. GILDEA, D.D.	WHITMAN.....	Dr H. B. BAILDON.
TREATY.....	Sheriff J. M. IRVINE, K.C., LL.D.	WIGAN.....	A. J. HAWKES.
TRENT, COUNCIL OF.....	Dr T. G. LAW.	WILKES.....	W. FRASER RAE.
TRIASSIC; VOLCANOES..	Professor JAMES GEIKIE.	WILL.....	Dr F. AVELING.
TROLLOPE.....	T. AUGUSTUS TROLLOPE.	WILL (Law).....	Sheriff J. M. IRVINE, K.C., LL.D.
TROUT.....	W. L. CALDERWOOD.	WIND.....	Lieut.-Colonel E. GOLD.
TUBEROLE.....	Sir R. W. PHILIP; Professor JAMES MILLER.	WINDMILL.....	A. J. LIVERSEDGE.
TUBERCULOSIS.....	Sir R. W. PHILIP; Dr W. LESLIE LYALL.	WINE.....	ANDRÉ L. SIMON.
TUNNEL.....	Professor Sir THOMAS HUDSON BEARE.	WIRE.....	G. E. DRAYCOTT.
TURKEY.....	Professor GEORGE YOUNG.	WIRELESS TELEGRAPHY	R. W. WEIGHTMAN.
TURNER.....	P. G. HAMERTON.	WIRELESS TELEPHONY.	R. W. WEIGHTMAN.
TUTANKHAMEN.....	Miss M. A. MURRAY.	WOMEN'S RIGHTS.....	Dame MILlicENT G. FAWCETT.
TYNEMOUTH.....	P. J. DORRIAN.	WOOD.....	W. S. JONES.
TYPES.....	C. T. JACOB.	WOOL.....	Professor ROBERTS BEAUMONT
U; V; W; &C.....	Dr HENRY BRADLEY	WORLD WAR.....	L. G. ROBINSON.
UNITARIANS.....	Rev. R. B. DRUMMOND; Rev. S. H. MELLONE, D.Sc.	WRECKS.....	J. R. BARNETT.
UR.....	C. LEONARD WOOLLEY.	WREN.....	Professor J. ARTHUR THOMSON.
URUGUAY.....	A. W. HIRST.	WYCLIFFE.....	F. D. MATTHEW.
VACCINATION.....	Professor JAMES RITCHIE.	XENOPHON.....	H. A. HOLDEN.
VANDYCK.....	J. M. GRAY.	YACHT.....	J. R. BARNETT.
VARIATION.....	Professor C. LLOYD MORGAN.	YARMOUTH.....	GEORGE A. STEPHEN.
		ZINC.....	Professor HENRY BRIGGS.
		ZIONISM.....	A. M. HYAMSON.
		ZOLA.....	Professor GEORGE SAINTSBURY.
		ZULUS.....	J. STUART.

A great many of the articles named above are new; others written for earlier issues of this Encyclopædia have been so thoroughly revised by their authors as to be virtually new. In addition to these many other revisers have taken part, including Professor J. A. S. WATSON (Agriculture), Professor DAVID HEPBURN (Anatomy), Sir FRANK DYSON (Astronomy), Dr DRINKWATER (Chemistry), Dr R. CAMPBELL (Geology), Miss M. A. MURRAY (Egypt), Mr G. E. SHEPHERD (India), Dr THOMAS ASEBY (Italy), Mr W. A. FLEMING, Advocate, and Mr NORMAN MACDONALD, Advocate (Law), Dr J. D. COMRIE (Medicine), Dr ALFRED DANIELL (Physics), Professor A. BERRIDALE KEITH (Sanskrit Subjects), Dr S. A. COOK and Mr HERBERT LOEWE (Semitic Subjects), and Professor J. ARTHUR THOMSON (Zoology). Thanks are due to many town-clerks and others for information and corrections.

# CHAMBERS'S ENCYCLOPÆDIA

A DICTIONARY OF UNIVERSAL KNOWLEDGE

**T**ithes is the name given in Scotland to tithes. The growth of the tithe system, under which a proportion of what was acquired from year to year from the fruits of the earth and the produce of animals, or from the profits of industry, was devoted to the maintenance of the clergy, is recounted at **TITHES**. Tithes were at first contributions made voluntarily as a religious duty, and enforced only by ecclesiastical sanctions. But after the practice of tithe-paying became general in western Europe the obligation to pay tithe was recognised and enforced as a civil obligation.

In the canon law tithes are divided into (1) personal and (2) predial. Personal tithes are those derived from the profits of trading or personal industry. Predial tithes are those derived from the natural and industrial fruits of the earth. In Scots law, however, personal teinds, save in exceptional circumstances, were not recognised. Predial teinds were, in Scots usage, divided into two classes, viz. parsonage and vicarage teinds. Parsonage teinds, called also *decimæ rectoriæ* or greater teinds, consisted of those drawn from cereal crops, such as wheat, bere or barley, and oats; vicarage teinds, called also lesser teinds, comprised those drawn from certain natural and less valuable kinds of agricultural produce, e.g. natural grass and garden-produce, as well as certain animals and their produce, e.g. fish, calves, lambs, wool, butter, and cheese. Vicarage teinds depended on custom, and in course of time have been, in most parishes, lost by desuetude. By statute 27 and 28 Vict. chap. 33, provision was made for vicarage teinds on fish being commuted into a capital sum.

With the rise of the parochial system, under which the local churches were served by resident priests, it became an established principle of canon law that the parish priest had right to the parish tithes. But in Scotland this rule, embodied in the maxim *decimæ debentur parochio*, was never fully

applied and acted upon, and, long before the Reformation, the teinds due under the canon law to the incumbent of the parish had in various ways been encroached upon or diverted. In particular, the emoluments of the acting parochial clergy were greatly diminished by the practice of appropriating the teinds of parishes to other churchmen or to religious houses. On a vacancy occurring in a parochial charge it frequently happened that the lay patron—that is to say, the layman who, having himself built or endowed the church or being the representative of the person who had done so, had the right to present an incumbent to the benefice—assuming to act as if he were the absolute proprietor of the benefice, granted or appropriated it to a monastery or a cathedral. By such an appropriation or annexation the monastery or cathedral acquired not only the right to present to the benefice, but also the right to its revenues. A parochial church, if appropriated or annexed to a cathedral, might be vested in the bishop, in which case it was styled 'mensal,' as being for the support of the expense of his table; or it might be vested in the chapter, in which case it was styled 'common,' as being for the common behoof of all the members of the chapter. In practice the cure of an annexed church was served by a resident vicar or deputy, who received either a stipend in money or such share of the teinds as the non-resident rector, or corporate body holding the rectorial rights, thought fit to allow him. A common arrangement was that the lesser teinds should be the vicar's portion; and so usual was this arrangement that, as already mentioned, the lesser teinds came to be generally called 'vicarage' teinds. Another cause operating to the disadvantage of the parochial clergy was the frequent infeudation of teinds to laymen. Although the disposal of tithes to laymen had been prohibited by several Lateran Councils, grants of part of the teinds of vacant benefices in Scotland were frequently bestowed by patrons on needy lay friends. Further, a considerable proportion of teinds was

diverted from the support of the parochial clergy by the practice, adopted by certain popes, of granting to privileged religious orders exemption from the payment of tithes out of lands held by them. Subsequently also a custom grew up of granting feus of such church lands *cum decimis inclutis*, grants which conferred on the grantees—subject to certain limitations—the same exemption from the payment of teind which the ecclesiastical proprietors had formerly enjoyed.

In early times the parsonage teinds, consisting of the tenth sheaves, were 'drawn' or uplifted from the fields during harvest. This practice was a hardship to the cultivators of the soil, as they were obliged to allow the crop to remain on the ground, exposed to all the vicissitudes of the season, until the teind was drawn. Consequently, even prior to the Reformation, it was common for heritors to enter into contracts for the conversion of parsonage teinds into fixed annual sums of money or for delivery of a quantity of grain or victual, called 'rental bolls.'

The possessions of the church in Scotland prior to the Reformation—styled, generically, benefices—embraced the lands bestowed on churchmen—called the 'temporality'—and the teinds—called the 'spirituality.' At the Reformation the great bulk of these possessions was by annexation, resignation, or otherwise acquired either by the crown or by other laymen. The church lands were for the most part erected into temporal lordships. The holders of these lordships were termed 'lords of erection,' while those persons who obtained grants of teinds were described as 'titulars of teinds.' The possessions of the church having thus passed into the hands of laymen, difficulty was experienced in obtaining stipends for the reformed clergy. To meet this difficulty Acts of Council were passed ordaining that rentals be returned of all the ecclesiastical benefices within the kingdom; and that one-third of the revenues thereof be collected and applied in providing stipends for the reformed clergy and in supplying the needs of the crown. This scheme, known as the 'Assumption of Thirds,' was subsequently ratified by parliament in the Act 1567, chap. 10, which enacted that the thirds of the benefices should be first applied for the support of the clergy, and that payment should be enforced notwithstanding any discharges granted by the crown. In 1573 a commission, styled the 'Commission of Platt,' was appointed to apportion stipends locally out of the thirds. On James VI. attaining majority the Act of Annexation of 1587 was passed, annexing to the crown, subject to certain specified exceptions, the temporalities of church benefices, that is to say, church lands. In 1606, when bishops were restored, this annexation was rescinded so far as it related to the benefices of bishops. The Act of Annexation of 1587 did not apply to teinds, and the Commission of Platt—although its functions were greatly diminished after the restoration of bishops in 1606—probably continued to act until 1617, in which year the system of thirds was brought to an end and the first parliamentary teind commission was appointed, with power to award stipend to the minister out of the teinds of each parish. Teinds, in so far as not required for stipend, remained in the possession of the titulars.

Charles I., immediately after his accession in 1625, by an Act of Privy Council, in view of the extent to which the property and revenues of the church had been dilapidated, revoked all grants of church lands and teinds made during the preceding reigns. In addition, he, in 1626, raised a general reduction of all grants and claims inconsistent with the Act of Annexation and the vested rights of the crown. As the individuals who had profited by the

prodigality of the crown were very numerous, these proceedings caused wide-spread alarm, and a strong petition or remonstrance was addressed to Charles, with the view of obtaining some modification of his demands. Eventually a compromise was agreed upon, and the parties principally concerned entered into four submissions, under which the whole questions in dispute were referred to the determination of the king. By the decrees-arbitral, pronounced on 2d September 1629, on these submissions, the crown was held entitled to repurchase the superiorities of erection at certain rates; but this power was never exercised, and ultimately under the Act 1707, chap. 84, passed immediately before the Union, the successors of the lands of erection were left in possession of the church lands. As regards the teinds, there was conferred on heritors who did not own the teinds of their lands the power to have the teinds of their lands valued and the yearly charge thus permanently settled; and, in addition, the heritor was given the right to bring an action of sale against the titular or his tacksmen, by which he could obtain right to the teinds at nine years' purchase of the value. The findings of the decrees-arbitral relating to the superiorities of erections and the valuation and sale of teinds were subsequently ratified by a series of acts of parliament in 1633. To the rule that a heritor was entitled to purchase, and the titular was bound to sell, the teinds, certain exceptions were made either under the decrees-arbitral or by subsequent legislation. Thus, as finally settled by the Act of 1693, chap. 23, the following teinds could not be sold: (1) Bishops' teinds, so long as belonging to the crown—these teinds having, on the abolition of Episcopacy after the Revolution Settlement of 1688, fallen to the crown; (2) teinds granted to burghs for pious uses; (3) teinds belonging to colleges and hospitals; and (4) teinds in general mortified for charitable purposes. These classes of teinds, though they could not be sold, might none the less be valued at the suit of the heritors liable in payment.

In 1627 a commission, known as the 'Commission of Surrenders and Teinds,' had been appointed to treat for surrenders of disputed rights, and in 1628 this commission was authorised by the king to name sub-commissioners for the valuation of teinds. By the Act 1633, chap. 19, a second commission, known as the 'High Commission,' or the 'Commission for the Plantation of Kirks and the Valuation of Teinds,' was nominated for the purpose of giving effect to the decrees-arbitral. These commissioners were instructed to carry out the valuation of teinds, and were authorised to appoint sub-commissioners to conduct local inquiries for this purpose. The reports of the sub-commissioners—known as sub-valuations—became effectual on confirmation by the High Commission. The Act of 1633 also conferred power on the commissioners therein named to modify a stipend to each minister to be paid out of the teinds of the parish. From time to time this commission was continued with increasing powers, or rather, successive commissions were appointed with more ample powers of uniting and disjoining parishes, and of transporting churches to more convenient places. At the Union the powers exercised by the then extant commissions were, by the Act 1707, chap. 9, vested in the judges of the Court of Session, in the character of Commissioners of Teinds. The administrative and judicial powers of the judges sitting in what came to be known as the Court of Teinds were subsequently regulated in a series of statutes—their powers in relation to the augmentation and modification of stipends being regulated in particular by an act passed in 1808 (48 Geo. III. chap. 138).

The chief interest of the church in teinds, as the law stood at the date of the Church of Scotland (Property and Endowments) Act, 1925, was the right on the part of the ministers of the old parishes of Scotland to have competent stipends awarded to them by the Court of Teinds out of the teinds of their respective parishes in so far as these were adequate. The minister of such a parish had the right, if he thought his stipend no longer competent, to apply at intervals of not less than twenty years to the Court of Teinds for an augmentation of stipend. (See AUGMENTATION, PROCESS OF.) The process of augmentation was combined with what was called a locality, whereby the proportion payable by each heritor was allocated on him. When it happened, as was the case in the majority of parishes, that the whole teind of the parish had been awarded to the minister as stipend, and the teind was thus exhausted, the stipend could not be further increased. The Court of Teinds, as a general rule, in conformity with the requirements of section 8 of the Teinds Act, 1808, awarded stipends, not in money, but in grain measured by chalders, which had to be converted into money before the money value of the stipend could be ascertained. The conversion was made on the basis of the Fairs Prices (q.v.) struck annually in each county, which rose and fell with the price of grain.

The Act of 1925 (15 and 16 Vict. chap. 33) makes provision for the conversion, at the standard of value defined in the act, of every stipend which in any way or to any extent depends upon fluctuations in the price of grain—referred to in the act as virtual stipend—into a stipend having a fixed money value and payable only in money. The conversion is termed the standardisation of the stipend. (See STIPEND.) As regards teinds, the act provides that there shall be prepared by the clerk of teinds a teind-roll for every parish in Scotland specifying in money—(a) the total teind of that parish; (b) the amount of that total applicable to the lands of each heritor; (c) the value of the whole stipend payable to the minister, so far as payable out of teinds; and (d) the proportion of that value payable by each heritor in the parish. When the teind-roll of a parish has been made up, liability for stipend is dealt with differently according as the annual amount payable by a heritor exceeds, or does not exceed, £1. On the one hand, where the proportion of the stipend, as standardised, exigible from the teinds of the lands of a heritor, as shown by the teind-roll, exceeds £1, the proportion so exigible is constituted by the act, as at and from the first term of Whitsunday or Martinmas after the date when the teind-roll becomes final, a real burden—termed the 'standard charge'—on those lands in favour of the General Trustees of the church—a burden or charge preferable to all other securities or burdens not incidents of tenure. The amount of the standard charge is to be payable to the General Trustees half-yearly at Whitsunday and Martinmas, and to be recoverable by the same means and in the like manner as a feu-duty. The standard charge over any lands may, at the option of the heritor of those lands or other person liable in respect of the standard charge, be redeemed in one of two ways specified in the act. Provision is also made for the allocation of the standard charge in the event of the sale or conveyance of part of the lands over which it is secured. On the other hand, where the proportion of the stipend, as standardised, exigible from the teinds of the lands of a heritor, as shown by the teind-roll, does not exceed £1, the heritor or other person liable in payment thereof is bound to redeem the amount by payment to the General Trustees of a capital sum calculated at eighteen years' pur-

chase, or alternatively in eighteen years by half-yearly payments. Where the proportion of the standardised stipend exigible from the teinds of all the lands of a heritor, as shown by the teind-roll of the parish, does not exceed one shilling, the liability for stipend is extinguished as at the first term of Whitsunday or Martinmas occurring not less than three months after the date on which the teind-roll of the parish becomes final. As from the date of standardisation, the standardised stipend is payable by the heritors to the General Trustees half-yearly until the standard value of the stipend, as shown by the teind-roll, is constituted a real burden on the lands of the heritors or has been redeemed or extinguished. On the passing of the Act of 1925 the then existing law relating to augmentation of stipend ceased to have effect. The conditions under which stipend may be augmented under the act are summarised in article STIPEND. Elaborate provisions are made, in the fifth schedule of the act, with regard to the preparation, issuing, and adjustment of teind-rolls, and, in the sixth schedule, with regard to the valuation of teinds and the surrender of valued teinds.

See Elliot, *Teinds and Procedure in the Court of Teinds* (1893); Duncan, *Parochial Ecclesiastical Law of Scotland* (revised edition, Johnston, 1903); Connell, *Treatise on Law of Scotland respecting Tithes* (2d ed. 1830); Buchanan, *Treatise on Law of Teinds* (1862).

**Tekeli**, or TÖKÖLY, PRINCE EMERICH (1657–1705), Hungarian soldier, was born at Kásmark in Upper Hungary, but fled from the religious persecution of Leopold I. to Transylvania. There in 1679, aided by Turks and Transylvanians, he headed a rebellion of the exasperated Magyars, and was successful enough to force the emperor to an armistice. In return for a yearly tribute the Turks gave him the title of Prince of Hungary, and he gave them good aid in their attempt to take Vienna in 1683. Thereafter he tried to effect a reconciliation with the emperor, but failed; and, falling into ill favour with the Turks, he spent a time in prison. On his release he made three expeditions into Transylvania, winning a great victory at Zernest in 1690 and the title of Prince of Transylvania. Later he served for the Turks against Austria, but being excluded from the amnesty contained in the Peace of Carlowitz (1699) he retired to Constantinople. He died at Nicomedia in Asia Minor and was buried there, but his remains were translated to Hungary in 1906. See HUNGARY.

**Tekna**, the country south of Morocco, extending from the Draa to Cape Bojador, a Spanish possession.

**Telephony** is the supposed influence on the future progeny of a female from the sire with which she had formerly been mated—a theory widely accepted amongst breeders. In a case described by Darwin, a mare mated with a quagga produced a colt such as might have been expected. The same mare, subsequently mated with a black Arab stallion, bore two colts in succession showing well-marked stripes. But Cossar Ewart and others have carried out extensive experiments in this connection with merely negative results. See HEREDITY; Cossar Ewart's *Peniculi Experiments* (1899); J. A. S. Watson's *Heredity* (1912).

**Telegraph** (Gr. *tēle*, 'far off,' and *graphō*, 'I write'). This is a general name for any means of conveying intelligence other than by voice or by the transmission of written messages. Perhaps also the idea of speed is generally understood. Alarm fires (see BEACON), Heliography (q.v.), the Semaphore (q.v.), and Signalling (q.v.) as used at sea are among the earlier forms of telegraphy; and while these methods are still employed in their particular spheres, they are not to be compared for-

speed or convenience with those systems of communication which depend upon electricity for their motive power, and of which the electric telegraph was the first type.

The idea of telegraphic communication by means of magnets is certainly more than three centuries old. In 1617 the possibility of communicating by means of sympathetic needles was assumed by one Strada, a famous Roman Jesuit. In 1632 Galileo, the great astronomer, referred to a secret art by which, through the sympathy of magnetic needles, it would be possible to converse at great distances. Again, in 1753, when a more defined idea of electricity had begun to dawn, a letter appeared in the *Scots Magazine* signed 'C. M.' (now almost certainly recognised to be Charles Marshall, a native of Greenock, who practised as a surgeon at Renfrew, whence the letter emanated), in which 'an expeditious method of conveying intelligence from one place to another by means of electric power was so clearly set down that we cannot but recognise that the writer must have had a considerable appreciation of the possibilities of electric communication. Many quiet workers occupied this field of research from that time, until 1837, which is the generally recognised year of the birth of the electric telegraph. Limited space forbids anything but a passing reference to the work of the fathers of the telegraph. If a comparison may be made, we may say that what Wheatstone and Cooke did in the development of the needle system of telegraphy in England, Morse and Alfred Vail did in the development of the Morse-recording and sounder-reading systems in America. The claim that may justly be made for the recognition of the genius of either workers does not in the least militate against the recognition of that of the others; but it must be conceded that while the method originated by the English inventors has found acceptance principally in England, the Morse system is of world-wide use, and has supplanted the other even in England except for railway working, for which the needle system is most admirably suited. We must now proceed to furnish such information as will give some idea of the present state of the science, with some notice of the more important systems in use in Britain. In doing this it will be necessary to assume on the part of the reader some general knowledge of the chief features of Electricity (q.v.; and see also MAGNETISM).

The general subjects dealt with occur in the following order, and it may be noted that special terms have been included and explained as far as possible. I. *Construction*—(1) lines, overhead and underground; (2) poles and insulators; (3) wire; (4) earths and earth-currents; (5) circuit; (6) batteries—universal battery. II. *Apparatus*—(1) needle system and Morse code; (2) the sounder system; (3) the Morse recorder; (4) the relay, polarised and non-polarised; (5) polarised sounder (Vyles); (6) double-current system; (7) duplex; (8) quadruplex; (9) Wheatstone automatic; (10) type-printing systems—multiplex telegraphy; (11) news circuits; (12) repeaters; (13) submarine telegraphy—cables.

I. *Construction*.—(1) *Telegraph lines* may be either overhead or underground. The overhead system has many advantages, and is generally adopted where the number of wires is not too great to be carried by one line of poles. The first cost is very much lower, the open wires are better for working purposes, and faults can be more easily traced and removed. On the other hand, climatic conditions do not affect underground lines, while a severe storm will sometimes do so much damage to open work as to cripple the whole system. Where more than one pole-line is re-

quired to carry the wires, the underground method may be the cheaper. For this reason, and in order to secure immunity from breakdown due to storms, most of the important industrial centres in England and Scotland are now connected with London, and in many cases with each other, by underground cable. The lines in large towns in Great Britain are all necessarily underground.

(2) *Poles and Insulators*.—Overhead wires are supported for the most part upon creosoted wooden poles by means of insulators. No hard and fast rule can be given as to the number of poles that should be used. For minor lines twenty or twenty-two to the mile may be used, but on main lines the number should be between twenty-six and thirty. Ordinarily the lowest wire on a pole should be not less than 12 feet from the ground, so that, allowing for setting in the ground (which varies from 4 feet to 6 for ordinary poles), and the sag or dip of the wire between the poles, the length of the poles used on branch lines is usually about 20 or 22 feet, and this is increased by 1 foot for each two additional wires required. The object of the insulator is to isolate the wire from anything which would be liable to conduct the current from the wire; the material of which the insulator is made is therefore of much importance. White porcelain is used chiefly, but brown earthenware and brown stoneware are both employed. Porcelain possesses rather better insulation properties than these. Glass is used in some directions on the Continent, and largely in America, but it has a tendency to condense moisture, which is against it for long lines especially. Brown insulators are less conspicuous than white, and are therefore less of a mark for stone-throwers. The heads of standard types of insulators are threaded internally to take the screwed spindle, and so to facilitate the removal or renewal of the insulator.

(3) *Wire*.—Hard-drawn copper, bronze, and galvanised iron wire (i.e. iron wire coated with zinc) is used. Copper wire is preferred for long lines, because of its better conductivity and its comparative immunity from corrosion. Bronze wire, the chief constituent of which is copper, is approximately 50 per cent. stronger than copper, and is used on long spans and in other directions where a greater tensile strength than that afforded by copper is required. Iron wire is no longer employed in Great Britain, but it is still largely used in the dominions and colonies, owing to its cheapness as compared with copper and bronze; also it is less liable to be stolen by natives in countries where copper-wire rings and bangles are a favourite form of personal adornment. Copper and bronze wires are usually secured to the insulators with copper tapes and binders, while iron wires are bound to the cups by means of a small-gauge soft galvanised iron wire. Underground wires are of soft copper insulated with paper, laid up in cable form, and encased with lead. The cables are usually drawn into ducts of stoneware or into iron pipes for protection and to facilitate handling, but in some cases they are armoured with steel tapes and laid directly in the ground. Where ducts are used, jointing chambers or boxes are provided at intervals, to afford a means of getting at the wires for jointing, testing, and tracing faults.

(4) *Earths*.—In 1838 Steinheil discovered that, if a good electrical connection is made with the ground at each end of a single line, the earth will act as a substitute for a return wire. This was a very important discovery, for not only does it save the expense of a return wire, but it also reduces the resistance of the line by nearly half, with several attendant advantages. The technical expression 'earth' is applied to this connection, and

an 'earth' may consist simply of a wire attached to a metal plate of a large surface buried in soil that is sure to be always damp; but metal pumps, or better still the iron water-pipe system in towns, will generally form excellent earths. Iron gas-pipes will do very well in default of water-pipes, but on no account must *lead* gas-pipes be used, as there is a possibility of a discharge of lightning fusing the pipe and causing an explosion or a fire by igniting the gas. *Earth-currents*.—From causes as yet unexplained different parts of the earth are frequently at different potentials, so that, if two such points be connected by a wire joined to earth at each end, it is traversed by an *earth-current*. Such currents vary during different periods of every day, and at certain periods they acquire such strength as to be termed 'electric storms.' They then may often render ordinary working impossible, and on long cable circuits may even endanger the safety of the cable. In order to secure communication in such circumstances it suffices, where practicable, to use a return wire instead of earth. Lines whose terminations run north-east and south-west are most liable to interruption.

(5) *Circuit*.—This term, which is of very frequent use, implies the whole path along which a current of electricity may be supposed to flow; that is, for instance, the battery, lever of key, line-wire, coils of receiving apparatus, and the 'earth' at each end. *Short-circuit* implies that the circuit between two particular points (say the two ends of a coil of wire) is bridged across by a conductor of no resistance.

(6) *Batteries*.—Where primary cells are employed, as in the smaller telegraph offices, the Leclanché, of either porous pot or 'sack' type, is now used almost exclusively. Formerly the Leclanché cell was not sufficiently 'constant' for the continuous withdrawal of current imposed upon it in telegraph working, especially on busy lines, and cells of bichromate and Daniell's types were employed. Dry-cells are also used, particularly where portability is desired. In the larger offices secondary cells have been very largely introduced. Ordinarily each set of apparatus at an office has a separate battery, but by a well-recognised law of electricity the universal battery system is applied when several circuits terminate in one office. By this system several sets of instruments are joined up to a common battery, each working independently. Where primary cells are used, the circuits served from the one battery must have about the same resistance, but with secondary cells any number of circuits of different resistances can be served from one common battery.

II. *Apparatus*.—(1) *The Needle System*.—In the earliest form of telegraph instrument, devised by Cooke and Wheatstone, five needles were used, each worked by two wires; this number was subsequently reduced to two, and now a single needle only is employed. Fig. 1 shows the dial of such an instrument. The needle normally hangs vertically, and is capable of

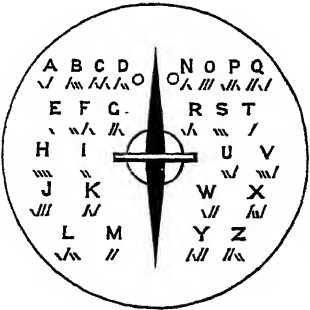

Fig. 1.

motion to the right and left between two stops. The signals are formed by combinations of the two directions of deflection. The alphabet in general

use, which is shown above on the face of the dial, is due to Professor Morse, and is hence called the 'Morse Code.' The letters most frequently used—*e* and *t*—are represented respectively by a deflection to the left and to the right. All the other letters of the alphabet are formed by two, three, or four combinations—the length of the signal for each letter being arranged with approximate reference to the frequency of its occurrence in ordinary English writing. In the same way the numerals, stops, and other signals are formed. The figures are represented by *five* signals, thus:

(1) . - - - -	(6) - . . . .
(2) . . - - -	(7) - - . . .
(3) . . . - -	(8) - - - . .
(4) . . . . -	(9) - - - - .
(5) . . . . .	(0) - - - - -

and the stops, &c. by six combinations. The dots and dashes represent respectively deflections to the left and right. Figures, however, are always spelt in full on the single needle. The needle system is specially English, and is used almost universally for railway telegraphs throughout the three kingdoms. It has no equal for working a large number of offices on one circuit, and it has the great advantage of being extremely easy to learn and simple to work.

(2) *The Sounder System*.—For commercial telegraphy, however, the sounder system is distinctly the most generally serviceable of hand-worked systems. Opposite the poles of an electro-magnet is placed a soft-iron cross-piece or *armature*, fixed upon a lever which is so pivoted that a spiral spring attached to the end of one arm tends to hold the armature away from the poles of the magnet. The passing of a current through the coils causes the armature to be attracted, and its motion is limited by two adjustable screws which are so arranged that the two sounds emitted when the end of the lever strikes upon them are easily distinguishable. Sound-reading then consists really of noticing the intervals of silence between these two sounds. The Morse code as shown above is used, and (1) a *dot* is represented by a very short interval of silence between the downward stroke and the upward stroke of the armature lever; (2) a *dash* is represented by an interval three times as long; and in the same way the *space* between (3) the elements of a letter; (4) the letters of a word; and (5) the words of a sentence are represented by intervals between the downward and the upward strokes respectively equal to one, three, and five *dots*. The instrument by which these signals are spaced out at the sending station is called a *key*. A *single current key* consists simply of a lever so

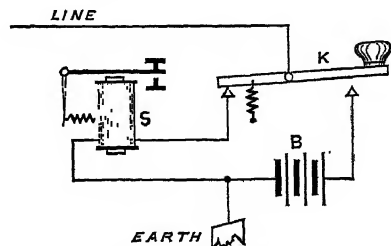

Fig. 2

pivoted as to make electrical contact with one or two stops. This is shown diagrammatically at K in fig. 2, where B represents the battery and S the sounder. Normally a spring holds the lever of the key in the position shown, so that signals sent from the other stations pass from line to the lever of K, thence by way of the back stop through the sounder to earth. When, however, the handle of

the lever is pressed a current passes from the battery, B, by way of the front stop and the lever of the key to the other stations. Thus the duration of the signals received at a distant station is determined by the periods during which K is depressed. The sounder system is worked on the open circuit method in England, but under some administrations the 'closed circuit' method is adopted. Under this method current from a battery at one or more stations on the line is always flowing, and the line is operated by first breaking the circuit by means of a switch. When it is thus broken, each depression of the key closes the circuit, and so produces signals.

(3) *The Morse Recorder*.—This instrument was the precursor of the sounder just described. The received signals were impressed on a paper tape, from which they were transcribed by the operator, and the tape was preserved for reference in the case of an error in the transmission of a message. Many devices for obtaining this tape record were put forward: one of the earliest was the Morse embosser, whose modern representative is known as the inker or recorder. As shown in fig. 3, the

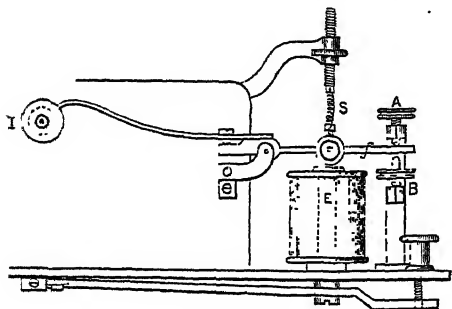

Fig. 3.

combination of the electro-magnet, E, with the armature, F, fitted upon the lever, *f*, which is adjustable by the stops, A, B, and the spring, S, is virtually a sounder, the lever of which is prolonged beyond the pivot and fitted with a small disc, I, kept constantly rotating in a well of ink; above this inking disc a strip of paper is moved forward by clockwork, so that whenever the armature is attracted by the electro-magnet the disc makes ink-marks upon the paper of a length proportioned to the period of attraction. Thus the *dots* and *dashes* of the Morse code can be recorded. For ordinary telegraph work the recorder is now used only in special circumstances. Where a permanent record of the signals is required, as in some methods of railway working, it still finds a place of usefulness.

(4) *The Relay*.—For such instruments as the sounder and the Morse recorder, however, where a comparatively considerable mechanical effect is required in order to secure satisfactory signals, a current must be used of such a strength as for a long line would absorb an inconveniently large amount of battery power. To obviate this a relay is introduced. A relay is practically a delicate form of the electro-magnet and lever of the sounder. The coils are wound with a finer and longer wire—finer only to get increased length of wire in the available space—and all its parts are proportioned with a view to the armature being actuated by very weak currents. The lever and limiting stops, which in this case are electrically insulated, are made to act as a key, and by this is introduced a local battery situated at the receiving station, by means of which the sounder or other receiving instrument is actuated. The forms of relay are very

numerous; but they may be divided into two groups—*non-polarised*, which are actuated alike by currents in either direction; and *polarised*, in which the armature, being either itself a magnet or permanently magnetised by a magnet placed in close proximity, is actuated according to the direction of the current. The form which is now most commonly used in England is the Post-office standard relay, the principle of which will be easily understood from fig. 4. Two coils, A and B, are fitted upon soft-iron cores having projecting pole-pieces, and are so fixed that two soft-iron armatures, *n*, *s*, fitted upon a common axle, may play between them. These two armatures are polarised by the magnet, N'S', brought near to their axle, and the two coils are joined up so that

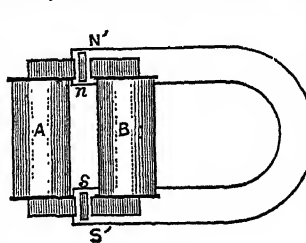

Fig. 4.

on the passing of a current their adjacent poles are of opposite polarity. Thus, if a current pass which makes the upper end of A of north polarity, the upper end of B will be of south polarity; A will therefore tend to repel *n*, and B will attract it; similarly (because the lower ends of A and B are then respectively south and north) *s* will be repelled from A and attracted towards B. All the forces therefore tend to move the armatures in the same direction, and so produce a very sensitive combination. The contact lever is fitted upon the axle with the armatures, and the contact stops are placed on either side.

(5) *Polarised Sounder (Vyles)*.—This instrument is similar in appearance to the standard sounder used by the British Post-office. The cores of the electro-magnet are polarised by means of a permanent magnet fitted in the base of the instrument, the poles of which are adjacent to the cores. The armature of the sounder is actuated electrically in a manner somewhat similar to that of the relay above described. The coils are wound differentially, and the instrument is therefore suitable for either simplex or duplex working. On working lines it displaces the relay and its attendant local battery, and its design ensures a remarkable degree of sensitivity.

(6) *Double-current System*.—In this system both poles of the sending battery are brought into play alternately in order to produce 'spacing' and 'marking' signals. The key is so designed that during transmission there is always a current passing to line, this current being in one direction when the key is up, and reversed when the key is depressed. Thus, with a polarised relay the 'spacing' current holds over the relay tongue to the spacing side, so that the spring or other power otherwise required for this purpose may be almost dispensed with; and consequently the relay will be actuated by a much less powerful 'marking' current than would be required for single-current working. In fact, double-current expedites working, reduces the current required (and so tends to increase the working distance of a telegraph line), facilitates the intercommunication of several stations on a single circuit, and is a very important feature in an extensive system.

(7) *Duplex System*.—By this system messages can be sent on one line in both directions at the same time, thus practically doubling the carrying capacity of the wire, because station A can transmit a message to station B while B is sending another message to A. Under ordinary

circumstances, when A is working to B on the open circuit principle, any interference on the part of B disconnects his receiving instrument, and so prevents A's signals from being recorded, because the back stop is disconnected (fig. 2). If now it can be arranged that the receiving instruments at both stations can be always in circuit, yet only affected by the currents sent from their own station when these currents interfere with the currents sent from the other station, then duplex telegraphy becomes possible. There are several modes of doing this, but we shall confine ourselves to a description of the *differential* method, which is almost exclusively that adopted in the British postal telegraphs.

If two circuits of precisely equal resistance be open to a current, it will divide itself equally between the two, and the currents in each wire will be exactly equal. If, for instance, the wire, ZIE (fig. 5), offer the same resistance as the wire, ZrE, the current in  $l$  will have precisely the same strength as the current in  $r$ . Now let an electro-magnet be similarly wound with two wires of equal length, one of which is in the circuit of  $l$ , and the other in the circuit of  $r$ . If the current through  $l$  traverse the electro-magnet in the reverse direction to that through  $r$ , it is evident that if the currents be equal the polarity induced by the one current must be exactly neutralised by that induced by the other current, for the effects are equal and opposite, and there will be no magnetism excited. Thus, as long as the two circuits are intact, the currents which flow will not affect the electro-magnet; but if the currents in  $r$  be interrupted, those in  $l$  will excite the electro-magnet, and if those in  $l$  be interrupted, the currents in  $r$  will excite the electro-magnet.

Assume A and B (fig. 6) to be two stations connected together by the line-wire,  $l$ . Let E be an electro-magnet at A, wound as just described, K a key, and Z a battery. Let  $r$  represent resistance coils

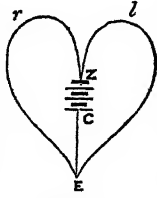

Fig. 5.

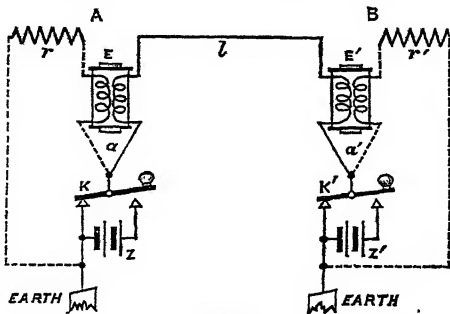

Fig. 6.

or an artificial line, giving a resistance equal to the line circuit. Have a precisely similar arrangement at B, as shown. Now let us in the first place assume A alone to be working to B; every time the key, K, at A is depressed a current is sent from A's battery. This current divides at  $\alpha$ , the one half going through the wire in connection with  $l$  in E, through  $l$ , and at B, through the wire in connection with  $l$  in E', through the key, K', to earth and thence back to the battery at A. This is called the *line current*. The other half, which is called the *compensation current*, passes around the electro-magnet, E, through the coil in connection with  $r$ , through  $r$  and back to the battery. As these two currents are equal, their effect on E is *nil*, but the line current passing through one coil only of E' operates it and causes

signals to be given. Thus while A telegraphs to B its own instrument is not affected, but that at B is actuated. Similarly, when B alone is working to A its own instrument is not affected, but that at A is actuated. But when B is working to A at the same time that A is working to B, what happens? Every line current that leaves A at the same time that a line current leaves B is neutralised. The compensation current at A is now able to excite the electro-magnet, and the armature is moved in precisely the same way as if B's current were received. In the same way B's line currents are neutralised, and its compensation currents move the armature of E' in precisely the same way as if A's currents were received. Thus E and E' continue to be worked by their respective stations, regardless of the fact that the line currents are being continually neutralised, so that practically no current flows between A and B, and that they are operated sometimes by the line current and sometimes by the compensation current. Thus, while A sends messages to B, B can be sending messages to A upon the same wire and at the same time.

We assumed that the line current received at A from B was exactly equal to that proceeding from A to B, and that therefore they were exactly neutralised, but it is not so in practice, for owing to the effects of bad insulation the incoming line current is always weaker than the outgoing one. Hence the current received at A from B does not neutralise the whole of the current sent from A to B, but only a portion of it. It so weakens A's current to line that the compensation current preponderates over this resultant current, and the signals are registered by the preponderance. The difference in the strength of these two currents when both stations are working is very nearly equal to the strength of the current received at A when B alone works, so that the marks, whether made by the received line current or by the preponderating compensation current, are practically the same.

We have shown in the diagram that the same poles of the battery are to line, and that therefore the line currents flow in opposite directions; but the same effects occur if the opposite poles are to line, and the currents flow in the same direction. If the current from B flows in the same direction as that from A, the effect, when the two stations work simultaneously, is not to weaken the resultant current, but to strengthen it, and therefore to produce a preponderance of the current in wire  $l$  over that in wire  $r$  of relay E, and consequently to register signals; but in this case the marks made at A when both stations are working simultaneously are not made by the preponderance of the compensation current over the line current, but by the excess of the resultant line current over the compensation current.

There are certain irregularities in the working of such a system in actual practice which have to be provided against, due to variations in the resistance and in the electrostatic capacity of the line. Telegraph wires, in fact, are in a constant state of change. If A and B be connected together by an aerial wire supported at intervals of about 80 yards upon porcelain insulators, then the current which arrives at B from A must necessarily be less than that which leaves A, because at each pole a small portion of the current escapes or leaks to earth. No porcelain support is an absolute insulator. Moisture is deposited upon its surface. The amount of this moisture continually varies, and the resistance of the insulator to the leakage of the current varies with it. Hence the difference between the current leaving A and that arriving at B is constantly varying, and the effect upon the current leaving A is precisely the same as if the

resistance of the line varied. If moisture be abundant more current leaves A, and the effect at the sending end is the same as if the resistance of the line-wire were reduced, but of course the increased current is not received at the other end. If the insulators become dry, less current leaves A, and the effect is the same as if the resistance of the line were increased. In fact, the resistance of the circuit does vary with the amount of moisture deposited on the insulators, and with the amount of dirt which necessarily adheres to them. Rain, fog, dew, and mist affect it. Lines exposed to the spray of the sea or the smoke of manufactories are peculiarly liable to this variation. Other causes also introduce irregularities which interfere with the constancy of a line. The wires are continually subject to accidents of various kinds, many of which tend to produce variable resistance.

Now what effect has this variation of the resistance of the line-wire upon duplex working, and how is it provided for? Clearly it disturbs the equality of the line and compensating currents, and causes the one to preponderate over the other; and if no means were adopted to compensate for this variation, duplex telegraphy would be impossible. Therefore the resistance in the compensation circuit is not made a fixed quantity, but consists of a series of resistance coils, by which the resistance of the compensation circuit can be varied in consonance with the variation of the line circuit. This instrument is called a *Rheostat*.

The compensation current is then adjusted by the aid of a *differential galvanometer*—i.e. a galvanometer double-wound in the same way as the relay coils, the line current passing through one coil and the compensation current through the other in the opposite direction. Thus, when the compensation circuit is properly adjusted, the outgoing current will produce no effect upon the galvanometer.

Another modifying influence present on a telegraph line is *electrostatic capacity*—i.e., in brief, the power which it has of retaining or accumulating a portion of any current passing in it. This also has to be properly represented in the compensation circuit, and this is done by means of *condensers*. This is a term applied in electricity to an apparatus generally composed of alternate layers of tinfoil and paraffined paper (or mica), so arranged and connected as to form virtually a flat Leyden jar of large surface. As the capacity of a telegraph line varies with weather and from other causes, the condenser is also made variable.

It will be seen that satisfactory duplex working demands more skill and attention from the operators than does ordinary working; hence, as there are always times during which the requirements of business do not render it necessary that a circuit shall be worked duplex, all duplex circuits are fitted with switches, by means of which recourse may be had to ordinary working, still using the same apparatus.

(8) *Quadruplex System*.—Duplex telegraphy, as explained in the last section, means the transmission on the same wire of a message from (say) station A to station B while B is sending another message to A. If A or B be able to send *two* messages to the other at the same time on the same wire we have *diplex* telegraphy; by combining these two systems—duplex and diplex—we may have four messages, two in each direction, being sent simultaneously on a single wire, and this constitutes *quadruplex* telegraphy.

Suggested by Stark and Bosscha in 1855, it was not until 1874 that the problem of quadruplex working was solved by a device of Thomas Alva Edison, and the system now in use is the result of

his efforts, supplemented by the work of Prescott, Gerritt Smith, and others. It may be broadly described as the duplex system provided with two keys in the sending circuit, and two relays, each having a coil in both the line and the compensation circuits (*l* and *r*, fig. 6). One key (on the A side of the set) is so connected that when its lever is depressed the battery connections are reversed, so reversing the direction of the current; while the other key (on the B side) is so constructed that the depression of the lever brings into circuit three times as much battery power, so that (whatever the direction of the current) it is increased in strength threefold. The A side relay at the other end is polarised, and responds correctly to the 'marking' and 'spacing' currents whatever their strength, while the relay on the B side is non-polarised, and is actuated only when the greater current is received, and then responds whether the current is 'positive' or 'negative.' With the earlier methods of working, an uprighting sounder was used with the non-polarised relay on the B side for the purpose of translating the signals on the local sounder; and this, due to the action of the distant A key, was liable to give rise to kicks in the B sounder and cause difficulty in working. This difficulty has been overcome by the substitution of a condenser arrangement in place of the uprighting sounder. The quadruplex system is now giving way to the multiplex type-printing systems referred to below.

(9) *Wheatstone Automatic*.—The several kinds of apparatus already described are dependent entirely upon the hand for the transmission of the signals, and this necessarily limits the possible speed of transmission. Even the sounder cannot be worked by the most expert of operators at a rate exceeding forty-five words a minute. This is, however, by no means the limit of speed at which signals can be recorded even by the simple Morse recorder. Early efforts were made to replace the hand-worked key by some mechanical contrivance which would not only remove the defects inherent to manual labour, but would secure precision in the formation of the characters, accuracy in the despatch of messages, and speed in transmission. Bain in the year 1846 was the first to propose this. He punched broad dots and dashes in paper ribbon, which was drawn with uniform velocity over a metal roller and beneath styles or brushes of wire, which thus replaced the key, for whenever a hole occurred a current was sent by the brushes coming in contact with the roller. The recording instrument was his chemical marker. The speed at which messages were transmitted at experimental trials was enormous; 400 messages per hour were easily sent; but when to the defects in the machinery were added the disturbances on the line from causes which were then unknown, it failed to commend itself. Perhaps the real reason for its not being persevered with was that at that time the amount of traffic on any line was not sufficient to require the use of so fast working an instrument.

Wheatstone's system of automatic telegraphy is that which is used in England. Bain's method of punching has been considerably modified, and the messages are recorded on an exceedingly delicate form of direct ink-writer. The apparatus consists of three parts: the *Perforator*, by which the message is prepared by punching holes in a paper ribbon; the *Transmitter*, which sends the message under the control of the punched paper; and the *Receiver*, which records the message at the distant station when thus sent by the Transmitter.

The *Perforator* consists of three levers or keys the depression of which actuates five punches in a certain order, and also a groove and a feed arrangement to guide and move forward the paper as it is

punched. The paper used is of a white description dipped in olive-oil. The three keys on being depressed drive the punches through the paper, cutting out clean round holes. The depression of the left-hand key causes the paper to be perforated

with three holes in a vertical line thus:  $\begin{smallmatrix} \circ \\ \circ \\ \circ \end{smallmatrix}$ ; the

depression of the centre key punches one—centre—hole only, thus:  $\circ$ ; and the depression of the right-

hand key perforates four holes arranged thus:  $\begin{smallmatrix} \circ \\ \circ \\ \circ \\ \circ \end{smallmatrix}$ .

The left-hand key corresponds with dots, the centre with spaces, and the right-hand with dashes. It will be noticed that the holes made in the centre of the slip are smaller than those in the upper and lower rows. They admit the teeth of a little star wheel, which is turned through a small space whenever one of the keys is depressed, and which thus moves the paper forward a certain distance for each depression of either key by a species of rack and pinion movement. The space through which the paper is moved for a dash is twice the length of that through which it is moved by either of the other keys. In fact two central holes are punched for each dash required, and the star wheel is made to turn two teeth instead of one as in the case of the other two keys. If left, right, and centre be struck or depressed in succession, we have the paper prepared for the letter A; if right, left, left, left, and centre be depressed in succession, we have the paper prepared for the letter B; and so on for all the letters and signals. The word *Paris* thus prepared is indicated by fig. 7. An expert

Fig. 7.

operator can punch at the rate of about forty-five words per minute, but the average rarely exceeds forty.

The *Transmitter* replaces the key of the ordinary apparatus, and it sends the currents by mechanical means under the control of the punched paper; hence the name of the system—the Automatic.

The arrangement of the parts is such that when running free the electrical portion sends alternate reverse currents of short duration, but when the slip is inserted these reversals are interrupted by means of the action of vibrating pins which tend to pass through the upper and lower holes of the slip. Thus, to take the first letter of the slip shown above: the transmitter would be sending a spacing current when the back pin would rise through the first upper hole and permit a reverse (marking) current to be sent. On the next rising of the front pin it would pass through the first lower hole, and the reverse (spacing) current would pass. Thus a 'dot' would have been sent to line. The spacing current would remain on (for a period equal to the length of a dot) until the back pin again rose through the second upper hole, when the marking current would again be to line. When the front pin again rose its progress would be stopped by the slip, as there is no hole in the lower row beneath the second upper hole, and therefore no reversal would take place; the same applies also to the next rising of the back pin, and the marking current would therefore remain on until the occurrence of the second lower hole permitted a reversal; thus the second signal would be three times as long as the first—the proper respective lengths of a dot

and a dash—and so on with the other signals and spaces.

The *Receiver*, by means of which the signals sent by the transmitter are recorded, is a direct ink-writer of a very sensitive character. The slip is drawn forward between two rollers by means of a train of wheels driven by a large weight. Before passing between the rollers the slip is brought near to a small inking disc which is rotated when the clockwork is in motion. The instrument is regulated by a fly to maintain uniform speed, and this fly is so arranged that by means of a lever the speed of slip can be adjusted to suit recording at any speed between 20 and 450 words per minute. The light marking disc is fixed to an axle geared with the clockwork, and rotates close to the periphery of a larger disc that moves, in the reverse direction, in a well of ink. This latter disc takes up the ink and feeds the marking disc by capillary attraction without introducing friction.

Passing now to the electrical arrangement of the receiver, the electro-magnets which work the recording armature consist of two bobbins of fine silk-covered copper-wire, having cores of carefully annealed soft iron. If these cores were provided with a cross-piece they would form what is generally known as a horseshoe-shaped electro-magnet; but less electro-magnetic inertia and greater rapidity of action are obtained by dispensing with the cross-piece and providing a second armature at the lower end of the axle, polarised in the opposite direction to the upper armature by means of the other pole of the inducing magnet. The arrangement is, in fact, similar to that shown by fig. 4. The *working* speed which can be attained by this system is about 400 words per minute, but in actual practice it is not usual to run at a higher speed than about 180 words a minute. Both transmitters and receivers can be driven either by a weight or an electric motor. An English telegraphic 'word' is taken to be twenty-four reversals on the transmitter. The 'Creed' type-printing apparatus described in the next section is now frequently used in place of the receiver.

(10) *Type-printing Systems, including Multiplex Telegraphy*.—By far the greatest advances in telegraphy in recent years have been in the development of type-printing systems. Many ingenious devices have been made in order to produce the received messages in plain printed characters. (Fig. 8 is a fac-simile of a piece of slip printed by

## PRINTING INSTRUMENT

Fig. 8.

means of the Hughes type-printer.) Some have not been able to survive the test of service conditions, and have fallen into disuse. The systems which are now in use may be divided into two classes—viz. those suitable for heavy and those for light traffic. The former may be further subdivided into those systems which operate on the multiple-channel or *multiplex* system, and those which operate at high speed on a single-channel circuit. The multiplex systems include the *Baudot*, the *Murray*, the *Western Union*, and the *Western Electric*. The high-speed single-channel systems are the *Creed* and the *Siemens Automatic*. Among the light traffic systems may be classed the *Hughes*, the *Morcrum 'Teletype'*, the *Western Electric 'Start-stop'*, and the *Creed Direct Printer*.

*Multiplex Telegraphy*.—In 1873 Meyer conceived the idea of so arranging two corresponding sets of apparatus at distant places that, by causing them to move in exact synchronism, the use of a telegraph line might be given successively to several

operators for a very short period of time, so that one at each end would have it alone during the recurring periods. The synchronous movement of the two sets would ensure that each operator at one end should always have communication with the corresponding operator at the other. The principle, indicated in fig. 9, is as follows. If the

Fig. 9.

arms,  $a$ ,  $b$ , which are electrically connected with the line-wire at A and B respectively, be made to rotate simultaneously around the circles 1, 2, 3, 4, making contact with the segments as they pass, then when  $a$  is on A1  $b$  will be on B1, when  $a$  is on A2  $b$  will be on B2, and so on. Again, if 1, 2, 3, 4 at each station be connected to a set of telegraphic apparatus (say a type-printing instrument), then each of the four sets at A will be successively connected with the corresponding set at B as the arms,  $a$ ,  $b$ , move over the segments 1, 2, 3, 4. Thus, for each revolution of the arms, the instrument connected to A1 and B1 will be in direct communication once, and so also with A2, B2; A3, B3; and A4, B4.

Various methods of multiplex working have been tried, but the most practical and successful system now in use is the *Baudot*, named after the distinguished French telegraph engineer, who first introduced it about 1880. It is largely in use throughout the world, either in its simple form with hand keyboard transmitters, or in the modified forms in which it has been introduced by Donald Murray, the Western Union Telegraph Co., and the Western Electric Co. of America. The system uses a special 'five-unit' code, in which various combinations of five positive and negative currents are made, in place of the dot and dash signals of the Morse code. All the letters are of the same length. The system can be arranged for two (double), three (triple), four (quadruple), five (quintuple), and six (sextuple) channels, and it can in each case be worked duplex, thus giving the same number of channels in each direction simultaneously. With the Baudot sextuple, for instance, twelve messages (six in each direction) can be sent out at the same time over a single wire. The Post-office has several sextuple and quintuple circuits in daily operation, but the set more generally in use is the quadruple.

With the quadruple system each station requires a distributor, three relays, four keyboard transmitters, and four tape-printing receivers. The distributor and relays are common to all the keyboards and receivers at the one end of the wire. Each keyboard has five keys resembling those of a piano; each key is connected to one segment on the distributor, and, when in the position of rest, transmits a negative current to the line as the rotating brush passes over its segment. Depressing a key causes a positive current to flow to line. The keys, when depressed, are held down by a mechanical catch until the rotating brush has passed over their set of segments. At this moment a local current, called the 'cadence,' flows through an electro-magnet, whose armature releases the keys and at the same time gives a signal to the operator to manipulate the keys for the next group of signals. On the keyboard is mounted a commutator for altering the various connections for sending or receiving. The distributor is fitted with two ebonite discs of equal size. The front disc is

used for receiving and the rear one for sending. Mounted on both discs are six contact rings; two rings on each disc are continuous, but the remainder are broken up into insulated segments of various sizes. A set of arms carrying brushes rotates over each disc; the set on the front disc has two arms carrying two pairs of brushes, while the set on the rear disc has three arms, each carrying a pair of brushes. When transmitting, the keys send the currents to their particular segments on the rear disc, from where they are connected to line through the 'line' relay. If desired, a 'leak' relay is also actuated, by means of which the signals are transmitted to a local receiver and recorded. Received signals flow in through their connections on the back disc, and thence through successive segments, keys, &c., to the 'line' relay. The tongue of this relay transmits corresponding impulses to the proper position on the front disc, and thence through the segments to the magnets of the receiving instruments. The rotating arms can be driven either by a weight or by an electric motor. Synchronous running is maintained through various contacts on the rings of the correcting distributor being periodically connected to the correcting magnet. The receiver is of most ingenious design, and it is at the same time of strong and robust construction. It is driven at a speed corresponding with that of the distributor. It consists essentially of five electro-magnets, the armatures of which, when attracted, actuate certain mechanical selectors; and these again, by a somewhat intricate combination of electrical and mechanical movements, bring the tape against the required letter on the type-wheel, and thus a letter is printed on the tape. The normal speed of the Baudot is 30 words per minute per operator. On a sextuple circuit-worked duplex it is, therefore, possible to transmit 360 words per minute. The system is remarkably flexible, inasmuch as, dependent upon the traffic, any number of channels up to the total number available can be operated, and channels can be closed down as the number of messages to be transmitted diminishes. The system is therefore eminently adapted for handling heavy traffic. It can also be extended, and forked circuits can be arranged. For instance, in the case of a quadruple set at A, two channels can be worked to B, while the two other channels can be extended to C, thus giving A communication with B and C over the same wire.

*Murray Multiplex.*—This system was evolved by Donald Murray, and brought into use in England in 1911. It is the Baudot system described above, with certain modifications, which make for an increase of working-speed. In place of the five-key hand-sender on each channel, a keyboard perforator similar in form to a typewriter is employed to prepare a paper tape, which is passed through a simple type of transmitter. The perforations are produced across the tape instead of lengthways as in the case of the Wheatstone Automatic system, the result being a great economy of tape. Perforated in this manner, a slip containing 120 letters (20 words) is only 12 inches in length. The speed per channel is really only restricted by the speed of the operator in manipulating the typewriter keyboard. Speeds up to 45 words a minute per channel are quite usual on this system, and with specially selected operators speeds up to 60 words a minute may be attained. The distributors employed are of the Baudot type, but Murray has introduced a new form of drive for the brush-arms by means of a phonic wheel and vibrator, which has advantages in maintaining the synchronism of the two distributors. This method of drive can be adapted to the ordinary Baudot system. For receiving the signals at the distant end, Murray uses various types of printers, the chief of which are the Baudot

tape-printer and the Mörerum tape-printer and page-printer. Another feature of the Murray system is that in the case of a message to be retransmitted, the sending station can, by means of a special signal, switch a receiving perforator into circuit, which perforates the signals on a tape. This tape can be run through a transmitter on another circuit, and so the work of transcribing the message and preparing it by hand for retransmission is obviated.

*Western Union Multiplex.*—Murray sold his American rights in the Murray Multiplex to the Western Union Telegraph Co. of America in 1912, and this company, assisted by the Western Electric Co., designed and brought into use on the telegraph company's lines multiplex apparatus adapted for the conditions and requirements of the country. The system has been largely introduced in the United States. It comprises perforators and tape transmitters, and in a general way follows the lines of the Murray Multiplex, although several new features have been added. The receiver is a page-printer, which is operated chiefly by electro-magnets and relays. The four-channel (quadruple) set is the largest in use, and this can be worked duplex.

*Western Electric Multiplex.*—This system follows the general design of the Western Union apparatus, but differs in a number of important details. It is in use in the British Postal Telegraph Service. The page-printer which is employed with the Western Union system is a feature also of this system.

*Creed Automatic.*—This is a high-speed single-channel system using the Morse code. It was invented by F. G. Creed in 1908. It is used in the British Post-office in conjunction with the Wheatstone Automatic (see above); but transmitters, together with keyboard perforators and other auxiliary apparatus specially designed by the Creed Company, are used in other directions. The essential parts are a receiving perforator and a printer. Originally compressed air was employed for actuating the punching and printing mechanisms of those machines, but in the latest designs they are both actuated electrically. The receiving instrument perforates the signals in the Morse code on a tape identical with the punched tape used at the transmitting end. This tape is then passed through the printer, which transposes the Morse code perforations into Roman characters, and prints these either on a tape or, by means of a special attachment, in column form. It is claimed that the receiver will operate accurately up to a speed of 200 words a minute, while the safe working-speed of the printer is about 140 words a minute. The system can be worked duplex. It is used to a considerable extent on newspaper circuits in Great Britain and on submarine cables, and is being employed on high-speed services in Wireless Telegraphy (q. v.).

*Siemens Automatic.*—This system, introduced by Siemens and Halske of Berlin in 1914, is in use in the British Post-office on a line between London and Berlin. It is worked duplex at a speed of 160 words per minute in each direction. It employs a five-unit code, and embodies the Baudot principles of synchronism by means of a distributor at each end. A keyboard perforator prepares a tape, which is passed through a transmitter. This sends current to line through the distributor-brushes and line relay. At the receiving end these currents actuate the line-relay, which brings local currents into play through the receiving distributor-brushes, which move in unison with those of the distributor at the sending end. These local currents control the relays of the printer, and at the right moment cause a paper tape to be pressed against the required letter on the type-wheel, which carries the letters on its rim.

*Hughes Type-printer.*—This system is a slow-speed single-channel one. It was brought out in 1855, and embodied principles which had not previously been introduced. It was further improved, and has for many years past been the principal instrument used on submarine cables connecting England with the Continent. It is also employed to a considerable extent in continental countries. The instruments at the sending and receiving ends are identical in construction, and synchronism is maintained by a cleverly designed 'governor.' The action is principally mechanical, the electrical part being confined to the transmission and reception of a single current of short duration for each letter or other sign registered. The sending portion is like a piano keyboard, with the letters and other symbols engraved upon the keys. The mechanism is stable and accurate in operation, although complex in character, and the operators entrusted with its working are required to be specially skilled. The system can be worked duplex, and a speed of about 30 words per minute each way is attained. Its use is not likely to be extended, as to cope with increasing traffic the employment of apparatus of larger output is necessary.

*Mörerum 'Teletype.'*—This instrument is made in two forms, one for tape-printing and the other for page-printing. The former comprises a keyboard transmitter and a tape-printer mounted together on the same base. A five-unit code is used, and the instrument when receiving is automatically started and stopped by impulses sent out by the sending station. These impulses also ensure synchronism between the printing mechanism and the transmitter. The instrument is specially adapted for use on private lines, and on public telegraph lines on which the traffic is not too heavy. The printer can be supplied as a separate unit. The page-printing machine is also in two units, mounted together where both transmission and reception are required. The system can be worked duplex, and in skilled hands a speed up to 60 words a minute can be attained in each direction. The Mörerum page-printer as a separate unit can also be used for reception on multiplex systems.

*Western Electric Start-stop.* This system, introduced by the Western Electric Co. of America, is suitable for circuits not requiring a greater traffic-carrying capacity than 60 words a minute in each direction. Transmission is performed either directly from a keyboard or by means of a perforated tape and a simple form of transmitter. In fundamental principles the system is similar to the company's multiplex system referred to above, and uses the same five-unit code and some of the same apparatus units. The 'Start-stop' functions are accomplished by current impulses controlled by the sending keyboard.

*Creed Direct Printer.*—This instrument has a keyboard mechanism for sending, and the received signals are produced on tape or in column form as desired. It is worked on the five-unit principle, and is capable of being operated at a speed up to 70 words a minute. It can be duplexed.

Other type-printing systems are in use by various private news agencies, and in these cases the apparatus must be relied upon to work without expert attention, or, indeed, any attention except that given for maintenance purposes at regular intervals. These systems generally require a current for every step forward of the type-wheel. One very interesting system is that of the Exchange Telegraph Company of London, which distributes news to many different points simultaneously, where it is printed on a paper tape. The speed of working with a skilful operator reaches 40 words per minute. This company also employs a column-printer, invented by their chief engineer;

Mr F. Higgins. It has many ingenious features, and was the first column-printing instrument to be brought into successful commercial use. Other instruments associated with type-printing telegraphs are the 'Gell' and the 'Kleinschmidt' keyboard perforators, which perforate tape in the Morse code. Both are used in the British Post-office.

(11) *News Circuits*.—Wheatstone automatic instruments are employed on nearly all long circuits in England, not only because they increase the capacity of the wires for the conveyance of messages, but because they are so specially adapted for the conveyance of news, which is such a distinctive feature of the English system of telegraphy. One batch of news is often sent to a great many different places, and as four or even eight slips can be prepared at one operation, and one slip can be used several times, the labour of preparing for transmission is very much reduced. In fact, without this system it would be simply impossible to transmit the enormous amount of intelligence sent telegraphically all over the country. There are many news circuits radiating from the Central Telegraph Station, having three and four intermediate stations upon them, one or more of which 'repeat' or 'translate' onward to three or four more stations. Thus one punched slip disseminates the news to many places. A large proportion of the news items handed in by news agencies has to be sent to addresses in all parts of the country, and to effect this the slip once prepared can be used over and over again upon different circuits; moreover, by means of pneumatic power, the perforators at the Central Telegraph Office are capable of punching four slips at a time, and, the pneumatic instruments being arranged to work several perforators, a proportionate number of slips are thus prepared at one operation. Not only can one slip be used upon several different circuits, but often several offices which generally take the same class of news can be placed upon one circuit, so that all take the same messages simultaneously. When an address is outside the delivery of a news circuit the message may have to be received, written up, and again transmitted, or it may be retransmitted by means of a perforated tape prepared by a Creed perforating receiver. The Creed system is also much used for receiving on news circuits, as the printing of the signals saves time and labour in writing out the news by hand. The Press Association News Agency of London has now its own system for the transmission of news to a number of provincial newspapers. The wires employed are provided by the Post-office on a rental basis, and the apparatus used is the Creed. The handling of this work by the Press Association has relieved the Post-office of almost 50 per cent. of the press-work previously dealt with by the department. Press messages are carried by the Post-office at a low tariff, especially during the night. To save delay and secure the transmission of their news at a fixed rate, many of the provincial newspapers arrange for the sole use of a wire during the night. Some of the London papers have special wires to the Continent. Practically all newspaper wires are now worked by one form or other of type-printing system, the Creed and the Murray Multiplex being most favoured on lines carrying heavy traffic. The Teletype is also used for this purpose.

(12) *Repeaters*.—The length and description of a circuit have a great deal to do with the possible speed at which it can be worked. The greater the distance, as a rule, the lower the speed, and the reducing effect of a mile of underground wire is greater than 20 miles of aerial line. But even with an aerial line the leakage, &c. at the insulators makes the strength of current received, as compared with that sent out, proportionally less

as the distance increases; and although it is of course possible to compensate for this loss by an increase of battery power, it is not so easy to compensate for the retardation due to electrostatic capacity. In dry climates the limit of distance for uninterrupted communication is rarely reached in practice, but in England the conditions are such that 400 miles may be taken as the limit. It then becomes necessary to take off the messages and repeat them by clerks, or to introduce a *repeater* or *translator* which, worked by the original currents, will automatically transmit or relay stronger currents similar in direction to, and of equal duration with, those which are passed through it. It is, in fact, an extension of the principle of the ordinary relay, and is introduced into the circuit for a similar reason—the relay is placed in circuit that it may be actuated by currents which would not work the sounder or Morse writer direct, and completes a local circuit in which the receiving apparatus is placed; the repeater is also arranged to relay similar currents to those which actuate it; but while the relay as ordinarily used is required to work an instrument in the same office, the prime function of the repeater is to retransmit the signals along an extension of the original line. By this means it is possible to work to any distance. Thus the Indo-European line from London to Karachi in India, a distance of 5300 miles, is worked directly (without any retransmission by hand) by means of fourteen repeaters.

Varley introduced repeaters at Amsterdam to translate the English double-current system of working into the Continental single-current system in 1858, but in England the Post-office has introduced them to increase the rate of working. There is, however, a limit to the number of repeaters which can be employed on one line. The motion, friction, and inertia, both magnetic and mechanical, of the moving parts, and the introduction of disturbing electrical causes, prevent the duration of the contact of the tongue of the relay from being the exact counterpart of that of the sending key. It is of less duration. Retardation therefore takes place, and the rate of working is reduced with each relay added. In few cases in England is more than one repeater introduced, but by means of that an actual and decided increase of speed is obtained, due to the fact that the speed of working of the whole circuit is made that of its worst section alone. With the placing underground of the long-distance lines and the introduction of the Creed perforating receiver on the Wheatstone Automatic circuits, the speed of working on these lines has been very much reduced. Instead of 400 words a minute, which was formerly the regular speed on these circuits, 130 to 200 is now the rule. At these speeds the use of repeaters is still required. It is impossible, however, in this article to give a correct idea of the working details of the repeaters now used.

(13) *Submarine Telegraphy*.—Owing to the retarding influence of a long submarine cable, by which it becomes difficult to pass ordinary electric currents through the cable except at very long intervals, giving the cable meanwhile time to discharge, and owing also to other disturbing causes, special means have to be adopted in working such cables in order to obtain the maximum possible speed. The method usually adopted was invented by C. F. Varley, and consists in interposing a condenser in the receiving circuit, so that instead of the circuit being complete it is interrupted at the condenser; and the instrument—a very sensitive form of galvanometer devised by Lord Kelvin—is actuated merely by the charge and discharge of the condenser. The Thomson galvanometer, without which long cables could scarcely have been commercially successful, consists essentially of a magnet

composed of one or more pieces of a watch-spring,  $\frac{3}{8}$ -inch in length, cemented upon a small circular convex mirror of silvered glass, which is suspended by a short thread of cocoon silk without torsion. This needle is suspended in the centre of a coil of very fine wire, and a ray of light is projected from a lamp upon the mirror. The beam of light is reflected at some distance upon a scale, and a very minute movement of the mirror therefore produces a considerable movement of the ray projected upon the scale. The movements of the spot of light upon the scale are read off in precisely the same way as the motions of the pointer on the dial of a single-needle instrument. The ordinary Morse system on an Atlantic cable could scarcely have a speed of one word a minute, while fifteen words was soon a usual speed with the reflecting galvanometer, and twenty-four was obtained. By Lord Kelvin's Syphon Recorder (1867) cable messages can be permanently recorded as on the Morse system.

With improved methods much higher speeds are now obtained. The speed attained on the London-Halifax section of the Imperial cable is thirty-five words a minute in both directions. The Morse signals received on many cables are converted into Roman characters, and printed on tape by means of Creed apparatus. The most remarkable feat on record in cable transmission occurred at the opening by the king of the Wembley Exhibition on the 24th April 1924. The king's message: 'I have this moment opened the British Empire Exhibition, George R. and I,' was signalled from the telegraph office at the exhibition round the empire from west to east, involving seventeen transmissions in all. On the outward journey it passed through Halifax (Nova Scotia), Montreal, Banfield (Vancouver), Fanning Island, Fiji, Auckland (New Zealand), and Sydney. From this point it came back by two routes, one touching Cocos, Rodriguez, Durban, Capetown, St Helena, Ascension, St Vincent, and Madeira, the other touching Singapore, Madras, Bombay, Aden, Suez, Alexandria, Malta, and Gibraltar. The time taken in transmitting this message round the world was eighty seconds.

Submarine cables naturally vary considerably in construction, but the following are the general principles. For deep-sea cables, the central conductor, to carry the current, is usually of several strands of fine copper wire; this is enveloped in a thick coating of insulating material, generally gutta-percha; next, a layer of jute yarn, which is covered by a spiral layer of iron or steel wires; and finally, a covering of jute yarn coated with pitch. In shallow water an extra outside covering is applied, and 'shore ends' are made still stronger owing to the increased risk of damage.

During the Great War a cable connection was established between Penzance (Cornwall) and Halifax (Nova Scotia), thus completing the Imperial chain of cable communication between London and the Antipodes.

See, besides the articles **ELECTRICITY** and **WIRELESS TELEGRAPHY**, T. E. Herbert, *Telegraphy: British Post-office System* (1920); Preece and Sivewright, *Telegraphy* (1914); and C. Bright, *Submarine Telegraphy* (1898).

**Telegraph Plant** (*Desmodium gyrans*), an Indian leguminous plant. Of its trifoliate leaves the lateral leaflets, which are small, have, especially in a warm, moist atmosphere, a strange spontaneous motion; they jerk up and down (sometimes 180 times in a minute), as if signalling, and also rotate on their axes (see **PLANTS**, p. 208).

**Tel el-Amarna, &c.** See **TELL EL-AMARNA, &c.**

**Tele'machus**, son of Ulysses (q.v.) and Penelope, was an infant when his father left home to

join in the war against Troy, but during his twenty years' absence grew into manhood. Under the guidance of Athene, who had assumed the appearance of Mentor (q.v.), Telemachus set out in search of his long-lost sire, after having vainly endeavoured to eject his mother's troublesome suitors from the house. Having visited Pylos and Sparta, Telemachus returned home to Ithaca, where he found his father in the guise of a beggar, and with him proceeded to slay the suitors.—In modern times Telemachus is known chiefly as the hero of Fénelon's romance, once very popular as a school-book.

**Telemark**, an administrative district of southern Norway, with an area of 5860 English sq. m. and a population of 125,000. It rises from a coastal plain to an upland region, attaining a height of 6000 feet at one point (Gausta). It is dissected by numerous large and beautiful lakes such as the Nordsjø, Bandaksvand, Totakvand, Nisservand, Fyrisvand, and Tinsjø. Capital, Skien.

**Teleology** (Gr. *telos*, 'an end'), the doctrine of final causes (see **CAUSALITY**), is usually limited to the argument for a creator and for the existence of God derived from the existence, beauty, and perfection of the world; the *a posteriori* argument of Apologetics (q.v.). See also **THEISM**.

**Teleosaurus**, a genus of fossil crocodiles, the remains of which occur in the Lower Jurassic rocks. They are found associated with marine fossils, and the peculiar modification of their skeleton seems to have specially fitted them for an aquatic life. Both surfaces of the vertebrae were slightly concave, the hind-legs were large and strong, and the anterior portion of the body gradually tapered into the long and slender jaws, giving the animal the aspect of the gavia of the Ganges; but the jaws were more attenuated, and the nasal aperture, instead of being oblique, opened vertically on the truncated end of the upper mandible. The jaws were armed with numerous equal and slender teeth, slightly recurved.

**Teleostei**. See **BONY FISHES**.

**Teleostomes**. See **FISHES** (*General Survey*).

**Telepathy**, a word coined about 1882 from the Greek to express the supposed power of communication between one mind and another by means unknown to the ordinary sense-organs. See the article **APPARITIONS**, and books cited there.

**Telephone**. This instrument is designed to reproduce sounds at a distance by means of electricity. Sound is due to vibrations of the air, and these vibrations differ among themselves in, and are characterised by, three particulars—viz. frequency or number per second, amplitude or range of displacement, and co-existence of simultaneous vibrations affecting the same air. These physical data determine respectively the pitch, the loudness, and the character, quality, or *timbre* of a sound. The mechanical problem of telephony then is, given an air-vibration which presents these three characteristics in any determinate way, to reproduce a similar air-vibration at a distance; then this, being received by the ear, will be perceived as sound. Under the most complex vibration no particle of air can be in more than one place at once: hence the net result of superposition of the most complex possible series of vibrations, from single melody or smooth harmony to the most complicated noise or the most delicate inflexion of the human voice, is a movement of each air-particle which may be represented by a curve of an apparently irregular form, lying alternately above and below a straight line which threads the curve and represents the position of the air-particle when undisturbed. The reproduction of this irregular resultant motion is the most general form of the problem: the earliest attempts were confined to the reproduction of the frequency of a vibration—i.e. the pitch of a sound,

the first of the particulars above mentioned. In 1860 Reis of Frankfort first attacked the problem: he used a collodion membrane, upon which the sound-waves produced by the voice were made to impinge; this membrane, vibrating under their influence, alternately displaced and liberated a lever, which alternately made and broke the circuit of a galvanic battery; the intermittent current thus produced acted upon a distant electro-magnet which alternately attracted and failed to attract its armature; the armature thus oscillated, and a wing or plate attached to it acted upon the air, which was thus set in vibration, reproducing the pitch of the original tone or the inflection of the original voice. It appears from recent inquiry that Reis actually did more than this; but the next step is attributed to Mr Elisha Gray of Chicago, who sent successions of electrical current of varying strength as well as of varying frequency into the circuit, and thus enabled the relative loudness as well as the pitch of sounds to be transmitted; and who afterwards took the important step of using the variations of a steady current. These variations, positive and negative, are capable of representing all the back-and-forth variations of position of a particle of air, however irregular these may be: and he secured them by making the sound-waves set a diaphragm in vibration; this diaphragm carried a metallic point which dipped in dilute sulphuric acid; the deeper it dipped the less was the resistance to a current passing through the acid, and *vice versa*: so that every variation in the position of the diaphragm produced a corresponding variation in the intensity of the current: and the varying current acted upon a distant electro-magnet, which accordingly fluctuated in strength, and in its attraction for a piece of soft iron suspended on a flexible diaphragm: this piece of soft iron accordingly oscillated, pulling the flexible diaphragm with it; and the variations of pressure in the air acted upon by the diaphragm produced waves, reproducing the characteristics of the original sound-waves, and perceived by the ear as reproducing the original sound or voice. Mr Gray lodged a  *caveat*  for this contrivance in the United States Patent Office on 14th February 1876; but on the same day Professor Alexander Graham Bell filed a specification and drawings of the original Bell telephone. In this the flexible diaphragm upon which the sound-waves impinge bore a small bar-magnet, which was thus made to oscillate; it oscillated in the immediate neighbourhood of the pole of an electro-magnet round which passed the continuous current of a battery: the oscillation of the bar-magnet in the neighbourhood of the pole caused fluctuations in the strength of the electro-magnet; these fluctuations caused variations in the intensity of the current passing continuously round the electro-magnet, and away to the distant receiver; there the varying current found an electro-magnet to act upon, and this exerted varying tension upon a soft-iron diaphragm. Later on Bell disclaimed the use of a non-metallic flexible diaphragm in the transmitter, and used only a soft-iron diaphragm; and he also used a permanent magnet instead of an electro-magnet in that instrument, it being found that currents of sufficient intensity were produced thereby. He also used similar instruments at both ends of the line. For these two later modifications priority is claimed on behalf of Professor Dolbear. Mr Edison secured the requisite variations of the current in another way. He found that lamp-black and certain other substances could be prepared in masses which were slightly compressible, resilient, and semi-conductive, and which varied in conductivity as they became exposed to greater or smaller pressures; and that the variations in

conductivity were very satisfactorily proportional to the variations of pressure. The vibrations of the diaphragm were accordingly made by him to concentrate themselves upon a small button of such a substance, and thus to induce variations in the conductivity of the circuit.

At the present time instruments of the Bell telephone type are mainly used as receivers only. In the Bell receiver itself both poles of the magnet are now brought into proximity to the magnet; and the instrument may be flattened down into the form of a watch. In the Gower receiver the form is also watch-shaped, and the sound is conveyed to the ear by tubes. In the Ader receiver the electro-magnetic field acting upon the ferrotype iron diaphragm is improved, being rendered more intense and more uniform by a ring of soft iron placed outside the diaphragm. In other receivers devices are applied for economising wire, for decreasing the magnetic resistance of the magnetic circuit, for facilitating construction and regulation, &c. The range of actual movement at the centre of the diaphragm of a receiver is, for the faintest audible sound, less than one fourteen-millionth of an inch. The transmitter is now almost always some modification of the Microphone (q.v.). Edison's instrument, above described, is in substance a microphone; it is, however, not operated by shaking the whole apparatus as in the original Hughes microphone, but by bringing variations of pressure to bear upon the carbon button. In the Blake transmitter the same principle is applied; the current of a battery passes through the button, and is there made to vary, and it also passes through the primary winding of an induction coil: the variations are taken cognisance of by the secondary winding which transmits them, adequately intensified, to the general circuit. The Crossley, the Gower, and the Ader transmitters are more obviously adaptations of the Hughes microphone, with eight, sixteen, and twenty loose contacts respectively instead of two, and attached to the under side of the vibrating diaphragm, which in the Gower and the Crossley is a thin sheet of wood. Other types are the Johnson, which is provided with a shunt so as to adjust the current transmitted, and thus prevent buzzing; the Hunnings, in which powdered coke is used; the Swinton, which depends on swinging carbon rods resting by loose contacts against a carbon bar, there being thus no diaphragm in the popular sense, though the English courts have decided that the carbon rods are mechanically equivalent to a diaphragm; and Thompson's valve transmitter, in which a ball of carbon rested upon three carbon buttons and was impinged upon by air-waves from beneath.

The word 'telephone' is now usually applied to the complete instrument, comprising the transmitter, the receiver, and the various subsidiary appliances, such as switch bells worked by a battery or by a small magneto-electric machine, driven by a crank for signalling purposes. The arrangements which have to be devised for the purposes of a central telephone station increase rapidly in complexity with the number of subscribers. Care must be taken to minimise the effects of induction from neighbouring wires. See Allsop's *Telephones* (1900); Preece and Maier, *The Telephone* (1889); Preece's *Manual of Telephony* (1893); and Miller, *American Telephone Practice* (N.Y. 1899).

Of the five leading telephone patents for Great Britain, the last, the Crossley transmitter, was to expire 1st February 1893. In 1880 (21st December) Mr Justice Stephen decided in favour of the British Post-office that telephony was a form of telegraphy. After that decision telephony was carried on in Britain under the Postmaster-general's license, on payment of one-tenth of the gross receipts. In

1891 this tenth amounted to £40,000, in 1904 to £169,800. France, Germany, Austria, and the Continent generally were well supplied with trunk lines; and in England most of the chief towns were connected directly with London, and there was an increasing number of other lines. The first London-Paris line was opened in March 1891. In Berlin the system of laying wires underground was very thoroughly developed. On the Continent the telephone is largely used by the rural post-offices; and in France any person may telephone from a call-office to a post-office, and his verbal message will be transcribed and sent on as a telegram. In the United States the microphonic transmitter patent only began to run its course of seventeen years in 1891, on account of a dispute as to priority between Edison and Berliner. In 1902-3 the total number of trunk-line conversations in Britain was 11,574,229, and in 1903-4 the number had increased to 13,467,975, and the receipts were £325,525.

In 1892 the Telegraphic Act gave the Post-office entire control of the trunk wires throughout the kingdom. The intention was to provide a complete system of telephonic communication between the important towns, leaving the towns themselves to be dealt with by individual companies. The National Telephone Company, using mostly Blake transmitters and Bell receivers, gradually absorbed the other companies, obtaining a practical monopoly of the work; and it secured a license from the Postmaster-general, which expired in 1911. In 1902 it had 1028 exchanges and 233,000 stations in the United Kingdom. Dissatisfaction having been expressed as to the imperfect service of the National Company, the government in 1898 appointed a select committee, which reported that no system can be satisfactory which is worked under a practical monopoly by a private company for private profit, and that the work should be carried on like the Post-office, for the benefit of the whole country, and not only certain localities and limited areas. They recommended general competition, either by the Post-office or by municipalities acting under license, but favoured the former as promising a more general benefit. The act of 1899 on these lines gave facilities for extending municipal licenses, but these did not come to much. By an agreement dated 2d February 1905 the Post-office acquired the whole undertakings of the National Telephone Company on 31st December 1912, at an arbitration price of £12,515,264. Under Post-office management the system extended fairly rapidly; but from it there were severed the Irish Free State telephones (194 exchanges, 19,037 stations) in 1922, and the Jersey telephones (15 exchanges, 1639 stations) in 1923. At 31st March 1925 there were under the British Postmaster-general 3775 exchanges and 1,273,800 telephones; and during the year there had been 990,000,000 calls. For the numbers in successive years consult the successive volumes of the *Manual of Electrical Undertakings*. Of late years great strides have been made in laying underground trunk cables and in putting in 'automatic' instruments which enable the users to connect by means of an automatic exchange. There are now many cables devoted to Anglo-Continental service, on which there were 822,531 calls during the year ending 31st March 1925. The history of the subject, so far as now traceable, both as regards appliances used and the business matters involved, is well set forth in *The History of the Telephone in the United Kingdom*, by F. G. C. Baldwin (London, Chapman & Hall, 1925). See also WIRELESS TELEPHONY.

**Telerpeton**, a remarkable genus of fossil reptiles, the relics of which have been found in fine-grained whitish sandstone of Triassic age quarried at Cummingston, near Elgin. A single

species, or rather a single specimen, is all that as yet has been detected. It exhibits the skeleton complete, with the exception of the termination of the tail, but the bones have disappeared, and left only the casts as dark-coloured cavities in the pale-gray rock. Nearly perfect casts of their forms were taken by Dr G. Mantell from these hollow casts. Some have regarded *Telerpeton elginense* as one of the Protosauri, with the New Zealand 'lizard,' *Sphenodon*, as its only living relative; others refer it to a lost race of primitive generalised reptiles known as *Cotylosauria*.

**Telescope** (Gr. *tēle-skopos*, 'far-seeing') usually consists essentially of a lens or mirror, to form within our reach a real image of a distant object suspended in space; and a Microscope (q.v.), to examine this image in detail. Anticipations of the telescope have been claimed for Roger Bacon (died 1294?); and Sir Richard Burton alleges that long ere this it was known to the Arabian scientists (see the supplement to his *Arabian Nights*). Leonard Digges, an English mathematician, very suggestively describes in his *Geometrical Practise* (1571) 'the marvellous conclusions that may be performed by glasses concave and convex, of circular and parabolic forms,' speaks of a separate volume (never published) describing 'the miraculous effects of perspective glasses,' and must be held to have at least anticipated the invention. Della Porta (died 1615) may have made a rude telescope. But the telescope from which all later ones proceed by lineal descent seems to be that presented to the General States of Holland on 2d October 1608 by the optician Hans Lippersheim or Lippershey of Middelburg—though possibly another optician, Zacharias Jansen, and the mathematician Adriaan Metius had also something to do with the development of this same telescope. The value of the invention was immediately realised; telescopes were being sold in Paris next year; and Galileo, hearing of the Dutchman's invention, made a telescope for himself, with which, the first night he used it (7th January 1610), he discovered three of Jupiter's moons. Kepler (1611) is the inventor of the astronomical telescope.

The way in which an inverted real image is formed by a lens is described under LENSES; see also MIRROR. The reason why it is necessary in a telescope to produce a real image which may itself be subjected to examination by means of a lens is the following: If a single magnifying lens, or an equivalent combination of lenses, be placed between a distant object and the eye, the image formed will not be thrown upon the retina itself, and nothing will be distinctly seen, unless indeed the eye is taken far enough back to see the minute real image itself. If, on the other hand, a real image be projected in space within our reach, a magnifying lens or combination of lenses can be made to examine that image as if it were an object, after the fashion of the Microscope (q.v.). If the eyepiece be equivalent to a single magnifying lens or simple microscope, the inverted real image will not appear to be re-inverted, and then what the eye sees on looking through the combination is an inverted magnified representation of the distant object, as in the astronomical *refracting* telescope; but if it be equivalent to a compound microscope, it will appear to re-invert the inverted real image under examination, and will thus furnish an un-inverted representation of the object, as in the terrestrial telescope. The astronomical form is thus simpler than the terrestrial, and absorbs less light; and it is accordingly used for sailors' night-glasses. If the real image be formed by a concave mirror, a plane reflecting surface or secondary mirror may be interposed so as to turn back or turn aside the reflected rays before they have

actually formed the real image, and thus to cause the real image to be produced in some place where it can conveniently be examined by a magnifying eyepiece. If the reflected rays be turned aside through  $90^\circ$  by a plane reflecting surface, the magnifying eyepiece will be at the side of the instrument; and then we have the Newtonian

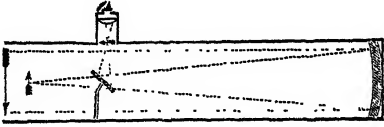

Fig. 1.—The Newtonian Telescope.

form of the astronomical reflecting telescope (fig. 1), exemplified by Lord Rosse's telescope. If the reflected rays be simply sent back along the axis of the instrument, they—or the central portion of them—may be allowed to pass through a small hole in the centre of the concave mirror, and dealt with by an eyepiece on the other side of that mirror; in which case we have the Gregorian form of the reflecting telescope (fig. 2), where the eyepiece is at

Fig. 2.—The Gregorian Telescope.

the end, as in the ordinary terrestrial telescope. If the concave mirror be tilted slightly to one side it will, without loss of light due to the intervention of a second mirror, itself bring the real image towards one side of the apparatus. There it may be examined by means of an eyepiece suitably placed, directed obliquely towards the mirror; and this is the Herschelian form of the instrument (fig. 3).

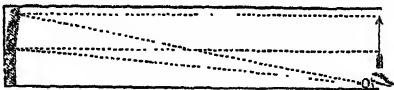

Fig. 3.—The Herschelian Telescope.

These are the three main forms of the reflecting telescope; they are subject to minor modifications, for which see works on practical astronomy.

A telescope cannot be made of invariable length, for two reasons. In the first place, for a given eye there is a fixed, most suitable distance between the eyepiece and the proper position of the real image to be examined by it. Wherever the real image happens to be formed, the eyepiece, simple or compound, must be moved into the proper relative position with regard to that real image; but the image of a nearer object is formed farther from a lens or from a concave mirror than is the image of a more distant object, for which reason the eyepiece of a telescope must be moved farther away from the objective or reflector in order to examine the image of a nearer object; and the telescope as a whole must be lengthened for nearer, or shortened for more distant objects. In the second place, the eyes of different observers may not be similar; each observer may have his own proper fixed distance between the eyepiece and the real image, according to his long-sightedness, short-sightedness, or normal vision. Consequently the distance traversed by the rays between the objective or mirror and the eyepiece is always made adjustable by sliding tubes or otherwise.

When a telescope is in 'focus' a pair of cross-fibres, placed in the focus of the eyepiece, will appear to retain a fixed position with regard to any point of the object as seen through the telescope, even though the eye of the observer be moved up and down or from side to side. This is called the parallax method of focussing. By substituting for a given eyepiece others of different magnifying powers, the magnifying power of a telescope as a whole may be varied. The magnifying power of a telescope is the ratio between the focal length of the objective and that of the eyepiece. For suppose an object, say a chimney-stalk, 100 feet high at 10,000 feet distance, and the telescope directed towards the bottom of it, the angle subtended by the object, from the point of view of the objective-lens, at the crossing-point of the rays from the top and the bottom of the chimney-stalk, will be a little over  $34'$ , an angle whose tangent is  $\frac{1}{100}$ . If the objective could be supposed to look backwards and to see the real image produced by it in the body of the telescope, that image would again subtend an angle of  $34'$ , and there would not be any magnification, for the visual angle subtended would be the same. If the image were produced at 1 foot from the crossing-point of the rays, it would have an actual length of  $\frac{1}{100}$  foot or  $\frac{1}{100}$  inch. But after passing through the eyepiece the rays from the virtual image of the whole object would tend to enter the eye of the observer at the same visual angle as the rays from the top and the bottom of the real image of the chimney would cross one another in their transit through the eyepiece if it were a real object there situated; and so we may look at the matter as if that crossing-point in the eyepiece were itself the organ of vision. From that point the real image of the size mentioned at say  $\frac{1}{100}$  inch distance would subtend an angle of  $13^\circ 30'$ , or an angle whose tangent is  $\frac{1}{24}$ , or twenty-four times the preceding. But the apparent size is proportional to the tangent of the visual angle measured with reference to the axis of the system; hence the magnification here is as 24 to 1, or as 1 foot (the focal distance between the real image and the objective) is to  $\frac{1}{24}$  inch (that between the real image and the eyepiece). If in this last case the aperture of the object-glass had been the same as that of the pupil of the eye, the magnification would have been the same, 24 : 1; but there would have been a lack of illumination, because an equal amount of light from the same source would have been made to produce on the retina an image about twenty-four times as large linearly, or 576 times superficially.

If, however, in the case supposed, the objective be twenty-four times as great in diameter as the pupil of the eye, this is—apart from loss of light by absorption in the lenses—compensated for, and the illumination is restored. With lenses of larger diameter than is necessary to compensate the loss of illumination by magnification, the field appears brightly lit. Where there is no loss of illumination through magnification, as in the case of stars, which are too far to be magnified into appreciable discs, the increase of brightness in the objects viewed enables objects to be seen which make no impression upon the naked eye. Suppose a star to be so far as to be visible and no more; then another equal star, ten times as far, would appear to shine, under the law of inverse squares (see LIGHT), with one-hundredth the intensity of the former, and would be invisible to the eye; but if its light were collected over an area a hundred times as great as that of the pupil, and sent into the eye, the eye would again be just enabled to perceive it; and in order to secure this hundred-fold area the diameter of the objective must be ten times that of the pupil of the eye. The space-

penetrating power of a telescope is therefore—assuming that there is no loss of light in the telescope itself, which is not the case—directly proportional to the diameter of the objective.

The Opera-glass (q.v.) is often described as a form of telescope under the name of Galileo's telescope; and, while it does not magnify greatly, it is very serviceable in collecting much light and brightening the field. Sir Francis Galton said (*Vacation Tours in South Africa*, chap. ix.) that a large opera-glass was 'one of the most perfect of night-glasses, besides being the most useful of telescopes.'

As to the unavoidable imperfections of the telescope, we find in the first place that even with a mirror, as in a reflecting telescope, where we are not annoyed by the breaking up of white light into its component colours, since the Law of Reflection (q.v.) is the same for all rays, it is impossible to form a perfectly sharp image of more than *one* definite point at a time. In order to do even this the mirror must be formed as part of the prolate spheroid produced by the rotation, about its longer axis, of an Ellipse (q.v.), one of whose foci is the object-point, the other the image. If the object-point be, like a star, practically at an infinite distance, the requisite form of the mirror is that formed by the rotation of a Parabola (q.v.) about its axis. The axis of the mirror must then be directed to the object-point, and all rays from it will, after reflection, pass accurately through the focus. But this is not strictly true for any other object-point in the field of view, although it is so nearly true that no inconvenience is practically found to result. But if the mirror used be part of a sphere, no point can be found such that rays diverging from it shall all be brought after reflection accurately to one point of the image; and this defect, called *Spherical Aberration*, increases with the surface of the mirror of any given radius; so that by increasing that surface, for the attainment of brightness, we increase proportionally the indistinctness of the image. To give an idea of the delicate manipulation required in the construction of a reflecting telescope we take the case of a speculum of 4 feet aperture and 40 feet focus, as calculated by Sir J. Herschel.

If this be first ground to a truly spherical form it must have a radius of 80 feet. Now, such a mirror will give a very indistinct image, even under the most favourable circumstances; yet to grind it to the parabolic form, which is practically perfect, leaving the middle untouched, and grinding more and more away from its surface as we proceed outwards to the edges, even at the edges we have to remove a film of metal of only the  $\frac{1}{1000}$ th part of an inch, somewhere about the  $\frac{1}{1000}$ th part of the thickness of the paper on which this is printed! The spherical aberration is partly compensated in Cassegrain's modification of Gregory's telescope, in which the small secondary mirror is convex.

Lenses, whether the object-lens or the eye-lens, have this defect also; but, as a rule, the most conspicuous fault of single lenses is their *Chromatic Aberration*, which arises from the different refrangibilities (see REFRACTION) of the various coloured rays, and leads to the formation, by a lens, of separate overlapping images of a bright object for each coloured ray. The remedy consists in *achromatising* (see ACHROMATISM, REFRACTION)

the lens—i.e. forming it of two or more lenses of different kinds of glass, so that the colours, separated by one, shall be reunited by the others. The curvatures of the lenses which make up the achromatic combination, and the distances between them, may be so chosen as to minimise the effects of spherical as well as of chromatic aberration. Galileo's telescope has less chromatic and spherical aberration than the common astronomical telescope, and is shorter, since the distance between the lenses is approximately the *difference*, not the *sum*, of their focal lengths.

Before the discovery of the possibility of forming an achromatic lens Huygens, Cassini, and others had endeavoured, by enormously increasing the focal length of the object-glass of the common astronomical telescope in proportion to its diameter, to get rid as far as possible of chromatic aberration.

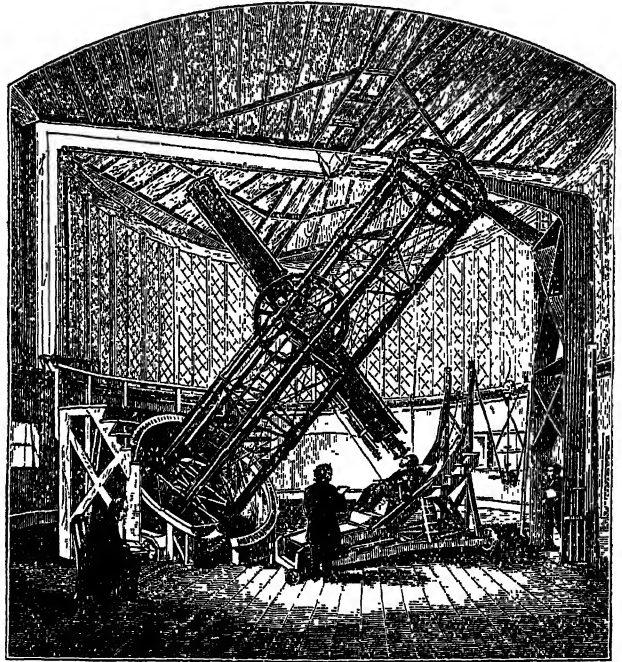

Fig. 4.—The Great Equatorial Telescope at Greenwich Observatory (from Dunkin's *The Midnight Sky*).

They thus formed the *aërial* telescope, in which the object and eye lenses were mounted separately on stands; the tube (which would have been 100, 200, or even 600 feet long) being dispensed with. Valuable work was done with some of these telescopes, of 125 feet focus, but the longer ones proved unmanageable. The principle involved in these constructions is, practically, the throwing the magnifying power more on the object-lens than on the eye-lens for the image formed by the former was still so imperfect as not to bear much additional magnification. The great step required for shortening the unwieldy instrument was therefore the perfecting of the object-lens, by achromatisation. Various very ingenious improvements on achromatic combinations, which might even yet be thought worthy the consideration of opticians, were devised by Dr Blair. He found solutions of mercury or antimony in hydrochloric acid to be much more refractive and more dispersive than crown-glass, while no irrationality of dispersion as compared with crown-glass could be detected in them. By means of lenses filled with these liquids he was enabled to

give the telescope an aperture of one-third of its focal length without a trace of residual colour.

The process of Liebig for depositing on glass an exceedingly thin film of silver, which, by careful polishing, can be rendered more highly reflective than any other material, has been taken advantage of by Steinheil in the construction of large specula for reflecting telescopes. This is an immense step, since any disk of glass will do, its optical properties not being employed; while, if it be once brought to a true parabolic figure, the silvering may be renewed as often as may be required. One of the great difficulties in the construction and working of large reflectors has hitherto been the casting and annealing of metallic masses of some tons' weight. This, in the silvered specula, is entirely avoided. Glass, however, gives trouble on account of its being slightly deformed by changes in temperature; and considerable attention has recently been paid to its replacement by fused quartz, which, once obtained, is easier to work and is unaffected by temperature changes. We cannot here enter into a description of the processes, often extremely ingenious, which have been devised for the grinding, figuring, and polishing of lenses and specula. Neither can we enter into the great differences which exist in the modes of mounting astronomical telescopes with a view to their ready adjustability by the observer. See *EQUATORIAL, OBSERVATORY*. The telescope has also been modified so as to act as a photographic camera with wide-angle, wide-aperture lenses, capable of photographing a fairly extensive region of the heavens.

Amongst the largest reflecting telescopes were those of Lord Rosse at Birr (72-inch mirror, 1844), Mr. Commons, London (1889, 60 inches), Bessemer (50½ inches), Sir William Herschel (48 inches, 1789, long since dismantled), Melbourne (48 inches), Paris Observatory (47 inches); and more recently the 60-inch and the 100-inch at Mount Wilson Observatory, California, and the 72-inch at Victoria, British Columbia. To the largest refracting telescopes belonged those of Yerkes Observatory, Chicago (41½ inches, 1897), Lick Observatory, California (36 inches, 1880), Pulkowa (30 inches, 1885), Vienna (27 inches), Nice (30 inches), Greenwich (28 inches; see fig. 4); and more recently the Thaw refractor at the Allegheny Observatory (30 inches), Simeis, Crimea (40 inches), Nikolaiev, South Russia (41 inches), Bloemfontein (27 inches). Among photographic telescopes may be mentioned the 16-inch aperture instrument at Arequipa (Harvard University's station), and the 10-inch at Mount Wilson, California.

For the subject in general, see Sir John Herschel's *Telescope*; and for the history, the histories of astronomy and the monograph by Servus, *Geschichte des Fernrohrs* (1885).

**Television**, a hybrid word, for which Teleoptics has been proposed without avail as a substitute, signifies the art of doing for the eye what telephony does for the ear. The sensitiveness of Selenium (q.v.) to light suggested early experiments. More sensitive photo-electric cells have since been devised. Mr J. L. Baird uses a large wheel set with lenses so arranged as to sweep rapidly over the whole field of view, directing the light from each part successively upon a cell, so that an electric current is strong when bright light falls upon the cell, weak when shadow. The current controls a beam of light at the receiving end as it sweeps over a ground-glass screen in synchronism with the transmitting apparatus.

**Telfairia**, a tropical African genus of Cucurbitaceæ. The seeds of *T. pedata* are edible and yield oil.

**Telford**, THOMAS, engineer, was born in Westerkirk parish, Eskdale, Dumfriesshire, on 9th August 1757, the son of a shepherd. During the intervals of his attendance at school young Telford or Telfer (so he was registered) followed the same calling, diligently employing his leisure moments in the perusal of whatever books were within his reach. At fourteen he learned the trade of a stone-mason at Langholm. In 1780 he removed to Edinburgh, and in 1782 to London, obtaining employment under Sir William Chambers on the erection of Somerset House. In 1784 he was appointed to superintend the erection of the resident commissioner's house at Portsmouth dockyard, a work which afforded Telford the opportunity of mastering the details of construction of docks, wharf-walls, &c. In 1787 he was appointed surveyor of public works for Shropshire; and his two bridges over the Severn at Montford and Buildwas gained for him the planning and superintendence of the Ellesmere Canal, to connect the navigation of the Severn, Dee, and Mersey (1793-1805). In 1790 he was appointed by the British Fishery Society to inspect their harbours; and in 1801 he received a commission from government to report on the public works required for Scotland. As a consequence the construction of the Caledonian Canal (q.v.) was entrusted to Telford, who also executed more than 1000 miles of road in the Highlands, Lanarkshire, and Dumfriesshire, and about 1200 bridges, besides churches, manse, harbours, &c. His next great work was the road from London to Holyhead, including the erection of the Menai Suspension Bridge, and the last was St Katharine's Docks (1826-28) in London. Among other works by him are, of bridges, the Conway, the Broomielaw in Glasgow (1833-36), and the Dean in Edinburgh (1831); of canals, the Macclesfield, the Birmingham and Liverpool Junction, the Gloucester and Berkeley, the Weaver system, the great tunnel (1½ miles long) on the Trent and Mersey; of harbours, Wick, Dundee, Peterhead, Banff, Fraserburgh, Fortrose, Cullen, Kirkwall, and Aberdeen. He was the first president of the Institute of Engineers; he supplied the nucleus of a library, and left towards it its first bequest of £2000. By Southey he was termed 'the Colossus of Roads' and 'Pontifex Maximus.' He died at Westminster, 2d September 1834.

See *Life* by himself (1838), which contains some specimens of Telford's homely poetry in its appendix, with its accompanying folio atlas of plans; and Smiles's *Lives of the Engineers* (vol. ii. 1861).

**Tell**, a district in the extreme north-west of Africa, stretches along the shores of the Mediterranean, and comprehends the corn-growing tracts extending south from the Mediterranean to the Atlas Mountains, and from west to east through Morocco, Algeria, and Tunis. The Tell is noticed under the articles MOROCCO and SAHARA.

**Tell**, WILLIAM, was, according to Swiss tradition, a countryman of Bürglen in Uri, who early in the 14th century rescued his native district from the tyranny of Austria. The following is the generally accepted version of the story. Albert I., Duke of Austria and German emperor, was in 1307 striving to annex the Forest Cantons to his immediate possessions. Hermann Gessler, his *vogt* or steward, perpetrated atrocious cruelties on the inhabitants. Werner Stauffacher of Schwyz, Walter Fürst of Uri, father-in-law of Tell, and Arnold Melchthal of Unterwalden met on the Rütli Meadow, 7th November 1307, and solemnly swore they would expel their oppressors before the following New Year's Day. Gessler had placed the ducal hat of Austria on a pole in the marketplace of Altorf and intimated that any one who

passed it without uncovering would be punished without mercy. Tell and his boy failed to do reverence to the hat, and were sentenced to be put to death unless Tell, who was a famous bowman, could hit an apple placed on his son's head. Tell performed the feat. 'What,' asked Gessler, 'would you have done with the second arrow in your bow?' 'Shot you if I had killed my child,' was the reply. Tell was bound and thrown into a boat to be taken with Gessler and his men to the Castle of Küssnacht, the residence of the tyrant. A frightful storm burst forth. Tell alone could save the party. He was unbound and pulled the boat to a rocky ledge, 'Tell's Platte,' he there sprang on shore and disappeared. The tyrant landed and was passing through a defile, the 'Hohle Gasse' near Küssnacht, when Tell, who lay in ambush, shot him through the heart. A rising followed, and wars with Austria, which ended in the independence of Switzerland.

The story was told as true by Johannes von Müller in his great history of Switzerland. Schiller made it the subject of his greatest drama, and Rossini of his best opera—and 'the patriot Tell' became the best-known hero the world had seen. Doubts, however, had been expressed as early as the beginning of the 17th century as to the very existence of Tell. In 1754 Voltaire cast a characteristic sneer at 'the apple story,' and in 1760 Freudenberger, a Bernese Protestant clergyman, published a pamphlet, *Tell, a Danish Fable*, pointing out that the story of the apple is the Scandinavian fable of Toko. His work was condemned by the government of Uri and burned by the common hangman. The doubts were not extinguished. The comparative mythologists showed that the Tell story was merely a Scandinavian form of an old Indo-Germanic myth (see Ideler, *Die Sage vom Schusse des Tell*, 1826). Egill, Wayland Smith's brother, performed the apple feat. An excellent parallel is that in our own north-country ballad, 'Adam Bell, Clym of the Clough, and William of Cloudeley,' printed in Percy's *Reliques*. The 'master-shot' indeed is not the property alone of Aryan folklore, but is found among Samoyeds, Turks, and Mongolians alike. It was further found that Tell is first mentioned in 1470 in a ballad, between 1482 and 1488 in the *Chronicle* of M. Russ of Lucerne, and in 1511 in a play acted in Uri. The first makes Tell the hero of the apple story and the rising which followed. Russ and the Uri play take no notice of the apple story, but refer to the boat scene and the atrocities of the bailiffs. They make Tell the hero of the revolution. A MS. known as the *White Book of Sarnen* (c. 1470) first combined the apple story and the atrocities. It makes the Rütli oath the pivot of events, and Stauffacher, not Tell, the hero. Tschudi in his *Swiss Chronicle* (1572) first melted all these incidents into a consistent narrative. He fixed the date of the Tell rising at New Year's Day, 1308, and Von Müller, warned by the fate of Freudenberger, with palpable misgivings told the tale as true history (see Vischer, *Die Sage von der Befreiung der Waldstätte*, 1867). There is no trace of Tell to be found in contemporary records. His name did not appear where it should have done in lists connected with the *landesgemeinden* of the period; in the register of deaths at Schadendorf it had been forged. The chapel on Tell's Platte was first mentioned in 1504, and the document declaring it to have been built by a *landesgemeinde* held in 1388 at which 114 men were present who had known Tell only appeared in 1759. The Tell chapels at Bürglen and the Hohle Gasse, represented as existing since the 14th century, belong to the 16th. Professor J. E. Kopp of Lucerne showed that the date of the Tell rising

is inconsistent with the history of the Forest Cantons (see Kopp, *Urkunden zur Geschichte der Eidgenössischen Bünde*, 1851). A complete record has been published of all the occupants of Küssnacht from 1250 to 1513. Among them there is no Gessler (see Rochholtz, *Tell und Gessler in Sage und Geschichte*, 1876). The researches of many other writers have gone to prove that there is no truth in any incident of the Tell legend. Although inconsistent with history, they, however, are not yet generally recognised as mythical. The people of the Forest Cantons cling even to the apple story. In 1890 a ferment was raised in Uri by the publication of a school history of Switzerland which did not mention Tell and the Rütli oath. Excellent French works on general history still represent all the incidents as historical, expressing a mere doubt as to the apple story; this is justified in a long article in the *Nouvelle Revue* of July 1891. It attributes disbelief in Tell to a conspiracy of German savants actuated by sycophancy, jealousy, and antipathy to liberal ideas. More recently some Swiss writers have attempted to recast the story with a modified historical basis, but with no outstanding success. See Albert Rilliet, *Les Origines de la Confédération Suisse, Histoire et Légende* (1868).

**Tell el-Amarna**, the modern name of a mass of ruins representing the capital of the heretic Egyptian king, Amenhotep IV. (see EGYPT, Vol. IV. p. 241), a little to the north of Assiut, on the eastern bank of the Nile. Here was found in 1887 a collection of tablets in Babylonian cuneiform, at that period—some time before the Exodus of the Israelites out of Egypt—used as a kind of *lingua franca* for all western Asia. These tablets were mainly reports from the Egyptian governors of Palestine, Syria, Mesopotamia, and Babylonia, some of which implored help against the Hittites (q.v.), then pressing southwards. Of about 230 tablets 160 went to the Berlin Museum and 82 to the British Museum. The site has been excavated by many explorers. Petrie discovered the palace-temple in 1891, and in 1914 the German expedition found the remains of a sculptor's studio, containing some of the finest examples of the art of that period.

**Tell el-Kebir**, midway on the railway between Ismailia and Cairo, was the scene on the morning of 13th September 1882 of Wolseley's capture of Arabi Pasha's entrenched camp, defended by 26,000 men. The British loss was about 430 killed and wounded, the Egyptian 1500.

**Tell el-Obeid**. See UR.

**Téllez**, GABRIEL, better known by his pen-name of 'Tirso de Molina,' a Spanish dramatist of great reputation, was born in Madrid in 1585, entered the order of the Brothers of Charity at Toledo, and died prior of the monastery of Soria in 1648. Téllez was a friend and pupil of Lope de Vega, whom he almost rivalled in facility of execution. His pieces are partly *Comedias*, partly Interludes, and *Autos Sacramentales* (originally about 300, of which but few survive), all displaying dramatic vitality, originality, and power of character-painting. The wit is rich and natural, and the language highly poetical. Some of his comedies still keep the stage. Among the best are *El Burlador de Sevilla* (*Don Juan*), *El Vergonzoso en Palacio*, *Don Gil de las Calzas Verdes*, and *Marta la Piadosa*. The best edition of his works is that of Hartzenbusch (12 vols. Madrid, 1839-42); there is a selection in the *Biblioteca de Autores Españoles* (vol. v. 1850). See a monograph by Muñoz Peña (Madrid, 1889).

**Tellicherry**, a seaport town and military station of British India, in the district of Malabar, Madras Presidency. The site of the town is very beautiful, and the neighbouring country highly

productive. There is a natural breakwater abreast of the fort, formed by a reef of rocks running parallel to the shore. The town, with suburbs, occupies about 5 sq. m. Coffee, cardamoms, and sandalwood are the chief exports. The East India Company founded a factory here in 1683, which was reduced to a residency in 1766. The old citadel and residency survive. Pop. (1921) 27,576.

**Tello.** See BABYLONIA, ART.

**Tellurium** (sym. Te; at. number 52; at. wt. 127.5) is a chemical element, which some authorities place among the metals, and others among the non-metallic bodies or metalloids. Although in its outward characters it closely resembles the metals, its close analogies with sulphur and selenium indicate that its true place is amongst the metalloids. It possesses a high metallic lustre, and is bluish white in colour; it melts at about 500° C., and at a higher temperature is converted into a yellow vapour; it is a bad conductor of heat and electricity, and is very brittle. Its specific gravity is 6.24. When strongly heated in the air it burns with a blue flame and gives off white fumes of tellurium dioxide. Like sulphur and selenium, it is soluble in cold oil of vitriol, to which it gives a fine purple-red colour, and on dilution it is precipitated unchanged: in these respects it differs from all metals. In nitric acid it dissolves with oxidation.

Tellurium forms two compounds with oxygen—viz. the dioxide  $\text{TeO}_2$  and the trioxide  $\text{TeO}_3$ , corresponding to the oxides of sulphur, and two acids, tellurous  $\text{H}_2\text{TeO}_3$  and telluric  $\text{H}_2\text{TeO}_4$ . *Tellurous acid* exhibits very slight acid properties, and its anhydride combines with acids, and acts the part of a weak base. These salts have a metallic taste, and are said to act powerfully as emetics. Tellurium trioxide has also a feeble affinity for bases, but it forms salts, which contain 1, 2, and 4 molecules of the trioxide to each molecule of base. Tellurium unites with hydrogen to form telluretted hydrogen,  $\text{H}_2\text{Te}$ , which is a gaseous body, analogous to sulphuretted hydrogen, and precipitates most of the metals from their solutions in the form of tellurides, which have a close analogy with the corresponding sulphides.

In experimenting upon the action of the salts of tellurium, it has been found that they possess the power of forming, in the body of a healthy person, compounds which impart to the breath, to the perspiration, and to the gases generated in the intestinal canal a disgusting fetor, which makes him a nuisance to every one he approaches; and this smell may last for weeks, although the quantity of tellurium that was administered did not exceed a quarter of a grain.

Tellurium is a rare substance, found chiefly in Transylvania, but also in Hungary, in North America, and in the Altaï silver mines. It sometimes occurs native, but more commonly as a telluride of gold, lead, or silver.

**Telugu.** See INDIA, p. 102.

**Tembu.** See KAFFIRS

**Temisoara**, or TEMESVÁR, a city of Rumania (till 1920 of Hungary), consisting of the city or 'citadel,' with four suburbs, on the Bega Canal, 160 miles SE. of Budapest by rail. It has a fine cathedral, an ancient castle, a magnificent episcopal residence, manufactures of flour, tobacco, cloth, silk, paper, leather, wool, and oil, and a brisk transit trade in grain, wax, honey, brandy, and horses. Temisoara has endured a great number of sieges—the latest being that of 1849, when it was besieged and bombarded for 107 days by the Hungarian insurgents, but was relieved by Haynau. Pop. 90,000.

**Tempe**, a famous mountain-gorge, some six miles long and 100 to 2000 paces broad, in the

north-east of Thessaly, between the mountains of Olympus and Ossa. The river Peneus forces its way through the rocky ravine to the sea, and along its right bank runs the tract, at some points hewn out of the rock. The vegetation is so rich and the scenery so grand that the name of Tempe became in ancient times a synonym for any beautiful valley, as the Tempe near Reate through which flowed the Velinus, and the Tempe in Sicily formed by the Helorus. Tempe was a favourite haunt of Apollo.

**Tempera.** See DISTEMPER.

**Temperament** is a term which has been employed in Physiology to designate certain physical and mental characteristics presented by different persons. A fourfold classification was long universal, doubtless based on the old idea of four humours (see HIPPOCRATES). But the two generally regarded as fundamental are the *sanguine* and the *melancholic*, the *phlegmatic* being a degree or modification of the sanguineous, and the *choleric* of the melancholic.

Some writers recognise a *nervous* temperament, in which the predominating characteristic is a great excitability of the nervous system, and an undue predominance of the emotional impulses—a temperament always associated with the sanguineous or the melancholic. The names of the jovial, mercurial, and saturnine temperaments are reflections of Astrology (q.v.). The artistic temperament is also a very current phrase. In both sexes the characteristics of the temperaments are far less manifest in old age than in earlier life. The different temperaments often merge so gradually into one another that very often it would be extremely difficult to decide to which variety any special case belongs.

**Temperament** is a system of compromise in the tuning of keyed instruments. Though the various intervals of the scale are spoken of broadly as consisting of tones and semitones, the successive tones are not all equal when given in just intonation according to harmonic law—i.e. so that the consonant intervals are in perfect tune; and as every note in the scale may become the keynote of another scale, if all these scales are to be given exactly a complete set of keys for each would be necessary. But it has been found in practice that by only a slight deviation from just intonation a much more limited keyboard, of twelve notes to the octave, gives results which do not offend the ordinary ear, though the discrepancy is distinguishable by a trained one. Up till about the beginning of the 19th century in Germany, till 1835 in France, and 1846 in Britain, the system generally adopted was that known as *mean* temperament, by which the intervals in some keys (those not employing more than three sharps or flats in the signature, and a few of the minor keys) were more exactly in tune than in others; some of the intervals in the less favoured keys, known as *wolf* intervals, being so unpleasantly out of tune as to cause composers to avoid these keys. This was remedied in a few instances by the use of two divided keys, one of which gave separately  $\text{D}\sharp$  and  $\text{E}\flat$ , and the other  $\text{F}\sharp$  and  $\text{G}\flat$ . The present practice, known as *equal* temperament, was foreshadowed by John Bull in his fantasia (from the *Fitzwilliam Virginal Book*) in which he states his theme in each of the twelve major keys, and by J. S. Bach in *Das Wohltemperirte Klavier*. Each tone and semitone in the octave is made approximately equal, so that every key is equally available; while at the same time every interval except the octave deviates slightly from just intonation. This deviation is more obvious on the organ, or still more the harmonium, than on the pianoforte; but it is of more

practical moment in the orchestra, where keyed instruments are heard along with others playing in just intonation. There are many advocates of a system of just intonation, at all events as applied to special instruments; and various keyboards have been invented to obviate the mechanical difficulties. The subject is still a favourite battlefield of theorists. Ensembles, such as that of the unaccompanied choir or of the string quartette, are, of course, free from the difficulty of temperament. See Helmholtz on *Sensations of Tone* and Bosanquet on *Musical Intervals and Temperament*; also the article SOUND.

**Temperance.** This term is defined in Murray's *New English Dictionary* as (*inter alia*) 'rational self-restraint,' and specifically as 'moderation in regard to intoxicants; sobriety; the practice or principle of total abstinence; teetotalism,' which last-mentioned use of the term follows Hobbes's definition of temperance as 'the habit by which we abstain from all things which tend to our destruction' (*De Corpore Politico*, cap. iv. s. 14).

Ages before scientific research had isolated alcohol and ascertained with precision its action on the human organism, the universal experience of mankind had realised the risks attending the consumption of what are now known as alcoholic liquors, and the social evils arising therefrom; and the moral codes of the great religions of the world have all either enjoined abstinence from such liquors, or inculcated that strict sobriety which abstinence alone can effectively secure. As a result a very large proportion of the human race avoids the use of these liquors.

Their manufacture and consumption have, however, prevailed to such an extent as often to call for special methods of cure and prevention; and the increasing industrialisation and urbanisation of civilised countries during the past two centuries, with the tendency to bad conditions of living and increased temptation to intemperance, have made the temperance problem one of present-day urgency.

During the 18th century the ravages of what Lecky called the 'gin epidemic' led to measures of a persuasive and legislative character designed to check this social danger. The earliest attack was made upon the use of spirits. In England Dr George Cheyne (1671-1743) denounced the use of spirits, and later Dr Beddoes of Bristol, Dr Thomas Trotter (of the Royal Navy), and Dr Erasmus Darwin took the same side, while Dr Samuel Johnson and John Howard the philanthropist set an example as abstainers from all alcoholic liquors. John Wesley forbade the use of spirits to his followers, and denounced the makers and vendors of such liquors as 'poisoners-general to His Majesty.'

In the United States Dr Benjamin Rush of Philadelphia adopted the same attitude to spirits; but while there were sporadic attempts to unite public sentiment against spirit-drinking, it was not until 1820 that the formation of the American Temperance Society at Boston inaugurated what is now known as 'the Temperance Movement.' This society did a remarkable work, especially in New York State. Its publications, the *Journal of Humanity*, the *Temperance Recorder*, and the *American Temperance Intelligencer*, had a very wide circulation, and large numbers of persons were reclaimed from intemperance.

In 1829, in Ireland, Professor Edgar of Belfast and the Rev. G. W. Carr of Wexford aroused a large amount of temperance sentiment in that country; and John Dunlop of Greenock and others promoted similar efforts in Scotland.

The first temperance society in England was formed at Bradford, Yorkshire, in 1830, by Henry Forbes; and other societies were speedily

inaugurated, the London organisation being converted in 1831 into 'The British and Foreign Temperance Society.' In 1834 public interest was aroused by the proceedings of a Select Committee of the House of Commons, promoted by J. S. Buckingham, M.P., to inquire into the causes, extent, and remedies of drunkenness. The Beer Act of 1830 had just led to the opening of many thousands of beer-houses, and greatly aggravated the existing evils, and bitterly disappointed the hopes of its promoters, who thought it would diminish spirit-drinking and substitute 'good malt and hops which could injure nobody.'

By 1835 temperance societies on the anti-spirit basis had been formed in all British colonies and in some continental countries such as Germany, Sweden, and, later, Russia, Prussia, and Denmark. It soon, however, became clear that to be effective the movement must promote total abstinence not merely from spirits, but from beer, wine, and other alcoholic beverages, and in September 1832 seven members of the Preston Temperance Society in England allowed Joseph Livesey to attach their names to a pledge of total abstinence from all intoxicating liquors; but it was not until 1835 that the full total abstinence pledge was made the test of membership. In 1833, at one of the meetings, Richard Turner, usually called 'Dickie Turner,' a rough, humorous speaker, advocating total abstinence as against 'moderation,' exclaimed, 'I'll be reet down out-and-out tee-tee-total for ever and ever.' The audience cheered, and Livesey added, 'This shall be the name of our new pledge.' The years 1835 to 1845 were years of great activity in the temperance cause throughout the world. In the United States a system of total abstinence was universally adopted in place of the limited anti-spirit principle. Considerable activity was shown in Scotland, and in Ireland remarkable developments followed the signing by Father Mathew in 1838 of the total abstinence pledge in Cork. From 1839 to 1842 this earnest priest visited nearly every part of Ireland, including the north, and administered the pledge to millions of people. There was an enormous consequent reduction in spirit consumption, and a lessening of drunkenness and crime.

In 1846 the first World's Temperance Convention was held in London, attended by 305 delegates.

Although the temperance leaders in all places were almost invariably religious men, the great majority of Christian churches did not, in their corporate capacity, at first unite in temperance work, but now every Christian denomination has its temperance society or department; and under the Temperance Council of the Christian Churches, formed in England in 1915, and consisting of the Baptist Total Abstinence Association, Baptist Union of Wales and Monmouthshire Temperance Association, Catholic Total Abstinence League of the Cross, Church of England Temperance Society, Congregational Union Temperance Committee, Congregational Union of Wales, the Society of Friends, the Moravian Church, Presbyterian Church of England, Presbyterian Church of Wales, Primitive Methodist Temperance Committee, the Salvation Army, United Methodist Temperance Committee, and the Wesleyan Methodist Temperance Committee, the churches take united action within the scope of the Council's activities. The Church of England Temperance Society, founded in 1873, has, however, a dual basis, membership not being confined to abstainers. The great majority of the ministers in the Nonconformist churches in the United Kingdom are total abstainers, and nearly the whole of the students; and a steadily increasing number of clergy in the Established and Roman Churches are taking the same stand.

The phrase 'Band of Hope' was first applied to juvenile societies in 1847, and this movement has greatly developed. It is estimated that at least 3,750,000 young persons are embraced in Bands of Hope and other juvenile societies in the United Kingdom, and the United Kingdom Band of Hope Union is one of the leading national organisations.

The evils arising from friendly societies and benefit clubs meeting in public-houses led to the formation in 1835 of the Independent Order of Rechabites, and later, in 1855, to the founding of the Order of the Sons of Temperance. The progress of these orders is shown as follows:

	ADULT MEMBERS.		JUVENILE MEMBERS.		FUNDS.	
	Rechabites.	Sons of Temp.	Rechabites.	Sons of Temp.	Rechabites.	Sons of Temp.
1870	15,402	7,707	4,889	1,301	90,824	10,101
1880	34,641	15,253	16,684	1,721	243,214	46,440
1890	95,074	26,693	47,495	7,559	531,973	102,087
1900	168,233	49,287	100,896	21,836	1,130,638	221,205
1910	239,508	97,352	210,775	78,836	2,250,086	480,891
1920	377,324	159,618	462,522	144,835	3,721,480	795,466
1924	379,533	160,888	439,749	121,710	4,402,143	1,087,750

Both societies are approved under the National Insurance Acts, and have together 556,000 state-members; and, eliminating duplicates, 750,000 adult total abstainers (state and voluntary) are to-day members of these two orders.

In 1868 Joseph Malins, who died at the age of 82 in January 1926, introduced into England from the United States the Order of Good Templars, which, as an international order, numbers over half a million members.

In 1876 the British Women's Temperance Association was formed, and in 1893 the Women's Total Abstinence Union; these societies are now united under the style of the National British Women's Total Abstinence Union.

As the movement for total abstinence progressed, temperance reformers increasingly realised that for many persons abstention from intoxicating liquors, in the presence of the facilities on every hand for the common sale of liquor, was practically impossible, and that the only effective solution of the drink problem was the elimination of alcoholic beverages from the social life of the community. Inasmuch as this could only be secured by legislative action, the United Kingdom Alliance was founded in 1853 for the legislative suppression of the liquor traffic. Its first president was Sir W. C. Trevelyan. He was succeeded in 1879 by Sir Wilfrid Lawson, who held the presidency till his death in 1906.

Its agencies of all kinds, while engaged in the dissemination of information as to the social, economic, and political aspects of the liquor problem, have for their special object the election of members of parliament favourable to the legislative suppression of drink by the votes of the people. As a first step, the Alliance has, since 1864, advocated a measure of legislation (Local Option) which would enable every district to decide by direct vote of the local electors whether the liquor traffic should exist therein or not. Such proposals have been repeatedly brought before parliament, and in 1908 received the sanction of a large majority of the House of Commons, though rejected by the House of Lords. In 1913 the Temperance (Scotland) Act was passed, securing to Scotland, in a somewhat imperfect form, this power, and Local Option is now the agreed policy of the whole organised temperance forces in the United Kingdom. The

influence of the Alliance has extended far beyond this country, and to-day, in Canada, Australia, New Zealand, and South Africa, temperance 'Alliances' are operating vigorously on the lines originally laid down by this organisation. The Alliance, through its political and literary secretary, publishes annually *The National Drink Bill*, accepted by all parties as a reliable estimate of the national expenditure on, and consumption of, drink; the *Alliance Year-book*, now the annual of the movement; and its monthly organ, the *Alliance News*, is the leading temperance journal in the country.

In Scotland the cause has probably a stronger hold numerically and politically than in any other section of the United Kingdom. In 1920, out of 1,697,251 local government electors entitled to vote, 1,181,405 (or 69.6 per cent.) took part in the first Local Option polls; and of these, 453,278 (or 38.4 per cent.) voted for no licence. In 1924 there was a union of the temperance forces, which now operate as the Scottish Temperance Alliance. In Ireland the Society for the Prevention of Intemperance represents temperance opinion and effort in the Irish Free State; while the Irish Temperance Alliance combines the forces in Northern Ireland.

Outside the United Kingdom the progress of the movement has been very marked during the present century, and the experience of the benefits of restrictions imposed during the Great War on the traffic has directed the attention of most civilised nations to the desirability of a greatly lessened consumption of alcohol. Effective temperance societies are at work in most countries. In Canada, the Dominion Alliance and the Women's Christian Temperance Union; Australia, the Australian Alliance Prohibition Council; New Zealand, the New Zealand Alliance; South Africa, the South African Temperance Alliance and Women's Christian Temperance Union; Norway, Federation of Norwegian Total Abstinence Organisations; Sweden, a similar organisation; France, Ligue Nationale Contre L'Alcoolisme; Denmark, Federated Danish Total Abstinence Organisations; and other organisations in other countries. The World League Against Alcoholism federates the leading organisations in thirty countries for certain special purposes. There is also a valuable International Bureau Against Alcoholism at Lausanne, under Dr Robert Herodot, which collects and files much information on this question.

The non-recognition by the then existing life insurance companies of the fact that the average longevity of abstainers is greater than that of consumers of alcoholic liquors, led in 1840 to the foundation of the United Kingdom Temperance and General Provident Institution, having a separate temperance section, and other societies have since been formed on similar lines. The experience of the United Kingdom Temperance Institution has been as follows:

PERCENTAGE OF ACTUAL TO EXPECTED CLAIMS.			
Period.	Temperance.	General.	Difference.
1866-70	74.9	98.7	13.8
1871-75	70.7	105.1	34.4
1876-80	69.8	99.7	29.9
1881-85	70.8	91.6	20.8
1886-90	68.9	94.8	25.9
1891-95	71.3	90.7	28.4
1896-1900	73.8	90.5	16.7
1901-05	72.0	88.3	16.3
1906-10	65.7	83.3	17.6
1911-15	62.8	83.9	21.1
*1916-20	77.4	82.6	5.2
1921-23	53.5	72.2	18.7
1924	54.1	64.2	10.1
1925	52.6	74.6	22.0
1926	40.6	64.3	17.7
1924-26	51.1	67.7	16.6

\* Excluding Great War claims, 62.1, 71.8, 9.7.

The Scottish Temperance Insurance Company shows a percentage during 1883-1922 of 54 in the temperance and 69 in the general section. The Abstainers and General Insurance Company for the period 1884-1924 shows 44 in abstainers and 52.1 in the general section.

*The Factors in the Problem.*—The factors which, during the past half-century, have probably affected this problem are of three kinds:

A. Increase or decrease of opportunity, due to increased or diminished spending power; variations in the price of intoxicants caused by taxation or otherwise; and restrictions on the number of drink-shops, and on the hours of sale. Probably the governing factor here is the spending power.

B. Social changes, such as the movement from the city to the suburbs; the garden city; greater love for open spaces; facilities for travel, cheap excursions, cycling, motoring; sport; entertainments, including cinemas with the growth of the practice of two houses nightly; and last, but by no means least, the enormous increase in the number of temperance cafés.

C. Educational and moral causes, including the educational effect of 'the zealous labours of countless workers in the temperance cause,' which, as the majority report of Lord Peel's commission on licensing laws pointed out in 1899, 'counts for much'; the reports of official inquiries, such as that on Licensing Laws referred to, on Physical Deterioration in 1904, on the Poor-Law in 1909; and, not least, the change in and influence of medical opinion.

This change was at first very gradual, but during the present century it has been marked, largely due to the pioneer work of Dr W. B. Carpenter, Dr B. W. Richardson, and others. The publication and wide circulation of *Alcohol and the Human Body*, by Sir Victor Horsley and Dr Mary Sturge in 1907, is a landmark in medical temperance history; in 1909 the Board of Education issued a Syllabus of Hygiene and Temperance for use in elementary schools, containing the general ascertained physiological facts as to the action of alcohol and the social consequences of its excessive consumption. In 1917 the Central Control Board (Liquor Traffic) published a report of a committee of leading medical and physiological experts, entitled *Alcohol and the Human Organism*, which, as revised in 1923 by the official Medical Research Council, contains the latest unchallenged scientific findings on the subject: (a) that the main action of alcohol (apart from the effects of its continued excessive use) is confined to the nervous system; (b) that alcohol is narcotic rather than stimulant in action; (c) that its nutritional value is strictly limited; (d) that its habitual use as an aid to work is physiologically unsound; (e) that alcoholic beverages are in no way necessary for healthy life; that they are harmful or dangerous unless taken at infrequent intervals, in a diluted form, and in strictly moderate quantities; and (f) that they are definitely injurious for children and for most persons of unstable nervous system, notably for those who have had severe injuries to the head, or who have suffered from attacks of mental disorder, or from nervous shock. In view of these findings, in English business life there is an increasing realisation that a very large part of our human machinery is not running freely and unfettered. Delicate, complicated, and costly machinery, often effecting many processes in a single operation, has displaced the cruder methods of earlier days. Business and industry demand skilled men with clear brains; and there is no place for brains made dull and fingers made clumsy by drink. The increase of motoring has also awakened the general public to the danger of even a so-called

moderate consumption of alcohol; and Benedict, the great American physiologist, has said: 'Inflexible science says to the motorist, "Moderate user, keep off! For at least four hours after a dose of alcohol formerly considered permissible you as a motor vehicle operator may well be considered a menace to society."'

In 1873 the increasing conviction that alcohol was not a necessary drug in the treatment of disease and accident led to the foundation of the temperance hospital, in which, while the visiting staff are authorised to give alcohol where they deem it necessary, the ordinary rule is treatment without alcohol. More than 48,000 in-patients have been treated, the mortality rate being only 7.8 per cent., and alcohol has not been administered in more than a fraction of the cases, namely .39 per cent. The change in the attitude of the medical profession to the medicinal value of alcohol is indicated in the remarkable decline in its use in hospitals generally, as appears from the following table:

	1900	1923.
Patients (276 hospitals).....	888,182	670,841
Milk.....	£142,805	£276,202
Malt.....	£9,106	£5,744
Wines and spirits.....	£15,993	£23,103
Estimated ozs. in terms of brandy.....	2,645,204	916,880
Per patient (ozs.).....	6.8	1.3
" " cost.....	10d.	8.2d.
Per occupied bed.....	18s. 1d.	9s.

\* In 1923 malt liquors had more than doubled in cost, and spirits were nearly five times their cost in 1900.

*Statistics of Consumption.*—The following table gives the *per capita* consumption of beer and spirits (in quinquennial periods up to 1910) from 1871 to 1922 for the United Kingdom:

	Beer Standard Gallons.	Spirits. Proof Gallons.
1871-75.....	82.3	1.18
1876-80.....	80.6	1.16
1881-85.....	27.6	1.02
1886-90.....	28.1	.96
1891-95.....	29.7	1.00
1896-1900.....	31.6	1.05
1901-05.....	29.5	1.00
1906-10.....	27.0	.80
1911-14.....	27.1	.68
1915-19.....	18.6	.51
1920.....	20.6	.47
1921.....	18.5	.39
1922.....	15.8	.36
*1923.....	17.0	.33
*1924.....	17.9	.33
*1925.....	17.9	.32
*1926.....	17.2	.29

\* Great Britain only.

The following table associates these figures in terms of alcohol with certain social facts:

Alcohol Gallons (U K.)	Alcoholism and Cirrhosis per million (England and Wales).	Infant Mortality (England and Wales).	Drunkenness Proceedings per million (England and Wales).
1871-75.....	2.44	158	7399
1876-80.....	2.34	145	6602
1881-85.....	2.10	139	7049
1886-90.....	2.09	145	6101
1891-95.....	2.20	151	5901
1896-1900.....	2.33	156	6855
1901-05.....	2.19	138	6590
1906-10.....	1.94	117	5598
1911-14.....	1.87	110	4985
1915-19.....	1.90	87	1964
1920.....	1.40	63	2561
1921.....	1.24	64	2079
1922.....	1.07	62	2001
1923.....	*1.18	56	2007
1924.....	*1.24	55	2041
1925.....	*1.23	57	1930

\* Great Britain only.

The decline is obviously much greater since the Great War began; but the important post-war factors of high taxation and much unemployment must be taken into account, and the warning of the late Lord Milner (1924) must be noted that: 'It would be totally contrary to all the experience of

the past if the next return of a boom period in the trade cycle was not accompanied by a fresh and great rise in the consumption of alcoholic liquor, unless, indeed, steps were taken to counteract what I can only call the secular tendency of times of prosperity and high wages, to result in an increase of drinking, and of the evils which result from excessive drinking.' In conclusion, it should be pointed out that the problem is one which most seriously affects the native races of the world, and considerable attention is being directed to this phase of the question which has such vital reactions on the policy of the British empire in regard to India and Ceylon and to our colonies and mandated territories in Africa.

**Temperature** is the thermal condition of a body which determines the interchange of heat between it and other bodies. Our first ideas of temperature are derived from our sensations of hot and cold. As explained under Heat (q.v.), the effect of adding heat to a body is to make it hotter, unless it is at its melting or boiling point. This rise of temperature is accompanied by volume changes, on which all our practical methods of measuring temperature depend (see THERMOMETER).

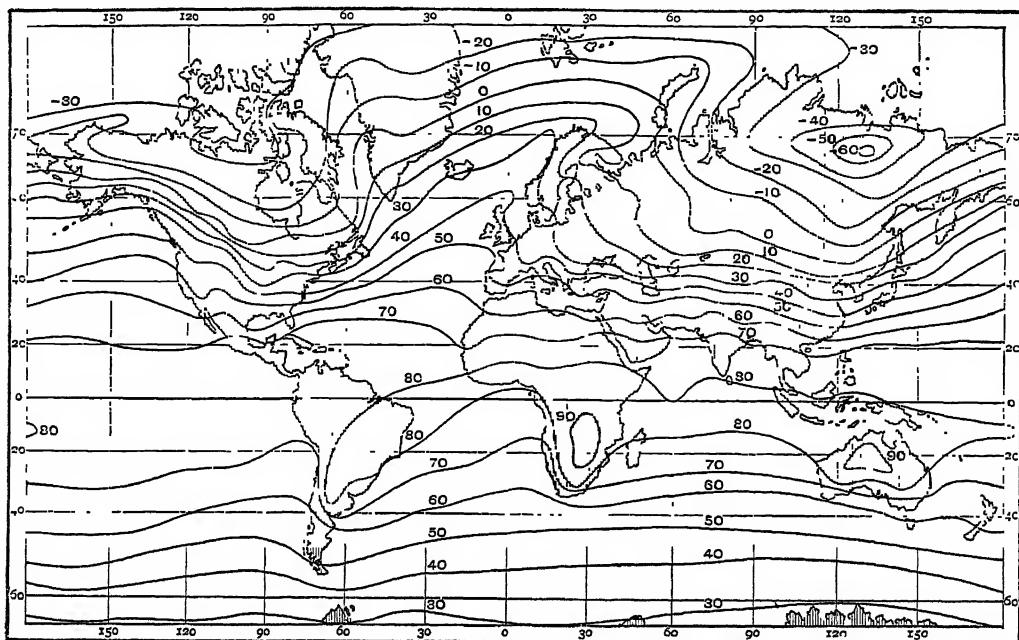

Now, although the idea of temperature is familiar enough, its true significance is difficult to understand. So-called thermometric measurements of temperature are not measurements in the strict scientific sense of the term. They are simply the comparison of certain other effects which accompany change of temperature in special bodies. A scientific measure of temperature should be independent of any particular substance, and should depend solely upon the fundamental properties of heat itself. This absolute measure of temperature was first given by Lord Kelvin (Sir W. Thomson), who based his system on Carnot's thermodynamic cycle (see THERMODYNAMICS). The kinetic theory of gases (see GAS, &c.) has given us a definition of temperature in terms of the kinetic energies of the molecules. The assumption is that the molecules are free from molecular forces; the conclusion is in agreement with Boyle's, Gay-Lussac's, and Charles's laws. As no gas obeys these laws rigorously, the inference is that intermolecular actions come into play, so that only part of the temperature can be expressed in terms of the kinetic energies of the molecules. The same is true, but in a much greater degree, for liquids and solids, for which as yet no thorough-going kinetic theory has been formulated.

From experiments made by Kelvin and Joule, the absolute zero of temperature was found to be 274 centigrade degrees below the freezing-point of water, or  $-461^{\circ}$  on the Fahrenheit scale. This agrees almost exactly with the value deduced from the kinetic theory of gases. From our present standpoint, therefore, we cannot expect to get a colder temperature. Temperatures down to within  $1^{\circ}$  C. above absolute zero have been obtained in the Leyden University laboratory by the late Professor Onnes. Guesses have been made from time to time as to the temperature of space, Pouillet, for example, putting it at  $-238^{\circ}$  F. and Fourier at  $-58^{\circ}$ . From our present physical outlook, however, the phrase 'temperature of space' is meaningless. Only where matter is can a true temperature exist. A thermometer placed in space will receive radiations from all sides, and the temperature indicated will depend on the power it has to transform these radiations into the irregular motions which constitute heat in a body. An ideal thermometer, transparent to all radiations, and capable only of receiving heat by contact with other bodies, would remain unaffected if isolated in space.

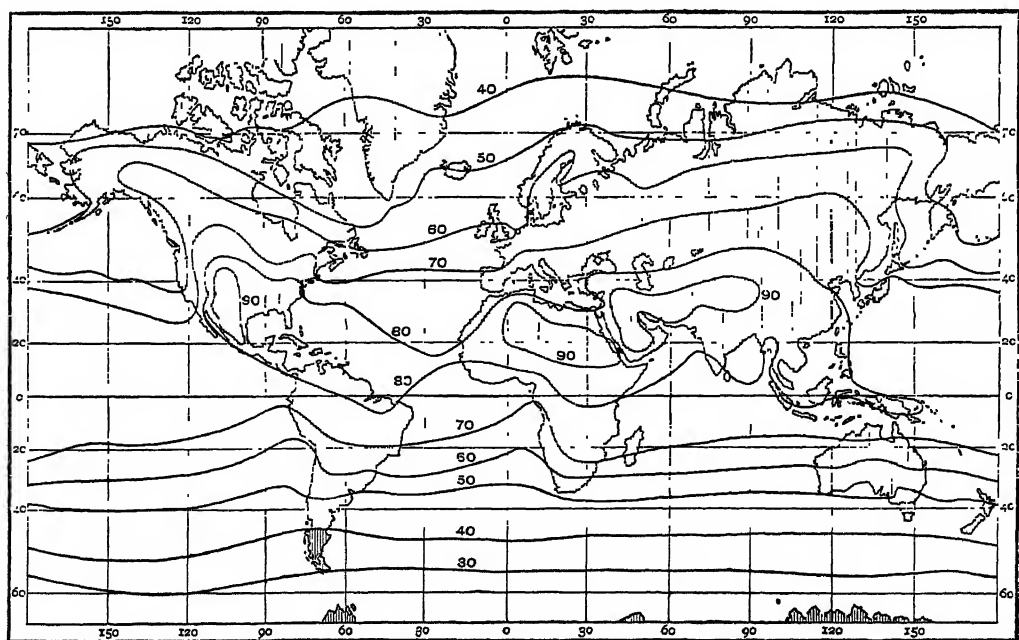

In meteorology the distribution of atmospheric temperature is one of the most important problems calling for discussion. The mean annual temperature over the whole surface of land and sea is perhaps about  $45^{\circ}$  F. At Verkhoyansk the lowest monthly mean averages  $-63.6^{\circ}$  F. The highest monthly mean averaged over several years may be set down at fully  $110^{\circ}$  F., and is experienced in the north-western parts of India, where the thermometer in free shaded air not unfrequently touches  $125^{\circ}$  F. Loomis in his *Meteorology* gives  $133^{\circ}$  F. as the highest authentic reading, made in the Great Desert of Africa. Exceptionally high readings made by travellers in Arabian and African deserts must, however, be accepted with great caution. It is indeed no easy matter satisfactorily to measure air temperatures, especially when they are high. It is not enough to shade the thermometer from direct sun rays. It must be shaded as effectually from reflected radiations from earth and sky; and at the same time the air must be free and not confined. To facilitate the study of the distribution of temperature at the earth's surface, it is usual to construct charts of *isotherms*. These are lines, each of which is drawn through all places having the same mean monthly,

mean seasonal, or mean annual temperature. An important series of charts of this character was prepared and published by Dr Buchan in his *Challenger Report on Air and Ocean Temperatures*

(1890). Two of these charts are reproduced here on a diminished scale. They show the mean temperature (Fahrenheit) of the globe for January and July, the typical winter and summer or summer

Isothermal Lines showing the Mean Temperature of the Globe for January.

Isothermal Lines showing the Mean Temperature of the Globe for July.

and winter months for all regions on the earth's surface. A glance will indicate how greatly the distribution of land and sea influences the distribution of temperature. In January the great land-areas in the northern hemisphere are much colder than the ocean-areas at the same latitude; in July

this relation is reversed. For a full discussion of the facts embodied in these and the charts for the other months of the year, as well as of the related facts referring to barometer pressure, rainfall, humidity, diurnal changes, &c., see the elaborate Report mentioned above. The coldest natural

temperature registered seems to be under  $-90^{\circ}\text{F}$ .; temperatures of  $-85^{\circ}$  to below  $-88^{\circ}\text{F}$ . have frequently been recorded at Verkhoyansk in Siberia ( $67^{\circ} 34' \text{N. lat. and } 133^{\circ} 51' \text{E. long.}$ ). The lowest temperature ever recorded naturally was a reading of  $-135^{\circ}\text{F}$ . or  $167^{\circ}$  below freezing-point registered during a pilot-balloon ascent at Batavia on 4th December 1913.

The periodic changes of atmospheric temperature are due to the sun. The earth itself has, however, a distinct temperature, which increases at the rate of  $1^{\circ}\text{F}$ . for every 50 or 60 feet of descent through the few miles of crust accessible to us. Upon this real earth temperature the mean annual temperature of the air must to a large extent depend. According to Professor Langley, the surface of the moon with its long 'day' of a fortnight never gets hotter than the freezing-point of water, however brightly it may be shone upon. This shows that the moon is intrinsically much cooler than the earth. On the other hand, it has been calculated that the heat of the earth is not sufficient to raise the temperature of the air more than  $\frac{1}{2}^{\circ}\text{C}$ . See also EARTH, CLIMATE, SEASONS, SEA.

**TEMPERATURE OF THE BODY.**—In the article ANIMAL HEAT the general principles of the subject have been discussed; it remains to consider more in detail the variations of temperature in health and disease. The temperature differs in different parts of the body; it is lower and more variable on the surface of the skin than in internal organs or closed cavities. Observations are usually made with the thermometer held either in the armpit or under the tongue; the latter gives results less than half a degree ( $\text{F}$ .) higher than the former. In the healthy adult in temperate climates the average temperature in the armpit is about  $98.4^{\circ}\text{F}$ ., but undergoes periodical daily variations of nearly a degree in each direction from the mean, being lowest between 2 and 6 A.M., highest between 5 and 8 P.M. A slight rise takes place during the digestion of each meal. In the tropics the temperature is a little higher (less than  $1^{\circ}$ ); it is less diminished in very cold climates. It is slightly higher in childhood, and slightly lower in old age. A persistent elevation or depression of the temperature of more than a degree beyond the limits thus indicated is good evidence that there is some departure from health. In some chronic diseases, especially chronic Bright's disease, diabetes, and myxedema, the temperature is persistently lowered; in the last it may be as low as  $95^{\circ}$ . But elevation of temperature is of much more common occurrence and much more important. It occurs in connection with all acute inflammations and all febrile diseases; and careful observations of its degree and its changes from day to day or hour to hour afford one of the most reliable guides to the diagnosis of many diseases, and the estimation of their severity and probable result. Generally speaking, a temperature of  $99.5^{\circ}$ – $101.5^{\circ}\text{F}$ . may be regarded as slightly febrile; up to  $103.5^{\circ}\text{F}$ . as moderately febrile; up to  $106^{\circ}\text{F}$ . as highly febrile; and above that as hyperpyretic, and, with rare exceptions, as indicative of great danger.

See Wunderlich's *Medical Thermometry*.

**Tempering** is the process of imparting to steel the desired degree of hardness. Heating above  $770^{\circ}$  followed by plunging in cold water makes steel hard and brittle. If it is then heated to a more moderate temperature and allowed to cool slowly, it is softened and toughened. Choice of temperature will depend on the character of the steel and the qualities suitable for the purpose in view. An old method of judging temperatures is by the colour produced, which ranges from yellow up through brown and purple to blue. See ANNEALING.

**Templars**, a famous military order, which, like the Hospitallers and the Teutonic Knights, owed its origin to the Crusades. In the year 1119 two comrades of Godfrey de Bouillon, Hugues de Payen and Geoffroi de Saint-Adh  mar, bound themselves and seven other French knights to guard pilgrims to the holy places from the attacks of the Saracens, taking before the patriarch of Jerusalem solemn vows of chastity, poverty, and obedience. King Baldwin II. gave them for quarters part of his palace, which was built on the site of the Temple of Solomon close to the church of the Holy Sepulchre. Hence they took their name as Templars (*pauperes commilitones Christi templique Salomonici*), and the houses of the order, as at Paris and London, that of the Temple. At the Council of Troyes (1128) Bernard of Clairvaux drew up its rule in seventy-two statutes, substantially the groundwork of the statutes as finally revised in the middle of the 13th century. The order at first consisted of knights alone, but later its members were grouped as knights, all of noble birth, chaplains, and men-at-arms (*fratres servientes*), besides mercenaries, retainers, and craftsmen affiliated, and enjoying its protection. The knights took the vows for life or for a certain period, and they alone wore the white linen mantle, with the eight-pointed red cross on the left shoulder (granted by Pope Eugenius III.), and white linen girdle; black or brown garments were worn by all others. The seal of the order showed the Temple, later two riders—a Templar and a helpless pilgrim—on one horse. The discipline of the order was austere, excluding all needless luxury or display in food, dress, or armour, and all worldly pleasures were forbidden—hawking and hunting all animals, with the characteristic exception of the lion. Married brethren were admitted, but no woman might enter the order, and all brethren were enjoined to shun the kiss of woman, even of mother or sister. The beard was worn, the hair cut short, and all slept alone in shirt and breeches, with a light constantly burning. At the head of the whole order stood the Grand-master; under him Masters, Grand Priors, Commanders, or Preceptors ruled the various provinces of Jerusalem, Tripoli, Antioch and Cyprus, Portugal, Castile and Leon, Aragon, France and Auvergne, Aquitaine and Poitou, Provence, England, Germany, Italy (Middle and Upper), Apulia and Sicily. Second in command to the Grand-master stood the Seneschal, his deputy; next the Marshal, whose business, moreover, was to provide arms, horses, and all the material of war. Visitors-general conveyed the commands of the Grand-master and convent or chapter of Jerusalem to the various provinces, exercised discipline, and settled disputes. The Prior or Preceptor of the kingdom of Jerusalem, also styled 'Grand-preceptor of the Temple,' was also general treasurer of the order. The Drapier had general charge of the clothing; the Standard-bearer (*balcanifer*) bore the glorious banner or war-banner (half black and half white, with the legend, *Non nobis, non nobis, Domine, sed nomini tuo da gloriam*) to the field; the Turcopilar commanded the Turcoples, a body of light horse, natives of Syria and Palestine, in the pay of the order; the Guardian of the Chapel (*custos capelle*) had charge of the portable chapel and the appurtenances of the altar, always carried into the field. The Templars were, by a papal bull in 1172, rendered independent of the authority of the bishops, owning allegiance to the pope alone, the immediate bishop of the entire order; and, moreover, they were allowed to have chaplains within their own ranks to whom they might confess, to erect oratories for divine worship within their bounds, and to enjoy exemption from all taxes and tithes, and from interdict. Their houses

enjoyed right of sanctuary, and they often preserved the treasure of kings and nobles.

The Templars, at once knights and monks, realised the two dearest of mediæval ideals, and men of the highest courage and purest devotion flocked into their ranks, bringing with them their wealth to fill their coffers. Already by 1260 the order is said to have numbered 20,000 knights, and these perhaps the finest fighting men the world has seen. Never in the history of the world did men fling away their lives more gloriously for a hopeless cause; never did a Templar play the coward in the hour of danger, nor, when all hope was lost, barter his soul to a Moslem conqueror in return for his life. Charges of pride, of immorality and impieties, of secret heresies, and even of betraying Frederic II. to the infidel (1229) and St Louis to the Soldan of Egypt (1250) were yet to be hurled against the order; never, from the beginning to the end of their two centuries of history, was a Templar charged with cowardice before the enemy. It was their proud boast that 20,000 of their number perished for the cause in Palestine; of their twenty-two Grand-masters seven died on the field of battle, five of their wounds, one of voluntary starvation a prisoner in the hands of Saladin. The most famous successors of Hugues de Payen (died 1136) were Bernard de Tremelai, who fell at Ascalon in 1153; Eudes de Saint-Amand (died 1179), who won a glorious victory over Saladin at Ascalon (1177), only to fall next year into the sultan's hands after a disastrous battle; Gerard de Riderfort, who suffered a terrible defeat near Nazareth in 1187, a second at Hittin two months later, and died in battle under the walls of Acre in 1189; Robert de Sable, who aided Richard Cœur de Lion to gain a glorious victory in the plain of Arsouf (1191), and bought from him the island of Cyprus, which was soon transferred to Guy de Lusignan, whereupon Acre became the seat of the order, the famous stronghold of Pilgrim's Castle being built, whose stupendous ruins exist to this day; Peter de Montaigu, whose courage helped to take Damietta in 1219; Hermann de Perigord, who rebuilt the fortress of Safed; Guillaume de Sonnac, slain beside St Louis at the Nile in 1250; Thomas Berard, an Englishman, under whom Safed was lost in 1266, Jaffa and Antioch in 1268; and Guillaume de Beaujeu, who lost Tripoli in 1290, and fell in the bloody capture of Acre in 1291. The remnant of the Templars sailed to Cyprus, and the latest dying gleams of the order's vigour in the East were the rash attempts to capture Alexandria (1300), and to establish a settlement at Tortosa (1300-2) under the last and most ill-fated of its grand-masters.

The Templars had failed in their work; their usefulness was past; the order had now only to sink into extinction in one of the darkest tragedies of history. Their wealth and pride had sowed a harvest of fear and hatred; their loyalty to the pope and their exceptional privileges had long since aroused the jealousy of the bishops; their bitter quarrels with the Hospitallers, which blazed into open warfare in Palestine in 1243, had shocked the moral sense of Christendom; and the exclusiveness and secrecy with which all their affairs were conducted opened a door for all manner of sinister suspicions among the populace. Philip the Fair of France was a king who covered with a thin veneer of piety a character of complete unscrupulousness; he had succeeded in placing Clement V., a miserable creature of his own, upon the papal throne (1305), and in his minister Guillaume de Nogaret and the officers of the Inquisition he found servants of character unscrupulous as his own. His unfortunate Flemish wars had brought him into desperate financial difficulties, and his treasury was now

completely exhausted in spite of extortionate taxation, a shameful debasement of the currency, and the merciless plunder of the Jews and the Lombard bankers. In the wealth of the Templars he saw a tempting prize, and the train of treachery was soon complete. Doubtless their numbers and even their wealth are enormously exaggerated by historians; Schottmüller assumed that in France alone there were 15,000 brethren, and over 20,000 in the entire order; Lea thought that at the end there may have been as many as 1500 knights. The Grand-master, Jacques de Molay, was summoned from Cyprus by the pope in 1306; he came, bringing with him the treasure of the order, and awaited his fate in France. On the 13th October 1307, which Dollinger in one of his latest lectures calls an outstanding *dies nefastus* in human history, the Grand-master and 140 Templars were seized at the Temple and flung into prison. Two degraded Templars supplied some of the charges the king required; tortures, infamous beyond the infamies of the Inquisition, provided the remainder. A habitual denial of Christ, spitting upon the cross, the worship of hideous images, travesty of the holy communion and of the sacrifice of the mass, sorceries, unnatural lusts, *oscula inhonesta* and other indecencies—such were the confessions suggested to and wrung from men racked by the agonies of inhuman tortures to which as many as thirty-six knights succumbed in Paris alone. In August 1308 Clement sent throughout Christendom the 127 articles of interrogation for the accused, and evidence in detail self-contradictory beyond all parallel was quickly accumulated. In the 225 witnessses sent to the papal commission (1310-11) from various parts of France the depositions, as Lea points out, occur most suspiciously in groups of identity according to the bishops from whose preliminary tribunals they had come. Philip held a so-called national assembly at Tours (May 1308) which obsequiously expressed its approval of the condemnation. The pope now took the formal responsibility upon himself by personally examining seventy-two Templars brought before him, when those who had already confessed under torture confirmed their confessions, knowing well that the penalty of retraction was burning forthwith as a relapsed heretic. The pope contended that the fate of the order as an institution must be submitted to a general council. Meantime, to the public commission appointed to examine into the charges at Paris, to give the order an opportunity of being heard in its defence, and to report there came (March 1310) as many as 546 Templars who offered to defend the order against all the charges—blunt, unlearned soldiers, deprived of their chiefs, and weak with torture, long imprisonment, cold and hunger. Four of these were at length commissioned to be present at the investigation on behalf of the order, when suddenly the commission was startled by the news that the provincial council of Sens was about to sentence without further hearing those Templars who had offered to defend the order as relapsed heretics in regard to their former confessions. On 12th May 1310 fifty-four knights were slowly burned to death, refusing in the midst of the most awful agonies to perjure themselves by false confessions. The commission at once suspended its sittings, but at length, after many delays, on June 5, 1311, transmitted its report to Clement to help the General Council in its deliberations. The closing act in this dreary and tangled drama of papal duplicity was Clement's failure to gain over the Council at Vienne, and the suppression of the order without formal condemnation, by the bull *Vox in excelso* (March 22, 1312). The bull *Ad providam* (May 2) laid it under perpetual inhibition, and transferred its pro-

perty to the Hospital of St John of Jerusalem. The persons of the Templars were handed over to the provincial councils, with the exception of the chiefs of the order, who were reserved to the jurisdiction of the holy see—a vain hope for which they had left their inferior brethren to their fate. At length, on March 19, 1314, Jacques de Molay and the gray-haired Geoffroy de Charney, Master of Normandy, were brought from prison to receive judgment, when, to the dismay of the churchmen and the astonishment of all, they rose and solemnly declared their innocence and the blamelessness of the order. That same day, on the Isle des Juifs in the Seine, they were slowly roasted to death, declaring with their last breath that the confession formerly wrung from them by torture was untrue. A strange tradition asserts that from the stake the Grand-master summoned both the pope and the king to meet him at the bar of Almighty God within a year, and history tells us that within the year both went to their account.

In England the trials were conducted with much less inhumanity, and it was only direct pressure from the pope that persuaded the king to permit torture to be applied. The charges for the most part failed to be established, and most of the prisoners were granted penances and permitted to escape with a formal abjuration, while a fair provision was made for their support. The last Master of the Temple in England, William de la More, died a prisoner in the Tower, to the last maintaining the innocence of the order. The memory of the various preceptories and possessions in England, Scotland, and Ireland survives in place-names; the round Temple Church in London, consecrated in 1185, was restored by the Benchers of the Inner and Middle Temple (1839-42) at a cost of £70,000. In Spain, Portugal, and Germany the order was found innocent; almost everywhere in Italy, save in the case of six at Florence, the charges broke down. Everywhere the larger part of their property was given to the Hospitallers, and even in France the king was in great part forced by public opinion to forego his prey.

The literature almost forms a library; here we can name only Raynourd, *Monumens hist. rel. à la Condamnation des Chevaliers du Temple* (1813); Willeke, *Geschichte des Tempelherrenordens* (3 vols. Leip. 1826-35; new ed. 1860); Michelet, *Histoire de France* (vol. iii.) and *Procès des Templiers* (2 vols. 1841-51); Havemann, *Geschichte des Ausganges des Tempelherrenordens* (Stutt. 1846); Loiseleur, *La doctrine secrète des Templiers* (1872), an ingenious but unreliable work; Merzdorf, *Geheimstatuten des Ordens der Tempelherren* (Halle, 1877), a work not to be trusted; H. de Curzon, *La règle du Temple* (1886), the most reliable book on this part of the subject; Konrad Schottmüller, *Der Untergang des Tempel-Ordens* (2 vols. Berlin, 1887), the most thorough-going of later apologies, and perhaps the best work on the subject; Hans Prutz, *Entwicklung und Untergang des Tempelherrenordens* (Berlin, 1888), the most learned of more recent attacks upon the order, but marred by laborious attempts to construct a preposterous case of Catharist heresy. Ranke (*Weltgeschichte*, 8 Theil, 1887) follows Hammer-Purgstall (*Die Schuld der Tempier*, 1855) in thinking that the order had fallen away from Christian faith, and adopted a body of secret and heretical doctrine, which had originated in their contact with Islam in the East; but, as Döllinger points out (*Akademische Vorträge*, vol. iii., Munich, 1891), he is hesitating and cautious, and makes many reservations, while he was evidently not acquainted with the most recent works on the subject. In English there are Addison's excellent *History of the Knights Templars, the Temple Church, and the Temple* (2d ed. 1842); Haye's *Persecution of the Knights Templars* (Edin. 1865); Froude's three interesting but superficial lectures (*Good Words*, 1886; reprinted in *Spanish Story of the Armada*, &c., 1892); and especially Henry C. Lea's admirable *History of the Inquisition* (vol. iii. 1888), which argues for the innocence of the order. Similar in view are

Gmelin's *Schuld oder Unschuld des Tempelordens* (Stuttgart, 1893) and H. Finke's *Papsttum und Untergang des Tempelordens* (1907).

**Temple** (Lat. *templum*; cf. Gr. *temenos*, from *temnein*, 'to cut off,' and so 'set apart'), a place or building dedicated to the worship of a god or gods, and amongst most peoples rendered impressive by the noblest architecture and richest adornment available. The history of Greek temple-building is largely the history of Greek Architecture, and is discussed at that head. See also the articles on OLYMPIA, EPHEBUS, ATHENS, &c. For other than Greek temples, see ROMAN ARCHITECTURE, PANTHEON, ROME; INDIA (*Architecture*), PAGODA, ELEPHANTA, ELLORA; BURMA (*Architecture*); EGYPT (*Religious Monuments*), EDFU, ABU-SIMBEL, PHILÆ; CHINA (p. 183), PEKING; BAALBEK, PALMYRA; BORO BUDOR; TEOCALLI, &c., where notices and illustrations of many types of temple will be found.

The Temple of Jerusalem has quite exceptional interest for us. When David brought the ark of Jehovah to Jerusalem, he pitched a tent for it within his citadel, and offered sacrifices before it. The Temple of Solomon replaced this temporary sanctuary, and in like manner consisted essentially of a chamber to contain the ark, and a court in front for the worshippers and their sacrifices. This was the common type of ancient temples, especially in Phœnicia, save that in them the place of the ark was taken by a sacred cippus ('pillar') or image. It was therefore natural that the Hebrew king, whose own subjects were unskilled in architecture, should send to Hiram, the great temple-building king of Tyre, for architects and workmen, and that the plan and decoration of the new sanctuary closely followed Phœnician models. The 'house,' as was often the case in greater temples, consisted of two divisions—the adytum, 'oracle,' or chamber of the ark, and an antechamber, in which stood the table of showbread, ten candlesticks of gold, and other articles of sacred furniture. The former was a cube of 20 cubits, or 30 feet; the antechamber had the same breadth, but was 40 cubits long and 20 high. In front of this again was a portico 10 cubits deep. Both the oracle and the outer chamber had folding-doors; the inner walls were lined with cedar and richly overlaid with gold, the motive of the ornament being the Phœnician cherub and palm-tree. Two cherubs with outstretched wings stood in the adytum and formed a sort of baldachin over the ark. There were windows in a sort of clerestory that rose above the triple tier of small chambers by which the main building was encased on all sides except the front. Of the façade we have no account. In front of the porch stood two pillars of bronze, 18 cubits high, with lotus-shaped capitals. Similar free-standing pillars are seen on coins in front of the temple of Paphos, and the same feature reappears in other eastern temples. We read of an inner and an outer court; the former was the proper court of the temple, the latter was the court of the palace as well as of the sanctuary, which thus presented itself as essentially the royal chapel. Later kings of Judah made considerable changes in and about the temple; thus Jer. xxxvi. 10 speaks of a 'new gate' in the 'higher court,' which is perhaps the same with the 'new court' of 2 Chron. xx. 5. Solomon's temple was burned by Nebuzaradan, Nebuchadnezzar's general, in the year 586 B.C.

The Temple of Zerubbabel, completed in 516 B.C., after long efforts and much discouragement, was designed, according to Ezra, vi. 3, to exceed the old in magnitude. But whether the dimensions there specified (a breadth and height of 60 cubits) were actually attained seems doubtful in view of Hag. ii. 3. In this temple, as in that of Herod, the

folding doors of the adytum were replaced by a veil or curtain; the altar in front of the house was a great platform of stone; the furniture was inferior in splendour; the ark was wanting; and there was only one golden candlestick. In the course of time a multitude of subordinate buildings grew up round the 'house,' in accordance with the requirements of a more elaborate priestly ritual. The circuit was fortified; and the approach to it from the higher ground on the north-west was further covered by a citadel, called the Baris. At the time of Pompey's siege (63 B.C.) the temple complex was an almost impregnable stronghold, strengthened on its weakest side (to the north) by great towers and a deep ditch.

*The Temple of Herod*, commenced by Herod the Great in the eighteenth year of his reign (20-19 B.C.), was new from the foundations and, with its outer courts and surrounding colonnades, covered double the old area. To form so large a level space on the hill-top of Zion enormous sub-structures were necessary, except along the east side, where the colonnade rested on old works ascribed to Solomon, and was accordingly known as Solomon's porch (John, x. 23; Acts, iii. 11; v. 12). According to Josephus, the southern and eastern colonnades were each a stadium, or 600 feet, in length, and the whole circuit of the plateau, including the citadel of Antonia, which stood at the north-west corner, and replaced the Baris, was six stadia. The citadel, which was occupied by the garrison, was of course not holy ground; but neither was the adjacent temple enclosure, connected with the Antonia by a flight of stairs, and usually called the 'outer court,' or, by modern writers, the Court of the Gentiles. Besides its porticos or colonnades, the outer court had various buildings connected with the priestly service, and also contained, near one of the western entrances, the council chamber of the Sanhedrin. It was here too that the money-changers and dealers in articles required for sacrifice had their tables and stalls. Towards the centre of this temple enclosure was a quadrangular platform, lying east and west—the 'inner court.' This, according to Josephus, was surrounded on all sides by walls, of which the external height was 40 cubits, and the internal 25 cubits, its floor being thus 15 cubits above the level of the outer court. On three sides it was surrounded by flights of steps; and the whole was cut off from the rest of the enclosure by a stone balustrade, 3 cubits high, with pillars at regular intervals bearing Greek and Latin inscriptions forbidding the alien to pass on pain of death. The eastern wall of this inner court was pierced by one gate; the north and south walls had four each; the west wall was unbroken. The eastern gateway was exceptionally splendid. Its doors were made of 'Corinthian brass' and not merely overlaid like the others with silver and gold. They were the gift of a certain Nicanor, a wealthy Jew of Alexandria, after whom the gate was named the 'Nicanor Gate.' It is undoubtedly to be identified with the 'Beautiful Gate' of Acts, iii. 2. The eastern and smaller portion of the inner court was walled off from the rest and known as the Court of the Women. The larger western portion, the Court of the Men (of Israel), stood on a somewhat higher level, and, besides having gates of its own on the north and south, was entered from the Court of the Women by a large gate, which some writers prefer to regard as the 'Nicanor' or 'Beautiful' gate above mentioned. The inner court was colonnaded all round, and there were chambers or 'treasuries' against the inner wall. In the middle of the Court of the Men stood the temple proper, again on a higher level, reached by a flight of twelve steps. Its ground-plan was the same as that of Solomon's temple, but its height,

obviously with a view to harmony with the larger surroundings, was greater (60 cubits?), and the porch was 100 cubits broad and 100 cubits high. The 'holy place' (as it is usually called) contained the candlestick with seven lamps, the table of showbread, and the altar of incense; the 'holy of holies,' separated by an exceedingly thick and heavy veil, was empty. In front of the fane was the stone altar, 50 cubits square and 15 high, according to Josephus; but the Mishna gives the more probable dimensions of 32 cubits square at the base, narrowing by stages to 24 at the top, with a height of 10 cubits. Round temple and altar ran a stone fence, about a cubit in height, which marked off the so-called Court of the Priests from the area accessible to the laity. The fane proper was completed eighteen months after its commencement, but the 'building' of Herod's temple in the larger sense of the word was still in progress when Jesus began his ministry (John, ii. 20), and was not in fact finished till the procuratorship of Albinus (62-64 A.D.). The whole was burned to the ground when Jerusalem was taken by Titus (August 70 A.D.).

Those scholars who accept Josephus' measurements (he wrote from memory and some years after the temple had been destroyed) necessarily hold that the temple enclosure occupied only a portion of the present Haram area, which measures about 1600 feet from north to south, with a breadth of some 920 feet. Others, however, regard Josephus' figures as much too small, and, broadly speaking, consider that the whole of the Haram area was levelled up by Herod. It is agreed on all hands that the south-west angle of the Haram area is the south-west angle of Herod's temple, and that the line of the west wall of that area is the west wall of the temple, or of the temple and Antonia. Almost all recent authorities are further agreed in holding that from first to last the altar of burnt-offering stood on the so-called Sakhra or sacred rock, now covered by the building known as 'The Dome of the Rock,' to the west of which rose the successive temple-buildings. Two of the most important data for the modern topographer seem to be the arch known as Robinson's arch at the south-west corner, and that known as Wilson's arch, 600 feet to the north of it; they seem to correspond to two of the four entrances on the west mentioned by Josephus. The best judges, such as Petrie, believe that nothing older than Herod is found in the extant western walls and substructures. Of other supposed data it is to be observed that, if Josephus' measurements are correct, the arch substructures on the south, known as 'Solomon's Stables,' are post-Herodian; on this view they are to be identified with the substructures of Justinian's church mentioned by Procopius. The so-called 'Golden Gate' in the eastern wall of the Haram area is certainly in its present form post-Herodian.

See De Vogüé, *Le Temple de Jérusalem* (1864); Fergusson, *The Temples of the Jews* (1878); Thrupp, *Antient Jerusalem* (1855); the publications of the Palestine Exploration Fund; and the arts. 'Temple' by Robertson Smith in the *Ency. Brit.*, 9th ed. and Kennedy, 11th ed., Witton Davies in *Hastings's Dictionary of the Bible*, and Benziger in the *Ency. Biblica*; Waterhouse in Sanday's *Sacred Sites of the Gospels* (1903); G. A. Smith, *Jerusalem* (1908). See also the article JERUSALEM.

**Temple.** See INNS OF COURT, TEMPLARS.

**Temple, FREDERICK** (1821-1902), from 1896 Archbishop of Canterbury, was born the son of an officer, at Lenkas in the Ionian Islands. He was educated at Tiverton and at Balliol College, Oxford, where in 1842 he graduated double-first, and was subsequently fellow and tutor of his college. Successively principal of Kneller Hall

Training College, inspector of schools, and headmaster of Rugby, he became conspicuous in the theological world in 1860 as author of the first of the *Essays and Reviews* (q.v.). In 1868-70 he supported the disestablishment of the Irish Church, and was in 1869 consecrated Bishop of Exeter—a Broad Church successor to the High Church Dr Phillpotts (q.v.)—in spite of strong clerical opposition. An admirable administrator, he was promoted to the see of London in 1885, and to that of Canterbury in 1896. His *Sermons preached in Rugby Chapel* appeared in 1861; he was Bampton lecturer in 1884, and took an active part in temperance reform.

**Temple, RICHARD GRENVILLE, EARL** (1711-79), elder brother of George Grenville (q.v.), is mainly known as having from 1752 to 1761 held office under the elder Pitt, who had married his sister; as having bitterly opposed Bute; and as having broken with Pitt (Chatham) on the question of the Stamp Act in 1766, soon after which time he ceased to take any prominent part in public affairs.

**Temple, SIR WILLIAM**, diplomatist and essay-writer, was the eldest son of Sir John Temple, Master of the Rolls in Ireland, and of Mary Hammond, sister of the well-known royalist divine, and was born at Blackfriars in London in 1628. He studied two years at Emmanuel College, Cambridge, where he had Cudworth for his tutor, but at nineteen went abroad on his travels, falling in love with Dorothy Osborne (1627-95) in the Isle of Wight on his way to France. His own father sat for Chichester in the Long Parliament, while Sir Peter Osborne was governor of Guernsey and a strong royalist, and naturally disliked the match. But the lovers were constant in their affection, and their seven years of separation gave opportunity for those delightful letters of Dorothy's, the charm of which defies the touch of time. Temple travelled in France, Spain, and Holland, married Dorothy in January 1655, lived some years in studious retirement in Ireland, and was returned for Carlow to the convention parliament at Dublin in 1660. Three years later he settled finally in England; in 1665 was sent on a secret mission to the Bishop of Münster; and on his return was created a baronet and appointed resident at the court of Brussels. His most important diplomatic success was the famous treaty of 1668, known as the Triple Alliance, by which England, Holland, and Sweden united to curb the ambitious schemes of France. This negotiation was accomplished in five days, in conjunction with the great Dutch statesman De Witt, but was rendered vain through the treachery of Charles II. in the secret Treaty of Dover (1670). Temple also took part in the congress of Aix-la-Chapelle (May 1668), and soon after was appointed ambassador at the Hague. He had his share in the long congress at Nimeguen, and was recalled in June 1671 a few months before the beginning of the shameful war between England and Holland. By the Treaty of Westminster (February 1674) Temple ended the war, and, after declining both the embassy to Spain and the secretaryship of state, went again ambassador to Holland. In 1677 he assisted in bringing about the marriage of the Prince of Orange with the Princess Mary. Charles II. in vain offered him again the secretaryship of state; and in the confusion of the Popish Plot accepted his proposed constitutional remedy of a reformed privy-council of thirty persons, by whose deliberations to be guided in all public affairs. As might have been foreseen, so numerous a council, under such an unprincipled sovereign as Charles II., and in times of such fierce faction and widespread corruption, proved an utter failure. For

some little time an inner council of four—Temple, Halifax, Essex, and Sunderland—attempted to control public business, but Temple, who was too honest for his fellows, soon felt himself being ousted even from this, and retired to his villa at Sheen, where he lived till 1686, thereafter at Moor Park in Surrey.

When the Revolution placed William III. on the throne Temple was again offered the secretaryship of state, but again refused. His son, the sole survivor of seven children, was made secretary for war, but a week after drowned himself in the Thames, his mind being unable to bear the burden of responsibility. The remainder of his days Temple gave to letters and to gardening. The king occasionally consulted him, and during great part of this period he had with him as his secretary young Jonathan Swift, who regarded his stately self-complacent patron with more fear than affection, but ultimately became his literary executor. Temple died at Moor Park, January 27, 1699, and was buried beside his wife in Westminster Abbey, his heart beneath the sun-dial at Moor Park.

As a writer Temple is now known chiefly by his historical *Memoirs* (1691, 1709) and his *Miscellanea* (1679, 1692), a collection of essays on various subjects—government, trade, gardening, heroic virtue, poetry. The second part contains the essay 'Upon the Ancient and Modern Learning,' which opened the famous controversy on the Letters of Phalaris. Temple has been considered one of the reformers of English style—the first writer, says Dr Johnson, 'who gave cadence to English prose.' His style wears a singularly modern air, and is smooth, flowing, and agreeable. 'What can be more pleasant,' says Charles Lamb, 'than the way in which the retired statesman peeps out in his essays, penned in his delightful retreat at Sheen? They scent of Nimeguen and the Hague. Scarce an authority is quoted under an ambassador.' Temple's pretensions to learning are merely amusing, and he has little real weight as a political writer, but he expatiates very pleasantly on foreign travel and country life, on flowers and fruits, on parterres, terrace-walks, and fountains. His epicurean temperament is happily and characteristically displayed in the last words of his last essay: 'When all is done human life is at the greatest and best but like a froward child, that must be played with and humoured a little to keep it quiet till it falls asleep, and then the care is over.'

His collected works fill 4 vols. (1814). The older *Lives* by Boyer, Swift, and Temple's sister, Lady Giffard, were superseded by the elaborate *Memoirs* by Thomas Peregrine Courtenay (2 vols. 1836), reviewed by Macaulay in a well-known and brilliant essay. The *Letters* of Dorothy Osborne, seventy-one in number, written during the last two years of their seven years' courtship, were edited in 1888 by Judge Parry, who, after suppressing a rival issue, produced a greatly improved edition in 1903. See also books by A. F. Sieveking (1908), and E. S. Lyttel (1908).

**Temple Bar**, a London gateway, dividing Fleet Street from the Strand, at the boundary of the City. Rebuilt after the Great Fire by Wren in 1669-73 at a cost of £1398, it was removed in 1878-79, and re-erected in Theobalds Park, Cheshunt, in 1888. Its site is marked by a memorial (1880) surmounted by an amazing griffin.

**Templemore**, a town of County Tipperary, which takes its name from a commandery of the Knights Templars, and is situated on the river Suir, 8 miles N. of Thurles by rail; pop. (1926) 2230.

**Temple Society**, a body of German Christians who wait for the second coming of Christ. They separated from the church in Würtemberg and formed a separate sect; and many of them settled in Palestine in 1868, establishing colonies at Haifa

(q.v.), Jaffa, Saron, and near Jerusalem, distinguished for industry, enterprise, and success.

**Temporal Power.** See POPE.

**Temuco**, in the province of Cautin, Chile, is a flourishing town, the centre of a fertile agricultural district. It has flour and saw mills. The town is meanly built. Pop. 28,000.

**Temujin.** See GENGHIS KHAN.

**Tenacity** is that property of matter by which it resists being pulled asunder. Liquids and gases have no tenacity. In technical language, the tenacity of a substance is the greatest longitudinal stress that it can bear without being torn asunder. For example, steel bars have a tenacity of between 50 and 60 tons weight per square inch, whereas oak has a tenacity of not quite 7. With regard to metals it is found that forging and wire-drawing increase their tenacity. See STRENGTH OF MATERIALS.

**Tenant**, in English law, means a person who holds lands or tenements under another. The feudal system of landownership, as established in England under the Norman kings, was based on the principle that the land of every subject of the crown was held by him of the crown, or of some superior lord who himself held from the crown. To his lord the landholder was bound to render services by way of return for his enjoyment of the land. The landholder was styled the tenant; and the duties which he owed to his lord—or the relation subsisting between him and his lord—constituted the tenure of the land. In modern times these feudal principles retain little of their former importance. Nevertheless, since, by the theory of English law, all lands are holden, immediately or mediately, of the crown, in which the ultimate ownership of the land resides, no subject can be more than a tenant of land. Whoever, therefore, possesses any interest in any parcel of English land is in the eye of the law a 'tenant'; the lands or other possessions he holds are 'tenements'; and the manner in which they are held is the 'tenure.' A landholder's 'estate' is his interest in the land, of which he is tenant. The words 'tenant' and 'estate,' when used in relation to ownership, are usually associated with other words denoting the extent of the landholder's interest. In English law there developed three systems of landholding—freehold, copyhold, and leasehold. A freeholding was held of the king or some mesne lord by free services, that is, by services free from servile incidents and so worthy the acceptance of a free man. An estate of freehold might be either (1) an estate in fee simple, that is, an estate granted to the tenant and his heirs generally, which, having incident to it the rights of free enjoyment and free disposition, was the most ample estate possible under the feudal principle of tenure; (2) an estate tail (or a fee tail)—deriving its existence from the statute *De Donis* passed in 1285—that is, an estate in which the full inheritance was cut down (*taillie*), being restricted to heirs of the body, or lineal descendants, of the tenant; and (3) an estate for life, that is, an estate granted until the death of some person or the last survivor of several persons. Such an estate, if held for the life of the tenant, is an ordinary life estate; and, if held for the life of some one else, is an estate *pur autre vie*. In course of time there arose, in addition to freehold, the customary tenure known as copyhold, and the right of the copyholder to maintain and recover possession of his holding as against all others became enforceable in law. (See COPYHOLD.) Further, it became common to hold land under a contract with a freeholder that the tenant should have possession of the land for a certain number or 'term' of years. In the older law a tenant for

a term of years was regarded as holding possession on behalf of the freeholder as his bailiff. In later times, however, a term of years, meaning not merely the time for which a lease is granted but also the interest acquired by the lessee, was fully protected by law. Accordingly, persons who thus occupied lands under tenants in fee or for life came also to be recognised as tenants—this kind of tenure being described as leasehold or as tenure by lease for years. Land can be held by several persons having simultaneous interests. According to the nature of their interests co-owners are distinguished as joint tenants or as tenants in common. Joint tenants hold collectively a single right of ownership, with the benefit of survivorship or the *jus accrescendi*, in virtue of which, on the death of one of them, the estate in the whole of the land remains to the survivors. Tenants in common, on the other hand, have distinct estates, either of the same or of different quantity, in the subject of common property; and, there being no right of survivorship attached to their interests, on the death of one of them his interest is subject to his will or, if he dies intestate, passes to his representatives as if it were held in severalty.

The law of England as to interests in land has been radically altered as a result of recent legislative changes, culminating in the Law of Property Act, 1925, and other statutes passed in the same year dealing with real property. Under these statutes, which came into operation on 1st January 1926, the only estates capable of subsisting, or of being conveyed or created at law are two in number, namely, an estate in fee simple absolute in possession and a term of years absolute. Such estates, when subsisting or conveyed or created at law, are 'legal estates,' and the owner of a legal estate is an 'estate owner.' All other estates and interests in land take effect as 'equitable interests.' Thus estates in fee tail existing on 1st January 1926 are now entailed interests. While there is no longer any such thing as a legal estate in fee tail, an entailed interest can be created by way of trust in any property, real or personal, and gives the same beneficial interests as were formerly conferred by the grant of an estate in fee tail in land. So an estate for life can now only exist as an equitable interest. Copyhold tenure is abolished and, as from 1st January 1926, every parcel of copyhold land is automatically converted into freehold. After 1925 joint tenancy is the only form of co-ownership which is recognised as regards legal estates; and, after that date, tenancy in common can subsist only in equity.

The words 'tenant' and 'tenancy' are, in popular use, generally applied to the relationship which arises from the hiring of land, houses, or other tenements. (See LANDLORD AND TENANT.) The term tenant is also used in reference to interests in personal property. Thus where a fund is held by trustees in trust for a person for his life, that person is spoken of as a tenant for life of the fund. In Scots law the word 'tenant' is applied only to a lessee under a contract of lease.

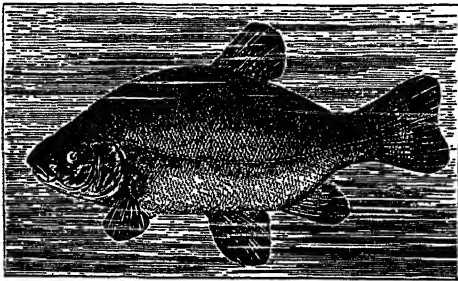

**Tenasserim** (*Ta-neng-tha-ri*), acquired by Britain after the war in 1825, the southernmost division of Burma (q.v.), is a long narrow strip of territory between the sea and the mountains of the Siamese frontier. Area, 35,788 sq. m.; pop. (1921) 1,613,523. There are six districts, the chief towns being Moulmein, Toungoo, and Tavoy. The town of Tenasserim, which has, through wars and other misfortunes, sunk to a village, stands 33 miles from the sea at the junction of the Great and Little Tenasserim rivers, the former of which has a total course of about 400 miles.

**Ten Brink.** See BRINK.

**Tenbury**, or TENBURY WELLS, a market-town of Worcestershire, on the Teme, 22 miles NW. of Worcester. Saline springs were discovered here in 1839, but the place was not developed as a spa until 1911. St Michael's College was founded in 1855 by the Rev. Sir F. Gore Ouseley (q.v.). Pop. 2000.

**Tenby**, a thriving watering-place of Pembrokeshire, South Wales, 9½ miles E. of Pembroke and 274 W. of London, is finely seated on a rocky headland overlooking Carmarthen Bay. The Cymric *Din-bach y Pysgod* ('fishy little fortress'), it was one of the Flemish colonies planted by Henry I. in Pembrokeshire, and retains a long stretch of its ancient walls, strengthened by Queen Elizabeth in 1588, and a fragment of a castle, whence in 1471 the future Henry VII. escaped to Brittany. Its mild climate, fine level sands, and capital bathing have been the making of the place, which has an interesting Gothic church (1250) with a spire 152 feet high, a colossal marble statue of the Prince Consort (1865), and a fort (1868), now a private residence. The Royal Victoria Pier dates from 1899. Its charter of incorporation was granted in 1402 by Henry IV., and with Pembroke (q.v.) and five other towns it returned one member to parliament till 1918, when it was merged in the county. Pop. (1921) 4854.

**Tench** (*Tinca*), a genus of fishes of the Carp family (Cyprinidae), represented by a single species, *Tinca vulgaris*. The thick body is covered with small scales and abundant mucus; there is a short barbel at each side of the mouth; the pharyngeal teeth are in a single row and slightly hooked. The tench lives in lakes and rivers in France, Germany, Austria, and more rarely in England, usually in muddy waters. It is of a deep yellowish-brown colour, more rarely golden or greenish. Instances

Tench (*Tinca vulgaris*).

have occurred of its attaining a length of almost three feet, but a tench of half that length is unusually large. It is very tenacious of life, and, like the carp, can be conveyed to a distance alive in wet moss. It spawns in May and June, depositing its spawn among aquatic plants. The ova are very small and very numerous. In the winter the fish remains dormant in the mud. The flesh is soft and insipid, except when the fish is very well fed, when it becomes delicate and pleasant. Tench are often placed in ponds along with carp. Angling for tench resembles angling for carp.

**Tencin**, MADAME DE (Claudine Alexandrine Guérin), a clever writer but worthless woman, was born at Grenoble in 1681, and entered the religious life, but soon found its restraints intolerable. Finally, in 1714, she came to Paris, where her wit and beauty soon attracted to her a crowd of lovers, among them personages so great as the Regent and Cardinal Dubois. She had much political influence, was a bitter enemy of the Jansenists, enriched herself, and helped the fortunes of her brother the

Cardinal Pierre Guérin de Tencin (1680-1758). But her importance died with the regent and the cardinal in 1723. In 1726 she lay a short time in the Bastille, after the tragic scandal caused by one of her lovers shooting himself in her house. Her later life was more decorous, and her salon became one of the most popular in Paris. She died 4th December 1749. One of her oldest lovers was Fontenelle; D'Alembert was one of her children. Her romances, *Mémoires du Comte de Comminges* (1735), *Le Siège de Calais* (1739), and *Les Malheurs de l'Amour* (1747), show taste, passion, and style, with all the 18th-century limitations. They resemble the romances of Madame de La Fayette in many points, but they lack the peculiar charm that lives in everything written by that admirable woman. Madame de Tencin's *Correspondance* with her brother appeared at Paris in 1790; the *Lettres au Duc de Richelieu* in 1806. See books by Nicolaus (1908), Masson (1909), and De Coynart (1910).

**Tender**, as a legal term, means the formal offer to perform some obligation incumbent on the person tendering. It is most frequently used in reference to the payment of money which is due. Whenever a tender of the debt is properly made the legal consequence is this, that if the money is refused the creditor will have to pay the costs of any action he may bring to recover it, and cannot claim interest afterwards. In case such an action is brought, the debtor has nothing to do but to plead that he duly tendered the money, and if he then pay into court the sum which he had formerly tendered the other party must stop the action, or continue it at his own risk. In order, however, that a tender should have the above effect, it must have been duly made—that is to say, it must have been made without imposing any conditions on the creditor, and at the proper time and place. The tender must be in money, and not by bill of exchange; but Bank of England notes are a good tender for all sums above £5. Sums not exceeding one shilling may be tendered in bronze coin, and not exceeding forty shillings in silver coin. Though other bank-notes than Bank of England notes are often tendered, the creditor is not bound to accept them; but if he take them without any specific objection, then it will be a sufficient discharge. The gold coinage of colonies may be made current by proclamation; and so might foreign coin. A tender of a larger sum than is due is good, but the debtor may not require change to be given. Nor must any condition be annexed to the tender, not even the condition of giving a stamped receipt; but a person receiving payment is bound to fill up a stamped receipt on its being tendered to him, and to pay the stamp; and his refusal subjects him to a penalty of £10. A tender in payment must, in general, be made to the creditor at the place he has indicated, and it is the duty of the debtor to find out and pay the creditor. It is, however, enough that a tenant be ready to pay the rent on the premises at the time it is due, it being the landlord's duty to send or call for it. In Scotland, Bank of England notes are not legal tender. By the Currency and Bank Notes Act, 1914, the treasury was authorised to issue currency notes for one pound and for ten shillings, which should be legal tender for the payment of any amount. By the same act the notes of Scottish and Irish banks were made legal tender for the payment of any amount in these countries. In the United States all the gold coins are good; and also the silver dollar for any amount, when the contrary is not expressly stated in the contract.

**Tendon**, the white fibrous tissue reaching from the end of a muscle to bone or some other struc-

ture which is to serve as a fixed attachment for it, or which it is intended to move. Tendons have been divided into (1) *Funicular*, or rope-like, as the long tendon of the biceps muscle of the arm; (2) *Fascicular*, as the short tendon of that muscle, and as the great majority of tendons generally; and (3) *Aponeurotic* or tendinous expansions, sometimes of considerable extent, and serviceable in strengthening the walls of cavities, as, for example, the tendons of the abdominal muscles. The tendons commence by separate fascicles from the end of each muscular fibre, and they similarly terminate by separate fascicles in distinct depressions in the bones, besides being closely incorporated with the periosteum. In some birds whose tendons are black the periosteum is black also. If a tendon is ruptured by an accident, or divided by the surgeon (tenotomy), the two ends, if not too far separated, unite with extreme readiness, by the formation of intervening plastic material, which soon acquires great firmness. The tendons most frequently ruptured are the Achilles Tendon (q.v.) and the tendons of the rectus femoris and the triceps humeri.

Amongst the diseases of tendons are *inflammation* and one of the forms of Whitlow (q.v.) known as *Paronychia gravis*, or *tendinous whitlow*, in which 'the tendons and their sheaths in the finger and hand are the seat of a severe and often most destructive inflammation, which, though often confined to one finger, not unfrequently extends to the hand and arm, attacking not only the tendons and softer parts, but exposing the bones, and disorganising the joints' (Holmes). A permanently bent finger, from adhesion of the tendon to its sheath, is a common result in severe cases of whitlow of this kind. Tendons may also be inflamed as the result of gout or rheumatism, and not very unfrequently they are the seat of syphilitic enlargements or other tumours. Fibrous tumours and small cartilaginous enlargements are often found in tendons.

**Tendrill**, a climbing organ in plants, may be of the nature of leaf or stem, and various parts of the leaf may take the form of tendrils. The tendrils of vines and passion-flowers are stem structures. In *Smilax* the stipules are tendrils. In *Lathyrus Aphaca*, on the other hand, the stipules are enlarged to perform the usual functions of leaves, while the rest of the leaf is transformed into tendrils. Other species of *Lathyrus* have a pair or more of ordinary leaflets at the base, the remainder of the leaf being modified for climbing, or merely reduced to a narrow tip. Sometimes the petiole of an ordinary leaf acts as a tendrill, as in *Tropæolum* and *Clematis*. Even a root may play the part, as in *Vanilla*. Tendrils are sensitive to contact, and grow more rapidly on the other side from the object touched, whereby they come to coil round it. The part not in contact then throws itself into a double corkscrew form, and draws the plant closer to its support. The corkscrew must of course be double, that is, it must twist in both directions, since both ends are fixed. Some tendrils end in adhesive disks (as *Vitis*).

**Tène**, LA. See IRON AGE.

**Tenebræ**. See GOOD FRIDAY.

**Tenedos** (*Bosdsha Ada*), a Turkish island in the Ægean Sea, off the Troad, and 12 miles S. of the entrance to the Dardanelles. It is 8 miles long and 2 to 4 broad, and is rocky, but not unproductive, and is fairly populous. The treaty of Lausanne (1923) provides for special administration. Tenedos is the chief town. Tenedos figures in the siege of Troy.

**Tenerife**, PEAK OF, or PICO DE TEIDE, a famous volcano, only slightly active now, the highest summit in the Canary Islands (q.v.), stands in

the south-west of the island of Tenerife, and is 12,180 feet above sea-level. The lower slopes of the mountain are covered with forests, or laid out in extensive meadows, yielding rich grass; but the upper ridges and the Peak, properly so-called, are wild, barren, and rugged in appearance. The Peak El Pitón and its two inferior neighbours, the Montaña Blanca and Chahorra (9880 feet), rise from a rugged circular plain of lava debris and pumice, 7000 feet above sea-level, about 8 miles in diameter, and fenced in by an almost perpendicular wall of rock. From the crevices sulphurous vapours are constantly exhaling. The wall of the crater at the top is formed of broken and jagged porphyritic lava rocks, is elliptical, 300 feet in diameter, and 70 deep. The colour of the whole is white. There is an ice cave at an altitude of 11,000 feet. The Peak can be seen more than 100 miles off. In 1795 and 1798 there was volcanic activity here.

See *Tenerife*, by C. Piazzi Smyth (1858), who made a series of experiments here; Olivia M. Stone (who ascended the peak), *Tenerife and its Six Satellites* (new ed. 1889); G. W. Strettell, *Tenerife* (1890).

**Tenesmus** (Gr. *teinein*, 'to strain') is the term applied in Medicine to a straining and painful effort to relieve the bowels when no fecal matter is present in the rectum, the effort being excited by some adjacent source of irritation. It is a common symptom in dysentery, irritation of the bladder, cancer of the rectum, &c.

**Teniers**, DAVID, the Elder, a Flemish master, was born at Antwerp in 1582. A pupil of Elsheimer at Rome and Rubens at Antwerp, he was admitted to the painters' guild of St Luke in his native city, and died there on 29th July 1649. His subjects are in general homely, the interiors of public-houses, rustic games, weddings, and the like; but they are full of reality, charm of colour, and happy ease of composition.—DAVID TENIERS, the Younger, son of the preceding, was born at Antwerp, 15th December 1610. He received his first lessons from his father, and the influence of his own contemporary, Adrian Brouwer, is strongly marked on his earlier work. He rose quickly to distinction, enjoying the favour and friendship of the Archduke Leopold William, Don Juan, bastard son of Philip IV. of Austria, the Prince of Orange, the Bishop of Ghent, and other dignitaries. His first wife was a daughter of the painter Breughel. He was admitted 'master' of the guild of St Luke in 1632, and in 1644 was elected its president by the common council of Antwerp; in 1647 he took up his abode at Brussels, where he died, 25th April 1690. Of his pictures John Smith in his *Catalogue Raisonné* enumerates no fewer than nine hundred. They possess, but in superlative degree, the qualities that mark his father's work. In the tone of his skies, the drawing of his trees, the animation and grouping of his figures, we see everywhere the presence of a richer, finer, more observant and more imaginative genius. None has realised more richly the charm of joyous open-air life. His scriptural subjects alone are unsatisfactory.

See Kugler's *Handbook to the German, Flemish, and Dutch Schools*, remodelled by Waagen, rewritten by Crowe (1874).

**Tenison**, THOMAS, Archbishop of Canterbury, was born at Cottenham in Cambridgeshire, 29th September 1636, studied at Corpus Christi in Cambridge, and after holding several cures was made Bishop of Lincoln by William III. in 1691, and primate of all England three years later. He was a favourite at court, held many important state offices, and attended Mary and William on their death-beds. He crowned Queen Anne and George

I., being a strong supporter of the Hanoverian succession, and died 14th December 1715. His works comprised some anti-papal tracts, sermons, and a criticism of Hobbes.

**Tennant, SMITHSON** (1761-1815), English chemist, studied medicine at Edinburgh and Cambridge, and became professor of chemistry in the latter in 1813. He was killed by the collapse of a bridge near Boulogne. He discovered osmium and iridium, and wrote a valuable paper, *On the Nature of the Diamond* (1797).

**Tennant, WILLIAM**, the author of *Anster Fair*, was born 15th May 1784, at Anstruther in Fife. A cripple almost from his birth, he naturally took to reading, and in 1799 went to the university of St Andrews, but was compelled to leave after two years to act as clerk to his brother, a corn-dealer. The business soon failed, and in 1813 Tennant was fain to accept the situation of parish schoolmaster at Dunino, near St Andrews, with a salary of £40 a year. The year before he had published his *Anster Fair*, a poem of much sprightliness and humour, notable as a first attempt to naturalise in our language the gay *ottava rima* of the Italians—soon after to be adopted with splendid success by Hookham Frere and by Byron. A highly laudatory notice of the poem appeared in the *Edinburgh Review* in 1814, from the pen of the then omnipotent Jeffrey. In 1816 Tennant became a teacher at Lasswade near Edinburgh, whence three years later he was transferred to a mastership in Dollar Academy. His attainments as a linguist were extraordinary, and in 1835 he was appointed by the crown to the chair of Oriental Languages in the university of St Andrews. He died near Dollar, 14th October 1848. Tennant never equalled his first poem, although there was no little merit buried with the *Thane of Fife* (1822), *Papistry Stormed* (1827), and even the dramas of *Cardinal Beaton* (1823) and *John Balliol* (1825). See the memoir by Matthew Conolly (1861).

**Tennemann, WILHELM GOTTLIEB**, historian of philosophy (1761-1819), lectured at Jena, became professor at Marburg in 1804, and wrote, from the Kantian point of view, a *Geschichte der Philosophie* (vols. i.-xi. 1798-1819), and a shorter history (1812), translated as a *Manual of the History of Philosophy* (1852), long a text-book in Britain.

**Tennent, SIR JAMES EMERSON**, born in Belfast in 1804, studied at Dublin, and after practising at the bar was sent to parliament in 1832. He first supported Earl Grey and then Peel, and was secretary successively to the Indian Board, to the government of Ceylon, to the Poor-law Board, and to the Board of Trade. He was made a baronet on his resignation of the last post in 1867, and died in London, 6th March 1869. He is best known for his great work on *Ceylon* (1859) and books of travels in Greece and Belgium.

**Tennessee**, one of the central southern states of the American Union, the thirty-fourth in area and nineteenth in population, is popularly called the Volunteer State, and is situated in the Mississippi Valley in 35°-36° 37' N. lat. and 81° 37'-90° 28' W. long. On the N. are Virginia and Kentucky, on the E. is North Carolina, on the S. are Georgia, Alabama, and Mississippi, and on the W. the Mississippi River separates it from Arkansas and Missouri. Its mean length is 385 miles, its mean width 109 miles; area, 42,050 sq. m. Politically the state is divided into East, Middle, and West Tennessee, and these sections may rudely serve as natural divisions in describing its surface and physical characteristics, though the variety presented in topography, geology, soil, climate, and the habits and occupations of the people represents the corresponding features of the states by which it is bordered. East Ten-

nessee extends from the Unaka and Smoky Mountains, which form the eastern boundary of the state, to the crest of the Cumberland Plateau. It contains some of the greatest ridges of the Appalachians, and abounds in magnificent scenery. Between the eastern ridges and the plateau stretches a valley region about 100 miles in width, broken by minor elevations and depressions. This valley slopes gradually from the north toward the south, and has an average elevation of about 1000 feet. Along its western edge the plateau rises in a bold wall from 100 to 200 feet high. The tableland has a broad flat top covered in places, especially toward the north, with the superimposed ridges and peaks of the Cumberland Mountains. Its western edge has a ragged contour notched by numerous 'coves' and valleys. The southern end is divided into two arms by a deep gorge with perpendicular sides rising from 800 to 1000 feet above the valley. The Sequatchie River flows through this trough until, near the southern border of the state, it is absorbed by the Tennessee River, which, breaking through the eastern arm, follows the valley for a distance of 60 miles into Alabama. The river then turns, and breaking through the western arm re-enters the state after forming part of the boundary between Alabama and Mississippi. Between the Tennessee River in its northern course and the Cumberland Mountains is Middle Tennessee, presenting a varied landscape of mountains, plains, hills, and valleys. It may be described as an extensive elliptical basin surrounded by an elevated rim. The Cumberland River, which enters the state from Kentucky, flows about 150 miles through the northern central part and then re-enters Kentucky. Between the Tennessee and Mississippi rivers lies the western division of the state. The narrow valley of the former river is skirted on the west by a ridge running north and south across the state. From this divide a rolling plain slopes towards the west, terminating in a steep bluff, beyond which are the alluvial bottom lands of the Mississippi.

Nearly all the geological periods are represented to a greater or a lesser degree, from the ancient metamorphic rocks of the mountains in the east to the recent alluvium of the Mississippi River bottom. Silurian deposits predominate in the mountain-region and in the valley of Middle Tennessee. Surrounding this valley are different groups of Carboniferous rocks, and in the Cumberland Plateau is a part of the great Appalachian coalfield. The coal-measures occupy an area of 5100 sq. m., and the seams are of exceptional thickness. West of the Tennessee River broad strips of Cretaceous and Tertiary deposits cross the state parallel to the alluvial bed of the Mississippi. The deposits of iron ore in different parts of the state are known to be very extensive, and the beautiful marbles which occur in great abundance are widely celebrated. Other minerals of importance are building-stone, copper, zinc, silver, gold, lead, petroleum, barytes, &c. Several famous mineral springs are the resorts of invalids.

The climate is mild and delightful, but marked by variety, which is due to numerous causes arising from geographical position and topography. The average length of time between killing frosts is 200 days. Herbage is often green throughout the year, and cattle generally graze during the winter months. The rainfall is ample, amounting to an average of 52 inches. The soil is very fertile, especially in the western region. Agriculture is therefore the leading industry, but the mining of coal and iron and manufacturing are rapidly growing interests. All the cereals and fruits of the temperate zone flourish in Tennessee. The staple crops are corn, wheat, oats, cotton, and

tobacco, fruit, hemp, pea-nuts, &c. The principal cotton districts are in the south-west and in the southern part of the central basin. Stock-raising, especially the breeding of mules, is extensively carried on. The forests of hard-wood timber constitute a great natural source of wealth. The production of pig-iron has greatly increased, and the number of factories for employing the raw material in the manufacture of machinery, agricultural implements, &c., has been proportionately augmented. There are also many cotton, woollen, flour, and paper mills, besides tobacco-factories and potteries. Within the limits of the state there are about 4500 miles of railroad, while both the Mississippi and the Tennessee are natural highways.

Tennessee contains ninety-five counties, and returns ten representatives to congress. The most important towns are Nashville, the capital of the state, Memphis, the largest city, Chattanooga, and Knoxville. The state has a good system of public schools, normal institutions, and many excellent private schools. The Vanderbilt University is at Nashville, and the headquarters of the University of Tennessee at Knoxville, and there are over twenty collegiate institutions in the state. In 1925 William Jennings Bryan's 'fundamentalist' propaganda resulted in a law forbidding the teaching of human evolution in state-supported institutions; and the trial of a teacher at Dayton drew the eyes of the world upon Tennessee. Hernando de Soto is said to have set foot on Tennessee in the middle of the 16th century, and the French settled for a time beside the Mississippi at the end of the 17th. The first real settlers, however, were the backwoodsmen who crossed the border from Virginia in 1768-9. The most notable of the Tennessee pioneers were James Robertson (1742-1814), John Sevier (1745-1815), and David Crockett (1786-1836). The early settlers asked and received the protection of North Carolina in 1776, and their territory was known as Washington county. In 1785 they organised the state of Franklin, and continued to dispute their rights with North Carolina till 1789, when the territory was ceded to the United States. In the following year territorial government was established, and in 1796 Tennessee became a state. It was the last of the southern states to secede in 1861, and the first to re-enter the Union in 1866. Its constitution was drawn up in 1870. Three presidents of the United States, Andrew Jackson, James Knox Polk, and Andrew Johnson, have come from Tennessee. Pop. (1800) 105,602; (1850) 1,002,717; (1880) 1,542,359; (1900) 2,020,616; (1920) 2,337,885.

See Histories by J. Phelan (Boston, 1888), J. Haywood (Nashville, 1891), E. Albright (1909), Hale and Merritt (Chicago, 1913), Moore and Foster (Chicago, 1923); also Thruston, *Antiquities of Tennessee* (Cin. 1890), and T. Roosevelt, *Winning of the West* (New York, 1895).

**Tenniel**, SIR JOHN, caricaturist, was born in London in 1820. A self-trained artist, he was selected in 1845 in competition to paint one of the frescoes—Dryden's 'St Cecilia'—in the Houses of Parliament. But to the public he is known, not as painter, but as book-illustrator, and chiefly as the cartoonist of *Punch*. He joined its staff in 1851, and year by year after Leech's death he produced its principal weekly political cartoons, notable not less for their pathos than for their wit, humour, and skilful draughtsmanship. His illustrations to *Alice in Wonderland* and *Through the Looking-glass* are remarkable for their grace, delicacy, and finish; earlier book-illustrations were to *Aesop's Fables*, Moore's *Lalla Rookh*, the *Ingoldsby Legends*, &c. He was knighted in 1893; and published his last cartoon in *Punch*—last of the fifty years series—in January 1901. He died on 25th February 1914.

**Tennis and Lawn-tennis.** These ball-games are descended from a handball game (*jeu de paume*) played in the parks and *fossés* of French and Italian châteaux in the middle ages. By the 14th century a form of the game played in enclosed courts was common in France; it was called *courte paume*, and, as distinct from it, the open-air form came to be known as *longue paume*. These two games may be regarded as respectively the forerunners of tennis and of lawn-tennis. At an early date 'paume' would appear to have been introduced into England. The English word *tennis*—also formerly spelled *tennise*, *tennys*, *tenys*, *tennes*, &c.—used as a general equivalent of *paume* would seem to be of old French origin; but no such old French name for the game of *paume* has been discovered. The etymology of the word is uncertain, and many suggestions as to its origin have been offered; perhaps the most acceptable is that the name comes from a presumed cry of *tenez* ('hold' or 'take') uttered by a player as a warning before putting the ball into play. Now the name 'tennis' is held to be properly applied to the modern form of the enclosed *courte paume*; at the same time, so much less widely known and played is this game than lawn-tennis that now probably all but all of those who use the word 'tennis' refer to lawn-tennis—that is to say, to the game whose origin may be traced to the open-air *longue paume*. It is in these circumstances that the enclosed court game is sometimes distinguished as *real tennis*, *court tennis*, *royal tennis*, *close tennis*.

**TENNIS.**—The beginnings of the game have been outlined above. Shortly after the development of an enclosed court game from the *jeu de paume*, a form of racket in place of the hand for purposes of striking was introduced, but the prototype of the modern implement was of so elementary a character that another century elapsed before it superseded hand play. In 1600 Paris is said to have possessed 1800 tennis courts, and in France the palmy period of the game—*le roi des jeux et le jeu des rois*, as it was called—lasted till the time of Louis XIV. The most historically famous tennis court was that of Versailles, in which the French National Assembly met in 1789. The numerous allusions to tennis found in English literature, from Chaucer onwards, prove that the game was played in England from the 14th century. It was the favourite pastime of several of the kings—Henry VIII. was an ardent tennis-player. For a long time indeed tennis became so popular that laws were passed prohibiting it. The expense of building and keeping up a court confined the game to the aristocracy, and during the 18th century the game declined both in England and France. By 1866 there were some 22 courts in England and fewer in France. The game revived considerably during the latter half of the century, numerous new courts being constructed. In London the Queen's Club was opened in 1887 and the Prince's Club in 1888. Tennis lapsed during the Great War, but was taken up enthusiastically afterwards, and both in Britain and in the United States, though not on the Continent, came to enjoy one of the most prosperous periods in its modern history. The game cannot claim, however, to be one that is widely played.

Scarcely two courts in existence are identical in all respects; the dimensions given below are therefore taken from the typical court in Marshall's *Annals of Tennis*. The *dedans* and *corridor* are covered by a sloping wooden roof, 7 feet 2 inches from the floor, called the *penthouse*. The *dedans*, galleries, and grille are openings in the wall below the eaves of the *penthouse*. The net is 3 feet high at the centre, 5 feet at the sides. In modern courts the floor is usually constructed of a number of dark grey or red composition slabs, and lighting is

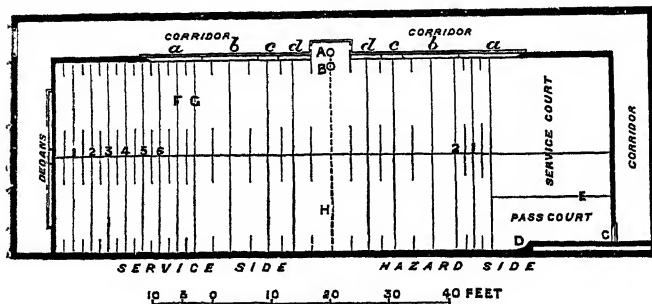

accomplished by side-windows and skylights. The racket consists of a strong hoop of ash tightly strung with gut, with a wooden handle, the whole being 2 feet 2 inches long, and weighing about 16 oz. The ball is made of woollen material covered with white cloth, and weighs  $2\frac{1}{2}$  oz. A set of six dozen balls is in use at one time, and a set will last fifty years or more if re-covered and moulded into shape from time to time.

The game may be played by two or four players. The server stands anywhere on the service side of the court and strikes the ball, so that it drops in the service-court after first touching the side pent-house. The striker-out must return it over the net either at the volley or first bound. A player scores a stroke (1) when he hits the ball into a winning hazard, viz. dedans, grille, or last gallery on the hazard side; (2) when his opponent hits the ball into the net, out of court, or loses a 'chase.' The latter term requires some explanation. When

(1767), Fourrier (1862), de Nanteuil (1898), and in English by Lukin (1822), J. Marshall (1878—a work of importance), J. M. Heathcote (1890), E. H. Miles (1902); and there was published in 1924 an exhaustive *History of Tennis* (2 vols.) by E. B. Noel and J. O. M. Clark.

**LAWN-TENNIS.**—As has been shown, the forerunner of lawn-tennis is *longue paume*. In France this game is still played, and as 'field-tennis' it was played also in England down to about 1800. The nearer origin of lawn-tennis is to be found, however, in the game of 'sphaéristique,' invented in England in 1874 by Major Wingfield. In principle this game was similar to the lawn-tennis of the present day. Almost immediately it was given the new name of 'lawn-tennis,' and developed in the course of a modification of its details into lawn-tennis as now known. In 1875 a code of rules was drawn up by the Marylebone Cricket Club, and this was revised in 1877 by the All England Croquet and Lawn-tennis Club, on whose courts (since 1922 on a new site) at Wimbledon the annual championships (amateur) have from 1877 been played. In 1888 the Lawn-tennis Association was founded, and this association continues in Britain the controlling body of the game. From the first lawn-tennis enjoyed a great popularity. This progressively increased in the 20th century, the game spreading very rapidly not only in Britain, but also throughout the world, and now of all ball-games lawn-tennis is perhaps the most cosmopolitan, as is evidenced by the diversity of the entry at Wimbledon and by the number of nations annually competing for the Davis Cup, presented as an international trophy in 1900 by D. F. Davis of the United States.

An important factor in the popularity of the game is the scope afforded for strategy over and above skill in strokes. The game is played equally by men and by women, the standard of women's play, though inferior to that of men, yet now being very high. The game is predominantly amateur, though in the train of its rapid growth a movement towards professionalism has become apparent.

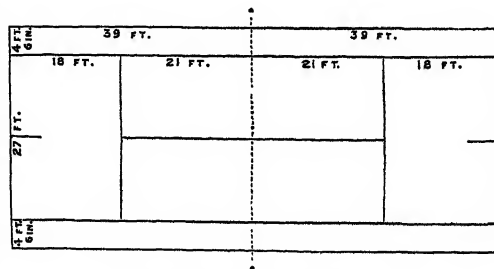

Plan of Tennis Court:

a, a, last gallery; b, b, second gallery; c, c, doors; d, d, first gallery. A, marker's box; B, basket for balls; C, the grille; D, the tambour; E, pass line; F, chase, last gallery; G, chase, a yard worse than last gallery; H, net.

a ball falls—i.e. touches the floor for the second time—on or between any of the lines marked across the court, or enters any of the galleries except the winning gallery (the hazard side last gallery), the marker calls out 'chase six,' 'second gallery,' 'better than two,' according as it falls 6 yards from the end wall, in or opposite the second gallery, or between the  $1\frac{1}{2}$  and 2 yard lines. When two chases have been made, or one if either of the players is within a stroke of the game, they change sides, and if the striker-out succeeds in making the ball fall nearer the end wall than his opponent had done, he wins the chase. If he makes the same chase it is called 'chase off,' and the score is not affected. When a player wins a stroke the score is called '15—love.' His next stroke brings him to 30, then 40, then game. Thus four strokes may win a game, but if both players reach 40 the game is called 'deuce,' and it is necessary to win two strokes more in succession to secure the game. A 'set' is won by the player who first wins six games; if the score, however, is five all, an 'advantage-set' may be played, requiring play to go on till one player is two games ahead of the other. The origin of the method of scoring by fifteens is doubtful. An obvious explanation is that in French courts there were fourteen chases, and so they began scoring at 15 to avoid confusion; but there seems to be conclusive evidence that this system of scoring was introduced before chases were in use. One writer has ingeniously connected it with coinage denominations of mediæval France. Rackets (q.v.) and Fives (q.v.) are cognate games to tennis.

The earliest writer on tennis was an Italian priest, Antonio Scaino (1534–1612), whose *Trattato del Giuoco della Palla* (1555) is very rare. There are books written in French by Forbet (1599), Hupleau (1632), de Garsault

Plan of Lawn-tennis Court.

Lawn-tennis is played by one ('singles') or two ('doubles') players a side. Broadly the idea of the game is the hitting of a ball (on the volley or before the second bounce) from one player to another over a net into a marked out space, till such time as one of the players, either through the inaccuracy of his own stroke or through the effectiveness of his opponent's, fails to do so, a point then being counted against him. The method of scoring is the same as in tennis (see above). The tactics of lawn-tennis have altered greatly since the time when the game was first played. In early days

play was confined for the most part to the back of the court; then it was found that a volley at the net was a deadly form of attack, and now the doubles game resolves itself for the most part into a contest of volleying, while a similar tendency is apparent in the singles game, only here the greater ease with which the single player may be passed at the net makes necessary a judicious combination of volleying and of back of court play.

Originally the game was played on grass, and still is to a large extent—the championships at Wimbledon are decided on grass—but asphalt, cinders, blaes, and various other substances have been tried. The hard court of red blaes has now come very greatly into favour, as being faster to play upon and more easily kept in playable condition than grass. Covered courts with wooden floors enable the game to be played in wet weather and in winter. The plan and dimensions of a lawn-tennis court are given on p. 36; formerly the court was of hour-glass shape and the service-line was 26 feet, not 21 feet as now, from the net. The net which runs perpendicularly along the ground is 3 feet 6 inches high at the sides and 3 feet in the middle; formerly it was 5 feet at the sides and 4 feet in the middle. For singles the width of the court is 27 feet; for doubles, 36 feet.

A lawn-tennis racket resembles in a general sense that in use in tennis (see above); the construction (size, weight, material, &c.) is wholly unregulated; for men a weight of from 14 to 15 oz. is recommended; for women one of from 12½ to 13½ oz. The balls, made of indiarubber, are filled with compressed air and have an outer covering of white cloth; they are 2½ inches in diameter, and weigh 2 oz. For table-tennis, see PING-PONG.

Of books on the instructional, historical, and other aspects of lawn-tennis may be mentioned those by Heathcote and others (Badminton Library, 1890; new ed. 1903), R. F. and H. L. Doherty (1903), Vaile (1904), Beldam and Vaile (1905), Myers (1908; 1921; *Fifty Years of Wimbledon*, 1926), Wilding (1912), Crawley (1919), Tilden (1920, 1923, &c.), Beamish (1922; new ed. 1926), Ritchie (1922), Parke (1922), Burrow (1923), Hillyard (*Forty Years of First-class Lawn Tennis*, 1924), Suzanne Lenglen (1925), K. McKane (Mrs Godfree, 1925); and see also *Ayles's Lawn Tennis Almanack* (annual).

**Tennstedt**, a Prussian town 15 miles NW. of Erfurt, with a sulphureous spring.

**Tennyson**, ALFRED, LORD, was born 6th August 1809, at Somersby, a little village among the wolds of Mid-Lincolnshire. The rector of Somersby was the poet's father, Dr George Clayton Tennyson; his mother, Elizabeth Fytche, being also of a Lincolnshire family. Dr Tennyson was a man of marked physical strength and stature; accomplished in fine art, music especially, and in language; in temperament imaginative, verging at times upon gloom. These conditions, more or less, reappeared in his family. Johnson's pretty phrase about his own college, 'a nest of singing birds,' might be applied to the Somersby parsonage. Alfred was fourth of eight sons, the first of whom died in infancy. His elder brothers, Frederick and Charles, became notable as poets. Frederick Tennyson (1807-98) in 1854 published *Days and Hours*; in 1890 the *Isles of Greece*; in 1891 *Daphne and other Poems*. A notice of Charles (Tennyson) Turner will be found in its place. To the latter Alfred was devoted with a child's warm love and reverence, which break forth tenderly in the *In Memoriam*, and later in the *Midnight* of June 30, 1879, while the *Poems by Two Brothers* (1826) witnessed to that profound early union of heart and soul between the two brothers. Of this little book it will be enough to say that it shows, even if imitatively and immaturely, wide range in subject and varied command of metre. Already in

fact, at thirteen or fourteen, Alfred had written a long epic, of which Dr Tennyson, an excellent and well-read scholar, said: 'If that boy dies, one of our greatest poets will have gone'; a paternal prophecy the fulfilment of which perhaps justifies its preservation. Byron at this time was the leading modern favourite of the brothers. At the fatal news from Missolonghi (April 1824) the world seemed at an end to Alfred, who, boylike, commemorated the event by carving upon a sandstone rock—*Byron is dead*.

As the landscape of Warwickshire has been traced in Shakespeare's early work, so in Tennyson's appears that of Lincolnshire; a county far more picturesque than many fancy, in its great contrasts of hill and level, wold and fen. Here was his earliest education through the most susceptible years of life. Near Somersby is Louth, where the brothers found their classical school; near also, Horncastle, where grew up meanwhile for Alfred the hope of youth, the blessing and mainstay of after years.

In February 1828 the 'two brothers' joined Frederick at Trinity College, Cambridge, finding presently a group of friends among whom many fulfilled the promise of their May: J. Spedding, J. M. Kemble, W. H. Brookfield, R. C. Trench, R. M. Milnes, C. Merivale, H. Alford, E. Lushington; and, above all (October 1828), Arthur Henry (born Feb. 1811), eldest son to Henry Hallam, the great historian. Early as he was lost (September 1833), sufficient proof exists of his commanding influence over his most gifted contemporaries, of his singular ability, his depth and tenderness of thought, his beauty of nature. In this genial atmosphere Tennyson's genius rapidly advanced. To this time belong *The Lover's Tale* (written 1827, published 1879), a blank verse rhapsody, and *Timbuctoo*, the poem (also in blank verse) by which he gained the university prize of 1829. Both pieces in general colour and in single phrases anticipate the style by which Tennyson presently became known to the world. After the appearance of *Timbuctoo*, A. Hallam wrote: 'I consider Tennyson as promising fair to be the greatest poet of our generation, perhaps of our century.'

His father's death broke off Tennyson's Cambridge residence early in 1831. In the autumn he made that visit to the Pyrenees recorded in the beautiful *All along the valley*. Meantime his first published volume, *Poems, chiefly Lyrical*, had appeared (1830), followed by a similar small series dated 1833. 'That greatest of persecutions, Silence,' was never his fate; he was now pelted and praised, misjudged and rightly judged—the common lot. But he turned to profit friend and enemy, dropping many less mature pieces, steadily studying and practising an art in which supreme excellence is never dissociated from intensity of labour: poor, and under the cloud of grief for the friend who had passed away in Vienna, 'and beloved of the gods.' To these nine years, spent partly in Lincolnshire, mostly in London, we owe many of his most lovely lyrics; some, the subjects of which were reworked or much expanded in later years. Together with the best of his earlier work, these were published in 1842. Henceforth his place was secure. 'He is decidedly the first of our living poets,' wrote Wordsworth in 1845, 'and I hope will live to give the world still better things.'

1847 brought *The Princess: a Medley*, written in blank verse, almost lyrical in its music; gay and fanciful as *The Midsummer Night's Dream* in plot, yet with the seriousness of life in its underlying chivalrous moral.

The year 1850 was a memorable one in Tennyson's long career. This year, at least, in succession to

Wordsworth, brought him the laureateship; and in this fell the publication of *In Memoriam*, that elegiac treasury in which the poet stored the grief and the meditation of many years after his friend's death; a series of lyrics which in pathos, melody, range of thought, and depth of feeling have been ranked with the *Canzoniere* of Petrarch and the *Sonnets* of Shakespeare. And in June of this year took place his long-delayed marriage with Emily Sellwood, in Shiplake Church, Oxfordshire.

Tennyson and his wife now settled at Twickenham. In 1851 they went through the Riviera to Florence, returning by Milan. In 1852 Hallam, his eldest son, was born; the great funeral Ode upon Wellington was written. By the close of 1853 the passion for his old country life, freedom and peace, and fair English scenery, carried him to Farringford in Freshwater. There Lionel was born (1854); and there, with Sir John Simeon as his highly prized neighbour, and frequent brief journeys interspersed, Tennyson lived uninterruptedly till 1870; having built meanwhile a house for summer and autumn residence (Aldworth), high up on the farther side of Blackdown by Haslemere: at once nearer London, and farther from that intrusion which is one of the penalties paid for fame. Some of these journeys may be recorded; they form no unimportant part of a poet's tranquil life. They included the Western Highlands, Staffa and Iona (1853); Inveraray (1858), to visit the Duke of Argyll, another much-valued friend; Portugal (1859); Cornwall (1860); the Pyrenees again (1861); Derbyshire and Yorkshire (1862); Weimar and Dresden (1865); Dartmoor and Salcombe (1867); North Wales (1869).

Lyrical poetry pure—free from divergence down those 'two byways' (as Schiller named them), the didactic and the rhetorical—in perhaps every one of its forms, had been now set forth by the poet: the lyric of melody, of passion, of description, of travel, of incident, of reflection; the ballad, the personal song, the elegy, the national ode. And the idyll—'that little picture' which has a natural but not exclusive affinity with country life and narrative gently suffused with passion—was also included. It remained for the poet to carry further these modes of song, and to add in particular the drama proper, with the humorous monodramatic presentation of character in rustic forms of speech.

In *Maud: a Monodrama* (1855), Tennyson gave to the personal lyric (for *In Memoriam*, strictly speaking, is elegiac in movement) its deepest and widest extension. As with Hamlet, a taint of mental distraction is supposed to affect the narrator and hero of the drama; leading him to over-colour, through the light of personal feeling, his pictures of the world about him, the politics and manners of the time; whilst the same stress of nature has raised the songs which paint his love-story, in its triumph and its despair, to a sevenfold fire of passionate melodious beauty. Lyrical poetry, unless it were among the *Æolic* singers of early Greece, had attempted no such scheme as that presented by *Maud*; and the poem may perhaps in popular estimate have suffered the penalty which thoroughly original treatment seldom escapes, for it was relentlessly criticised.

As *Maud* extends the domain of Tennyson's lyrical work in depth of feeling, variety of subject, and area traversed by the narrative, so that 'small picture,' the idyll, epic and historic, tale and character-picture, was treated by him henceforth. To this enlargement witness first the *Enoch Arden* and *Ateline's Field* of 1864. The poet's power had reached full maturity; his art was perfect. He now took up seriously that Celtic legend which, lacking adequate Teutonic material,

England for eight centuries has welcomed as her national epic—our old Arthurian story, to which he had preluded already by a few beautiful sketches; and in 1859 appeared the first four of the twelve *Idylls of the King*, completed by instalments in 1870, 1872, 1885.

Picturesque as the old stories of Arthur (q.v.) and of the Grail (q.v.) became, throughout their many modifications of five centuries and more, they could hardly have been lifted above a poetic-antiquarian interest for Englishmen generally, were their early tone and quality and adventures repeated in modern verse, however accomplished. This difficulty has been felt before with regard to our own and other mediæval romances. Ariosto by skilful serio-comic treatment gave a vitality which is now well-nigh exhausted to the legends of Charles. Spenser turned Arthur and his knights into an allegory, with constant allusion to Elizabethan times. And similarly that *quidlibet audendi potestas* which Horace with absolute right claimed for the poet was everywhere exercised by Tennyson in the *Idylls*. Throughout they are inter-fused with the vital atmosphere of the Victorian age; and by no other mode could the king return, as it were, and live again in the hearts and souls of men. The fitness of this great change, which presents Arthur not as noble, guilty, and repentant, but as noble, blameless, self-restrained, and far-sighted, is of course fairly debateable. Tennyson has throughout imaged the king as he appeared to the old Welsh historian: 'God has not made, since Adam was, the man more perfect than Arthur.' Nor is it easy to see how the needful central figure for the Arthurian epic, as imagined in its unity by Tennyson, a figure at once human and ideal, could otherwise have been presented; although whether in his picture the delicate balance has or has not been kept may perhaps long remain a fit subject for critical declamation.

The noble *Dedication* (as indeed was already noted in the prelude to the *Morte d'Arthur* of 1842) sets forth the main underlying intention of the *Idylls*. They are a 'new-old' tale, 'shadowing Sense at war with Soul.' This inward conflict is displayed under the guise of the legend how Arthur, through the Round Table (that late mediæval picture of imagined chivalry), the knights and ladies of the court, tries to lead a crusade on behalf of a perfect civilised Christian state; how also, through the sins and selfishness of his followers, the fair Utopia is here never realised. It is a tale, not a mere allegory, although allegory be occasionally introduced; the persons, each in turn, are the mixed human characters of all times.

Most disappointing—and not least so to himself—were Tennyson's incursions into the field of drama. Attracted by the materials of his nation's history he wrote three plays, spread in subject over some four centuries—*Queen Mary* (1875), *Harold* (1877), *Becket* (1884). And with these, certain less important dramas may be named: *The Cup*, founded on a Graeco-Roman tale; *The Promise of May*, a modern domestic piece; *The Foresters* (1892), the poet's own version of the Robin Hood legend.

Dramatic art is, however, hampered by many peculiar laws and limitations; nor is the close air of Victorian civilisation favourable as that of the 16th and 17th centuries to the poetical drama. Nor, again, does the highest gift for character or incident-drawing carry with it necessarily the power to put incident into dialogue, or to make the most of dramatic situations suitable to the theatre. No play of Tennyson's acted during his lifetime (unless with exception of *The Cup*) reached—in England at least—definite popular acceptance. *Becket*, how-

ever, enjoyed considerable success after Tennyson's death. Perhaps the time to estimate their spectacular value has not yet arrived; but meanwhile we may at least say that they form a noble contribution to our history.

A few more volumes, idylls, lyrics, ballads, remain (1880, 1885, 1886, 1889, 1890). Compared with much of Tennyson's earlier work, these, in general, reveal a more mature and certain art, a greatly wider range. History (mostly English); tales in dialect, chiefly that of Lincolnshire; a few beautiful classical pieces; narratives, idyllic and lyrical, of the profoundest pathos; poems treating great problems in religion and morality, philosophy and science—all are included. Among the later volumes were *The Lover's Tale* (1879), *Ballads, &c.* (1880), *Tiresias* (1885), *Locksley Hall—Sixty Years After* (1886), *Demeter* (1889), *The Death of Enone, Akbar's Dream, and other Poems* (posthumous, 1892). The more decoratively imagined art, frequent in the poet's youthful verse, has now, by natural law, given place to art not less finished but deeper, often darker, in thought. If, compared with *In Memoriam*, a gloomier scepticism is allowed to speak, faith reaches a sweeter and surer creed. Titian, in a word, has made way for Rembrandt.

Tennyson in 1876 once more visited the Pyrenees; in 1878, Ireland; 1882, Lombardy; 1883, Copenhagen; 1887, St Davids and the Channel Islands; 1891, Devonshire.—The losses and the gains of prolonged life he was called on to experience. Besides many among the band of earlier friends, his brother Charles died in 1879; his younger son Lionel, after an honourable career in the public service, in 1886. Hallam, the elder, married Audrey Boyle, grand-daughter to Admiral Hon. Sir Courtney Boyle, one of Nelson's captains, in 1884. And several children of the brothers renewed the charm and sunshine of youth to Aldworth and Farringford. In 1884 the poet-laureate was created Baron Tennyson of Freshwater and Aldworth. He died at Aldworth on the 6th October 1892, and was buried in Westminster Abbey.

Of Tennyson's rank in the hierarchy of Parnassus, when a century or more has gone by, 'the days to come will be the wisest witnesses.' Natural it is, indeed, that the half-century of enthusiastic popularity which Tennyson enjoyed at the hands of his fellow-men should be followed by a period of reaction. But such a reaction is surely but a trying of the metal. It is too much—and far too soon—to say that Tennyson is weighed and found wanting. Rather 'at the balance let's be mute' until we have eyes to see and hearts to understand what is enduring in his work.

The authoritative biography, by the second Lord Tennyson, appeared in 1897. See also other books on Tennyson, and his works by Wace (1881), Van Dyke (5th ed. 1896), Tainsh (1868; new ed. 1893), Jennings (1884; new ed. 1892), T. Davidson (Boston, 1889), Churton Collins (1891), Eugene Parsons (Chicago, 1891), A. Waugh (1892), Ritchie (1892-3), Jenkinson (1892), Jacobs, (1898), Stopford Brooke (1894), Cuthbertson (1898), F. Harrison (1899), Gwynn (1899), A. Lang (1901), Lyall (1902), A. C. Benson (1904), Firmin Roz (Paris, 1912), R. B. Johnson (1913), T. R. Lounsbury (1916), Fausset (1922), Nicolson (1923). For criticisms, see the list in R. H. Shepherd's *Tennysonianism* (1866; new ed. 1879; bibliography separate, 1896). The article by Canon Ainger in the *Dictionary of National Biography* (1898) deserves special mention; also Lady Richmond Ritchie's *Records of Tennyson, Ruskin, and the Brownings* (1892). There are an analysis of *In Memoriam* by F. W. Robertson (1862); a *Key* to it by Dr Gatty (1881; 4th ed. 1891); a *Commentary* on it by A. C. Bradley (1901); *Concordances* by D. B. Brightwell (for the works up to 1869) and A. E. Baker (1914); a *Tennyson Handbook* by Morton (1895), a *Tennyson Primer* by Dixon (1896), and a *Tennyson Dictionary* by Baker (1916). See also A. J.

Church's *The Laureate's Country* (1890), J. C. Walter's *In Tennyson Land* (1890), G. G. Napier's *Homes and Haunts of Alfred Tennyson* (1892), and B. Francis's *Scenery of Tennyson's Poems* (1893).

HALLAM, second LORD TENNYSON (born 1852), was educated at Marlborough, Trinity College, Cambridge, and the Inner Temple, and acted as his father's private secretary. He contributed to the magazines in prose and verse, edited his father's and his uncle's poems, and wrote the definitive memoir of his father (2 vols. 1897). In 1899-1902 he was Governor of South Australia, and in 1902-4 Governor-General of the Commonwealth.

**Tenor**, in Music, is the higher adult male chest voice (see VOICE). The tenor clef (a C clef on the fourth line of the staff) is now little used, the music being usually written an octave above its real pitch, on the treble clef. In early church music the tenor part was the melody.

**Tenos**, or TINO, a Greek island, one of the Cyclades, 18 miles long. The capital is Tenos, on the S. coast.

**Tenrec** (*Centetes*), a genus of Insectivora, represented by one species (*C. ecaudatus*), restricted to Madagascar. It is the largest known insectivore, measuring from 12 to 16 inches in length; and it is probably the most prolific of mammals, since as many as twenty-one young are said to have been brought forth at once. The squat body has hardly any tail; the adult males have long canines; the young have strong white spines in lines along the back, but these are afterwards lost.

Tenrec (*Centetes ecaudatus*).

It feeds chiefly on earthworms, and is said to become dormant during the hottest part of the year.

**Tent** (Lat. *tentus*, 'stretched,' from *tendere*). Tents have been used since very early times as an advance upon cave-dwellings, especially amongst nomadic tribes. The skins of animals, or leaves, or bark formed the earliest coverings, textile fabrics being substituted as civilisation advanced. Bible patriarchs always dwelt in tents, probably much the same as the modern Arab tents, which are large structures, very rude in form and of small height, but covering a considerable area. The covering is felted goat-skins. The Jewish Tabernacle was a large tent, and had a covering of rams'-skins and badgers'-skins (new translation, seal-skins or dugong-skins. Nineveh sculptures show Sennacherib's tent, like modern tents supported by ropes. The manufacture of goatskin tents was an established industry in the time of St Paul, who took part in it. The early Greek tents were made of skins, each accommodating two soldiers. Alexander the Great is said to have had a pavilion of extraordinary magnificence. Its roof, one mass of gilded embroidery, was sustained by eight pillars covered with gold. In its centre was the royal

throne; and a hundred beds could be made up within it. The Roman tent was made of canvas or some such material, supported by two upright posts carrying a ridge pole. Each held ten soldiers with their *decanus* or corporal. In Persia many tribes live entirely in hemispherical felt tents much decorated and with handsome door hangings. Chinese tents are usually of matting, of great size, and often very comfortable. The American Indians' wigwag is a conical tent of bark, mats, or skins on poles. The tents of gypsy tent-dwellers are stretched on rods bent into hoop shape. Like canoeing and caravanning, camping out in tents is a popular way of holidaying for those who are not unwilling to rough it a little.

Except in tropical or very inclement climates tents are not carried by European armies now in any large numbers. Troops are billeted in villages or bivouacked. A few tents for the senior officers, for offices, guards, and hospitals are provided in the equipment of British troops operating in Europe, and in peace manoeuvres a sufficient number for all ranks. In India, too, this provision is always made. The European tents generally used are three in number: the *hospital marquee* (dimensions 29 feet long, 15 feet broad, and 15 feet high; sides, 5 feet high) has two poles; weighs in its valise with poles, four large and 180 small pins, and two mallets—492 lb. dry, about 600 lb. wet. It accommodates ten sick in beds or sixteen without. The circular *bell-tent* has a diameter at the base of 12½ feet, and is 10 feet high, taking fifteen men, and weighs about 83 lb. dry, about 100 lb. wet. The pole is in two pieces like those of the hospital marquee, and forty-two pins with two mallets go with each tent. Both these tents may be floored with wood or tarpaulin, and if the interior is dug out are much more commodious. They are made of sail canvas. The *tente abri*, or *shelter tent*, consists of two sheets, two poles, and seven pins; weighs 11 lb. dry, 16 lb. wet; and takes two or three men lying down. Each carries a part of the tent. They were used in the Nile expedition of 1884, but are now 'articles of store.' In India a large double-roofed square tent is always used, the upper roof projecting so as to form verandas. The sides are vertical and 5 feet high, kept rigid by short poles, and there is one large pole in the centre. Each accommodates sixteen soldiers or twelve sick. The Durbar tents of the Indian government are very large and beautifully made. Those used by the government officials are also much more commodious than ordinary tents.

**Tentaculites**, a genus of annulated tapering shells, found abundantly in Silurian and Devonian strata. Their affinities are somewhat obscure. By some writers they are regarded as tubicolar annelids, while others refer them with some hesitation to the pteropoda.

**Tenterden**, a municipal borough and market-town in the Weald of Kent, 12 miles SW. of Ashford and 9 S. by E. of Headcorn station. The church has a noble Perpendicular tower, built in the 15th century, and associated by legend with the Goodwin Sands (q.v.). The town, which enjoys the privileges of the Cinque Ports, obtained a charter from Henry VI. and another from Elizabeth. Pop. (1851) 3901; (1921) 3438.

**Tenterden**, CHARLES ABBOTT, BARON, was born a barber's son at Canterbury, 7th October 1762. A founder of King's School, Canterbury, he proceeded to Corpus Christi College, Oxford, where he graduated in 1785. Entered at the Middle Temple, he was called to the bar by the Inner Temple in 1796. He joined the Oxford circuit, and, in spite of a husky voice, a heavy face,

and timid manners, his energy and knowledge soon brought a large practice. In 1801 he became recorder of Oxford, and next year published his clear and learned treatise on the *Law relative to Merchant Ships and Seamen*. It had the effect of increasing his employment in the more lucrative mercantile causes, so much that in 1807 he returned his income as upwards of £8000. In 1816 he accepted a puisne judgeship in the Court of Common Pleas; and in 1818 he was knighted, and chosen to succeed Lord Ellenborough as Chief-justice of the King's Bench. As a judge his most marked characteristic was his perspicacity and freedom from bias. He was raised to the peerage in 1827. In the House of Lords he strongly opposed the Catholic Relief Bill, and in his last speech he made a vow that if the Reform Bill, that 'appalling bill,' passed, he would never again take his seat as a peer. He died suddenly, 4th November 1832.

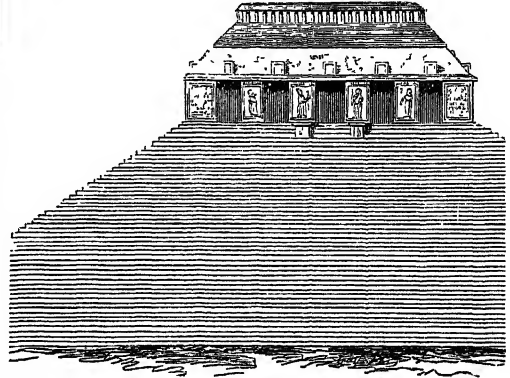

**Tenure**, a general name for the conditions on which land is held by the persons who occupy and use it. Forms of land tenure are of various kinds; the earliest of them are connected with the occupation of a tract of country by a tribe or village community; with the advance of civilisation individual rights were more precisely defined; under the Roman law land was a thing *in commercio*, to be used and disposed of at the discretion of the owner. The feudal system combined something of the precision of Roman law with the personal tie between lord and vassal as recognised in the customs of the barbarian nations. Rights in land were made the basis of social order; every man rendered definite services to the superior of whom he held. The Norman Conquest brought in a race of expert lawyers who would have carried feudal theory to an oppressive extreme if it had not been for the principles recognised in Magna Charta and afterwards embodied in legislation. All lands in England were, and still are, held of the crown; the actual owner or cultivator of the soil owed suit and service to the king or to some subject lord who held of the king. The Manor (q.v.) was the unit of administration. The tenures recognised by law were of three kinds: (1) Military tenures, such as knight-service, the chief incidents of which were the duty of serving in war, suit of court (attendance in the courts of the superior), aids, reliefs, and primer seisin (money payments on certain occasions), and escheat (reversion of the land to the lord on failure of heirs, &c.). The lord exacted a fine on alienation of the holding; he had the wardship of an infant heir, and as guardian disposed of his hand in marriage. These tenures were extremely burdensome, and the feudal rights of the crown were greatly abused. At the restoration of Charles II. the military tenures were abolished, except only the honorary services of Grand Serjeanty (q.v.). (2) Free socage—the service of freemen who rendered fealty and suit of court, together with some fixed service, such as might be, and always was, commuted for a payment in money. (3) Copyhold, the tenure of persons who originally were villeins or villagers holding at the will of the lord, but had gained a more secure position by the custom of the manor, and held copy of the court rolls on which their rights were recorded. Land assigned for the endowment of the church was held 'by divine service' or by the still easier tenure known as *frankalmoign* or free alms. In process of time feudal ideas of social order gave way to commercial ideas; land was regarded merely as a form of property to be used and disposed of at the discretion of its owners. The Law of Property Act, 1922, turned copyhold, customary freehold, and copyhold of ancient demesne into freehold, or, in some instances, into leasehold. The picturesque

and honorary services of grand and petty serjeanty were expressly retained. The result of recent legislative changes, culminating in the Law of Property Act, 1925, and other statutes passed in the same year dealing with real property was to leave only two forms of tenure, viz. (1) freehold, (2) leasehold. Copyhold, converted by the Act of 1922 into freehold, was automatically freed from the customary suits and services and from liability to do fealty, and provision was made for the extinguishment, at latest at end of 1935, of other manorial incidents. Freehold existing at the end of 1925 was not affected, except that, at the end of 1935 at latest, any liability to payment or relief will be extinguished. Fealty and suit of court, which are still theoretically due from a freeholder, are apparently not extinguished in the case of freehold existing before 1926. These two and the services and grand and petty serjeanty will at the end of 1935 be the only remaining incidents of freehold tenure. The distribution and management of land are governed by contract, not by feudal rule. Economists and lawyers hold for the most part that 'free trade in land' is justified by its results; Sir H. Maine points to the rapid settlement of North America as a sample of what can be done by men stimulated by the hope of acquiring property. Socialists and land-nationalisers hold that property in land is the cause of an unjust distribution of wealth; they would take all land (with or without compensation to existing owners) into the hands of the community, and they would permit no tenure except on such terms as the community might consider to be advantageous.

In Scotland, as in England, the feudal system was long established. Subinfeudation (grant of land by a free vassal to another person to hold under himself) has been forbidden in England since 1290, because it was found to prejudice the rights of superior lords; but the practice was permitted in Scotland. Modern Scots law distinguishes between the property or *dominium utile* of land and the superiority or *dominium directum*, the chief incident of which is the feu-duty paid by the vassal. On alienation of the land or death of the vassal forms were used implying consent or recognition by the superior, and casualties or additional payments were made on such occasions. These forms and the endless creation of subordinate feudal rights tended to complicate the whole system of conveyancing; but the law has been greatly simplified by recent statutes (see CONVEYANCING). In Ireland the English law displaced and abolished the customs of the Celtic tribes; but the country never was thoroughly feudalised, and the peasant farmers have always been hostile to English notions of free trade in land (see LAND LAWS). In the United States (except Louisiana) and in those British colonies which have been formed in countries previously unsettled the English law of tenure forms the historical basis of the local law; but in a new country there are of course neither lords nor vassals, and the phrases of the feudal law only serve to remind us that land is and always must be held under some governing authority, and on such terms as legislators may impose upon the owners and cultivators.

For the early history of tenure, see Coulanges, *Origin of Property in Land* (trans. by Ashley); Elton, *Origins of English History*; Skene, *Celtic Scotland*; and Richey, *Irish Land Laws*. For curious tenures on quaint and merely nominal conditions, such as bearing a silver jug and basin as often as the king might visit the lands granted, see Thomas Blount, *Ancient and Jocular Tenures* (1679; new ed. 1815). For a comparison of modern forms of tenure, Cliffe Leslie, *Land Systems*, and the Cobden Club Essays may be mentioned. See also the articles BLANCH, CHARTER, COPYHOLD, FEU, FEUDALISM, FREEHOLD, &c.

**Teocalli** (Mexican, lit. 'house of a god'), the name given to the temples of the aborigines of Mexico, of which many still remain in a more or less perfect state. They were built in the form of four-sided pyramids, and consisted for the most part of two, three, or more stories or terraces, with the temple, properly so called, placed on a platform on the summit. In some cases they were natural hills, faced with layers of stone, adobe, plaster, &c. The largest and most celebrated is the pyramid of Cholula, measuring 1440

Teocalli at Palenque.

feet each way, and 177 in height; it is much defaced, and the temple on its summit has been removed. The teocallis in Yucatán are in far better preservation; they are not generally built in terraces, but rise at an angle of 45° to the level of the platform, with an unbroken series of steps from base to summit. The temples on their summit are sometimes ornamented with bas-reliefs and hieroglyphic tablets. See MEXICO.

**Tepic**, a town of Mexico, capital of Nayarit territory, in a fertile upland valley, 30 miles E. by S. of San Blas. Its 14,000 inhabitants are largely employed in the numerous neighbouring mines.

**Teplitz** (Czech. *Teplíce*), a watering-place in the north-west of Bohemia, in a beautiful valley near the Erzgebirge, 20 miles NW. of Leitmeritz by rail. The baths are supplied from about a dozen hot alkali-saline springs, are taken exceedingly hot, and are good for gout, rheumatism, &c. One of the springs is used also for drinking. Schönaue (*Sanov*), a neighbouring village, was incorporated with Teplitz in 1895. Pop. of Teplitz-Schönaue, 29,000.

**Teral**, or TARAI. See HIMALAYA.

**Teramo** (anc. *Interamna Praetuttiorum*), a town of Italy, the capital of a province, on the Tordino, 84 miles S. of Ancona by a branch-line, 16 miles long, from Giulianova on the coast railway. Its Gothic cathedral (1355) has been partly modernised; some Roman antiquities have been discovered. Pop. (1901) 24,091; (1921) 25,830.

**Teraphim**, a Hebrew word of uncertain derivation, denoting a certain kind of images, idols, or household gods, of a human figure, associated with divination, and commonly used in the popular worship. The gods which Rachel stole are called teraphim, and Saul's daughter Michal placed a teraph in David's bed to conceal his flight. This veneration for teraphim flourished side by side with the worship of Jahweh, though condemned by the prophets.

**Teratology**, the study of malformations or abnormal growths, animal or vegetable. Those of the animal kingdom are treated at MONSTROSITY, DEFORMITIES, CLUB-FOOT, DWARF, HARELIP, &c.

For those of the vegetable world, see **PLANTS** (*Diseases*), and such articles as **ANBURY**, **BEDEGUAR**, **GALLS**. Under this head come abnormal forms like four-leaved clover, &c., as well as changes in the form of plants brought about by the skill of gardeners and agriculturists—such as the bulbous modification of the roots of turnips, the development of such a growth as cauliflower, the production of double-flowering plants, and the metamorphosis of organs.

**Terbium** (Tb; atom. number 65; atom. wt. 159.2), a rare metallic element found in gadolinite and other minerals. It takes its name from Ytterby (see **YTTRIUM**, **ERBIUM**).

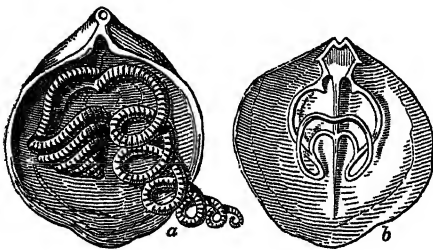

**Terburg**, or **TERBORCH**, **GERARD**, born at Zwolle in 1608, studied first under his father, Gerard (1584–1662), and afterwards visited Italy and England, was at Münster during the congress of 1648, and later at Madrid. On his return he settled at Deventer, where he became burgo-master, and died 8th December 1681. The elegant life of his time, with its superfine manners and splendid costume, found in Terburg an admirable painter. The central figure in many of his pictures is a fair-haired young lady in white satin; delicacy, grace, and humour, and marvellous mastery of technique in draperies inform all his work. His most famous picture is a small work on copper containing portraits of the sixty-nine plenipotentiaries who drew up the Treaty of Westphalia. See Hellens, *Terborch* (1911), Smith and de Groot, *Catalogue Raisonné of Dutch Painters* (v. 1913).

**Terce**. See **BREVIARY**; and for *terce*, the widow's portion, see **HUSBAND AND WIFE**.

**Terceira**. See **AZORES**.

**Terebinth** (Gr. *terebinthos*), another name for the Turpentine-tree, described at **PISTACIA**, the genus to which it belongs, and for the turpentine obtained from it. *Terebinthaceæ* is a term that has sometimes been used either for a part or for the whole of the *Anacardiaceæ*, to which belong the turpentine-tree, pistachio-nut, mango, sumach, Japan lacquer (*Rhus*), &c.

**Terebratula**, a genus of Brachiopods (q.v.) or lamp-shells, represented from Devonian Ages to the present day. Extant forms live fixed to stones or rock on the sea-floor at various depths; thus *T. vitrea* occurs from 5 to 1456 fathoms. The animal is of complicated structure, and is enclosed in a finely punctate shell with two hinged valves (dorsal and ventral, not lateral as in bivalve molluscs). The ventral valve has a beak through

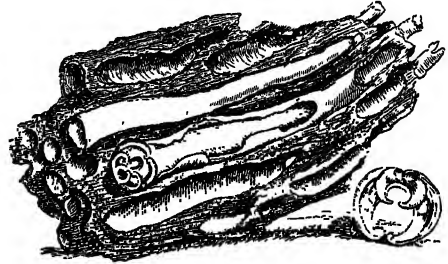

*Terebratula* :

a, valve with the spiral arms; b, valve with arms removed.

a hole in which an attaching muscular stalk projects. In the cavity within the shell there are two long coiled processes of the body-wall, called 'arms,' which bear ciliated (food-wafting and respiratory) tentacles, and are supported by a calcareous loop. There are two British species.

**Teredo**, or **SHIPWORM**, a genus of bivalve molluscs, related to *Pholads*, peculiarly adapted as wood-borers. The body of the animal is elongated into a worm-like shape; the two respiratory siphons are also long and protrusible from the open end of the tunnel. As to the limy parts, they include (1) two relatively very small, deeply-notched anterior valves, the rasping instruments in the boring; (2) a long thin 'tube' lining the tunnel; and (3) two small 'pallets' at the base of the siphons, which close the mouth of the tunnel when the siphons are retracted. The length of 'tube'

Common Shipworm (*Teredo navalis*).

varies from a few inches to a couple of feet. The 'foot' is short and truncate; its movements probably help the shell-valves in boring. Shipworms feed on the triturated wood, but also on microscopic organisms. They do much damage to ships' timber and the woodwork of harbours; they caused the famous dam-break in Holland at the beginning of the 18th century. The burrows usually follow the grain, and one does not encroach on another. Some very hard woods resist them; metal sheaths, an armature of nails driven in, and thick coatings of tarry material may be used as preventives. Shipworms were well known to the ancients. See references in Theophrastus, Pliny, and Ovid.

**Terek**, a stream of the Caucasus, rising near lofty Mount Kasbek, and flowing 350 miles, generally north-east, until, at Kisliar, it divides into several branches, which form a delta 70 miles broad, and finally falls into the Caspian Sea.

**Terence**. Publius Terentius Afer, Roman comic poet, was born at Carthage about 185 B.C., in the interval between the second and third Punic wars. He was presumably a Phœnician by race; and he became, by birth or purchase, the slave of the Roman senator P. Terentius Lucanus, who brought him to Rome, and, out of regard to his handsome person and unusual talents, educated him highly, and finally manumitted him. On his manumission he assumed, of course, his patron's *nomen*, Terentius. His first play was the *Andria*, acted in 166 B.C. Its success was immediate, and introduced its author to the most refined society of Rome, where his engaging address and accomplishments made him a great favourite. His chief patrons were Lælius and the younger Scipio, after living with whom in great intimacy for some years in Rome he went to Greece, doubtless with the view of becoming personally familiar with Greek life and manners; and there he seems to have died in 159 B.C., only about twenty-five years old. Six comedies are extant under the name of Terence, which are perhaps all he produced—viz. *Andria*, exhibited in 166 at the Megalensian games, an adaptation of Menander's *Andria* with additions from the same poet's *Perinthia*; the bright and lively *Eunuchus*, from Menander's *Eunouchos* and some parts of his *Kolax*; *Heauton Timoroumenos* ('the self-tormentor'), after Men-

ander's play of the same title, without the use of another play, a comedy of intrigue, with a somewhat extravagant plot, and but little attempt at delineation of character; *Phormio*, so called from the parasite in the play, the original by Apollodoros of Karystos being entitled *Epidikazomenos*, a bright merry comedy, with an interesting plot and careful character-painting; *Hecyra*, the mother-in-law, his least successful piece, the plot poor and uninteresting, the characters peculiar; and *Adelphi*, from Menander's *Adelphoi*, with the addition of a scene from the beginning of Diphilos' *Synapothnēskontes*, an effective comedy, with simple and harmonious plot, and careful delineation of character—the two old men, the easy bachelor about town and the embarrassed country landlord, forming an inimitable contrast. Thus, as we have seen, Terence has no claim to creative originality, his plays, Greek in origin and Greek in scene, being directly based on Menander, who, indeed, is best known to us through the works of his copyist. Cæsar, in a well-known epigram, addresses him 'O dimidiata Menander.' A foreigner in Rome and a total stranger to Greece when he wrote, he gave the still somewhat uncouth Romans a picture of the grace, elegance, and refinement of Greek manners; and he wrote in singularly pure and perfect Latin—ranked by Munro in the very highest level with Cicero, Cæsar, and Lucretius. His style, indeed, is pure almost to being immaculate, and, though inferior to Plautus in comic power, in mastery over passion, in vigour and variety, he is more than his match in consistency of plot and character, in tenderness, in wit, in effective dialogue, and in metrical skill. He employs almost exclusively iambic and trochaic metres. He admitted and defended from the example of the older Roman poets the practice of *contaminatio*—constructing one Latin play by uniting scenes from several separate Greek ones. He was a true artist. In conjunction with Plautus, Terence, on the revival of letters, was studied as a model by the most accomplished play-writers. The *Eunuchus* is reflected in the *Bellamira* of Sir Charles Sedley and *Le Muet* of Brueys; the *Adelphi* in Molière's *École des Maris* and Baron's *L'École des Pères*; and the *Phormio* in Molière's *Les Fourberies de Scapin*.

His plays have been translated into most of the European languages, as by G. Colman (1765 *ad seq.*) and Ritchie (1927) into English. Notable editions of his works are those of Bentley (1726), Davies, Parry, Fleckeisen (1857), Wagner (1869), Umpfenbach (1870), Dziatzko (1884), R. Y. Tyrrell (1903), and Sargeant (text and trans., 1912 *ad seq.*). See also G. Norwood, *The Art of Terence* (1923).

**Teresa**, or **THERESA**, St, one of the most remarkable of the women saints of the modern Roman calendar, was born at Ávila, in Old Castile, March 28, 1515, of the noble house of Cepeda. Even as a child she was remarkable for piety of a most enthusiastic kind; and, educated in a convent in her native city, she entered a convent of the Carmelite order there in 1534. In this convent she continued to reside for nearly thirty years, but it was not till about the year 1539 that her constitution became strong enough to permit her to follow, even in an imperfect way, the observances of conventual life. Her own account of her mental and spiritual condition is interesting from the first; but it was not till 1555 that a change of heart and of purpose came, which was as complete and decisive as her former condition had been purposeless or fluctuating. After a time her religious exercises reached a most extraordinary degree of asceticism. Her prayers were almost continual, and she was reported to be favoured with visions, ecstasies, and other supernatural visitations. The fame of her sanctity spread not only throughout

Spain, but into almost every part of the church. By some the reality of the reported supernatural favours which were ascribed to her was called in question; and there were even some who threatened to invoke the rigorous investigation of the Holy Office; but the popular voice was freely accorded to her, and the authority of St Francis Borgia, St Peter of Alcántara, and other influential churchmen eventually disarmed the opposition. The most notable and permanent fruit of the enthusiastic spirituality of Teresa is the reform of the Carmelite order, of which she became the instrument. She commenced this work in concert with a few zealous members of her own sisterhood in the convent at Ávila, where she had resided from the date of her profession; but after a time she obtained permission from the holy see to remove with her little community to a humble house in the same city, where she re-established in its full rigour the ancient Carmelite rule, as approved by Innocent IV. in 1247, with some additional observances introduced by herself. This new convent of St Joseph's was established in 1562, in which year she assumed the name of Teresa de Jesús; and in 1565 she obtained from the pope, Pius IV., a formal approval for the rule as modified by her. For two years Teresa lived in great privacy and quiet in her convent; but in 1567 the general of the Carmelite order, F. Rubeo, was so struck, during his visitation of the convents at Ávila, with the condition of that over which Teresa presided that he urged upon her the duty of extending throughout the order the reforms thus successfully initiated. Teresa entered upon the work with great energy, and although she met with much opposition, nevertheless succeeded in carrying out her reforms. In 1579 the Carmelites of the stricter observance established by Teresa were released from the jurisdiction of the old superiors, and united into a distinct association, with a separate head and a distinct organisation, which was approved in 1580 by Pope Gregory XIII. Under this new constitution the association flourished and extended; and within her own lifetime no fewer than seventeen convents of women and sixteen of men accepted the reforms which she had originated. Teresa died at Alba, October 4, 1582, in her sixty-eighth year. She was canonised by Gregory XV. in 1622, her feast being fixed on the 15th October.

She left a number of works, which have at all times maintained a high reputation among a large section of her own church; their merits are also acknowledged by non-Catholic writers. They consist of ascetical and mystical treatises, instructions in the conventual life, meditations, besides a large number of letters which possess remarkable literary merit. The best-known treatises are her autobiography, *The Way of Perfection*, *The Book of the Foundations* (trans. by Dalton, 1853), and *The Interior Castle* (trans. by Dalton, 1852). Her works in the original Spanish fill two folio volumes (Salamanca, 1587), and they have been in whole or in part translated into almost every European language. Migne issued a French edition in 4 vols. (1840-46). Another complete French edition (6 vols.) by the Carmelites of the First Monastery of Paris was published in 1907-10. An English translation of her *Letters* (4 vols.) by the Benedictines of Staunbrook began to appear in 1920. Her life occupies nearly an entire volume of the *Acta Sanctorum*; and several biographies have been written in Spanish (Ribera's appeared in 1690), French, Italian, German, English—as that by Canon Dalton (1851), that edited by Cardinal Manning (1865), Miss Trench's (1875), Father Coleridge's (3 vols. 1881-88), Mrs Cunningham-Graham's (1894), and that by a French Carmelite nun, translated by Alice Lady Lovat in 1912.

**Terlizzi**, a town of Italy, 18 miles W. of Bari. It has a very strongly fortified castle, to which the Emperor Frederick II. sometimes resorted. Pop. (1921) 23,639.

**Term**, a day fixed by law and usage for payment of rent, and for the commencement and

termination of the contract between landlord and tenant; also the period between two terms. In England and Ireland the year is divided into four quarters or terms. These are Lady Day, March 25; Midsummer Day, June 24; Michaelmas Day, September 29; and Christmas Day, December 25. In Scotland the terms as between landlord and tenant are divided into legal and conventional terms. There are two terms recognised by common law—viz. Whitsunday, May 15, and Martinmas, November 11; while other two conventional terms subdivide these—viz. Candlemas, February 2, and Lammas, August 1. Removal terms and the terms by which domestic servants are engaged are the 28th May and 28th November. The Michaelmas term is the most important in England, whereas in Scotland it is Whitsunday. There is also a subdivision of the year into Law-terms; since the passing of the Judicature Acts the traditional terms are superseded by the times fixed for sittings of the courts by statute, but for some purposes we still distinguish Hilary, Easter, Trinity, and Michaelmas terms. At the English universities there are nominally four terms in the year, but usage has established three working terms of about nine weeks each.

**Termini Imerese**, a seaport on the north coast of Sicily, 23 miles ESE. of Palermo by rail. Pop. (1921) 18,640. The industries are tunny and sardine fishing. The ancient city of *Thermae Himerenses* was founded here by the Carthaginians in 407 B.C., after the destruction of the Greek city of Himera. The springs are praised by Pindar. Agathocles was a native of this city, and captured it in 307. Under the Roman rule it flourished through its baths. Of these some fragments still exist (though hidden by the construction of the modern bath establishment, which is still fairly well frequented), as well as of an amphitheatre and two aqueducts. These last are especially noteworthy; at one point a deep valley is crossed by an inverted siphon. The city museum is interesting, and has remains of Quaternary mammals.

**Terminus**, a Roman divinity, supposed to preside over public and private boundaries. Originally he appears to have been the same as Jupiter himself, but gradually he was recognised as a separate and distinct god.

**Termites**, or WHITE ANTS, a remarkable order or sub-order, Isoptera, of somewhat primitive insects, distantly related to cockroaches and the like, with highly developed social organisation,

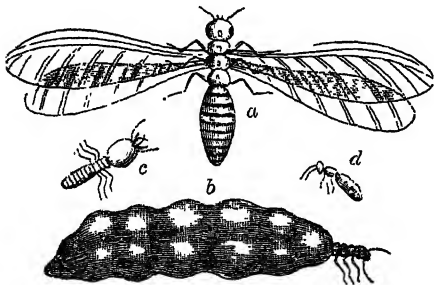

Fig. 1.

a, perfect male termite; b, female distended with eggs; c, soldier; d, worker.

though not always to the same degree. They are widely distributed in tropical and sub-tropical countries, and over a thousand species are known. They are in no way related to true ants, which belong to the highly evolved order Hymenoptera,

and they are much more archaic. For although no fossil termites are known before the Eocene, they probably diverged from an Orthopteran or primitive cockroach stock in late Palaeozoic or early Mesozoic times. Termites feed almost exclusively on dead vegetable substances, and all the wood-eaters that have been studied have been found to contain numerous symbiotic Infusorians in their food-canal, which prepare the dryadust food. By slightly raising the temperature it is easy to kill the partner Infusorians without injuring the termites, and in this way it has been proved that the Symbiosis (q.v.) is indispensable. In the cases that have been studied, the termites cannot utilise the masticated wood unless the Infusorians first work on it. Although termites are in many places very common and their ant-hills or termittaries very conspicuous, the insects themselves are not nearly so familiar as true ants, for they have usually a great dislike to the light of day, and hide their pale thin-skinned wingless bodies in covered galleries and tunnels. The dark-skinned sexual forms are winged, but do not fly about for more than a very short time.

Among the structural characters of termites the following may be noted: the strong jaws suited for chewing; the weak cuticle; the elongate abdomen with ten or eleven segments and two terminal spines or cerci; the long delicate wings with few veins, restricted to the sexual forms, and showing a basal suture across which they readily break off; the predominance of sterile wingless individuals; the simple nature of the antennae; the frequent absence of eyes. The young termites that hatch out of the eggs are not very different from the adults except in size. In other words, there is little or no metamorphosis. The termite's brain is relatively small. Sounds are mechanically produced by working one part of the body against another, and these sounds probably serve as a means of communication. But both these points are obscure. So also is the secretion of a strong corrosive fluid.

Among the higher termites, such as the African *Termites bellicosus*, there may be hundreds of thousands of individuals in a colony, sometimes probably millions. But in a primitive species there may be only a few dozen or fewer. In the great majority there are five castes, three fertile and two normally sterile. First, there are the 'kings' and 'queens,' the ordinary males and females, deeply pigmented, with relatively large brain and eyes. After the antenupital flight they discard their wings, and the female settles down to extraordinary maternity. Second, there are complementary or substitutional kings and queens, less pigmented, with small brain and eyes, with vestigial wings. Third, there are peculiar, not very intelligible, adults, sometimes called 'ergatoid,' scarcely pigmented, entirely wingless, small-brained. Fourth, there are the wingless, unpigmented, non-reproductive workers, arrested individuals of both sexes, small-brained and often blind. Fifth, there are the wingless, big-headed, very small-brained, usually more or less blind soldiers, also arrested individuals of both sexes. Soldiers and workers are in some respects persistently larval; the complementary and ergatoid reproductive forms are also arrested. The fully-winged 'kings' and 'queens' are the only individuals that attain complete development. As there are often two sizes of workers and three sizes of soldiers, there are sixteen different kinds of individuals, though no single colony may show them all. It used to be thought that the differences between the castes were due to differences in nurture, but further investigation points to the conclusion that the differences are largely germinal, that is

determined in the egg. Thus, in the youngest stage there seems to be a distinct difference between the reproductive and the sterile. Here it should be noted that the workers and soldiers are occasionally fertile, apparently producing others like themselves. The kings and queens can reproduce all the castes; the complementals give rise to complementals, ergatoids, workers, and soldiers; the ergatoids can give rise to ergatoids, workers, and soldiers, just as if somewhat was lost at each stage. In this connection the chromosomes deserve close study as well as the metabolism.

The dark-coloured kings and queens leave the nest in an aerial swarm, but the association in couples occurs on the ground after a short flight and after the discarding of wings. A hole is dug by the young king and queen, and this is the beginning of the termitarium. Only after some construction is completed does actual pairing occur, and the whole colony is the progeny of the two.

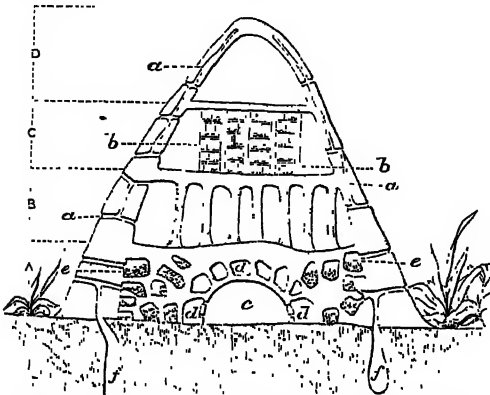

Fig. 2.—Diagrammatic section of a Termite's Nest (after Houssay):

In the walls there are winding passages, *a*; uppermost is a well-aired empty attic, *D*; the next story, *C*, is a nursery where the young termites are hatched on shelves, *d*; the next is a hall, *B*, supported by pillars; beneath this is a royal chamber, *a*, in which the king and queen are imprisoned; around this are the chambers of worker-termites, *c*, and some store-chambers, *e*; excavated in the ground are holes, *f*, out of which the material used in making the termitary was dug.

In the higher termites the queen's abdomen eventually becomes extraordinarily swollen, even four inches long, 20,000 times the volume of a worker's. According to Escherich, she may for a long period lay an egg every few seconds, about 30,000 a day; 10 million may be laid in a year, and 100 million during her lifetime of about ten years. The complementals or the ergatoids may take the places of the king and queen if these should die. The workers have to do with foraging, feeding, nursing, building, and repairing. The soldiers are defensive, but some with vestigial jaws, known as nasuti, squirt drops of sticky fluid on their assailants. The domestic economy includes feeding one another with saliva, regurgitated food, and faecal matter. Moreover all the castes form exudates which the others lick off. This is most copious on the swollen queen, who is therefore much licked, and not always gently, by the workers.

Termites like darkness, moisture, and stagnant air, only a few exceptional forms foraging in the open sunlight; and these conditions are fulfilled by the nests or termitaria, which also afford protection against enemies. The nest may be a system of excavated tunnels in the soil or in dead wood, but it is often an elaborate construction of chewed earth or wood or both, built on the ground or some-

times up a tree. Some great ground edifices attain a height of 20 feet, and they may be strong enough to bear a man's weight. The salivated clay is sometimes hard like cement. A common feature of the termitary is the central royal chamber for the prolific queen. Also noteworthy is the absence of doorways, for these lucifugous insects reach their feeding grounds by tunnels in the earth or along covered arcades made of earth or wood. In many cases there are store-chambers in the termitary, full of cut grass or plant fragments of some sort. Tree-nests are usually somewhat spherical, varying from the size of a football to that of a barrel, and they are mostly made of masticated wood. Some strange African and Indian tree-nests are like big brown stalactites hanging from the branches. The famous compass or meridional termitaria of northern Australia, often 10 feet in height, have their two long surfaces facing east and west, and their narrow gable ends facing north and south, thus reducing exposure to the heat of the sun. Many ground-nests are like big mole-hills, but strong enough to stand on; in equatorial Africa there are neatly built mushroom-like forms, from a few inches to a foot in height.

Termites are represented by various genera, of which *Termites* is the most important. Others are *Eutermes*, *Calotermes*, *Anoplotermes*, *Hodotermes*, *Reticulitermes*. They are grouped in four families, *Mastotermitidae*, *Protermitidae*, *Mesotermitidae*, and *Metatermitidae*, which are arranged in order of their evolution from the generalised (*Mastotermites*) to the highly specialised (*Termites*). A few species of *Termites* have been introduced into Europe, e.g. *Termites lucifugus* in dockyards.

The inter-relations of termites with other organisms are many. No mixed colonies are known, but there are compound nests whose galleries are tenanted by two or more species. True ants often live in termitaries. Various insects, the 'termito-philous,' habitually live in association with termites, just as with true ants; and in both cases the associates may be grouped as injurious intruders, parasites, tolerated guests, and true guests. The last exude secretions which are greedily devoured by the termites; in exchange they sometimes receive regurgitated food. But they may also help themselves to young termites. Most of the termito-philous are beetles, but there are representatives of some other orders, such as *Diptera*. Very remarkable is the development of pathological 'plyso-gastric' among some of the guests, a curious state with abdominal enlargement, accumulation of fat, blindness and winglessness, which Wheeler attributes to confinement within narrow galleries and chambers, the very limited supply of oxygen, the absence of light, and an abundance of carbohydrate food. Some termites, like true ants, form fungus gardens in their galleries. The symbiotic *Infusorians* in the food-canal have been already alluded to. The termite mounds often shelter other animals, such as scorpions, snakes, lizards, and even birds. The Aard-Vark burglars them at night; and termites afford food for many other insect-eaters. Termites prune off decayed branches from trees; they devour decaying vegetation; they keep the soil circulating, for instance in making tunnels of salivated earth up the stems and along the branches, for those that are not too hard are eventually weathered off and the fine particles may be carried by torrential rains into streams, and go to increase the alluvium of the distant valley. In short, termites have, like earthworms, a soil-making function. The circle of their life often intersects man's, as when they destroy floors, rafters, furniture, boxes, books, and papers. The Australian bushmen make temporary ovens of the termite mounds, and may even eat some of the salivated clay; the hillmen of India

eat the termites themselves; the pulverised earth is often used as a basis for tennis-courts and the like.

See W. M. Wheeler, *Social Life among the Insects* (1923); Escherich, *Die Termiten* (1909), *Termitenleben* (1911); Hegh, *Les Termites* (1922); Maeterlinck, *Les Termites* (1927).

**Tern**, the name applied to several genera of birds of the Gull family (*Laridae*), by some made into a sub-family (*Sterninae*); they have the bill as long as or longer than the head, nearly straight, compressed, slender, tapering; the wings long and pointed; the tail usually long and more or less forked, sometimes graduated; the legs and feet short and small. In plumage the terns resemble the gulls, but are usually smaller. From this, and from their forked tail, they are often called Seawallows, though their flight is more like that of a gull. They are constantly on the wing, swooping on small fishes and other small animals in the water, or catching insects over the land. The species are numerous, and found all over the world.

Common Tern (*Sterna fuscata*).

The *Scotia* explorers found the Arctic Tern (*S. macrura*) as a summer visitor within the Antarctic circle. The Common Tern (*S. fuscata*), abundant on the more southern coasts of Britain, is also found on the coasts of Europe, western Asia, western Africa as far as Accra, and eastern North America. Terns make little or no nest, laying their spotted eggs on sand or shingle, from which they are often with difficulty distinguished. Some, however, breed in marshes, and some occasionally build on trees and bushes, as is the case with the Noddy (*Anous stolidus*). This bird derives its name from the ease with which it is caught when it alights on ships to rest; it has a graduated tail, and is sooty-brown, with a gray cap. It is found in all tropical waters, and has even occurred on the Irish coast. The Sooty Tern (*S. fuliginosa*) breeds in vast numbers on Ascension Island, where it is known as the 'Wideawake.' Careful experiments by Prof. J. B. Watson and Dr K. M. Lashley have shown that marked Sooty and Noddy terns removed from their nests on the Tortugas and taken in closed baskets on board ship into waters not within their migratory range will 'home' in a variable percentage of cases, even from a distance of 850 miles (Cape Hatteras).

**Ternate.** See MOLUCCAS.

**Terneuzen**, a small Dutch port in Zeeland, on the south bank of the Scheldt.

**Terni**, an episcopal see of Central Italy, situated on the Nera, 70 miles NNE. of Rome by rail. Pop. 20,230 (town); 36,320 (commune). It was the ancient *Interamna Nahars*, and its site was inhabited in the early Iron Age, as the discovery of numerous Villanovan tombs and huts shows. In Roman times it was a city of some note. The historian Tacitus was perhaps born here (the

Emperor Tacitus certainly was), and remains of the city walls, of an amphitheatre, and of other buildings may still be seen. There was continual litigation with Reate (mod. Rieti) as to the regulation of the river Velinus (mod. Velino), which deposited so much carbonate of lime as to block up its own channel; and similar difficulties occurred in the 15th-18th centuries. Remains of the mediæval walls, and of a few Romanesque churches are still to be seen. But the town is now important for its iron and steel works, the largest in Italy, at which armour-plating, artillery, machinery, rails, &c., are made. Wool, jute, carbide of calcium, &c., are also manufactured. Three miles to the E. are the famous falls of the Velino, which falls in three leaps from a total height of 525 feet. They were celebrated by Byron in his *Childe Harold*; but their beauty has been much diminished by the use of the water for numerous electric power-plants.

**Ternstroemiaceæ**, or **THEACEÆ**, a family of dicotyledons, consists of trees and shrubs. They are most abundant in America and tropical Asia; some are found in Madagascar and other African islands (one, *Ternstroemia africana*, on the mainland in Angola), and some in Pacific islands. The leaves are alternate, leathery, in many species evergreen, generally undivided, sometimes dotted. Those species which have penetrated the temperate zones have adapted themselves to conditions and become deciduous. This family is very important as containing the Tea-shrubs. It is also interesting because of the great beauty both of the foliage and flowers of many of the species, of which the genus *Camellia* affords the best-known examples. See **TEA**, **CAMELLIA**, and **GORDONIA**. The genus *Ternstroemia* was named in 1781 from the Swedish naturalist Ternström.

**Terpander**, regarded as the father of Greek music and lyric poetry, a Lesbian from Antissa, is supposed to have settled in Sparta about the time of the first Messenian war.

**Terpsichoré** (Gr., 'delighting in the dance'), one of the nine Muses (q.v.), presided over choral song and dancing.

**Terraces**, in Geology, comparatively level strips of land near the sea, lakes, or rivers, with a sharp descent at the edge towards the water, showing an ancient water-level. See **BEACHES (RAISED)**, **GLENROY**, **RIVER**, **LAKE**, **VALLEY**.

**Terracina**, a coast town of Central Italy, 68 miles by rail S.E. of Rome; pop. 13,000. The Roman Tarracina occupied the site of the Volscian Anxur, and the mediæval town, surrounded by walls with towers of the late Roman period, is largely built upon or among Roman remains. Thus, the pavement of the Roman forum (which in part rests on arched substructions) is still preserved in the piazza in front of the cathedral, itself built into the chief temple of the ancient city. The back of the temple is still preserved; while the cathedral, with its Cosmatesque portico, campanile, pavement, pulpit, and Easter candlestick, is of great interest. There are also massive polygonal substruction walls of the Volscian and Roman periods. In imperial days the city (the local museum gives an idea of its importance) extended over the low ground towards the sea: here were the harbour (now in part filled up), the amphitheatre, the thermæ, &c.: and here Pius VI., who restored the Via Appia, built the Borgo (suburb), the modern part of the town. Here there is a small harbour at the mouth of the navigable drainage canal of the Pomptine Marshes: and here we may notice the base of the Pesco Montano, an isolated dolomitic rock some 300 feet high, which was cut for 120 feet vertically, probably by Trajan,

in order to allow the Via Appia to pass round its base. The road originally ascended through the town and over the top of the promontory of Monte S. Angelo (747 feet), where considerable remains of its course, and of the buildings along it, may still be seen. On the summit of the promontory was the citadel of the republican period, and within this, immediately above the Pesco Montano, the platform of the temple of Jupiter Anxur, supported by colossal arcades of concrete. From here there is a magnificent view of the coast towards Gaeta, of the lake of Fondi, of the Circeian promontory, and of the Pomptine Marshes, at the edge of which Terracina lies, though not itself affected by the *Maloria*.

See *Forma Italiae* (fasc. i., by Lugli, 1926).

**Terra-cotta**, an Italian term for hard unglazed pottery ('baked clay'), used (first to any extent by the Greeks) for making decorative bricks and tiles, architectural embellishments, statuary, vases, &c. After the clay was modelled, or moulded, it was usually coloured. Much excellent ware has been found at Tanagra (q.v.), while the Etruscans produced some splendid terra-cotta sarcophagi (see ETRURIA, *Civilisation*). The Romans rivalled but hardly equalled the Greeks in producing masterpieces of sculpture in this material, and the industry spread to the provinces but came to an end with the fall of the Roman Empire. It was revived at the Renaissance for use with Gothic architecture, while Donatello and other Florentine sculptors produced some beautiful work in terra-cotta. Luca della Robbia (see ROBBIA) introduced many improvements in the process of manufacture. After the 16th century the industry again died down, and was only revived in the last half of the 19th century (see DOULTON, TINWORTH), when terra-cotta came to be employed both for the purposes of sculpture and also for the fronts and other portions of important buildings, such as the Natural History Museum and the Albert Hall in South Kensington. Terra-cotta is peculiarly well suited for architectural work in towns like the metropolis, where stone too readily decays, or in cities like Berlin, to which stone has to be brought from a long distance. Important collections of ancient and mediæval terra-cotta work are to be found in the British Museum, the Victoria and Albert Museum, the Louvre, and the museums of Berlin and Athens.

See POTTERY; the relevant catalogues and publications of the principal museums; Hutton, *Greek Terra-cotta Statuettes* (1899); Walters, *Ancient Pottery* (1905); Lecuyer, *Antiques terres cuites* (1905).

**Terra di Lavoro**, the old name for the province of Caserta. (q.v.).

**Terra firma**, a term frequently employed to denote continental land as distinguished from islands. But it was at one time more specially applied to all the mainland of Italy which acknowledged the supremacy of Venice, and to the northern part of South America. Colloquially, the phrase *terra firma* is applied (but erroneously) to dry land as distinguished from water.

**Terra Japonica**. See CATECHU.

**Terramara** is an Italian name, adopted by archaeologists, for a mixture of clay, sand, ashes, &c., found in the form of artificial mounds. Terremare are most abundant in the basin of the Po, but they occur in other parts of Italy, even the extreme south. The mounds are analogous to the kitchen-middens of northern Europe, and they have been formed under pile-dwellings. The dwellings themselves seem to have been quadrangular log-huts. There is reason to believe that when rubbish filled up the space between the piles the settlement was burned and rebuilt at a higher level. The

mound is surrounded by a moat. Objects found in the *terremare* indicate the end of the Stone Age and the earlier part of the Bronze Age. They include coarse and fine pottery, needles, pins, combs and other articles of bone, horn, and wood, clay figures of animals, a few axes, spear-heads, chisels and other weapons and implements of stone, and numerous objects of copper and bronze, such as knives, razors, axes, sickles, weapons, pins, and brooches. Who the inhabitants were is disputed (see ITALY, *Ethnology*). They cultivated wheat, beans, flax, and the vine. They kept domestic animals. They hunted. The form of their settlements, if not intended as a protection against floods, may be a survival from a time when they built in lakes. On the other hand protection against enemies may have been the object. Some at least of the dead seem to have been cremated. See Ridgeway, *Early Age of Greece* (1901-10), *Who were the Romans?* (1908); Montelius, *La Civilisation primitive en Italie* (1895); Peet, *Stone and Bronze Ages in Italy* (1909); Munro, *Palæolithic Man and Terramara Settlements in Europe* (1912).

**Terranova di Sicilia**, a seaport (there is no proper harbour, but only an open roadstead) on the south coast of Sicily, 60 miles W. of Syracuse; pop. 26,000. It occupies the site of the ancient Gela (q.v.). Its greatest prosperity was under Hippocrates, who defeated the Syracusans in 492 B.C. It was in the same century that its inhabitants erected a treasury at Olympia (q.v.), decorated with painted terra-cottas. It was sacked by the Carthaginians in 405 B.C. and repopulated in 338 B.C. by Timoleon; but in 311 B.C. Agathocles massacred 5000 of its citizens, and finally Phintias of Akragas founded, about 284 B.C., a city under his own name (the modern Licata), and compelled the Geloans to remove thither, after which it disappears from history until Frederick II. refounded it in 1230. On high ground to the east of the town are the scanty remains of a Doric temple of the 5th century B.C.; and close by, in 1806, the stylobate of an earlier temple (6th century) dedicated to Athena, with fine architectural terra-cottas, was found. The cemeteries of Gela, excavated in 1900-5, have yielded numerous fine vases, now in the Syracuse museum: those from earlier excavations are in private collections or in foreign museums.

**Terranova Pausania**, or TERRANOVA DI SARDEGNA, a seaport of Sardinia, 72 miles E. of Sassari by rail, now, as in ancient times when it bore the name of Olbia, the port of embarkation for Italy. Its foundation is attributed by Pausanias (x. 17, 5.), with whom the name Pausania has no connection, to the Thespians and Athenians under the leadership of Iolaus. Remains of the ancient walls have been found. The 11th century Romanesque church of S. Simplicio contains a large collection of Roman milestones from the road from Olbia to Cagliari (q.v.; anc. Carales). Pop. 6600.

**Terrapin**, the popular name of many species of fresh-water and tidal-water tortoises of the family Testudinidae, natives of tropical and the warmer temperate countries. About twenty fresh-water species are found in the United States. But the terrapin *par excellence* is *Malacoclemmys terrapin*, the diamond-back salt-water terrapin, highly prized as a delicacy for the table. It is caught in salt marshes along the coast from New England to Texas, the finest being, however, those of the Massachusetts and the northern coasts. Another species is *M. geographicus*, with peculiar map-like markings; and there are several species of *Pseudemys*. 'Brer Tarrypin' is an intelligent and genial interlocutor in many of the beast stories of *Uncle Remus*. See TORTOISES AND TURTLES.

**Terra Rossa**, a name given to a ferruginous red earth which is extensively developed in the limestone districts of south-eastern Europe, especially in Istria and Dalmatia. See RED EARTH.

**Terre Haute** (*Terre* pron. *Ter-re*), capital of Vigo county, Indiana, on the river Wabash (crossed here by three bridges), 72 miles by rail WSW. of Indianapolis and 178 S. of Chicago. It is regularly built on a plateau some 60 feet above the river, and, being within a dozen miles of the great block-coal mines of Clay county, contains numerous foundries, rolling and other mills, and factories. There are oil-wells in the neighbourhood, and grain is grown. Its public institutions include the state normal school, a college, a polytechnic and other institutes, an orphans' home, &c. Pop. (1870) 16,103; (1900) 36,673; (1910) 58,157; (1920) 66,083.

**Terrestrial Magnetism**, &c. See MAGNETISM, TEMPERATURE, &c.

**Terrier**, a name originally applied to any breed of dog used to burrow underground, but now applied to any small dog. Terriers may be divided into three classes: those able to follow their game into its earth, those kept for hunting above-ground, and those kept merely as companions. Among terriers proper the Fox-terrier (q.v.) holds the position of greatest popularity. The Scotch terrier, though long familiar in Scotland, only became generally known about 1870, but has spread very rapidly since then. Weighing from 16 to 20 lb. he is a small, compact dog, short in the leg; body of moderate length, with pronounced hind-quarters; coat short, hard, dense, and with no semblance of a curl; ears erect; and with a keen, bright expression. In character he is generally alert and active, and makes a splendid companion. Allied to the Scotch terrier is the white West Highland terrier, with body compact and deep, and powerful jaws. The best weight is about 16 lb. The Cairn terrier is doubtless related to the Skye terrier; it is small, deep-chested, has a long jaw and blunt muzzle; weight about 14 to 16 lb. Another variety used for going to ground is the Dandie Dinmont, called after the character in Scott's novel of *Guy Rimmering*, a character founded on James Davidson (d. 1820), a well-known Border farmer, who was one of the founders of the breed. The Dandie is a low and powerful dog, very courageous, a quality probably gained by an admixture of bulldog blood, but headstrong and difficult to keep under control. Dandies are divided into 'peppers' and 'mustards'—i.e. those coloured slate-blue and those of a light yellow. They should weigh about 18 lb. The coat is rather longer than the Scotch terrier, but not so hard. The small, hard-coated Sealyham terrier, scaling about 18 lb., apparently traces its ancestry to Fox-terrier, Dandie Dinmont, and Bull-terrier sources.

Among terriers kept for hunting above-ground the most popular is the Irish terrier, a dog larger and considerably leggier than the fox-terrier, but built on the same lines. The coat is hard and wiry, neither long nor shaggy, bright-red or wheaten-red in colour. The ears used always to be cut to a fine point, standing erect, but are now allowed to fall over in their natural shape. The Kerry terrier (Kerry Blue) is a variety of Irish terrier, blue in colour and weighing as much as 40 lb. or more. The Border terrier, blue, wheaten-red, or even white in colour, resembles the Irish terrier. The Bedlington (q.v.) is popular in the north of England. The Bull-terrier (see BULLDOG) also makes a good sporting dog, but is kept mainly as a companion; the Boston terrier, very popular in the United States and in Canada, is a similar dog. The Black-and-Tan or Manchester terrier, showing

traces of the Bull-terrier and Whippet, once gave promise of popularity, but has fallen away; its coat is short and glossy, with the tan distinctly marked off. The large dogs weigh from 14 to 22 lb., and the 'toy' variety not more than 7 lb. The Yorkshire terrier is an important-looking 'toy' dog, weighing from 5 to 7 lb. A rich 'fall' of tan hair covers its head, while its body coat is of moderate length and bright steel-blue in colour. The English White terrier is similar to the Black-and-Tan, except that it is white; it is a breed not often met with nowadays. Airedales have attained considerable popularity both as sports dogs and as companions. They are vigorous animals, weighing normally from 40 to 45 lb. or more, and must be carefully trained. Head, ears, and legs are tan, the body is black, and the hair hard and wiry. The Welsh terrier is a smaller but similar dog. The long-coated Skye terrier (q.v.) is somewhat less popular than formerly as a companion dog, and the closely-allied Clydesdale (Paisley) terrier is never likely to be much in evidence. The main points to be attended to in the case of terriers are cleanliness, abundance of exercise, regular feeding, and grooming. Frequent bathing should be avoided, as it softens the coat. See books by F. T. Barton (1907), D. Matheson (1922).

**Territorial Forces**. See VOLUNTEERS, &c.

**Terror**, REIGN OF. See DANTON, ROBESPIERRE.

**Terry**, DAME ELLEN, actress, was born at Coventry, on 27th February 1848. She made her first appearance on the stage when only eight years old, playing Mamilus in *A Winter's Tale* at the Princess's Theatre, under the management of Charles Kean. In 1858 she acted the part of Arthur in *King John*, and in 1863 made her debut as a regular performer, playing Gertrude in *The Little Treasure* at the Haymarket. From 1864 to 1874 she practically retired from the stage, her only notable appearances being at the Queen's Theatre for a few months in 1867. In 1875 she made a great success in Portia at the old Prince of Wales's Theatre, where she remained for some time under the Bancrofts, playing in *Money*, *The Lady of Lyons*, *Masks and Faces*, and *Ours*. In 1876 she joined the Court Theatre, where her most notable character was Olivia, in Wills's play of that name. On 30th December 1878 she first appeared at the Lyceum in conjunction with Sir Henry Irving (q.v.), with whose brilliant successes her name is inseparably connected. She married G. F. Watts (q.v.), E. A. Wardell (Charles Kelly), and (1907) James Carew. See her *Story of My Life* (1908).

**Terschelling**, one of the chain of islands to the north of Holland. It consists of fertile arable and meadow lands, is protected on the south by large dykes, and in other parts by dunes, which are carefully preserved. Area, about 45 sq. m.

**Tertian Fever**. See MALARIA.

**Tertiaries**, a name given by church writers to a class in the Roman Catholic Church, who, without entering into the seclusion of a monastery, aspire to practise in ordinary life all the substantial obligations of the scheme of virtue laid down in the Gospel. It was under St Francis and the mendicant orders generally that the institute of Tertiaries reached its full development (see FRANCISCANS). Similar lay associations were organised in connection with the Dominican, Carmelite, and Augustinian, as well as with certain of the more modern orders; and a brotherhood of the same character had already been formed by the Templars. The institute of Tertiaries, properly so called, is quite distinct from that of the lay 'confraternities' which

exist in connection with the several orders, and the objects of which are very similar.

**Tertiary**, or CAINOZOIC, the term applied in the science of Geology (q.v.) to a group of systems intervening between the Mesozoic rocks and the superficial deposits which are grouped as Quaternary or Post-tertiary. The Tertiary systems include Eocene, Oligocene, Miocene, and Pliocene.

**Tertullianus**, QUINTUS SEPTIMIUS FLORENS, a great theologian of the Western Church, was born of heathen parents at Carthage about 160. His father was a Roman centurion under the proconsul of Africa. The details of his life are little known, but the strongly marked character of the man comes out in every page of his numerous writings. He had a liberal education, and shows extensive acquaintance with poetry, history, and law, and considerable knowledge of philosophy and science, though he calls the philosophers 'the patriarchs of heretics' and the learning of secular literature 'folly with God.' He speaks of the delight he once had in the indecent profanities of the public plays, and confesses that he had fallen into the greatest sins. He nowhere says much about his personal religion, but calls himself 'a sinner of all brands, and fit only for penitence, and asks his readers to remember in their prayers Tertullian the sinner.' He had sufficient command of Greek to write in that language his earliest treatises, all of which are lost. Jerome mentions that he was a presbyter of the Catholic Church, whether at Rome or Carthage is unknown. Tertullian himself speaks of his having lived at Rome. Eusebius says 'he was accurately acquainted with the Roman laws, and one of the most distinguished men in Rome.' It is possible that before his conversion he had practised there as an advocate or rhetorician. He did not become a Christian till about 190, and he has not recorded the history of his conversion. That he was married is shown by his two books *Ad Uxorem*, in which he argues against second marriages. Some time between 199 and 203 his opposition to the spirit of worldliness in the church culminated in his becoming a leader of the Montanist sect. According to Jerome, this was owing to 'the envy and insults of the clergy of the Roman Church,' but the chief causes were doubtless the uncompromising character of his natural disposition, and his repugnance to the laxity of the Roman clergy in their reception of the *Lapsi*, and very probably the favour shown to the Patripassian heresy by the Roman bishops Zephyrinus, and Callistus. He died probably between 220 and 240, at all events 'in decrepit old age' (Jerome). Augustine says that he at last withdrew from the Montanists, and 'propagated conventicles of his own,' which is rendered less likely by the fact that the Montanist sect survived in Africa till the 5th century, under the name of 'Tertullianists.'

Tertullian was a man 'of an eager and vehement disposition' (Jerome), who threw all his great gifts of learning, imagination, eloquence, and wit into the religious controversies of his time for thirty years (190-220). Along with the Roman love for substantiality and strength, he had the 'bitter, stern, and harsh temper' which Plutarch ascribes to the Carthaginians. He wanted the sweet reasonableness and calmness, the feeling for harmonious form, and the instinct for speculative thought that distinguish the greatest Greek fathers of the church. He had the heart of a Christian with the adroit intellect of an advocate. His aim is always to make his adversaries appear ridiculous and contemptible. He pours unsparingly upon them a fiery stream of strong argument and satire, mixed with the sophisms, insinuations, and hyperboles of a special pleader. His style is most vivid, vigor-

ous, and concise, abounding in harsh and obscure expressions, abrupt turns, and impetuous transitions, with here and there bursts of glowing eloquence, reminding the reader at one time of Carlyle, at another of Lamennais. What appear to be African provincialisms Niebuhr contends are only words and expressions taken from the ancient Latin writers. He was the first to give such words as *persona*, *liberum arbitrium*, *trinitas*, *satisfactio*, *sacramentum*, *substantia*, &c. the place they hold in Christian theology. Many sentences of Tertullian's, as, for example, 'the blood of the martyrs is the seed of the church;' 'Christ is truth, not custom;' 'It is absolutely credible because absurd—it is certain because impossible;' 'the human race has always deserved ill of God;' 'the unity of heretics is schism;' 'it is contrary to religion to compel religion;' 'how wise an arguer does ignorance seem to herself to be,' have become proverbial. 'Who can sufficiently extol the eloquence of Tertullian!' exclaims Vincentius of Lerinum; 'almost every word conveys a thought, every sentence is a victory. He is among the Latins what Origen is among the Greeks—the greatest of all.' Like Origen, Tertullian was a man of great genius, sincerity, and zeal, a vigorous ascetic, and an indefatigable worker, and, though wielding great influence over his contemporaries, was never more than a presbyter. Like him, too, this champion of the Christian faith against all opponents, Jews, heathens, and heretics, was himself a heretic to the majority of the Christians of his time. Both show the same contempt of the world and enthusiasm for martyrdom. But in the tendency of their views the contrast between them is as striking as in their natural temper and their literary style. Tertullian is an intense realist, with leanings towards materialism, Origen a pure idealist. Origen, like Justin, holds that Greek philosophy was 'a preparation for the Gospel,' 'a fragment of eternal truth from the theology of the ever-living Word.' Tertullian thinks that 'philosophers are blockheads when they knock at the gates of truth,' and that 'they have contributed nothing whatever that a Christian can accept.' 'The eloquence of the one,' says Presensé, 'is broad and transparent like his genius: it is a noble, full, majestic river: that of the other is a turbid mountain-torrent. Origen speaks to philosophers as a Christian philosopher: Tertullian is a tribune of the people passionately haranguing the crowd in the forum or at the cross-roads; he is the ancient orator, with his vehement gestures, his vivid images, his grandiose pathos.'

His writings have been called 'Tracts for the Times.' Most of them are short. They are a rich mine of information as to the relations between Christians and heathens in his time. Though perhaps not the first of the Latin Christian writers, Tertullian was the creator of ecclesiastical Latinity, and impressed upon the language a new character, as he bent it to the service of Christian ideas. His works are divided into three classes: (1) Controversial writings against heathens and Jews. His *Apologeticus* (ed. by Woodham, 1843; by Bindley, 1891), addressed to the Roman authorities, is an attempt to establish the Christians' right to toleration. A popular edition of this work is presented in his two books *Ad Nationes*, possibly, as Uhlhorn and Hauck believe, of earlier date. *Ad Scapulam* is a bold rebuke of the persecuting Roman proconsul Scapula. In his *De Testimonio Animæ* he acutely develops the thought that Christianity responds to the religious necessities and postulates of human nature. The treatise *Adversus Iudeos* is to prove that prophecy is fulfilled in Christ.

(2) Against heretics. Against these Tertullian takes his stand, as Irenæus did before him, on the

old apostolical tradition as the fixed foundation of belief. He formulates this position juristically in his *De Præscriptione Hæreticorum*. Against the Gnostic attempts to volatilise Christianity in Gnostic spiritualism he maintained its reality as a practical form of life in his *De Baptismo*, *Adversus Hermogenem*, *Adversus Valentianum*, *De Anima* (in which he contends that even the soul is material), *De Carne Christi* (against Docetism), *De Resurrectione Carnis*, and the five books *Adversus Marcionem*. Against the Patristian heresy he wrote the book *Adversus Praxean*.

(3) Practical and ascetic treatises. It is especially in these writings relating to Christian life and discipline that we can trace Tertullian's increasing hostility to the church and adoption of the Montanist views, which had great influence among African Christians. He hailed the testimony of 'free prophecy' as God's witness against the laxity which the Catholic Church had shown in dealing with the sensual weaknesses of the great multitude within her pale. Hence the division of these treatises into *Pre-Montanist* and *Montanist*. To the former class belong *De Baptismo*, *De Penitentia*, *Ad Martyres*, *De Spectaculis*, *De Idolatria*, *De Cultu Feminarum*, *De Oratione*, *De Patientia*, and *Ad Uxorem*; to the latter, *De Corona*, *De Fuga in Persecutione*, *Scorpice*, *De Exhortatione Castitatis*, *De Monogamia*, *De Pudicitia*, *De Jejunio*, *Adversus Psychicos*, and *De Pallio*; while *De Virginibus Velandis* marks the transition stage.

Tertullian had a greater influence on the Latin Church than any theologian between Paul and Augustine. His Montanism indeed prevented it from being exercised directly, but Cyprian, who called Tertullian 'his master,' was the interpreter who gave currency to his views. The following is a summary of Harnack's estimate of Tertullian (3d vol. of his *Dogmengeschichte*), whom he calls 'the founder of Western Christianity.' Tertullian's Christianity was moulded by the enthusiastic and strict faith of the early Christians on the one hand, and by the anti-Gnostic *regula fidei* on the other. A trained jurist, he sought to express all religion in legal formulas, and conceived the relation between God and man as one of civil law. 'God appears always as the powerful partner, who watches jealously over his rights.' Further, his theology shows a syllogistic-dialectic stamp; it does not philosophise, it reasons, using now the argument *ex auctoritate*, now the argument *e ratione*. He shows striking power of psychological observation. Finally, his writings have a strong practical evangelic tendency; with their vivid appeal to the reader's will, and their simple concrete expression of the Gospel, they appealed not to theologians only, but to all. In these characteristics, and their union, Tertullian became the type of the Christianity of the Western Church.

The best complete edition of Tertullian's works is still that of Oehler (3 vols. Leip. 1853-55). A complete critical edition in the Vienna *Corpus Script. ecclesiast.* Lat. began in 1890. The most important studies are those of Kaye (*Eccles. Hist.*, 3d ed. Lond. 1845), Neander (*Antignosticus*, 2d ed. Berlin, 1847; Eng. trans. by J. E. Ryland, 2 vols. 1851), Pressensé (in his *Histoire des Trois Premiers Siècles de l'Eglise Chrétienne*, 1858-77; Eng. trans. 4 vols. 1879), Böhlinger (*Biographien*, vol. iii. 2d ed. Leip. 1875), Möhler (in his *Patrologie*, vol. i. Regensburg, 1840), Grotmeyer (Kempen, 1863-65), Freppel (Paris, 1864), Hauck (with a selection of characteristic extracts, Erlangen, 1877), J. M. Fuller (in the *Dictionary of Christian Biography*, 1887), Farrar (*Lives of the Fathers*, vol. i. 1889), and Ernst Noeldchen (*Tertullian dargestellt*, Gotha, 1890). See also Harnack, *Dogmengeschichte* (2d ed. 1888-90), N. Bonwetsch, *Die Schriften Tertullians* (1878); Koff-

mane, *Geschichte des Kirchenlateins* (vol. i. Berlin, 1879); Van der Vliet, *Studia ecclesiastica. L. Tertullianus* (Leyd. 1891); Monceaux, *Histoire littéraire de l'Afrique chrétienne* (Paris, 1901); D'Ales, *La Théologie de Tertullien* (Paris, 2d ed. 1905); Turmel, *Tertullien* (2d ed. Paris, 1905); Hoppe, *De sermone Tertulliano* (Marburg, 1897), *Syntax und Stil des Tertullian* (Leipzig, 1903); Bardenheuer, *Geschichte der altkirchlichen Literatur* (Freiburg, 1903); R. E. Roberts, *The Theology of Tertullian* (1917). A bibliography is given in J. E. B. Mayor's *Bibliographical Clue to Latin Literature* (1875), which is brought up to date in the introduction to his *Tertullian's Apology* (1917). Translations of nearly all Tertullian's works are included in Clark's *Ante-Nicene Christian Library*.

**Teruel**, a town of NE. Spain, capital of the province of the same name, stands on the river Guadalquivir. Its cathedral and its great aqueduct date from the 16th century and there are some interesting churches. Pop. 12,000.—The province, once part of the kingdom of Aragon, contains several mountain ridges. The river Tago rises in the west of the province and flows west; several other rivers flow north to the Ebro. Corn, wine, fruits, timber, silk, and wool are the chief products, but there is considerable cattle-raising, and some manufacturing industry. The mineral wealth awaits exploitation. Area 5720 sq. miles; pop. (1920) 252,096.

**Ter Vere.** See CAMPVERE.

**Teschen** (Czech. Těšín; Pol. Cieszyn), the name of an ancient town and principality of Silesia. The town lies on the river Olsa on the border between Czechoslovakia and Poland, and, being a centre of communications, is a strategical point of some importance. Coke and gas coal are produced locally. In 1910 the Austrian principality, about 850 sq. m. in area, had a population of 426,000, more than half Polish-speaking. After the Great War considerable friction and some bloodshed arose between Poland and Czechoslovakia over the partition of the Teschen area. The plebiscite method, proposed in 1919, was discarded, but in July 1920 an agreement was concluded at the Ambassadors' Conference. The greater part of the territory, including the town, was awarded to Poland; the western portion, with the coalfields and a suburb of the town, went to Czechoslovakia.

**Tesla**, NIKOLA, born the son of a Greek priest at Smiljan, in Croatia, in 1857, studied at Graz and Prague, and in 1885 joined Edison at Menlo Park, but left him in order to work out in New York his own ideas, such as telegraphy through the earth without wires, the securing of an effective electric light by means of Vacuum Tubes (q.v.), the controlling of a torpedo boat from the shore by electricity, the utilisation of alternating electric current, the induction motor, and the perfection of electrical apparatus—transformers, dynamos, condensers, &c.

**Testacella**, a genus of carnivorous slugs, represented in Britain by two or three species, probably imported with plants from the continent. The shell is a mere vestige at the posterior end of the body. The animals are burrowers but often come up at night (especially in spring and autumn or after continued wet weather); they bury themselves deeply in prolonged drought; they lie dormant in the ground through the winter. They creep quickly and feed on earthworms, which they harpoon with their jerked-out toothed proboscis and swallow whole.

**Test Acts**, acts meant to secure that none but rightly affected persons and members of the established religion shall hold office, include all such acts as enforce oaths of Abjuration, Allegiance, Supremacy, or, amongst the clergy, Uniformity; as well as the Corporation Act of 1661, requiring

members of corporations to receive the sacrament after the manner of the Church of England. But the term is specially used of two English statutes imposing certain oaths on the holders of public offices, and directed against Catholics. The act of 1673 directs that all magistrates shall take the oaths of allegiance and supremacy, as well as an oath renouncing the doctrine that it is lawful to take arms against the king, and provides that they must receive the communion according to the rites of the Church of England within a year before their election. A Scottish act was passed in 1681. Another act of 1685 imposed the like conditions on the holders of all public offices, civil and military, and obliged them in addition to abjure all belief in the doctrine of transubstantiation. These acts, which were practically evaded to a large extent by means of an act of indemnity passed every year, and were at various times partially repealed, were not finally repealed till 1829. In Scottish church history of the 17th century 'taking the test' meant taking the oaths, abjuring the Covenant, and recognising the reigning king, oaths enforced on all and sundry, especially on Covenanters, during the 'killing times.' The universities had their own special tests, now abolished save in the case of offices with clerical functions. See OATH.

**Testament.** See BIBLE, WILL; and for apocalyptic testaments, TWELVE PATRIARCHS.

**Testing Clause,** in a Scottish deed, is the last clause, which narrates when and where the parties signed the deed, before what witnesses, the number of pages of which the deed consists, and who was the person who penned the deed. Moreover, if there have been any interlineations or erasures of important words during the engrossing, these should be mentioned in this clause. The clause is an essential part of a Scottish deed, and no deed written by another than the party is valid unless the testing clause is regular. See DEED.

**Test-papers** are made by dipping unsized paper into an alcoholic solution of a vegetable colouring matter which changes colour when exposed to the action of an acid or alkaline solution. The paper, after being gently dried, is cut into slips of a suitable size. Hence, by dipping the appropriate test papers into any solution, we can ascertain whether it is acid, alkaline, or neutral. Litmus and turmeric are most commonly used as the colouring matters; litmus for the detection of acids, and turmeric for that of alkalies. Test-papers are also employed for detecting sulphuretted hydrogen, &c., and for such a purpose the paper must be dipped in the solution of an appropriate substance. Thus acetate of lead paper becomes black in presence of sulphuretted hydrogen, while starch paper becomes blue when touched with iodine.

**Testudo.** See TORTOISE.

**Tetanus** (derived from the Gr. *teinein*, 'to stretch'), or LOCK-JAW, is one of the most formidable diseases of the nervous system, and is characterised by an involuntary, persistent, intense, and painful contraction or cramp (see SPASM) of more or less extensive groups of the voluntary muscles, nearly the whole of the body being sometimes affected. Hippocrates (4th century B.C.) mentions tetanus as a serious complication of wounds involving bones and joints. The condition follows most commonly a lacerated wound contaminated with dirt; but it may develop after a slight scratch or even some other injury of the skin, such as frostbite or chilblain, which has been similarly soiled. Among soldiers in the Great War, tetanus was a dreaded consequence of shell wounds, and among the civil population gardeners and stablemen are supposed

to have more than the average liability to its onset.

The first symptom noticed in some cases is rigidity of the jaw (*trismus*), which may become so pronounced even within twenty-four hours that the mouth cannot be opened at all. In other cases, discomfort in the throat and difficulty in swallowing are first noticed. Sometimes the first spasm consists in a hardness of the muscles round the wound by which infection has entered the system; and this may either remain the only part affected (local tetanus) or the spasms may become general throughout the body (general tetanus). The neck, in general tetanus, feels stiff within a few hours, the mouth is opened with difficulty, the jaw may be tightly clenched, and at a later stage the face has a peculiar fixed smile (*risus sardonius*). The disease spreads so as to affect the other muscles of the trunk and limbs. Owing to spasm in the powerful muscles of the back, the body becomes strongly arched backwards (*opisthotonos*), or it may occasionally be twisted to one side or bent forward. The hands and feet are however seldom much, if at all, affected. These muscular contractions are very painful; a particularly acute pain may be present in the lower part of the chest due to spasm of the diaphragm. Some of the affected muscles, for example those of the abdomen, are so rigid as to be board-like to the touch, and it is not usual for the spasm to remit completely till the disease finally passes away. Aggravated spasms on the other hand come on, while the disease is at its height, every quarter of an hour or so, and last for several minutes; and if the patient is sinking, these paroxysms become more frequent. They may occur spontaneously, or may be induced by the slightest disturbance—a touch, the opening of a door, or the least attempt at movement. A distressing feature is that consciousness is fully maintained as a rule, and when the violent spasms occur, the patient assumes an agonised expression. The tongue may be bitten during a spasm, which is sometimes so violent as to break the teeth or rupture powerful muscles. Death results from a mixture of causes, but mainly from want of breath due to the rigid condition of the respiratory muscles, associated with general weakness, and flagging of the heart's action. There may be no fever during the course of the disease, and even if it is present it is not usually high; but sometimes, just before death, the temperature becomes extremely high (110° or 112° Fahr.). The mortality in untreated cases is said to be about seven deaths to every one recovery, but generally those cases which are slow in development are much milder and less fatal than more acute cases. During the war when all the wounded received protective doses of antitetanic serum, the mortality varied from 6 per cent. to about 22 per cent. of all those who developed this disease.

Tetanus at its commencement is sometimes mistaken for rheumatism, or for simple sore throat if the throat muscles are early affected, and it has some resemblance to Hydrophobia (q.v.). It may be closely imitated by hysteria, but particularly by poisoning with nux vomica or its alkaloid strychnine. In these cases there is less persistent rigidity between the spasms.

The cause was long suspected to be a micro-organism, since tetanus became much less common as a result of operations after the introduction of Antiseptic (q.v.) methods. Nicolaier (in 1884) first described the sporing bacillus now known to cause the infection, and Kitasato (1889) obtained it in pure cultures and completely demonstrated its relationship to the disease. The manner in which the bacillus produces its dangerous effects is that as it multiplies in the wound it produces

substances (toxins) which are powerfully irritant to the nerve cells of the body; these pass up the lymphatic spaces of the nerves and later into the blood, thus finding their way into the central nervous system where they poison the cells and so bring about the excessive muscular contractions. Methods have been devised whereby animals can be rendered 'immune' or incapable of inoculation with tetanus. The serum of horses thus protected is capable of conferring protection upon other animals into which it is injected; this antitoxic serum is therefore used as a means of preventing or even of curing the disease.

In treatment of so serious a disease, prevention is of the highest importance. During the war, every British soldier who chanced to be wounded, no matter how slightly, received as part of the first dressing an injection of tetanus antitoxic serum (500 units, later raised to 1500 units); and as he passed through hospitals three further injections were given at intervals of a week. In the event of tetanus occurring in spite of this precaution, much larger doses were given both into the muscles and directly within the spinal membranes (16,000 units). When the treatment was carried out at an early stage of the spasms, the patient appeared to stand a better chance of recovery. Perfect quiet, a darkened room, and avoidance of all causes of irritation are necessary in the treatment of a case presenting the spasms. Drugs are useful in controlling the violence of the muscular contractions, among which may be mentioned the prolonged inhalation of chloroform and chloral or morphine in large doses.

*Tetany* is a rare and little understood disease of the nervous system, occurring both in children and adults, characterised by recurring attacks of tonic spasm of various muscles, particularly those of the fingers and toes. It is associated with defective hygienic conditions, imperfect ventilation, poor diet, and in children with Rickets (q.v.). It is often relieved by administration of extract of the parathyroid glands. Complete recovery generally ensues; fatal cases are very rare.

It is not yet definitely settled to which of these two very different diseases *tetanus* or *trismus neonatorum* (of newborn children) should be referred. It has been supposed on the one hand to be traumatic tetanus, due to the injury to the umbilical cord at birth, and resembles it in its great fatality, and in the extension of the spasms over the larger muscles (of trunk, &c.); the opposite view, that it is an extremely aggravated form of tetany, is supported by the facts that the muscles of the fingers and toes are specially affected, and that improved ventilation alone has been known to produce a great diminution of the disease in lying-in hospitals.

Tetanus, or lock-jaw, both traumatic and idiopathic, occurs in most of the domesticated animals, but most frequently in horses. It is due to the action of a microbe, the *Bacillus tetani*, which gives rise to the formation of a toxin termed *tetanine*, by the action of which the tetanic symptoms are induced. This bacillus is also found in garden-mould, and tetanus is induced by the entrance of the microbe into a wound or exposed structure. Tetanus has been transmitted from diseased to healthy animals by inoculation. The symptoms usually come on gradually, involve most of the muscular structures, which become hard and rigid; the nose is protruded, the limbs move stiffly, the tail is raised, the bowels are constipated. The patient must be kept perfectly quiet, and in an airy but fairly warm place, and plentifully supplied with cold water, and with soft, sloppy, but nutritive food, which he will usually greedily suck in through his firmly-closed teeth. A full dose of

purgative medicine must at once be given; extract of belladonna repeated twice or thrice daily is occasionally serviceable; any discoverable wound or injury should be fomented and disinfected, and all causes of irritation avoided. An antitetanic serum is now prepared from cultures of the bacillus, and is injected hypodermically as a means of treatment. Except in the most acute cases, it is very useful if given in time, but is most valuable as a preventive.

**Tetbury**, an old market-town of Gloucestershire, 5 miles NW. of Malmesbury; pop. 1600.

**Tête de Pont.** See BRIDGE-HEAD.

**Tetrao.** See GROUSE, BLACKCOCK, CAPERCAILLIE.

**Tetrarch** (Gr. *tetrarchēs*, Lat. *tetrarcha*, 'governor of the fourth part,' i.e. of a country), a title originally designating what is signified by its etymology, the governor of one of four divisions of a kingdom or country; but in the usage of the later Roman empire given undistinguishingly to all minor rulers, especially in the East, possessing sovereign rights within their territory, but dependent on the emperor, and in many cases removable at his pleasure. This was especially the case in Syria, where the princes of the family of Herod are called indiscriminately by this title (Luke, iii. 1) and by that of king (Matt. xiv. 9).

**Tetrazzini**, LUISA, Italian singer, was born in 1871 at Florence, studied singing there, and made her début in 1890. She has appeared in most of the principal European opera-houses, has toured in North and South America, and in 1921 published *My Life of Song*. As a coloratura soprano, she appeared mostly in the operas of the old Italian school, Donizetti, Bellini, Meyerbeer, &c.

**Tetschen** (Czech. *Ďčín*), a town of Czechoslovakia, situated on the right bank of the Elbe, 50 miles north of Prague. The town has an historic castle, an agricultural school (1850), a busy river traffic, and manufactures of chemicals, paper, textiles, &c. Pop. 11,200.

**Tetter**, the popular name for skin diseases of the kind described under PSORIASIS and HERPES.

**Tetuan** (Arab. *Tetawin*), a port of Morocco, capital of the Spanish zone, about 4 miles from the sea, 22 miles S. of Ceuta. The old Moorish town is surrounded by walls, flanked with towers, and is defended by a castle; the Spanish town outside has pleasant markets. Its harbour does not admit large vessels; but a brisk trade is carried on, mainly by the Jews, in fruit, wool, silk, girdles, leather, cotton, &c., and it exports provisions largely to Ceuta. Tetuan was taken by the Spaniards under O'Donnell (q.v.), February 1860, but was evacuated next year. Pop. 24,000.

**Tetzel**, JOHN, the famous seller of indulgences, was born at Leipzig about 1455, and in 1489 entered the Dominican order. His ability and success as a preacher led to his being entrusted in 1516 with the charge of preaching an indulgence in favour of contributors to the fund for building the church of St Peter's at Rome (see INDULGENCE). It was in opposition to him that Luther published his celebrated theses, on the 31st October 1517. Tetzel published counter-theses and detailed replies, but was himself severely rebuked by the papal delegate Miltitz, for the extravagance in statement and other improprieties which had brought so much scandal upon the church. His personal character was the subject of controversy. He died of the plague at Leipzig in August 1519.

There are (hostile) Lives by Hofmann (1844) and Körner (1880), and from the Catholic point of view by Gröne (2d ed. 1860) and Hermann (2d ed. 1883). See also Kayser, *Geschichtsquellen über Tetzel* (1877), and the exhaustive study by Paulus (1899).

**Teutoburger Wald**, a mountain range of Germany, running in a north-westerly direction, mostly on the borders of Westphalia and Hanover. It is covered by many fine forests. A monument stands on the Grotenburg, near Detmold, erected to the memory of Arminius (q.v.), who defeated the Romans here in the year 9 A.D. See ARMINIUS.

**Teutonic Knights**, one of the three military-religious orders of knighthood founded during the period of the Crusades. Certain merchants of Bremen and Lübeck, witnessing the sufferings of the wounded Christians before Acre in 1190, were so moved with compassion that they erected tent-hospitals for them, and provided for surgical and nursing attendance. There had been a German hospital in Jerusalem from 1128 to 1187; and the new arrangement at Acre was in some sort a continuance of this, being called the Hospital St Mary of the Germans in Jerusalem. The new hospital, the attendants and founders of which formed themselves into a monastic order with the same rules as the Knights Hospitallers of St John, found a patron in Duke Frederick of Swabia, and through him secured the countenance of his brother, the Emperor Henry VI., and the confirmation of the pope (1191). Seven years later it was converted into a knightly or military order; and the change was stamped with the papal approval in 1199. The knights, in addition to the usual monastic vows, bound themselves to tend the sick and wounded and wage incessant war upon the heathen. Their distinguishing habiliment was a white mantle with a black cross. The chief officer of the order was the grand-master or 'high-master,' who was assisted by five other dignitaries. The chapter consisted of these six officers in conjunction with the provincial masters. The minor districts and individual castles were governed by commanders, who constituted also the respective provincial councils. There was, moreover, a class of 'serving brothers,' who performed menial offices about the hospitals; and to these were added in certain places a class of inferior female domestics called 'half-sisters.'

About the year 1225 the Duke of Masovia (in Poland) invited the Teutonic Knights to come and help him against the heathen Prussians. The grand-master, Hermann von Salza, sent a body of knights, who experienced little difficulty in establishing themselves in the territories of the heathen. Twelve years later they were strengthened by the absorption into their order of the Brethren of the Sword, a military order which had been formed to convert to Christianity with the sword the Livonians, Esthonians, and Courlanders. At length the successive encroachments of the knights roused the Prussians to bitter opposition. A fierce warfare was then carried on for nearly a quarter of a century; but by 1283 the knights were masters of the territory lying between the Vistula and the Memel, and as heirs of the extinct Brethren of the Sword they had also extensive possessions in Livonia and Courland. In 1309 the executive officers of the order established themselves in the great castle of Marienburg, near the Vistula. After subduing the Prussians, the order entered upon a hundred years' contest against the Lithuanians. But a most serious blow was struck at the knights by the conversion of the Lithuanians to Christianity and the accession (1386) of their prince to the throne of Poland. From this time, having lost their main *raison d'être*—fighting against the heathen—the order began to decline. During the period of its prosperity, however, it had acted as the principal force in the politics of the Baltic countries; and both by its own exertions and by the encouragement it gave to the Hanseatic traders it was the means of spreading

German civilisation and manners throughout the coast-lands of the south-eastern Baltic. The order suffered an incalculable loss of prestige through the terrible defeat inflicted upon them by the Poles and Lithuanians at Tannenberg in 1410. A desperate attempt to recover their power resulted (1466) in the loss of West Prussia and the alienation of the esteem and affection of their subjects in East Prussia, which they could only retain as a fief of Poland. In 1525 the order was secularised; its grand-master, Albert of Brandenburg-Anspach, being created hereditary duke of Prussia under the suzerainty of Poland. The headquarters of the order—for it still possessed several estates scattered throughout the German empire and in one or two other countries—was fixed at Mergentheim in Swabia, and its possessions were reorganised in twelve bailiwicks. Thus it existed until 1801, when the estates west of the Rhine were annexed by France; in 1809 the order was entirely suppressed by Napoleon in all the German states. This left only a couple of bailiwicks in Austria and one at Utrecht; of which the latter still exists, severely aristocratic. The Austrian branch, reorganised in 1840, justified its existence by maintaining an organisation for the care of the wounded in war.

See Voigt, *Geschichte des deutschen Ritterordens* (1859); Lohmeyer, *Geschichte von Ost- und West-Preussen* (1880); and Perlach, *Statuten des Deutschen Ordens* (1890).

**Teutonic Languages**. See PHILOLOGY; also ENGLISH LANGUAGE.

**Teutons**, a group of peoples speaking Teutonic tongues, an important division of the Indo-Germanic family of languages. The name is derived from the ancient Teutones (and is a form of the modern German *Deutsch*, O. H. Ger. *Diutisc*, or Gothic *Þiudisclō*; see GERMANY). The Teutonic peoples, as they exist at the present day, are divided into two principal branches: (1) Scandinavian, embracing Danes, Swedes, Norwegians, Icelanders; and (2) West Germanic, which includes, besides the German-speaking inhabitants of Germany proper (see GERMANY) and Switzerland (q.v.), also the population of the Netherlands (the Dutch), the Flemings of Belgium, and the descendants of the Angles, Saxons, and Jutes in Great Britain, together with their offspring in North America, Australia, and other British colonies—the English-speaking peoples of the world. For the extinct East Germanic branch, see GOTHs. It is necessary in this case, as in all similar cases, to guard against making language the test of race. See the articles on the several Teutonic lands; EUROPE; PHILOLOGY.

**Teviot**. See ROXBURGHSHIRE.

**Tewfik Pasha**, MOHAMMED (1852-92), Khedive of Egypt, the eldest son of Ismail Pasha, succeeded on his father's abdication in 1879, in virtue of the arrangement of 1866 between Ismail and the Sultan. The chief events of his reign—the insurrection of Arabi, the war with the Mahdi, the pacification of the Sudan frontiers, and the steady improvement of the condition of Egypt under English administration—have been indicated at EGYPT. Tewfik, a pious Moslem, utterly alien to his father's love of luxury and extravagance, was throughout loyal to his engagements with Britain.

**Tewkesbury**, a quaint old market-town of Gloucestershire, on the Avon at its confluence with the Severn, 8 miles NNW. of Cheltenham, 10 NNE. of Gloucester, and 15 S. by E. of Worcester. On the site of the cell of the hermit Theoc, from whom the place got its name, was founded in 715 a monastery, refounded in 1102 by Robert Fitzhamon as a great Benedictine abbey. Its noble

church, consecrated in November 1123, measures 317 feet by 124 across the transepts, and remains essentially Norman, in spite of later additions—Early English, Decorated, and Perpendicular. It was restored by Scott in 1875-79. Special features are the west front and the massive central tower, 132 feet high. The seven 14th-century windows are the chief glory of the choir. They were entirely rereaded and rearranged in proper order to commemorate the 800th anniversary of the consecration of the abbey. Many of the Clares, Despencers, Beauchamps, and other lords of Tewkesbury are buried here, as also the murdered Prince Edward and (possibly) Clarence; and in 1890 a tablet was erected to Mrs Craik, the scene of whose *John Halifax* is laid in Tewkesbury. The place has also a town-hall (1788), a corn-exchange (1856), Telford's iron bridge over the Severn (1824), with a span of 176 feet, a free grammar-school, &c. The thick mustard Falstaff speaks of is a thing of the past, and the trade is chiefly agricultural. Within half a mile was fought (4th May 1471) the famous battle of Tewkesbury, in which the Yorkists under Edward IV. (q.v.) gained a crowning victory over the Lancastrians. First incorporated by Elizabeth in 1574, Tewkesbury returned two members to parliament from 1609 till 1867, one till 1885; it was merged in the county till 1918; since then it has united with Cirencester to return one member. Pop. 4800.

**Texarkana**, the name of two towns lying one on either side of the boundary between Texas and Arkansas. Though in different states they virtually form one town. Manufactures include textiles, and there is considerable trade. Pop. 19,700 (11,500 in Texas, 8200 in Arkansas).

**Texas**, the extreme south-western state of the American Union, is popularly known as the Lone Star State. It extends farther south than any other of the United States except Florida, and lies in 25° 51'—36° 30' N. lat. and 93° 27'—106° 43' W. long. Its very irregular boundary consists largely of natural lines formed by rivers and the Gulf of Mexico. Oklahoma lies to the north, Arkansas and Louisiana to the east, Mexico and the Gulf to the south, and New Mexico to the west. Texas not only is the largest state in the Union, but forms, with its area of 265,896 sq. m., nearly 9 per cent. of the total area of the United States, exclusive of Alaska. It is considerably larger than France. Its extreme length is about 825 miles, and its greatest breadth 750; the coastline is 400 miles long. The surface of Texas is greatly diversified. From the low, flat prairie lands along the coast the land rises in a series of gradual elevations till it reaches the plateau and mountains of the distant west, where some of the peaks attain a height of 5000 feet above the sea. The coast is low and sandy. From the mouth of the Sabine River to that of the Rio Grande there extends a fringe of low islands and peninsulas, separated from the mainland by lagoons several miles in width. These islands are characterised by sand-dunes which rise about 20 feet above the beach. Padre Island, extending north from the mouth of the Rio Grande, is more than 100 miles in length. The alluvial coast-belt, extending from 25 to 60 miles inland, comprises both fertile lowlands and stretches of barren soil. In the waste portions there are extensive areas of cactus and thorny mesquite chaparrals. A white, sandy tract reaching south and west from Corpus Christi Bay to the Rio Grande is known as 'the desert.' Beyond this coast-plain lies a terrace of rich rolling land called the 'prairie belt.' In the eastern prairie sections there are extensive timber regions of live oak and deciduous forest trees, which cover an area greater than that of the state

of Kentucky, not including two wide forest-belts called 'cross-timbers,' which extend southward from the Red River. To the north and west of the prairies the land rises and presents a rough, broken surface, with occasional bluffs. Much of the soil is fertile, and nearly all of it is excellently adapted for grazing. On the southern border of the plateau the elevation is about 1000 feet, but a height of 2000 feet is reached as the ascent continues toward the arid *mesas* of the *Llano Estacado* and the base of the Rocky Mountains, from which some outlying ridges extend into the state.

There is every variety of soil, from the fertile lands of the river-bottoms and prairies to the sterile sand of the southern desert. The coast-prairies have in general a sandy loam. In those of the interior there are heavier brown and black loams, while in the northern part of the state there are great areas of red lands. In the south and south-east, where fortunately much of the best land is located, the rainfall is ample, but the supply in the west and north-west is less reliable. However, it has been shown that even the *Llano Estacado*, or Staked Plains, which were once considered utterly uninhabitable, are capable of supplying plenty of water for irrigation by the use of artesian wells and windmills. The northern winds are usually dry, the rain comes almost entirely from the south-west, and the winter months are generally the driest. The best water-supply is found in the timber-lands. In a state extending through eleven degrees of latitude there is naturally found a considerable range of temperature. The climate on the coast-plains is semi-tropical, but is tempered by the winds from the Gulf. A dry, healthful climate prevails in the middle region, and the north experiences cool winters, with heavy snowstorms at times. The air of western Texas is so dry that meats are perfectly preserved in the open air without salt, and carcasses of dead animals on the plains emit no odour. A notable feature of Texas climate is the 'norther,' which is a sudden and extreme change of temperature produced by a rush of cold wind from the north. This unwelcome visitor arrives usually unannounced, except for the fact that its coming is frequently preceded by a spell of warm weather. It ordinarily remains for three days, and the fall in temperature is often as much as 30°. The drainage of Texas is received by the Gulf of Mexico. The Red and the Arkansas rivers convey the waters of the northern part of the state to the Mississippi. The other streams flow directly into the Gulf. The Red and Sabine rivers and the Rio Grande form parts of the boundary line. Within the state the most important rivers are the Trinity, the Brazos, and the Colorado. With the exception of the Rio Grande, the Brazos, and the Sabine, nearly all the streams discharge their waters by means of large estuaries, from which steep clay banks rise for some height to the level of the prairie above. Knowledge of the details of the geological structure of Texas is quite imperfect. The coast-plains and prairies are of recent alluvial formation. Beyond these is a broad strip of Tertiary deposits, and farther inland the country belongs to the Cretaceous period, except in the central regions, which are penetrated from the north by contiguous arms of Jura, Trias, and Permo-Carboniferous formations. Texas is rich in minerals. It is one of the chief states producing petroleum, quicksilver, asphalt, and sulphur. It has large beds of coal and lignite. Silver, gold, copper, iron, lead, and zinc are mined, and natural gas is abundant. Building-stones of excellent quality occur in many districts; the supply of lime, gypsum, and salt is abundant; and cement production is important.

Agriculture and stock-raising have been the

leading occupations of Texas. Large tracts are still practically uninhabited, only one-sixth of the land being under cultivation, but settlements are encroaching each year upon the unrequited districts, and the primitive methods of the cattle-ranges are rapidly disappearing. Texas is pre-eminently a cattle-breeding state. The abundance of suitable pasturage and the genial climate give it advantages over many other sections. The old custom of sending young cattle in enormous 'drives' into other states, where they were sold to be fattened, has given place to owners 'ripening' their own cattle, thereby securing better prices, and opening the way for manufacturing industries connected with the preparation of beef and hides, and for the direct export of beef abroad from Galveston and New Orleans. Texas ranks first in cattle-raising, and in the number of sheep, horses, mules, and swine it is almost without a rival. The breeds of all varieties of live-stock have been very much improved. Wool and dairy-produce are important staples. Since 1883, when its crop surpassed that of Mississippi, Texas has been the leading cotton state; it produces about one-fifth of the world's cotton crop, and Galveston is the chief cotton exporting port of the United States. Wheat is an important crop, and the other grains are extensively cultivated. Sugar and rice yield abundant harvests along the coast, and fruits and vegetables in great variety are produced in the southern sections. The principal sugar district is the 'sugar-bowl' in the Brazos delta. Honey is another product of considerable value, and the output of timber—mostly yellow pine—is important. Manufactures are connected with the agricultural industry, and consist of refined petroleum, flour, cotton-seed oil, textiles, &c. The state capital is Austin (pop. 35,000). Other important towns are San Antonio (161,000), Dallas (159,000), Houston (138,000), Fort Worth (106,000), El Paso (77,000), Galveston (44,000). The Houston Ship Canal (1915) connects Houston with the Gulf of Mexico, and has made Houston a great cotton port. There is a state university at Austin, and there are numerous teachers' (normal) colleges, technical colleges, and sectarian institutions. The state has about 16,000 miles of railways, while 1000 miles of its inland waterways are navigable.

The earliest settlements in Texas were made in 1685 by the French, but the Spaniards followed a few years later. The country formed part of the Spanish province of Mexico, which in 1822 threw off the yoke and became a republic. On 20th December 1835 Texas declared itself independent of Mexico, and in 1836 Houston (q.v.) was made president. In 1845 Texas, with an area of 375,000 sq. m., was annexed to the United States. All its territory except that now enclosed within its borders was ceded to the United States in 1850 for the sum of \$10,000,000. Texas had maintained continued war with Mexico, and its annexation was the prime cause of the war between that country and the United States. The state seceded from the Union 1st February 1861, and re-entered it 30th March 1870. The growth of Texas has been prodigious, and, though it ranks fifth among its sister commonwealths in population, it is in many aspects still in a transition period. In 1870 Texas had a population of 818,579, in 1880 of 1,591,749 (393,384 coloured), in 1900 of 3,048,710, and in 1920 of 4,663,228 (negroes, 741,694).

See *Histories of Texas* by H. Yoakum (2 vols. 1856), W. C. Baker (1873), H. S. Theall (1879), H. H. Bancroft (1885), and D. G. Wooten (2 vols. 1898); also W. B. Phillips, *The Mineral Resources of Texas* (Austin, 1915); T. H. Lewis, *Along the Río Grande* (N. Y. 1916).

**Texas Fever, or PIROPLASMOSIS.** See RED WATER.

**Texcoco** (*Tezcucó*) a city of Mexico, on the east shore of the salt lake of the same name, 25 miles by rail ENE. of Mexico city. The ancient *Acolhuacan*, once the chief seat of Aztec culture, it still contains traces of old palaces and of a noble aqueduct. Pop. 6000. The salt lake has an area of 92 sq. m.

**Texel**, an island belonging to the province of North Holland, at the entrance to the Zuider Zee. It is separated from the mainland by a narrow strait, called the Marsdiep, and contains about 35,000 acres of arable and pasture lands. Its sheep are famous both for their wool and their cheese. The Marsdiep channel or part of it is also often called the Texel; and here or hereabouts many important naval battles have been fought. Blake defeated Tromp and De Ruyter in 1653; Prince Rupert fought De Ruyter in 1673; Duncan blockaded the Texel (for a time with a single ship) in 1797; and a Dutch fleet of twelve ships of war and thirteen *Indiamen* surrendered to Admiral Mitchell in 1799.

**Textiles**, fabrics produced by weaving. See the articles in this work on Weaving, Spinning, Cotton, Fibrous Substances, Hemp, Linen, Jute, Silk, Wool, &c.; also on Bleaching, Calico-printing, Dyeing, &c.

**Thackeray, WILLIAM MAKEPEACE**, one of the greatest of English novelists, came of a widely scattered family, whose members engaged in the army, the church, and the learned professions. The Thackerays were originally a race of small landholders settled at Hamptsthwaite in Yorkshire. In fullness of time the younger sons began to leave their native village and try their fortunes in other walks of life. In 1711 we find the Rev. Elias Thackeray of Christ's College, Cambridge, established in the rectory of Hawkswell, Yorkshire. His nephew, Thomas Thackeray, became headmaster of Harrow School and the father of sixteen children; the youngest of whom, William Makepeace, was the grandfather of the novelist. This William Makepeace Thackeray went to Bengal in the East India Company's service, from which he retired in 1777 with a fortune. The fourth of his twelve children, Richmond Thackeray, born in 1781, was the father of the novelist. Richmond Thackeray also went to India in the Company's service, where he married Miss Anne Becher, a renowned Calcutta beauty, the daughter of a fellow civilian.

William Makepeace Thackeray, 'the only child of the marriage, was born on the 18th July 1811 at Calcutta. When he was five years old his father died; and soon after his mother married Major Carmichael Smyth, of the Bengal Engineers. She lived to survive her son. There were no children of the second marriage. On the death of his father, Thackeray, then a child of five years old, was sent home. He lived partly under the care of an aunt, Mrs Ritchie, who is recorded to have been surprised to find that her husband's hat fitted the little boy. At eleven he was sent to the Charterhouse, where he remained six years. Innumerable passages in his books prove that his schooldays had as important an influence on his art as the more adventurous boyhoods of Sterne and Dickens had on theirs. It should be added that the broken nose so conspicuous in all Thackeray's caricatures of himself was the accident of a school fight. While Thackeray was at school his parents returned from India and settled near Ottery-St-Mary in Devonshire, which is made the scene of the earlier chapters of *Pendennis*. In 1829 Thackeray was entered at Trinity College, Cambridge. He left the university after two years without taking his degree; but except from the

academical point of view his time was not wasted. Without being a scholar, he acquired a literary knowledge of the classics; and he gained all those indirect advantages which distinguish Oxford and Cambridge from other seats of perhaps purer learning. For one thing, Cambridge fixed his social status. Though afterwards he was to consort with Bohemians and other strange acquaintances into whose company a man is forced by adversity, he was never a Bohemian, and always faithful to the traditions of the class in which he was born and bred. It was at Trinity that Thackeray first appeared in print, the work being a burlesque of the prize poem on the subject of *Timbuctoo*, which had been won by Alfred Tennyson. 'A poem of mine,' he writes to his mother, 'hath appeared in a weekly periodical, here published and called the *Snob*. . . . Young had a pleasant wine party at which for a short time I attended. *Timbuctoo* received much laud. I could not help finding out that I was very fond of this same praise. The men knew not the author, but praised the poem.'

On leaving Cambridge Thackeray travelled for two years, in Germany for the most part, and on his return determined to go to the bar. It was necessary for him to choose a profession, as his fortune did not exceed some £500 a year. This, moreover, was soon diminished by losses from the failure of an Indian bank; and he was probably glad of an excuse to abandon the law for the more immediately remunerative pursuit of literature. From the very first he had a passion for drawing and literary composition, his fancy in both running to caricature. Early in 1833 he became a regular contributor to the *National Standard* and *Weekly Journal of Literature, Science, Music, Theatricals, and the Fine Arts*, a weekly journal, price two-pence, edited by F. W. N. Bayley, Esq., a then well-known journalist. With the nineteenth number Thackeray took the editorship, and subsequently became the proprietor also. 'My *National Standard*, as usual,' he writes from the Garrick Club. 'It has increased in sale about twenty in the last month. At this rate I shall be ruined before it succeeds.' The paper finally came to an end after little more than a year's existence. But art, not literature, was Thackeray's real ambition at that time. 'I think,' he says in a discussion of plans which followed the family losses, 'I can draw better than do anything else, and certainly I should like it better than any other occupation.' And towards the end of 1833 he joined his parents at Paris to study painting seriously. 'I am sure we shall be as happy here as possible, and I believe I ought to thank Heaven for making me poor, as it has made me much happier than I should have been with the money. I spend all day now, dear mother, at the Atelier, and am very well satisfied with the progress I make.' But Thackeray was not destined to realise the ideals of the envied 'J. J.' of *The Newcomes*. Money was wanted, and could always be earned by the pen. It is curious to observe that Thackeray, who must, one would have thought, have been conscious of his genius for fiction, was content for years to work in the humble and practical walks of journalism. How much or what he wrote at this period is not known, but it is certain that his portrait appears in a conspicuous place in the group by Maclise of the contributors to *Fraser* which was published in the magazine for January 1835. It was at this time too that he made his famous application to illustrate *Pickwick*.

In 1836 Thackeray married Isabella, daughter of Colonel Shawe, of the Indian army. His bride brought him no fortune, and he must have known that his marriage plunged him in grim earnest into the battle of life. Years afterwards, writing to a

friend, he says: 'I married at your age with £400, paid by a newspaper which failed six months afterwards, and always love to hear of a young fellow testing his fortune bravely in that way.' The newspaper which failed was the *Constitutional*, the property of the Metropolitan Newspaper Company, of which Thackeray's stepfather was chairman. It was started to rival the leading daily papers, but it only existed from September 1836 to July 1837, when it failed, carrying with it the rest of the fortune of Thackeray and his parents. During the first months of the life of the *Constitutional* Thackeray acted as Paris correspondent. Early in 1837 he moved with his wife to London, living first in Albion Street, Hyde Park, where his eldest daughter was born, and then at Great Coram Street. The marriage was a very happy one, and, in spite of the failure of the *Constitutional*, work was abundant and the future promising. Thackeray was writing regularly in the *Times*, which was then no less important than it is now, and also in the *New Monthly*, *Fraser's Magazine*, and in Cruikshank's *Comic Almanacks*. It is perhaps worth mentioning that in the *Times* he wrote the review of Carlyle's *French Revolution*. In 1838 was born a second daughter, who died in infancy; and in 1840 a third, Mrs Leslie Stephen, who died in 1875. The illness which followed the birth of the third daughter affected Mrs Thackeray's mind, and she never recovered, though she lived till 1894. This misfortune broke up the home. The children were sent to Paris to their grandmother, and for a year Thackeray travelled about with his wife from watering-place to watering-place, as the doctors recommended, but without result. The truth had to be realised, and Thackeray went back to London, alone and worse than alone. But his genius was by this time asserting itself, and, though his success in the vulgar sense of the word was not assured till the publication of *Vanity Fair*, not a year passed without his contributing to the magazines—in addition to a great mass of journalism—work the quality of which is not now disputed. In 1840 appeared his first book, *The Paris Sketch-book*, a series of reprints, followed in 1841 by the *Comic Tales and Sketches*, which contained the *Yellowplush Papers* from *Fraser*, *Major Gahagan* from the *New Monthly*, and the *Bedford Row Conspiracy*. These publications were a failure. In the same year the *Hoggarty Diamond* and the *Shabby Genteel Story* appeared in *Fraser*, followed by *Barry Lyndon* and *Men's Wives* in the same magazine. In 1843 and 1846 appeared respectively the *Irish Sketch-book* and *Cornhill to Cairo*. 'I can suit the magazines,' he wrote to a friend, 'but I can't hit the public, be hanged to them.' However, the magazines, and more especially *Punch*, the staff of which he joined in 1842 both as writer and drawer of pictures, enabled him in 1846 to set up house again; and he brought his family over from Paris to Young Street, Kensington Square. He was installed in this new home when the publication of *Vanity Fair* began, in monthly numbers, early in 1847; at which time he was also bringing out the *Snob Papers* in *Punch*. *Vanity Fair* was not at first a success. The earlier numbers failed to attract attention, and there was even a talk of stopping the publication altogether. Towards the end of the year, however, luck changed. Thackeray himself used to say that it was the success of the first of his Christmas books, *Mrs Perkins's Ball*, which made him fashionable. But, whatever the cause, there was no doubt about the fact. Every month the sale increased, and by the time *Vanity Fair* was finished it had made the author's reputation. Thackeray was no longer the servant, but the master of the public.

*Vanity Fair* had two results for Thackeray—the first, that he became a lion of society, and for some years enjoyed or endured the consequences of his position; the second, that he had no longer to look to *Punch* and the magazines for bread. The last number of *Vanity Fair* appeared in July 1848. It was followed in November of the same year by the first instalment of *Pendennis*. *Pendennis* was followed by *Esmond*, which was published in three volumes in 1852; and Thackeray then sailed for America with his lectures on the humorists, which he had already delivered with great success in London. On his return in 1853 *The Newcomes* began to appear; and on its conclusion in 1855, after the publication of *The Rose and the Ring*, which was begun at Rome for the amusement of his children, Thackeray again made a journey to America with his lectures on the 'Four Georges.' In 1857 he tried to get into parliament, standing for the city of Oxford as a Radical against Mr Cardwell, but was defeated by a majority of seventy-three. During this year and the next the *Virginians* came out. On the 1st January 1860 the *Cornhill Magazine* made its appearance, with Thackeray as editor. To the *Cornhill* he contributed *Lovel the Widower* and *Philip*, which seem to have been written somewhat against the grain, though *Philip* is specially interesting for the autobiographical element which it contains. But if the *Cornhill* did not bring out Thackeray's best work as a novelist, it furnished the occasion for the *Roundabout Papers*, the desultory form of which was a source of strength, not of weakness, and showed his powers at their best. In 1862 he gave up the editorship of the *Cornhill*, not being equal to the task of refusing manuscripts; but he continued to work for the magazine, and in that year he moved into a new house which he had built on Palace Green, Kensington. He always had a taste for bric-a-brac, which was not so fashionable then as now; and this house was the first built in London in red brick, in the style of Queen Anne, which has since taken such developments throughout the country. Here he began to write *Dennis Duval*, which, so far as he had completed it when he died, promised to be as great as anything he had done. But his health, which had practically been broken by a fever caught in Rome in 1855, was bad. No immediate danger was feared, but he was found dead in his bed on the morning of Christmas Eve, 1863. He was buried in Kensal Green. His bust is in Westminster Abbey, in Poets' Corner.

The best commentary on Thackeray's books is furnished by the story of his life, as will be seen, it is hoped, even from the short account we have given. The qualities of his work speak for themselves to the least experienced of those who read him, and little need be said by way of exposition. It may be worth while, however, to point out that as an artist he is unsurpassed by any novelist, either in style or in his powers of description and of character drawing, or in the crowning gift of telling a story. His ideal of the novel was, like Fielding's, that it should be not an affair of plot or a form of idyll, but a prose epic; and if this ideal has ever been approached it is surely in *Vanity Fair* and *The Newcomes*. In the second place, it is worth dwelling for a moment on Thackeray's extraordinary sense of fun. So much of his humour is tinged with irony that readers sometimes fail to observe what sources of natural laughter are in his books, and what an unrivalled exhibition they give of purely comic power. Lastly, a word must be said about his satire. There will always be a class to whom Thackeray must appear as attacking the very essence of human society and turning to ridicule its most useful and ornamental members. Critics of this school can naturally never forgive

him or sympathise with his genius. There is another class which takes a different view, and considers that what Thackeray calls 'snobishness' is neither an essential nor a necessary part of human nature. Which of these two opinions may be correct it is impossible to prove; but if one turns from what Thackeray ridiculed to what he admired, it must be admitted that for a satirist his views of life are strangely sentimental. No one, it is safe to assume, ever read *Vanity Fair* without preferring Rawdon Crawley to his brother Pitt. But if those who think the *Book of Snobs* unjust will consider the reasons for this preference, they will understand why Thackeray disliked some things and why he cared for others.

No authorised biography of Thackeray has ever been published. There is a good short Life in the 'Great Writers' series (1891), by Herman Merivale and F. T. Marzials. In 1899 Lewis Melville published a Life in two volumes. Some of his letters were published in *Scribner's Magazine* (1887). Many of his drawings may be found in *The Orphan of Pimlico* (1875). The best portraits of him are by Samuel Lawrence; there was also a vigorous statuette by Boehm. See also Lady Richmond Ritchie's *Chapters from Some Memoirs* (1894) and her introduction to the *Biographical Edition* of the works (13 vols. 1898-99; and the *Centenary Biographical Edition* (1910); Eyre Crowe, *Thackeray's Haunts and Homes* (1897); Sir W. W. Hunter, *The Thackerays in India* (1897); Whibley's study (1903); and another Life by Lewis Melville (1910).

His eldest daughter, ANNE ISABELLA (1837-1919), born in London, passed her childhood in Paris, her girlhood at Kensington, and first appeared as an author in vol. i. of the *Cornhill* (1860) with 'Little Scholars.' To this sketch succeeded a dozen or more volumes of novels, tales, biographical essays, &c., of which may be mentioned *The Story of Elizabeth* (1863), *The Village on the Cliff* (1867), *Old Kensington* (1873), *Miss Angel* (1875, its heroine Angelica Kauffmann), *Mrs Dymond* (1885), *Chapters from Some Memoirs* (1894) and *Blackstick Papers* (1908). She wrote introductions to *Cranford*, *Our Village*, and the fairy tales of Mme. d'Aulnoy; a book on *Tennyson and his Friends: Portraits and Reminiscences*; and edited her father's works with biographical introductions. *Letters*, selected and edited by her daughter Hester Ritchie, appeared in 1924. In 1877 she married her cousin, afterwards Sir Richmond Thackeray Ritchie, K.C.B. (1854-1912), permanent under-secretary of state in the India Office, who wrote the preceding article on his father-in-law.

**Thais**, an Athenian courtesan, famous for her wit and beauty, who was in Asia with Alexander the Great, and according to Cleitarchus—a doubtful authority—induced him, when flushed with wine, to fire the palace of Persepolis (q.v.). After his death she had several children by Ptolemy Lagi.

**Thalberg**, SIGISMOND (1812-71), Austrian pianist, born at Geneva, a natural son of Prince Dietrichstein and Baroness Wetzlar, was intended for a diplomatic career, but made his début as pianist at the age of fourteen. He was made court pianist at Vienna, toured in Europe, Brazil, and the United States, and settled down in 1871 at Naples, where he died. He married a daughter of Lablache. As a pianist, in graceful and brilliant execution and in manual dexterity, he had scarcely a rival. It is said that the under tips of his fingers were 'real little cushions,' which were used with such effect in producing wonderful legatos that Liszt once made the remark: 'Thalberg is the only artist who can play the violin on the keyboard.' His compositions are of no value.

**Thale**, a pleasure and health resort of Saxony, on the river Bode, 7½ miles by rail SW. of Quedlin-

burg. The town is near several points of interest in the Harz district, and has saline springs, some manufactures, and an old foundry (16th century). Pop. 14,000.

**Thales**, an early Greek philosopher, born in 640 B.C. probably at Miletus in Asia Minor, was the founder of the Ionic or physical school of philosophy, and a pioneer of Greek geometry and astronomy. His profound knowledge gained him celebrity as one of the Seven Wise Men. He is said to have recommended the Ionians, who were menaced by the Persians, to form a federation against their powerful enemy, and to select Teos as the capital, and later we are told he induced the Milesians to withdraw from a union with Croesus against Cyrus. He is also said to have predicted the eclipse of the sun which happened during a battle between the Medes and Lydians about the year 585 B.C.; and numerous other astronomical discoveries are attributed to him. Plutarch and others say that Thales was a trader, a calling which accounts for his reported visits to Egypt. He appears to have gleaned from the Egyptian priests his first knowledge of geometry, but he developed it in such a way as to be himself called the founder of line geometry. To him are credited the propositions that the angles at the base of an isosceles triangle are equal, that the angle in a semi-circle is a right-angle, that a circle is bisected by its diameter, and several others of importance. Thales is also regarded by some as the first Greek that speculated on the constitution of the universe. According to him the original principle of all things is water, from which everything proceeds, and into which everything is again resolved. In connection with this doctrine he had, it seems, some idea of a soul or force in water productive of all the phenomena we see.

**Thali'a**. See MUSES.

**Thalictrum**, a north temperate genus of Ranunculaceæ with rue-like leaves and small sometimes wind-pollinated flowers without petals. British species include *T. flavum*, the common meadow-rue.

**Thallium** (sym. Tl; atom. number 81; atom. wt. 204.1) is a metal which derives its name from Gr. *thallos*, 'green,' because its existence was first recognised by an intense green line appearing in the spectrum of a flame in which thallium is volatilised. It was discovered by Crookes in 1861 in the seleniferous deposit of a lead chamber of a sulphuric-acid factory in the Harz Mountains; and it was soon obtained in large quantities by M. Lamy. Thallium is slightly heavier than lead—a metal which it resembles in its physical properties. It is very soft, being readily cut with a knife or drawn into wire; and its freshly-cut surface exhibits a brilliant metallic lustre and grayish colour, somewhat between those of silver and lead. In contact with the air it tarnishes more rapidly than lead, and becomes coated with a thin layer of oxide which preserves the rest of the metal. It fuses at 554° (290° C.), and at a red heat becomes volatilised. The metal and its compounds give a bright green tint to colourless flames; the spectrum of thallium is marked by a single sharply-defined green line. It is used to produce a green light in firework displays, and is employed to render glass highly refractive. The metal can best be preserved free from oxidation by being covered with paraffin and kept below water. Thallium forms a number of compounds, including three oxides.

**Thallophyta**. See VEGETABLE KINGDOM, ALGÆ, SEAWEEDS, FUNGI, &c.

**Thallus**, a vegetative body showing little or no differentiation into leaf, stem, and root, and characteristic of the *Thallophytes* or lower Cryptogamia. Even in the higher members of the ascending series the thallus has neither true vessels nor woody tissue.

**Thames**, the most important river of Great Britain, flows east-south-east across the south portion of the country. Its four head-streams—the Thames or Isis, Churn, Coln, and Leach—rise on the south-east slope of the Cotswold Hills, the upper part of the main stream being often called Isis (a quasi-classical form of *Ouse*), especially in the neighbourhood of Oxford. The Thames or Isis flows east-north-east for about 35 miles, when, curving south-east, it passes Oxford, and flows on to Reading, where, after receiving the Kennet from the west, it again changes its course; and with a generally eastward course it passes Windsor, Eton, Teddington (the lowest of some forty locks from here to Lechlade, and the highest point to which the tide ascends), Richmond, London, and Gravesend, a few miles below which it expands into a wide estuary, and enters the North Sea. On its tidal estuary, and on the fact that like most British rivers it has no delta, depends the river's importance as a navigable waterway; the navigation is, however, somewhat impeded by what has been called a 'submarine delta'—banks formed of river sediment. From Lechlade to the Nore the direct length is 120 miles, and with the windings is about 210 miles (112 from Oxford to London Bridge); the area of its basin is about 6000 sq. m. Throughout the greater part of its course it forms the boundary-line between several of the southern counties. Passing Cricklade, it forms part of the northern boundary of Wilts, and below this point it separates the counties of Oxford, Buckingham, Middlesex, and Essex on the north from those of Berks, Surrey, and Kent on the south, but cuts across the county of London. Its chief affluents are the Windrush, Cherwell, Thame, Colne, Lea, and Roding, on the left; and the Kennet, Loddon, Darent, Mole, Wandle, and Medway, on the right bank. At London Bridge the width of the river is about 290 yards; at Woolwich, 490 yards; at Gravesend Pier, 800 yards; three miles below Gravesend, 1290 yards; and at its mouth, between Whitstable and Foulness Point, about 8 miles below the Nore, it is 18 miles across. At the Nore Light, the commonly reputed mouth of the Thames, the breadth is nearly 6 miles. The river is navigable for barges to Lechlade, and it is connected with several important canals, by means of which it maintains communication with the west and south coasts, and with the interior of the country. Vessels drawing 20 feet can reach St Katharine's Docks; much larger ones can ascend to Blackwall, 6 miles below London Bridge; and the largest sea-going steamers reach Tilbury Docks, 26 miles below. The part of the river in the immediate vicinity of London Bridge is called the *Pool*; and the part between the Bridge and Blackwall is called the *Port*. Two embankments have been formed, one since 1864 on the north shore from Blackfriars Bridge to Westminster, and one since 1866 on the south shore from Westminster Bridge to Vauxhall. Some of the great bridges which span the river at London are described at BRIDGE.

The Thames was given to the Lord Mayor of London in 1489, but for long commerce was greatly hindered by the existence of locks and weirs set up by individuals. In the 18th century the river administration was placed under commissioners. In 1857 the Thames Conservancy Board was established (see LONDON), but the Port of London Act (1908) put the administration of the river below Teddington in the hands of the Port of London Authority. Private companies owned the various wharves, docks, and quays until 1909, when they were bought up by the government. The port extends for 70 miles of the Thames, and the quays for 33. Above London the scenery is rich and beautiful, though not romantic, the numerous

islands or eyots lending a peculiar charm. The Thames is the best beloved of English rivers for those who boat for pleasure. It is the centre of boat-racing in England (see ROWING); the Thames watermen are renowned in song and story. Since Spenser's days 'the silver-streaming Thames' has been sung by England's poets; Herrick calls it 'Silver-footed Thamesis'; Denham's apostrophe has long been famous; and Pope has gracefully word-painted much of the scenery of its banks. It was (now alas! long since) famous for its salmon, as it still is for other anglers' fish; below London flounders and eels are still plentiful, while the young herrings and sprats, known as whitebait, are characteristic of the lower Thames.

The Thames has a copious bibliography of its own, many of these works being richly illustrated. A few books worth consulting are those by Huxley (*Physiography*, 1877), George D. Leslie, R.A. (1881; new ed. 1888), Church (1885), Herring (1885), Cassell (*Royal River*, 1886), Justin McCarthy and Mrs Campbell Praed (1890), Senior (1890), Pennell (1891), Wyllie and Allen (1894), Charles Dickens, jun. (1880), Sir Walter Besant (1905), Jerrold (1906), Vincent (1909), Belloc (1907-13), F. S. Thacker (1909, 1914, 1920), W. Higgins (1923), F. V. Morley (1926).

**Thames** (or GRAHAMSTOWN), New Zealand, a gold-mining town of 6000 inhabitants, on an inlet of Hauraki Gulf, 40 miles SE. of Auckland.

**Thamugas**, or TIMGAD, 'the Numidian Pompeii,' near the Aures Mountains, and 22 miles from Batna, which is half-way by rail from Constantine to Biskra. Here are in the solitude extensive remains of colonnades, temples, a forum, a triumphal arch in honour of the Emperor Trajan (founder of the city), and numerous statues and inscriptions coming down to the 5th century, when the Roman city was destroyed by the barbarians.

**Thana**, or NORTH KONKAN (see KONKAN), a British district of India, consisting of the island of Salsette and a strip of coast. The chief town, Thana, a seaport, is 21 miles NE. of Bombay by rail.

**Thane** (O.E. *thegn*), a member of a class in the old English community that stood distinctly below the old nobility (*eorlas*, &c.), but above the mere landowners or *ceorls*. The word *thegn* seems to have meant first soldier, then attendant, servant of the king, royal official; and gradually the thanes came to constitute a kind of nobility of service as distinguished from nobility of blood. Finally, however, the ordinary thane was simply a landholder on a larger scale than the *ceorl*—one who had five hides or more of land—and the dignity was hereditary, the 'king's thane' being a superior class. The thanes nearly corresponded to the Norman knights; and after the conquest they were mostly absorbed into the knighthood. After the reign of Henry II. the name of thane fell into disuse in England. In Scotland, on the other hand, where the title is occasionally used as late as the 15th century, the thane was a hereditary non-military tenant of the crown; and there is no foundation for the notion derived by Shakespeare from Boece, that the Scottish thanes all became earls.

**Thanet**, ISLE OF, forms the north-eastern corner of the county of Kent, from the mainland of which it is cut off on the western side by the river Stour and the Nethergong rivulet—the ancient Wantsome channel, completely silted up since the beginning of the 16th century. It is bounded on the N. and E. by the sea, and opens on the south side into Pegwell Bay. It measures 10 miles east and west, and about 4 miles north and south, and contains 26,117 acres. On the shores of the island are the well-known watering-places, Ramsgate, Margate, and Broadstairs; and on the

North Foreland, in the north-east, there is a lighthouse. Pop. (1871) 42,129; (1881) 50,646; (1921) 112,597. It is a parliamentary division.

**Thanet Sands.** See EOCENE SYSTEM.

**Thanksgiving Day**, in the United States, is an annual festival of thanksgiving for the mercies of the closing year. Practically it is a national harvest festival, fixed by proclamation of the president and the governors of states, and ranks as a legal holiday. In 1789 the Episcopal Church formally recognised the civil government's authority to appoint such a feast, and in 1888 the Roman Catholic Church also decided to honour a festival which had long been nearly universally observed—though nowhere with such zest as in the New England states, where it ranks as the great annual *family* festival, taking the place which in England is accorded to Christmas. The earliest harvest thanksgiving in America was kept by the Pilgrim Fathers at Plymouth in 1621, and was repeated often during that and the ensuing century; congress recommended days of thanksgiving annually during the revolution, and in 1784 for the return of peace—as did President Madison in 1815. Washington appointed such a day in 1789 after the adoption of the constitution, and in 1795 for the general benefits and welfare of the nation. Since 1817 the festival has been observed annually in New York, and since 1863 the presidents have generally issued proclamations appointing the last Thursday of November as Thanksgiving Day.

**Thann**, a town of Alsace-Lorraine (department Haut-Rhin), 13 miles NW. of Mühlhausen by rail. It contains a superb Gothic church (1516) surmounted by a spire of delicate open work, upwards of 300 feet high; and near-by are the ruins of the feudal castle of Engelburg. Cotton cloths, silks, chemicals, and machinery are manufactured. The town was taken by the French in August 1914. Pop. 7400.

**Tharandt**, a picturesque town of Saxony, 9 miles SW. of Dresden, is a favourite resort, and has an old and famous forestry school.

**Tharsis.** See TARSHISH; and for the modern Tharsis copper-mines, see RIO TINTO.

**Thasos**, an island in the northern Aegean Sea, off the coast of Macedonia, was famed of old for its gold mines, its marble quarries, and its timber. The mines and quarries are no longer worked. The surface is covered with wooded hills (the summit of Hypsaria being 3428 feet high), and though the timber resources are not exploited as they might be, there is an export of charcoal and some boat-building. Oil and honey are also produced. The population, mostly Greek, is about 15,000, distributed in some eleven villages, besides hamlets and scattered huts. Thasos was colonised by the Phoenicians, then by the Greeks (c. 700 B.C.). It fell to the Persians in 492 B.C., and later was subject in turn to Athens, Sparta, Macedon, and Rome. The Venetians took it in 1204, and the Turks in 1462. From 1841 the Khedive of Egypt held sway, but the Turks reaffirmed their possession in 1908. Greece obtained the island by the Treaty of Bucharest (1914).

**Thaumatrope.** See ZOETROPE.

**Thayetmyo**, a district in the Magwe division of Upper Burma; area, 4750 sq. m.; pop. (1921) 255,406. The chief towns are Thayetmyo (10,768) and Allammyo (11,219).

**Thea, Theaceae.** See TEA, TERNSTROEMIACEAE.

**Theatines**, a religious brotherhood of the Roman Catholic Church, which played a very important part in the internal movement for reformation which took place in Central and Southern

Italy towards the middle of the 16th century. The founders of this association were a party of friends, Cajetan di Thiene, John Peter Caraffa, at that time Bishop of Theate (from which the Congregation took the name *Theatine*), Paul Consiglieri, and Bonifazio di Colle. Cajetan and Caraffa, in concert with the two other friends named above, having resigned all their preferments, obtained in 1524 a brief of Clement, formally constituting the new brotherhood, with the three usual vows, and with the privilege of electing their superior, who was to hold office for three years. They were forbidden to possess property, and were to subsist entirely upon the alms of the faithful; and yet they were strictly forbidden to beg, or in any way to solicit charitable contributions. Their first convent was opened in Rome, and Caraffa, afterwards Pope Paul IV., was chosen as the first superior. He was succeeded in 1527 by Cajetan, and the Congregation began to extend over Italy, and afterwards into Spain, Poland, Germany, not reaching France till 1644. To their activity, devotedness, and zeal Ranke ascribes much of the success of that remarkable reaction against Protestantism which took place in the later half of the 16th century. The Theatines were also active as missionaries in distant lands such as Peru, East Indies, &c. The order declined greatly during the 19th century. Bodies of Theatine nuns were founded in 1583 and 1617 by Ursula Benincasa.

**Theatre** (from the Greek *θέατρον*, 'a place for seeing,' *θεάομαι*, 'I see'), a name given to that portion of the building in the enclosure sacred to Dionysus Eleuthereus in which the spectators sat in contemplating the lyric-dramatic spectacles evolved from the ancient rites of the god. It is now given to any building constructed to exhibit drama or other spectacle. The designation 'lecture-theatre' is given to a place built for university demonstrations in which sight as well as hearing is given full consideration. A room constructed for surgical work with a special view to sight is called an 'operating theatre.' This article treats only of the theatre as the home of the drama.

Since the beginning of the present century the study of the relationship of the place to the play, including all their modifications down the ages, has been attracting a growing number of scholars. By a gathering together of additional enlightening records and by a more scientific interpretation of the collected facts than was formerly made, the continuity of theatrical history is becoming apparent. It was thought during the 19th century that the Elizabethan theatre immortalised by Shakespeare was 'a theatre without precedent,' but a gathering chain of evidence shows the great extent of the classical forces which reached England in early Tudor times. Many points which were interpreted as showing puerility of Elizabethan scenic method, in the light of recent discovery and insight into the inherent nature of this form of human expression, are seen to be in line with the highest tradition of the most ancient theatre, to the living principles of which a return may yet be made. The Greek theatre is the prototype from which all European theatres are derived. This being so, it is one of the most interesting buildings in the world.

Discoveries made in Crete since 1900 have revealed, after centuries of oblivion, far more ancient places of spectacle than those of Greece, from which the modern theatre was more or less consciously derived. The oldest is at Phaistos, in the palace, the building of which is placed at c. 2200-2100 B.C. A terrace, cut in the slope of the hill on which the palace stands, has beyond it a flight of steps about 60 feet in length which lead nowhere, and are therefore presumed to have been constructed to

accommodate people in order that they might watch spectacles in the area below. The Homeric songs, which are held to depict a civilisation in transition from the Bronze to the Iron Age, make reference to a figured dance,

Such once was seen  
In lofty Cnossus for the Cretan queen  
Form'd by Daedalean art.

(*Iliad*, Book xviii.)

The excavations at Cnossus have brought to light the palace of Minos and, around the queen's chief apartment, a dado of dancing girls. Abutting on to the highway to the sea is a paved space of about 40 feet by 30 feet. On two sides of this are tiers of steps joining at a right angle. A small adaptation of this design has been found at Gounia.

The golden age of Crete is placed at c. 1500-1450 B.C. Its culture spread to Greece, and its own power passed away, whilst the splendour that had been was enshrined in Greek art. Scenes depicted on gems and rings found in Crete show priestesses dancing in a circle around the shrine of the Earth-Mother. The Eleusinian Mysteries in honour of Demeter, held in Greek temples long prior to the foundation of the theatre at Athens, included as part of the initiation of the worshippers a sacred representation of a dramatic nature. See MYSTERIES.

*The Classic Theatre.*—The Dionysian rites from which the Greek drama grew were communal festivals of Asiatic origin in time immemorial. In essence they were passionate expressions of the national desire for fertility and thanksgiving for the blessings of the god. They were celebrated at the time of the gathering of the grape, again at its pressing, and on the first drawing of the new wine with its tasting, and lastly in a great festival held at the end of the month of March, known as the *Great Dionysia of the City*. The celebrations required a large open space, to which a procession was made by the whole community, who there performed ritual movements around a central altar, or *thymelē*. The name *orchēsis* was given to the actions. This word is translated by 'dancing,' as being the nearest term, but it signified much more than the modern application generally includes. In ancient times dancing included the whole symbolism of bodily movement and attitude. References made to it by classical writers show that the arm and hand movements were even more studied than those of the feet, and the performers had power to reveal thought and feeling by an appreciable principle of correspondence. The circular space around the altar gained the title *orchestra*, as being the ground of the orchesis. The god Dionysus was represented by an image presiding over the altar. The poet Arion is credited by tradition with giving a measured form to the improvised song and orgiastic dithyramb or 'revel of the god' (c. 600 B.C.). Arion was a worshipper of Apollo, the 'Shaper,' the god of Order. The number of performers was now limited to a *chorus* of fifty men and boys, whom the rest of the community deputed to represent them while they became onlookers. In the city of Sicily the chorus celebrated the character of Adrastus, the type of unavoidable suffering, who was but Dionysus under another mask or aspect. The dramatic poet Epigenes of Sicily was followed by a succession of leaders of the chorus until Thespis, who is credited with the introduction of dialogue between himself as chief, or *hypokritēs*, 'one who answers,' and the rest, for the sake of variety and alternating some repose with the evolutions of the dance. It seems that, in B.C. 535, at the bidding of Pisistratus the ruler of Athens, Thespis united the Dionysian song and dance with the Apollonian rhapsodical recitation hitherto cultivated, par-

ticularly in Ionia. This amalgamation appears to have taken place in the orchestra within the enclosure sacred to Dionysus Eleuthereus at the foot of the Acropolis or Upper City. The remains of a circular dancing-place belonging to the 6th century B.C., and of successive theatres built on approximately the same site, have been excavated here.

Thespis as first actor, or *protagonist*, represented an imaginative figure of the god whose mask he wore, and in addressing the chorus he was elevated on to a narrow stage beyond the altar and facing the spectators. The community in this way was now differentiated into the chorus of dancers and singers in the circular orchestra, the contemplators in the theatre, and the imaginative figure on the stage. The state recognised the national passion and genius for dramatic art and proceeded to establish a great organisation of dramatic contests. Æschylus (524-456) introduced a second actor, the *deuteragonist*; a third, the *tritagonist*, was introduced by Sophocles (496-406). In the hands of these two supreme theatric artists dramatic expression reached its greatest height. The art of the theatre was a plastic projection of the drama as conceived in the minds of the dramatists. They did not begin by conceiving dialogue, but by conceiving a sequence of situations as between man and his destiny. The execution of the drama thus conceived required first the symbols of the place in which the imaginary *agôn* or contest was to be worked out.

*The Skênê*.—The stage was enlarged to a width equal to one diameter of the orchestra, approximately 65 feet. Passages, or *parodoi*, were left at either end between it and the seats of the spectators. By a convention growing out of the position of the Athenian theatre, that on the right led supposedly to or from the neighbourhood, that on the left, to or from a distance. The *parodoi* were used by the chorus and sometimes by the actors. Behind the stage, buildings were elaborated from the *skênê*, or 'covering made by art,' which was the first actor's booth or dressing-room. The façade, which in time

the look-out for the beacon signals in the opening of the *Agamemnon*. The ever-growing need of the dramatists for freedom in imagination expressed itself in an ever-growing ingenuity and experiment. According to Aristotle, perspective scene-painting was introduced by Sophocles.

Vitruvius, in his *Architectura* (written during the reign of Augustus), said: 'In the first place Agatharchus, in Athens, when Æschylus was bringing out a tragedy, painted a scene and left a commentary about it. This led Democritus and Anaxagoras to write on the same subject, showing how, given a centre in a definite place, the lines should naturally correspond with due regard to the point of sight and the divergence of the visual rays, so that by this deception a faithful representation of the appearance of buildings might be given in painted scenery, and so that, though all is drawn on a vertical flat façade, some parts may seem to be withdrawing into the background, and others to be standing out in front.'

Scenography was thus anciently regarded as a serious and not a trivial matter. In describing the ancient theatre Vitruvius said: 'The *scaena* itself presents the following scheme. In the centre are double doors decorated like those of a royal palace. At the right and left are the doors of the *hospitalia*. *Secundum* are spaces provided for decoration places that the Greek call *periaktoi*, because in these places are triangular pieces of machinery which revolve, each having three decorated faces. When the play is to be changed, or when the gods enter to the accompaniment of sudden claps of thunder, these may be revolved and present a face differently decorated. Beyond these places are the projecting wings which afford entrances to the stage, one from the forum, the other from abroad.'

The meaning of this passage has been endlessly disputed, chiefly owing to the difficulty of determining the sense in which the word '*secundum*' is used in introducing the description of the *periaktoi*. Notable renaissance architects and scenographers understood it to mean *beyond*, the required faces of the triangular prisms being viewed through the open doors. Others have assumed that the *periaktoi* were used in front of the scenic wall. The allusion to their use in connection with the entrance of the gods has been interpreted as meaning that the entrance was effected by their use, a ledge in one face accommodating the figure which was turned into sight. This interpretation confuses the *periaktoi* with another machine. Their use in conjunction with the entrance of the gods may have been to produce a *transformation* as a fitting accompaniment to the wonder.

Servius, in his commentary on the *Georgics* of Virgil, written in the 4th century A.D., records, as an alternative to the *periaktos* or *scaena versilis*, the *scaena ductilis* which could be withdrawn to display the next required species of decoration. At what date either of these first came into use is not known. One grammarian mentions the *periaktoi* among a list of appliances which might be ascribed to Æschylus.

With the advance of scenography three types of scene were evolved for tragedy, comedy, and satyr play which were performed in a sequence in one day. Vitruvius wrote: 'There are three types of scenes, one called the tragic, second the comic, third the satyric. Their decorations are different and unlike each other in scheme. Tragic scenes are

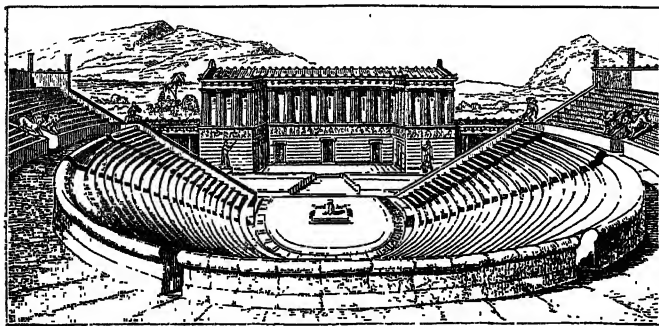

Fig. 1.—Theatre at Segesta, restored.

came to have a projecting wing, or *paraskēnia*, at either end, formed the background against which the drama was enacted. It derived the name *skênê* from that previously given to the whole stage building. The stage was sometimes called the *logeion*, or speaking-place, and sometimes the *proskēnion*, from its position in front of the *skênê*. The locale of the early plays was before a temple or royal palace. The architectural *skênê* was built to symbolise such a place. The text of the plays and other evidences indicate that there were double doors in the centre and others at either side. An upper story was required with a platform or balcony, the *distegia*, on which the actor might appear and obtain a distant view, as in the case of the watchman on

delineated with columns, pediments, statues, and other objects suited to kings; comic scenes exhibit private dwellings, with balconies and views representing rows of windows, after the manner of ordinary dwellings; satyric scenes are decorated with trees, caverns, mountains, and other rustic objects delineated in landscape style.

Lines in the *Georgics* (iii 24-25) of Virgil indicate that the poet was familiar with the sight of an *aulaeum*, a front screen which rose from below instead of being fixed above, as are the curtains of to-day.

*Machines*.—Vitruvius, besides describing the triangular pisms and the changes of scene effected by them, describes other machines. He shows that it was regarded as the duty of the rulers to provide them. Pollux, the Greek grammarian of the 2d century A.D., in his *Onomasticon*, also gives a list and description. When it was desired to show an interior scene, an inner stage was brought forward into the line of sight. This was known as the *ekkyklēma*. Pollux says that this device was used in tragedy, while the *exōstra* was used in comedy. The imagination of the great dramatists saw visions of gods driving through the air in chariots. Æschylus imagined Oceanus descending on a 'winged quadruped,' or the body of Memnon carried by the Dawn into the sky. Being a dramatic artist, and not merely a descriptive poet, he recognised that he must show these visions, not describe them. And so a powerful crane was placed in the western corner, the left, of the stage at the very top of the back-scene. By its means gods or heroes could pass from earth to heaven, or from heaven to earth, or hang suspended midway. This machine was so important that it became known as the machine, the *mēchanē*. The term *deus ex machina*, 'the god out of the machine,' soon became proverbial. The dramatists felt also that there is a correspondence between disorder in the elements, 'civil strife in heaven,' and disorder in human relationships. Thunder and lightning are to them direct symbols of divine power and wrath. It became immediately necessary to represent these symbols. So the *keramioskopeion* signified flashes of lightning (by prismatic mirrors or other means) and the *bronteion* thundered. A flight of steps, known as Charon's steps, enabled ghosts to ascend from below on to the stage. Other machines, in the nature of trap-doors, gave access to the Furies, river gods, and any subterranean beings. The dramatists sometimes wished to show the gods presiding in celestial splendour over human destiny. These then appeared on the *theologeion*, the gods' speaking-place, high in the back-scene. Aristophanes needed such devices for his comedies just as much as did the tragic poets for their serious work. Early writers merely record their use and designations, for the most part without comment, accepting them as a matter of course. But late commentators have enlarged upon their mechanical aspect in an apologetic manner, liable to prejudice the reader, forgetful of the fact that they were introduced by dramatic artists who produced greater effect than has ever since been witnessed. The machinery of the most advanced theatres of to-day is still a matter of pulleys, wheels, and grooves. It is only the dramatic aspect that the true play-goer criticises. Modern science has improved the mechanical power, and there has been an increase in elaboration and expense, but in principle these scenes and machines remain what they were. Their reconstruction was a matter of the deepest interest to all the great theatrical artists of the Renaissance, because a reaction between actor and scene is inherent in the nature of drama, and the poetic play requires the variety they were originally designed to effect.

The Athenian theatre gradually attained some permanence of form, and the first wooden structure was replaced by one of stone. Lycurgus interested himself in improving the building in the 4th century. 'A Greek town could hardly be so small as not to have its own theatre and dramatic festival.' The most beautiful structure was that at Epidaurus. Others of great interest are found at Eretria, Tyndaris, Delos, Sicyon, and Segesta.

*The Performers*.—The performances were treated as divine observances in honour of the god, and the performers had civil privileges as ministers consecrated to the service of religion. The world represented in the drama was an ideal world, differentiated from the natural world. The spectator saw projected on to the stage, not a human actor but the image, male or female, the mask, which the dramatist designed. Æschylus devoted study to these dramatic masks, which in his hands had considerable power of expression, and were designed to define and carry over the vast expanse of the theatre. Their use as a cover to the natural countenance of the actor left no room for doubt as to the imaginative nature of the art. The expression of the mask varied with the variety of the play of light and shadow and as the angle of the head changed, and thus it appeared alive with the life of art. The tragic actor was given height by the *cothurnus*, a boot of special design, and by the *onkos*, a head-piece worn above the mask, while his rich ideal costume suitably enlarged the appearance of his body. There was no thought of being 'just like life,' but every endeavour was made to realise the figures of imagination by emphasising certain aspects of nature. The Apollonian rhapsodical part of the drama was the portion of the actors. Sustained dramatic attitude and gradual transition was required. Their voices were the finest the country could produce. The members of the chorus were distinct from the actors, and preserved the Dionysian traditions. Their dances were of three kinds, appropriate to the tragic, the comedic, or the satyric play. Their masks and costumes were similarly of the three types. The mere appearance of the Furies, in a tragic chorus as designed by Æschylus, inspired terror in the beholders. The satyric chorus portrayed men as half-goat and half-human. The comic chorus was of a most varied and fanciful range of disguise as clouds, seasons, towns, islands; mythological beings, as Amazons, sphinxes, sirens; or animals, birds, fish, and insects, as dolphins, vultures, frogs, ants, bees. These were not represented with what is called realism, but with the selective genius of visual artists. The chorus formed a bridge, as it were, between the ideal beings on the stage and the spectators, who not so long before had been one with them. The prizes in the contests were awarded on the totality of impression, not on the work judged as literature. The playwright supervised the whole, and himself taught the actors their parts. They were paid high wages by the state. Some rich men, the *choregoi*, deemed it an honour to be responsible for provision of the chorus. Preparations extended over the year.

Æschylus was his own protagonist in the earlier part of his career. When he retired to direct the productions only, Cleander became his first actor. When he introduced a second actor, the part was fulfilled by Myniscus. Sophocles sometimes appeared, on one occasion as a harpist and on another as leader in a ball game in which he showed great skill. Cleidemides and Tlepolemus are referred to as actors of Sophocles. Nicostratus delivered long narrative speeches so well that to 'do a thing like Nicostratus' became proverbial for excellence of execution. The tragic actor Polus

of Aegina is said to have taught Demosthenes the art of delivery. About the middle of the 5th century, names of actors appeared in the official lists of the victors in the contests side by side with those of the poets and the *chorēgoi*. The foremost actors were the friends and sometimes the ambassadors of monarchs. In the course of the 4th century the poets, actors, chorus-singers, dancers, trainers, and musicians formed a guild. Its members were called *The Artists of Dionysus*.

*The Decline of the Classic Stage.*—The rise of sophistry in Athens caused the dramatists, led by the powerful genius of Euripides (c. 480–406), to change from inspirational artists into rationalists. The interest of the performance deserted the dancers in the orchestra, and became more and more centred on the dialectics conducted amongst the characters on the stage. These characters lost their divinity, and represented only the double of the citizen. This was anciently regarded as a decline or an advance accordingly as the sympathies were with the ancestral wisdom or the 'new thought,' and it is still so to-day. There can be no two opinions about the loss of power caused by the division. The significance of the chorus was reduced until it formed merely a musical link between the parts of the action. An alteration in structure accompanied the change of conception. The later stages were deepened and raised. The chorus, now representing human beings as sophists, poets, sorcerers, athletes, tradespeople, Persians, Thracians, Macedonians, and so on, was transferred to the stage or disappeared. At the end of the 3d century the orchestra was made watertight, and nautical episodes enacted therein. All along the theatre had been put to other uses besides that of showing the drama. With the fall of Athens and the rise of Roman domination further changes were made. In the Græco-Roman theatre, when the orchestra was not required for the spectacle, distinguished spectators were given seats therein, and the stage was lowered for their benefit. In the theatres which the Romans themselves now built, the typical orchestra formed approximately a semicircle. The scenic façade became a grand and ornate structure, while still retaining its essential features. A beautiful theatre on this model is found at Aspendos. Rome still preserves the ruins of the theatre of Marcellus, begun under Julius Cæsar, and finished by Augustus in 13 B.C., under the name of his nephew. Theatres have been excavated at Pompeii (q.v.), at Herculaneum (q.v.), at Verona, and more recently at Ostia, near Rome. Pliny records two temporary theatres which were made to revolve and form one amphitheatre when required. The finest specimen existing of a Roman theatre is at Orange, in the south of France. Sites of Roman amphitheatres can be seen in England at Dorchester, and other places. That at Caerleon is at present in process of excavation with the financial support of Lord Rothermere. The Romans gave the name *cavea* to the spectators' portion of the building. The orchestra was covered with sand for sporting events, and so derived the name of *arena*. The stage was sometimes called the *pulpitum*.

From holding a position of privilege and esteem, actors fell into disgrace, and by Roman law they were deprived of civil rights. Exception was made in the cases of Laberius and of Roscius in recognition of their genius. The name of Mæcenas, the patron of Bathyllus, a pantomimist, has long been proverbial as that of a lavish supporter of artists.

In the 1st century A.D. the stage-buildings of the Athenian Theatre were reconstructed. The façade was decorated with an inscription dedicating it to Nero. About two centuries later the stage was rebuilt by one Phædrus, this fact being commemor-

ated in verse on one of the steps. During the dark ages the place was deserted, and the theatre gradually disappeared from view. Even the site was forgotten, not to be located until 1765, when it was pointed out by Chandler. Excavations were begun in 1862 by Strack, a German architect, and continued for three years. An effort was again made in 1877. Dr Dörpfeld, acting on behalf of the German Archaeological Institute, directed further excavations in 1886, 1889, and 1895. *Das Griechische Theater* by Dörpfeld and Reisch, giving an exhaustive account of the discoveries, was published in Athens in 1896.

*The Christian Theatre.*—Besides the drama, pantomimical shows, gorgeous ballets, acrobatics, gladiatorial contests, sword-swallowing, and such marvels were given, in the early Christian era, and exhibitions of an appalling licentiousness, until all spectacle ended with the downfall of the Empire. Many of the theatres were converted into fortresses. The scene of the next drama was within the Christian church. During the 6th century, and particularly under the rule of Pope Gregory the Great, rites and ceremonies of a dramatic nature were elaborated. Outside the church wandering players appeared on improvised stages. The mediæval guilds manifested dramatic enthusiasm. Sir E. K. Chambers, in *The Mediæval Stage*, quotes references to a theatre in Exeter as early as 1348. In 1402 the Brothers of the Passion set up a temporary stage in the great dormitory of the *Hôpital de la Trinité*, Paris. Records of mystery plays show that they were acted on many curious stages. A *multiple* scene, that is, one with a required number of settings shown simultaneously, either in a long parallelogram or built in two stories, was often used. The beautiful carved reredoses of the 15th century show the method of visualisation; so also do the Stations of the Cross. Two pictures by Hans Memling are derived from such performances. One of these is in the gallery at Turin, and one at the Pinakothek, Munich. A miniature painted by Jean Fouquet, showing the martyrdom of St Apollonia, as designed by him for a mystery play, is reproduced by Mantzius in his *History of Theatrical Art*. Ten rooms, or mansions as they were called, are shown built in two stories with a semicircular head-scene. Brunelleschi designed on classical lines for the church scene. A wide study of theatre construction recommences with the publication, in 1486, of the *De Architectura* of Vitruvius, hitherto known to a few only in manuscript. The edition was dedicated to Cardinal Raffaele Riario, of the Roman Academy, the great patron of the revival of classical drama. An edition of the plays of Terence, published in 1493, has a woodcut showing the interior and exterior of a theatre, which appears to be octagonal in plan and to have three tiers of seats and boxes at the side of the proscenium, one of which is reserved for the municipal chiefs. The proscenium opening is provided with a hanging curtain and has three arches supported by pillars; two or three steps lead down from the inner stage to a forestage. A reproduction of the picture is given in *The Mask*, Vol. VI. By 1500 there were numerous academies in Italy devoted to the production of classical plays, and every ducal court had a hall temporarily or permanently converted into a theatre. George Vasari, in his *Lives of the Painters*, gives account of the study of perspective painting made by Baldassare Peruzzi from the earlier work of Piero dal Borgo. Peruzzi was also a student of Vitruvius. Bramante of Milan and Bramante of Urbino showed early interest in perspective. Leonardo da Vinci observed that 'Perspective is to painting what the bridle is to a horse.' The scenic production of drama with

perspective painting was taken as seriously as its oral production and accepted as an essential. Sir E. K. Chambers, in *The Medieval Stage*, mentions a theatre built in the Vatican by Alberti, about 1452, of which no performances are recorded. In 1513 Pope Julius II. called upon Michelangelo, Bramante of Urbino, one of the San Gallo family, and Raffaello to prepare a great festival. Flechig records a theatre built for this occasion. Engravings exist showing the Corte di Belvedere, in the Vatican, in form of a theatre. In 1514, on the death of Bramante, Raffaello was made General Superintendent of Fine Arts, in which position he was responsible for the building of theatres and for dramatic production. He caused a special translation of Vitruvius to be made. A performance of *La Calandria* by Cardinal Bibbiena was given at the court of Urbino in 1513, and again before the Pope in 1514. For this, Vasari records, Peruzzi 'made two such scenes as were marvellous, and opened the way to those who have since made them in our day.' Raffaello made a production, in 1515, in the Capitol, and, in 1518, the *Suppositi* of Ariosto and other plays were acted in the Castello di San Angelo with his scenic collaboration. Ariosto himself directed a theatre at Ferrara. The classic *aulaeum* was used at this time and remained in use, while curtains which rose or divided also came in. Theatres were built in the palace in Ferrara in 1528; in Mantua, by Bertani, in 1549; in Siena, by Riccio, in 1560.

A curious sketch belonging to about this period, made by Antonio San Gallo il Giovane, is preserved in the Uffizi Library. It shows the artist's interpretation of the scheme of the classic *scaena* as described by Vitruvius. He strangely places the periaktoi *inside* the wings at either end of the stage, though others understood Vitruvius to say that the projecting wings were *beyond* the periaktoi. Having so read the directions, apparently he is puzzled as to how the required face of the triangular prism was to be seen. He makes his prisms about half the height of the wings, in which he cuts windows to display the decoration called for. The drawing was reproduced for the first time in *The Mask*, Vol. XI. It illustrates the difficulty long made over the use of the periaktoi and the interest which their reconstruction, in reality a childishly simple matter once their position is agreed upon, evoked. The first edition of Vitruvius was followed by numerous editions, commentaries, and translations. In 1537 the *Architettura* of Sebastiano Serlio began to appear. The second book of this work, 1546, deals with perspective and in particular with scenography. Serlio was himself engaged in building temporary theatres in princely halls and academies, and gained a great reputation as a producer of spectacles. He based his practice on his study of Vitruvius and of his master Peruzzi. He regards stage works as 'things which stately and great persons do, which are the enemies to niggardiness.' He conceives his scenes in the three types of tragic, comic, and satyric; he is unconcerned with questions as to the relationship of the scene to the drama, accepting this relationship as inherent. He directs that an inner and a forestage are to be built, the inner stage to be raised one-ninth of its depth above the other and to rise as it recedes—this for the better displaying of the scene. (Such a rise is to-day called a *rake*, borrowing the nautical word.) Serlio adapts the Vitruvian description of the triangular perspectives into a *built scene*, constructing frames of wood, covering them with canvas and painting them. Such 'houses' he carefully foreshortens according to rules of 'false perspective.' He gives directions for stage-lighting.

In 1556 Daniello Barbaro, a fellow student

with Andrea Palladio, published an Italian translation of Vitruvius, which he followed with an edition of both the Latin and the Italian together, 1567. This was three times reissued. Barbaro understood Vitruvius's description of the triangular machines to mean that the three faces corresponded with the three types of drama and that the required face of a number of prisms was viewed through the open doors of the scenic façade. (From the early days of the great revival of interest in perspective, artists had been engaged painting walls in rooms, corridors, and gardens of private houses to give an illusion of a continuance of the scene.) The interpretation of Barbaro was put into practice perhaps before his book appeared, certainly soon after. Palladio built a theatre in Venice in 1565. He commenced the *Teatro Olimpico* in Vicenza in 1578. This was built for the Olympic Academy, of which he was one of the founders, and for which Serlio had built an experimental stage. Palladio died in 1580, and the theatre was completed by his son in 1584. Palladio's pupil, Scamozzi, carried out a stage scene which was derived from the interpretation of Vitruvius, as held by Barbaro, but instead of being on revolvable triangular frames, streets, five in number, were built to stretch back some twenty-five to thirty feet from the scenic façade. *Proscenium doors* or entrances at either side of the forestage were also provided with such streets. Perspective paintings were designed to close the distant prospect. This theatre, which still stands, represents the best ideas of the time. It was visited and studied by Luigi Jones (1572-1652). Scamozzi built a model theatre at Sabbioneta, in 1588-90, the present existence of which had been overlooked by historians until Mr Gordon Craig called attention to it in an article in *The Architectural Review* (Dec. 1923). In 1618 Aleotti completed the *Teatro Farnese* in the ducal palace, Parma. This also still stands and is a splendid witness to the genius of the designer and the generosity of his patron. It has a wide proscenium arch.

The academic buildings were at first occupied by academic actors, who learned their lines by rote and were aided by a *prompter*, whose box was sometimes placed in the middle of the front of the stage, or, at other times, within one of the wings in what became known as the prompt corner or side, P. S., that on the other side being the opposite prompt or O. P. side. The *Commedie Erudite ed Antiche* were soon opposed by amazing companies of professional actors and actresses who performed *all' improvvisa* or a *sogetto*, the *Commedie dell'Arte*. The finest of the improvising companies, early that of *il Ruzzante*, then those of *I Comici Confidenti*, *I Comici Accesi*, *I Comici Gelosi*, were eagerly invited to the royal and ducal courts of Europe. Their arrival was celebrated by tournaments; the most distinguished of their members were honoured by emperors, and their children held at the font by kings and queens; cardinals banqueted them and poets sang their praise. Isabella Andreini and her husband, Francesco Andreini, truly lived up to the motto of the company of which they were the pride—*Virtù, Fama, ed Honor ne fer gelosi*. Tasso celebrated the beauty of this lady, who was herself an accomplished poetess. On her death in the town of Lyons, at the early age of forty-two, while on a journey from the French court to that of Mantua, she was buried with civic honours, 1604. Her husband retired from acting and edited her writings and his own. Their son, Giambattista, headed a new company, *I Comici Fedeli*. From improvisation he elaborated many pieces, notably an opera, *Adamo*, which has been compared with the *Paradise Lost* of Milton. Alberto Ganassa, of Bergamo,

famous in the part of *Arlecchino*, took the traditions of the improvisers into Spain, where he appeared with a company at the court of Philip II. in 1574. At a later period, there followed in the extempore school of acting, Tiberio Fiorilli, known as *Scaramuzza*, the delight of the young Dauphin, who was destined to become Louis XIV., and the master chosen by Molière. The spirit of improvisation and brilliant experiment was shared by the scenic artists. A great wave of enthusiasm for theatre building spread over Europe. The neo-Vitruvian theories which determined the structure of playhouses on the Continent were also at work in England.

*The Early English Theatre.*—Henry VII. had a royal company of actors, and he granted a licence to a public company, which acted in inn-yards and cock-pits on improvised stages. At court Italian artists and craftsmen were employed to produce spectacle after the famous Italian manner. Henry VIII. inherited his father's taste and, in 1527, he built a 'place of plesyer,' called Long House, at Greenwich. In it Italianate masques and revels were held. Sir Thomas More, whose powers of improvisation first gained him preferment, was one of the animating spirits. Holbein decorated the house.

Documents, believed to date from 1573, indicate the tasks of those appointed to the Office of Revels in Elizabeth's reign: *The conynge of the office resteth in skill to devise, in understandinge of historyes, in iudgement of comedies, tragedyes and shewes, in sight of perspective and architecture, some smacte of geometrye and other thinges wherefore the best helpe is for the officers to make good choyce of cunynge artificers severally accordinge to their best qualitie, and for one man to allowe of an other mans invencion as it is worthie.* The Accounts, after 1564, show entries for the provision of scenes, the first being for the Christmas season, and specifying payments to linen drapers for 'canvas to cover divers townes and howsses and other divisses and Clouds for a maske and a shewe and a play by the childerne of the chaple,' &c. The absence of earlier entries for scenes in the Accounts is not to be taken as conclusive proof that they were not in use before. When James Burbage built the first public theatre, known as The Theatre, in Moorfields, Shoreditch, in 1576-77, it was at once recognised as being after the Italian model, and preached against as 'the gorgeous Playing place erected in the Fielde,' and, 'even after the manner of the old theatre at Rome, a show place of al beastlie and filthy matters.' Burbage was a member of the Earl of Leicester's players, a company which had been in existence since 1559. It is more reasonable to conclude that his ideas of theatre construction were derived from the culture prevailing at Kenilworth Castle, where plays were performed, than from cockpits, as has been adjudged. The Theatre certainly was used for sport, and the name *pit* popularly substituted for the classic 'orchestra.' A second theatre, The Curtain, was soon built near by, and references are found to 'the painted theatres' of Shoreditch. Then followed The Blackfriars, 1577; Paul's, c. 1581; Newington Butts, c. 1586; and The Rose, between 1587 and 1592. In *Plays confuted in Five Actions*, 1582, Stephen Gosson maintained that the devil entices the eye at the playhouse with 'nothing forgot that shall serve to set out the matter with pompe or ravish the beholders with variety of pleasure.' The Swan theatre was built in 1595. A drawing of this was discovered, in 1888, in the Library of Utrecht, in a MS. of Arend Van Buchell containing information communicated by his friend Johannes de Witt, who had paid a visit to London, presumably in 1596. The Van Buchell sketch is

therefore second-hand information. It is only a crude thing by an untrained hand, and by its first interpreters this crudity was transferred from the drawing to the subject, so that it was held to prove that the Elizabethan theatre was a poor makeshift. Reflection shows that if an engraver of genius had

Fig. 2.—The Swan Theatre, London, in 1596.

recorded the same scene the impression would have been finer. It must be correlated with the remarks in the MS. that, 'its form seems to approach that of a Roman structure,' and its columns were, 'painted in such excellent imitation of marble that it might deceive the most cunning.' The drawing gives the classic designations to the parts of the building, which has a round arena, a raised proscenium platform projecting into it, and a dramatic scenic façade, with its doors, upper story, and windows. The arena is unroofed, while the inner stage has a cover, known in Elizabethan stage parlance as 'the heavens' or 'the shadow.' Above is a turret in which were the classic machines for the descent of the god in the cloud, for the production of lightning and thunder. In battle scenes, ordnance was let off from its apertures. Behind the façade is the actors' 'tiring-room.' In the early days of the Elizabethan theatre, partly because of its private entrance and distinctive position, the lords insisted on occupying the room over the stage, which became known as 'the lords' room,' and viewing the play through its windows, though some of these were sometimes needed for the action of the play. Later they abandoned this for the front seats around the orchestra, which position usurped this designation for a period, as shown in the Swan sketch. The vain and pushful annoyed the actors and common spectators by sitting on the edge of the platform. It has been held that this custom alone would be fatal to the production of scenic illusion, but that would depend on the genius of the actors. Irving could create an illusion when reciting in a drawing-room with people close to him. When the Globe Theatre was built in 1598, incorporating material from the dismantled Theatre and all the best ideas

available, a rail was put round the platform. No authentic view of this theatre, forever to be remembered as the great scene of Shakespeare's activities, is known. Its form can only be deduced from a knowledge of the inherent requirements for the enactment of drama, from knowledge of the pronounced tendencies of the foremost theories of the age, from the Swan drawing and three other drawings of pre-Restoration theatres, and from documents the most important of which are copies of the plays known to have been enacted therein and the *Henslowe Papers* which include the building contract for the Fortune Theatre (1600). One popular misconception of the present day needs to be removed. That is the ill-founded notion that 'placards' took the place of other scenic symbols. Inscriptions of a decorative kind were used, in the elaborate scenic productions of the court, to fulfil the primary function of a playbill in announcing the title, and, it might be, the author and scene. There was nothing puerile in the manner in which they were introduced. The popular theatres saw the value of this as of other ideas from the same source and used it on occasion. The question as to whether or no perspective scene-painting was used at all at the Globe was first debated in print in Malone's *Historical Account of the Rise and Progress of the English Stage*, in the third volume of the Boswell edition of Shakespeare, 1821. To Malone's examination of the subject, concluding that such scenes were not employed, are there appended the comments of Steevens, who held that they were. The preponderance of 19th-century criticism, made by writers whose chief interest was in writing, was heavily on the side of Malone. The inquiry made by Sir E. K. Chambers, Mr Gordon Craig, Miss L. B. Campbell, and others into the facts concerning the Italian influences at work shows the view held by Steevens to be the more likely. Malone's blindness to the full course of the stream is apparent in his opening paragraph in which he says, 'The drama before the time of Shakespeare was so little cultivated, or so little understood, that to many it may appear unnecessary to carry our theatrical researches higher than that period. Dryden has truly observed that he "found not but created first the stage." . . . A minute investigation therefore of the origin and progress of the drama in England will scarcely repay the labour of the enquiry. However . . . and he gives a few points, the significance of which he fails to see. The 'placard myth' dates from Malone. Being familiar with certain few references to inscriptions in the text of some old plays, he hazarded the conjecture that these were habitually used, 'in the early part at least of our author's acquaintance with the theatre,' in place of scenic changes. The tentative suggestion was converted by others into a statement of fact covering the whole pre-Restoration period. Armed with this dogma, those with an inability to appreciate the essentially plastic and visual nature of theatric art deprecated the needs of the scene as subsidiary and accessory. The occasional use of inscriptions by the Elizabethan public players is no proof of the absence of scenic study. They had not the funds available to rival the court performances in expenditure, but no divergent theory is yet evident. They frequently gave command performances before the queen, and there seems to have been a reciprocal borrowing and lending of apparatus for court and public performances. The second Blackfriars Theatre, which had been commenced by James Burbage and, on his death, completed by his son Richard in 1596, for the first six years of its existence was virtually a court theatre subsidised by Elizabeth. After this, the Globe company used it as a winter theatre, it being a roofed building. It was a small recti-

lineal hall with three galleries along three sides. The best seats were on the ground floor. Prices of admission were high, so it was regarded as exclusive or 'private.' Artificial light was used, in both indoor and open-air theatres, to gain dramatic ends. Torches were brought in, or candles lit, in broad daylight, to symbolise a night-scene. The stages were provided with machinery including *traps*. A practical working fountain is required for *Cynthia's Revels*, which play of Ben Jonson's was performed at the Blackfriars. Burbage was famous as a visual artist, not merely for his powers of rhetoric. The complementary nature of visual and dramatic art is recognised in the *Character of an Excellent Actor*, drawn from Burbage, by Sir Thomas Overbury: 'He is much affected to painting and 'tis a question whether that makes him an excellent player or his playing an excellent painter.' The description of the great painting of the fall of Troy, in *The Rape of Lucrece*, is not that of a dramatist who would repudiate scenic art such as the Italians were then producing. Three generations of the Ferrabosco family were employed in England, the eldest being in this country by 1562. The diary record of an eye-witness at a performance of *Macbeth* at the Globe, made by Dr Forman, is not like the impression of a spectator who had merely read a placard: *Macbeth* and *Banquo* were to be observed 'riding through a wood.' The universities, grammar-schools, and inns of court had been giving plays, in what they reckoned to be the classical manner, from early in the 16th century. Dr Boas, in *University Drama Under the Tudors*, concludes that, 'There is little here to give countenance to the traditional view of the primitive simplicity of Elizabethan stage-arrangements.'

By a statute of 1572, actors who were unlicensed to a baron of the realm or person of higher degree were classed with rogues, vagabonds, and beggars, and liable to whipping. As in Athens, men and boys enacted all the rôles in the public theatre. Thus the two highest peaks of theatrical history were reached with an exclusively masculine organisation. The heroine was acted by a beardless boy; while the older female characters were represented by full-grown men. Great reputations were made by actors in both lines, notably by Edward Kynaston as a boy-actress, and James Nokes as an old woman. The heroines of Shakespeare are never placed in situations which it would be embarrassing and ridiculous for boy-actors to portray. A certain reticence and selection was forced upon the dramatist, whether he chose it or not, which the introduction of actresses destroyed. To what extent masks were worn is not known. Coleridge and Shelley both expressed the opinion that the Shakespearean drama requires masks, and observed how much was lost by their neglect. They hoped that an effort would be made to revive this art. Masks were used by the Italian professional actors, as a matter of course. In the Eastern theatre, which had something in common with the European classic ideal, masks were developed with consummate skill, and are maintained to this day. Oscar Wilde's essay on *The Truth of Masks* can be recommended for its discussion of Shakespeare's use of costume.

Inigo Jones, schooled in the finest Italian theory and practice, in collaboration with Ben Jonson and others, produced masques for the early Stuart court in a manner which enchanted all beholders. The writers saw that, 'In these things, wherein the only life consists in shew, the art and invention of the architect gives the greatest grace and is of the most importance; ours the least part, and of the least note in the time of performance thereof.' Some began to show jealousy, though they still had their own literary fields to themselves. But Ben Jonson, in his published *Works*, had written of the

beauty of a masque, 'Only the envy was that it lasted not still; or, now it is past, cannot by imagination, much less description, be recovered to a part of that spirit it had in gliding by.' He testified that a purely theatric performance, like the lily of his famous verse, 'although it fall and die that night,' may manifest a loveliness which no words can express. In his embittered years, when he had become, as William Drummond of Hawthornden testifies, 'a great lover and praiser of himself, and contemner and Scornor of others, given rather to lose a friend than a jest, jealous of every word and action of those about him,' he penned his *Expostulation with Inigo Jones*, with its oft-quoted ironical line, 'Painting and carpentry are the soul of the masque.' They are so, just as 'soul is form and doth the body make,' but this Jonson failed, and those who side with him in this matter still fail to understand.

The first five books of Serlio's *Seven Books of Architecture* were translated into English, in 1611, at the instance of one Robert Peake, who is presumed to be the Robert Peake known to have held the office of serjeant-painter to James I. Coryat visiting a Venetian theatre in that year, remarked that, 'The house is very beggarly and base in comparison with our stately Playhouses in England; neither can their actors compare with us for apparell, shewes, and musick.'

Such men as Wotton, Evelyn, Bacon, Wren, showed great interest in stage architecture and 'shewes.' A new edition of *Pratica di Fabrica Scene e Machine ne' Teatri*, by Nicola Sabbatini, in 1638, based largely on an earlier work by Ubaldo, summed up all that was regarded as finest in the craft. From Malone onwards, through the 19th century, writers mistakenly cited this work as initiating Italian scenic influences in England.

The first public opera-house, the rebuilt Teatro di San Cassiano in Venice, was opened in 1637. Movable scenery, behind a single proscenium arch, was regularly employed.

*French Influences.*—In France, where Italian scenic artists and companies had appeared since 1548, and possibly earlier, Cardinal Richelieu conceived the ambition of making the finest national theatre in Europe. He caused a model theatre to be built, especially adapted for the display of changing scenes. He founded the French Academy, whose members ceaselessly debated the *Poetics* of Aristotle. They clung unanimously to the 'Aristotelian' principles of unity of time, place, and action, while the dramatic artists were demonstrating that the only unity which matters is unity of dramatic action. They were divided by the contradictory passages in the *Poetics*, in which 'decoration' is first recognised as a necessary part of a performance and subsequently held in question. The treatise had been written when the power of sophistry had upset the proportions of dramatic art as exemplified in the productions of the highest master, Aeschylus. Students clung to one passage of the *Poetics* or the other accordingly as their delight lay the more in visual or in literary art. Richelieu appointed Mon. Hedelin, l'Abbé d'Aubignac, to the position of superintendent of the theatres of France. In 1640 Hedelin undertook to write a treatise, *Pratique du Théâtre*, which he published in 1657. An English translation, *The Whole Art of the Stage*, appeared in 1654. It contains the abbé's interpretation of classical theory and a project for a great theatre, the erection of which the death of Richelieu, in 1642, had prevented. The demand of the French Academy for 'verisimilitude' and 'probability,' matters most earnestly and quaintly discussed in this book, led to the scenic artist being regarded as definitely the subordinate of the writer by those

whose chief interest was in literature. Cardinal Mazarin introduced Italian *Opera Musicale* in 1645.

In England during these years, Sir William Davenant had long nursed the desire to produce opera as he learnt the Italians were doing, 'after the Manner of the Ancients.' In 1656 he gave *The Siege of Rhodes* at Rutland House. He had the help of Inigo Jones's assistant, John Webb, who continued to work on the scenic methods which had been adopted in the production of court and university performances. The stage on this occasion lay entirely behind the proscenium opening. Side-wings, no longer of the triangular design of the old *periaktoi*, but single *flats*, arranged in the receding order familiar to-day, remained stationary, while back-shutters were varied as 'illustrations' to the play. The use of this term by Davenant shows that he signally failed to appreciate any theory which sought a totality of impression. Painted borders, as they are now called, were suspended from the ceiling to screen the upper finish of the side-wings and back-shutters. In 1658 Davenant carried this arrangement into a public theatre, the Cock Pit, Drury Lane, with a production of *The History of the Spaniards in Peru*; this was followed soon after with *The History of Sir Francis Drake*, 'expressed by Instrumentall and Vocall Musick, and by the Art of Perspective Scenes.' Evelyn, who saw one of the operas, described it as being after the Italian way, 'But much inferior to ye Italian composure and magnificence.' There was no consistency between the scenic changes and the changes of dramatic action. The idea that there should be was late in development.

Under a royal grant of 1660, Davenant and Thomas Killigrew were given 'power and authority to erect two companies of players.' Davenant's company, known as *The Duke's*, began to play regularly at Salisbury Court playhouse. It moved to a new theatre in Lincoln's Inn Fields, in 1661 or 1662, where changeable scenes were the much advertised feature. In 1662 a royal patent was issued to Davenant and in 1663 another to Killigrew under which 'they and their heirs and assignees operated for over one hundred and eighty years in London.' The Theatre Royal, Drury Lane, was opened in 1663 by Killigrew with his company, known as *The King's*. *A Short Discourse of the English Stage*, by Richard Flecknoe, 1664, contrasts the magnificence of the new theatres with the simplicity of the old, but adds that, 'For Scenes and Machines, they are no new invention, our Masks and some of our Playes in former times (though not so ordinary) having had as good or rather better than any we have now.' Davenant's patent had authorised the performance of women's parts by actresses, and comedies of intrigue became the fashion both before and behind the scenes. After the Great Fire, Davenant, in 1668, engaged Wren to build him a new theatre in Dorset Garden. Davenant died a few months later, but the work was completed under the management of the actor Betterton, the scenic artist Harris, and Charles Davenant. Grinling Gibbons carved the decorations. In 1674 a new Theatre Royal, Drury Lane, designed by Wren, was built on the site of the first, which had been destroyed by fire in 1672. In 1682 the two companies were forced to unite, and the fine Dorset Garden Theatre was deserted.

In 1660 Giacomo Torelli (1608–1678), 'the theatrical wonder worker of the age,' retired from the Court of the Grand Monarch. Molière, at the head of *Les Comédiens du Roi*, had been producing his comedies in the Petit Bourbon Palace. This theatre was now demolished, and the company was given permission to act in the Palais Royal, where they shared the stage with the actors of

the *Comédie Italienne*. Gaspare Vigarani, who succeeded Torelli, destroyed all vestiges of his predecessor's work and erected the grandiose *Salle de Machines*, the court theatre of the Tuileries. His son, Carlo, was the great artificer for the grand production of the works of Molière and Corneille. Carlo Vigarani built the first opera-house in Paris, as the home of the *Académie Royale de Musique*, in 1672. His influence was felt in the production of opera in England. Bernini, Paradossi Troili, Mitelli, Giulio Paragi, Ferdinando and Francesco Galli da Bibiena are 17th-century designers of great fame. Chiaramonte wrote a book, *Delle scene, e teatri* (1675). In 1690 Duke Ranuccio II. of Parma had two theatres in his palace (the larger seating 4500, and the teatrino seating 2000), two in his garden, and two in the town. Between May 20 and 25 he gave an opera at night in the teatro, an open-air performance before ten thousand people in his garden, and two other operas in his teatrino.

From 1700.—The section devoted to *Théâtres et Machines de Théâtres*, in Diderot's *Encyclopédie*, illustrates the astonishing activity put into theatrical enterprise in the 18th century. Spectacle was no more the fine art it had been when concentrated in Italian academic circles as the expression of consummate artists and scholars. The few simple pulleys, wheels, and grooves which had served them, and Æschylus before them, were now multiplied and complicated with the intention of making scene-changing and 'effects' easier. The increased machinery, Mr Edward Gordon Craig remarks ironically in his book *Scene*, only made them more difficult, so that by 1800 nothing could be changed—all had become *repetition*. The great opera-house of San Carlo, Naples, is typical of this age of *Salles de Spectacles*. Members of the Bibiena family continued to work in the theatre. Other notable designers were Servandoni, Tessi, and Juvarra. The design of a theatre, as by this time established, and as it persisted, allows of space over the stage in which to 'fly' the front curtain and the painted cloths, and from which, as of old, divinities may descend in chariots and clouds of fire. The roof is raised to accommodate these out of sight until called for. The cloths, on *battens*, hang from a *grid*, above which may be a *barrel-loft* in which are windlasses and drums for raising and lowering heavy weights such as the chariot. The whole upper region is known as the *flies*. *Fly-galleries*, from which stage hands raise and lower painted cloths in scene-changing, are built against the side walls just above the height of the proscenium arch, or opening. Windlasses and drums may be on either or both of these galleries. Hand-labour alone may raise the cloth and lower it by its own weight. There are lines of pegs or hooks to which the ropes, which run over pulleys, may be tied. The front curtain may be worked from this level, or from that of the stage, as also may the cloths, by windlass or without. Counter-weights may be used to facilitate these operations. At the rear of the stage is a store-space or *scene-dock*, in which scenery can be stored. This space is cleared when the depth is required for the spectacle. (London theatres of to-day have often to dispense with the luxury of this depth on account of the ground rent, and have stores elsewhere.) Over the scene-dock, or where possible, is a *paint-room* in which the scenic artist works. A *property-room* is provided for storing small objects of dramatic use. Whole pieces of scenery can be raised through large transverse openings in the stage by means of platforms, which are termed *bridges*. These work in and out of the *well*, or *cellar*, a space under the stage nearly as deep as the proscenium opening is high. There is an intermediate floor running round the well, which is

called the *mezzanine*. It is about 8 feet below the stage, and from it the *star trap* and the *vampire trap* are worked. These are contrivances for the sudden appearance or disappearance of spirits. In the case of the vampire trap the actor throws himself against a couple of shutters in the stage, which open to let him through and immediately close again with great force, he landing on a mattress placed to catch him on the mezzanine. The star trap is cut in the stage like a star, with the points meeting in the centre. The actor stands on a little platform on the mezzanine, which is run up with tremendous force by counter-weights against the stage. The actor's head opens the points of the star, through which he shoots like an arrow, and before he reaches the stage again the star has closed and is kept solid by the platform on which the actor came up. Farther 'up' the stage—i.e. nearer the back scene—is the *grave trap*, used, for instance, at Ophelia's funeral. These are the chief traps, but the whole stage of a theatre is practically movable, the only immovable parts being the narrow joists, which are called *runners* or *fillets*.

The first Royal Opera House, Covent Garden, was built in 1732 by John Rich, who had come into the Davenant-Killigrew patents. The Little Theatre in the Haymarket opened in 1720 and was unlicensed. In 1736 Fielding here produced his satirical comedy *Pasquin*, which gave great offence to Walpole and led to the passing of the play *Licensing Act*, 1737, and the institution of the office of *Examiner of Plays*. The theatre gained its royal patent, and a licence to open from 15th May to 15th September each year, as consolation to Samuel Foote, its manager, who had lost a leg through an accident which happened to him while riding with the Duke of York. Enlarged and otherwise improved it reopened as the Theatre Royal, Haymarket, in 1766. Garrick has often been credited with having introduced *footlights* into England at Drury Lane Theatre, in 1765. Footlights, however, are shown, together with hanging chandeliers, as the lighting of an indoor theatre, in the frontispiece to Kirkman's compilation, *The Wits*, 1673. Provision is made for them in the directions of Sabbatini. A footnote to a satire, *The Theatre*, 1771, confirmed by Malone, makes it evident that Garrick's improvement was the substitution of concealed *winglights* for the visible candle-rings or chandeliers, in 'the focus' of which actors had hitherto been seen. The new winglights were fixed on *ladders* which could be revolved to heighten or lessen the power or to produce changes of colour. Their electrical substitutes of to-day are called *lengths*. Footlights are sometimes called *floats*, an early form of them having been constituted by wicks threaded through corks which floated in a long, shallow bath of fish-oil. Decrease or increase of light was effected by lowering the trough under the stage or raising it to the level. In 1777 Garrick introduced the continental ideas of the scenic artist, De Louthembourg, to Drury Lane Theatre. The subsequent admission of the scenic artists—De Louthembourg, Clarkson Stanfield, and Roberts—to the rank of Royal Academicians aroused the protest of a world of critics who were unaware of the aristocratic history of scenic art and of the association of the divine Raffaello with its renaissance.

The *Comédiens Français* acted from 1689 to 1770 in the *Théâtre de la Comédie Française* (*Théâtre Molière* or *l'Illustre*), then situated in the *Rue des Fossés St Germain*. The shell and remains of this famous stage can still be seen facing the old *Café Procope* in the renamed *Rue de l'Ancienne Comédie*. They then moved to the *Salle de Machines* in the Tuileries. In 1782 the company left here for a new

home constructed on the site of the *Hôtel de Condé*, where stands the *Odéon* of to-day. In 1789 or 1790 this theatre took the name of *Théâtre de la Nation*. In 1791 the actors broke into two parties, one group crossing back over the Seine to the *Théâtre de la République* in the *Palais Royal*, Rue de Richelieu. In 1793 Mlle. Montansier opened her *Théâtre National de la rue de Louvois* (part of the rue de Richelieu), facing the *Bibliothèque Nationale*. Molé of the *Comédiens Français* went over to this house. Fifteen days later, 3d September, all the actors, with the exception of the favoured Molé, were imprisoned. The records of the following years are full of troubles and changes until the nomination of Napoleon as first consul in 1802, when the *Théâtre Française*, with Talma, Fleury, and Molé in the company, was housed in the building in the *Rue de Louvois*. In 1804 the troupe was called *Comédiens de l'Empereur* and their home *Le Théâtre de l'Impératrice*.

Napoleon, by the *Décret de Moscou* 1812, brought together a number of reforms which he had been making since 1802, for the superintendence, administration, and discipline of French theatres. He gave Paris two weeks in which to close its many hundred theatres; eight alone were to be thoroughly developed. Provision was made for the training of actors and actresses at the *Conservatoire Impérial de Musique*. The clauses of this decree with very little alteration govern the state theatres of France still. The Opera House of Vigarani was succeeded by the present building, designed by Charles Garnier, 1875. The present *Théâtre Français*, adjoining the *Palais Royal*, is a reconstruction made after a fire, 1900.

Gas slowly replaced candles and oil, Drury Lane leading the London theatres (c. 1814). The brighter illuminant was not welcomed at first, as methods of acting and of scene-designing required readjustment. The old lighting, whatever its inconveniences, had lent beauty and disguised shabbiness. Under primitive methods of manufacture the smell of gas was obnoxious, so much so that, in 1828, Covent Garden Theatre closed for a week while the gasometers and apparatus for making gas were removed. (Amusing theatre bills relative to this were printed by Clement Scott in *The Drama of Yesterday and To-day*.) Owing to the terms of its lease the Haymarket Theatre continued to use candles and oil until 1843 when gas was introduced there, and, at the same time, the 'useless' forestage or apron was removed and the room appropriated to orchestra stalls. The following year J. R. Planché, Somerset herald and dramatist, gave an experimental performance of *The Taming of the Shrew* in what was supposed to be the Elizabethan manner, the stage being draped and placards being used. The loss of the apron must have been felt. An unauthorised performance of one of the pieces of Planché had led to the Act of 1833 giving legal protection to dramatic authors.

Experimental productions of high interest were made by Richard Wagner, who realised, what had been forgotten, that the scene and the play are conceived fundamentally together and as a vision. In this he had the championship of Nietzsche, who wrote *The Birth of Tragedy* to further the ideal. In 1872 the composer laid the foundation-stone of his great theatre at Bayreuth in which many fine principles were incorporated.

The band of musicians was concealed under the stage by Wagner. The bands of earlier times had sometimes been so concealed and had at other times occupied space in the orchestra, from which they eventually appropriated the name; or they had, as in Elizabethan times, performed in the gallery in the upper story of the scenic façade.

Pioneer productions were made in England from 1875 to 1886 by Edward William Godwin, F.R.S., an architect and designer versed in the highest traditions. His most notable work was in the production of *The Merchant of Venice*, on the occasion of Ellen Terry's first appearance as Portia, of *Claudian* and *Hamlet* for the actor Wilson Barrett, of *As You Like It*, as a pastoral in Coombe Wood, for Lady Archibald Campbell, and *Helena in Troas*. For this last named he constructed a temporary theatre, on the Greek model, within Hengler's Circus. Herbert Beerbohm Tree made an early appearance, as Paris, in this production and afterwards, paid tribute to the inspiration which he owed to its producer. Ellen Terry, in her autobiography, tells how the influence of Godwin, from the time she was fourteen, led her to 'think' and to 'aspire.' The knowledge which she gained from this source she was able to put at the service of Henry Irving in the productions at the Lyceum Theatre, which together they made unforgettable. Irving's management of this theatre opened in 1878.

In 1888 Tree, as manager of the Haymarket Theatre, was able to advertise, '*Electric light throughout the auditorium*,' but it was some ten years before a full installation was adopted on the stage. The Saxe-Meiningen Court Company brought their own plant when they played *Julius Caesar* at Drury Lane in 1881, in which theatre it was installed in 1889. The first iron curtain had been used here in 1794, and a safety curtain was fixed in 1898. Hydraulic lifts were built on the stage in 1897. The use of lime-light (see DRUMMOND LIGHT) came into theatres during the 1880's. This is now suffering eclipse by the more powerful light of gas-filled electric lamps and other inventions, but the proverbial phrase 'in the lime-light' has entered the language.

Amongst the professional scenic artists employed by Irving and Tree were Hawes Craven, Cuthbert, Telbin, and later Joseph Harker. Partly from policy, Irving interested such famous studio-painters as Alma Tadema, Burne-Jones, Madox Brown, Gustave Doré, Seymour Lucas, and John Tenniel in designing for him. Distinguishing between the value of the work of artists of the theatre and artists in the theatre, Ellen Terry's son before long had the temerity to question the value of this incursion. The over-elaboration of some of the productions of this time led to a reaction and an ignorant press campaign against the use of any form of scenic art.

The financial difficulties of theatre enterprise in an industrialised world were growing more apparent. The ground rent of the Opera House, Covent Garden, in 1732 was £100 a year; in 1761 this was raised to £300, and in 1792 to £940. London statistics, issued by the L.C.C., shows increases by thousands in rateable value.

The physical strain of running a theatre with rising costs became too great for an artist of Irving's stamp, and in 1899 he was expropriated by the Lyceum Theatre Company, Limited.

It is significant that Henrik Ibsen (1828-1906) retired from the direction of the bankrupt theatre of Christiania in 1862, and from being a playwright became what he recognised as being a lesser thing, a playwright—the most famous of his time in the world. He found the material of the theatre impossible of control, but he averred its control to be necessary 'if our theatrical art is not to perish altogether.'

August Strindberg (1849-1912), of Sweden, and Stanisław Wyspiański (1869-1907), of Poland, struggling against hard conditions, devoted genius to exemplifying that there is a high art of the theatre which is not included by the art of writing.

André Antoine founded the *Théâtre Libre* in 1887, and produced the works of the serious writers of the time, but they proved too serious for the mood of Paris. Antoine has been manager of the *Odéon*, and is recognised as the most able man of the theatre in France to-day, but at present he is unemployed.

In 1878 George Godwin, F.R.S.A., published a tract on *The Desirability of Obtaining a National Theatre*. A larger work on *A National Theatre*, by William Archer and Granville Barker, came out in 1907. A Shakespeare Memorial National Theatre Committee was formed and still endeavours to raise means for such a theatre. In 1904 a school of dramatic art was founded by Herbert Beerbohm Tree, which in 1920 was granted a royal charter. The theatre of this, the Royal Academy of Dramatic Art, was opened in 1921. Charles Dickens had helped in the foundation of an earlier Royal College of Dramatic Art, a charitable establishment for theatre-workers with a school, museum, and library, in 1860. This came to nothing. A lectureship in dramatic art was founded in 1921 at Liverpool University by Colonel Shute. Since 1925 the senate of London University has held examinations for a diploma in Dramatic Art. At East London College a school of dramatic study and research was inaugurated by Dr Allardyce Nicoll in 1925. Harvard University has a department of dramatic study which was for some years directed by Professor G. P. Baker, who made his 'Workshop 47' well known. In 1925 Yale University received a gift of one million dollars for the building of a theatre which Professor Baker now directs. The small Shakespeare memorial theatre at Stratford-on-Avon built by a local resident was destroyed by fire in 1926. The help of America is being sought towards raising a large sum for rebuilding on a large scale with endowment and foundation of a school.

A motion in favour of establishing a national theatre was brought before parliament by the first Labour government. The consideration of the question of the grant of a subsidy was deferred until such time as a national movement sufficiently strong should manifest itself. It may be remembered that the Athenian government of old only undertook supervision when the nation had demonstrated its unanimity. Royal, state-owned, or state-subsidised theatres exist under every European government except the British to-day. The Irish Free State on coming into being immediately granted a small subsidy to the Abbey Theatre. The policy of state-organised theatres in modern times is conservative. Exceptional talent has been known to work uneasily under the control of a committee of officials and to break away.

*The Art of Acting.*—Architects, painters, and musicians have recognised that, in the arts, genius, like ordinary intellect, must needs be amenable at first to such laws as preceding masters have been able to formulate from the sum total of their experience; have recognised that a license may afterwards be claimed to break away from a more or less improvised and arbitrary rule in such respects as it is defective and its basis unsound and insufficient; have recognised that genius in this way finds a truer definition of the law; and that it is by such means that expansion in the power of their arts has been made. The wiser of them see that the purpose of theory is to provide a basis of appreciation, of criticism, not a recipe for the production of art; that the mind requires some standard from which to measure vagaries. This the actor has been slow to understand. 'Rules may teach us not to raise the arms above the head; but if passion carries them, it will be well done; passion knows more than art,' said a spokesman repre-

sentative of a host, though not of all (Baion, of the *Théâtre Français*), with 'theatrical' emphasis. That natural impulse is more to be trusted than reason is the actor's claim and often his excuse for shirking further analysis. This attitude explains why many fine critics who have been fascinated by the activities of the stage have looked askance at the claim of the performer to the title of artist at all. The actors' trust in passion as a sure guide could only be allowed if the human species were still living in the age of innocence, acting, in correspondence with its order in creation, with the unreflective surety of the bee or the ant. But since ours is a fallen world, the actor's passions, untutored by reason, cannot be relied upon to overstep not the modesty of nature and so not to make the judicious Hamlet grieve. The actor will not arrive at an understanding of the scope of dramatic art by claiming the supremacy of passion and neglecting reason, but by studying the true relationship of instinct to reason and the complementary parts which these have played in the development of the theatre and the drama of which he is an instrument.

Antiquity has bequeathed us no treatise on acting. Its philosophers, however, were interested in the first question as to whether the existence of the actor were justified at all, and if so, how justified.

The rational mind of Socrates was unable to reconcile itself with theatrical representation; the didactic plays of Euripides were the only ones that he cared to attend. He is shown, in *The Republic* of Plato, defining art as imitation, twice removed from divine truth, and as the worthless mistress of a worthless friend and the parent of a worthless progeny: 'The peevish temper furnishes an infinite variety of materials for imitation; whereas the temper which is wise and calm, is so uniform and unchanging, that it is not easily imitated; and when imitated is not easily understood, especially by a general gathering of all sorts of persons collected in a theatre. For these people witness the imitation of a state which, if I am not mistaken, is far from being their own.' He concludes that a republic which would enjoy a good constitution will be justified in denying admission to the imitative poet (and with him, therefore, the actor), 'because he excites and feeds and strengthens this worthless part of the soul, and destroys the rational part.'

Euripides, in his old age, emerged from the influences of rationalism to the extent of singing:

Knowledge, we are not foes.  
I seek thee diligently;  
But the world with a great wind blows,  
Shining, and not from thee;  
Blowing to beautiful things,  
On, amid dark and light,  
Till Life, through the trammellings  
Of Laws that are not the Right,  
Breaks, clean and pure, and sings  
Glorying to God in the height.

(*Bacchae*.)

Following the condemnation of Socrates, came the recognition of Aristotle that imitative or representative art may be justified on the ground that, firstly, 'to learn gives the liveliest pleasure, not only to philosophers, but to men in general; whose capacity, however, of learning is more limited,' and learning can be effected through the satisfaction of the instinct of imitation implanted in man; and secondly, because 'there is the instinct for "harmony" and rhythm, metres being manifestly sections of rhythm. Persons, therefore, starting with this natural gift, developed by degrees their special aptitudes, till their rude improvisations gave birth to poetry,' and thus to drama.

Dramatic expression proceeds from improvisatory

forms to studied form, not only over one period, but over successive, and, it may be, overlapping, periods. The powers signified to the Greek mystics by Dionysus and Apollo belong to all time. The one is immediate spirit and the other calm reflection. We call them instinct and reason. They have shown themselves at times to be mutually antagonistic; by this antagonism they have instigated one another; and there have been occasional periods of reconciliation in which the balance of dramatic art has been attained. Provision must be made for their exercise to-day, if art is to be witnessed to-morrow.

Much dramatic criticism shows itself impatient of the times of improvisation, disdaining the immature, heedless of the seedtime and caring only for the literary harvest. The process, however, goes on in spite of those who would drive a red-hot poker through 'the dreary propaganda of clownship,' failing to see in the clown and the knock-about comedian the genesis of a Molière; and of those who object that the puppet is only a bag of sawdust or a stick of wood and are incredulous when reminded that this little figure is a descendant from the animated image of a god who taught the Asiatic and the Greek actor to have style, and doubtful of the promise that in a healthy dramatic environment the old stature will be re-attained. The more penetrating criticism which has studied to understand the origins of art in its improvisatory stages brings an added wisdom to the appreciation of mature forms.

That mediæval art took a lead from the Provençal poets and their neighbours is generally allowed. The art of the troubadours encouraged improvisation. In their *Courts of Love*, held during the 12th century, in every palace and castle in the territories south of the Loire, a dramatic *tenson* or contest was held. A subject was proposed, in extempore verse, by one lordly competitor, and answered, in a stanza of the same measure and order of rime, by another. On the conclusion, the court deliberated the merits of the question and the skill shown by the competitors. On some occasions ladies answered extemporaneously the verses which they inspired. The compositions followed certain rules, whilst, at the same time, it was recognised that the spur of the moment may be a wonderful thing and may prompt expression leading to a finer appreciation of art. The academies of Europe, when they came into being, sometimes encouraged these improvisatory exercises, but more often they devoted their studies to the analysis of classic forms and the more ponderous composition and performance of tragedy and comedy on ancient models. The academic theatre was confident of a superiority to the stage of the improvisers which grew up outside. But there came a day when one of its own students, with all the studied capabilities of the school, glanced over the road, listened to the spontaneous laughter and applause, noted a sudden breathless hush, and then crossed over to discover some magic which the academy had not taught him, apprenticed himself to the vagabond players, fathomed their secret, and became their leader, guiding natural high spirits by his educated criticism. This is what happened in the notable case of Angelo Beolco (1502-42), surnamed *il Ruzzante*, 'the quick of wit,' who is regarded as the founder of the *Commedia dell'arte*. Beolco forswore academic models and trained a company of improvisers on a principle of which he was deeply convinced. The literary student has difficulty in crediting this principle with the importance which *il Ruzzante* attached to it as, in fantastic costume, he stepped before his public and said:

'Let us amuse ourselves a little. Is there any one amongst you who knows who I am? You have

the air of wishing to reply that I am Mercury, or the reciter of arguments from comedies. No, you will never guess it. I won't leave you in doubt any longer. I am an elfin spirit. Do you know why I show myself? Why I permit you to see me? Do you know whence I come? From the other world; and I will tell you why. One of those who are there, called Accius by some and Plautus by others, has sent me to tell you that since a comedy is to be played this evening you are not to blame me if it is not in Latin and in verse and in beautiful language, because if to-day he were among the living he would not write comedies in any other style than that of this which you are about to witness. He begs you not to judge by this one those which he left written; for he swears to you by Hercules and Apollo, that they were recited in other days in terms very different from those which you see printed now, for the very good reason that many things which look well on paper look ill upon the stage.

This maker of plays learned by stage experience that words in themselves unremarkable may acquire remarkable significance from the circumstances in which they are spoken, while fine writing may prove too fine for the conditions of the theatre and require to be pondered in the study. Drama is not in the words but in the situation, in the relationship of the actor to his environment. Words may help to an appreciation of the situation, but they are not indispensable. Objectors to this argument feel that there must be some flaw in its logic, because Shakespeare seems to them to be the highest dramatic expression, and comes to them through the medium of language. But critics of great discernment, as Lamb, Hazlitt, Coleridge, have never been satisfied that the stage performance of Shakespeare (from the plays as 'printed now') equals the impression which they derive from the reading; while the testimony of very high intelligences is that the performances of the best troupes of the *Commedia dell'arte* realised their imaginings.

It seems that the bare information that these actors improvised from a mere outline, a plot, or scenario, which was pinned up in their sight behind the scenes, and a glance at which sufficed to prompt their performance, has left readers incredulous. For the reader, mentally putting himself in the place of the actor, feels that his own mind would be a blank if confronted with such a situation. It has to be realised that the plot was a deduction from action which had already been rehearsed in many forms and built by practice. Many associations with it had been memorised. The method allowed the actor to veer and return to line according to the feeling in the air and the mood of those to whom he found himself playing, and an electrical atmosphere might be generated from which trained genius might catch inspiration. Some help towards understanding the quality which gained Beolco his fame can be obtained to-day from noting the sense of adventure produced by an extemporaneous speech of an adept like Lord Birkenhead, as compared with the reading of a set speech by a speaker who is unable to depart from a manuscript and 'check at every feather that comes before his eye,' according to the vagaries of circumstance. Such skill must have a fund of observation and experience on which to draw. Coleridge said of his improvisatory lectures, 'I take far, far, more pains than would go to the set composition of a lecture, both by varied reading and by meditation.' And many of his auditors declared that 'they never felt so secure of a good lecture as when they perceived that I had not a scrap of writing before me.' The masters of this method give a lesson to those who read by rote.

The discovery of some 'plats' or plots preserved

from Elizabethan times (one of which is amongst the papers left by the actor, Edward Alleyn, and preserved at Dulwich College which he founded, while four others are in the library of the British Museum) suggested to Benjamin d'Israeli reflections on the intercourse between the Italian and English actors, and the possibility that the clown, Tarleton, attempted to introduce the extemporary comedy of the Italians. Dr W. W. Greg, who edited the publication of the plots, which he includes in *The Henslowe Papers*, regards it as an open question whether or no English professional actors ever practised anything like the improvisatory methods of the Italians. The fact that one of the plots is that of a play which had been worked out and was already in print in full, he holds to be conclusive proof that in any case these particular outlines cannot be regarded as comparable to Italian *scenarii*, and suggests that they were merely aids to the prompter and his assistants. This reasoning overlooks the fact that, as Beolo makes clear, it was part of the method of the actors to seize on plays already in full literary form, and to reduce them to a plot, and then recreate an entertainment on the theme according to fancy and circumstance and to the peculiar conditions of the stage. There is evidence that Gianbattista della Porta worked in this way. So the proof as to the English plots is inconclusive. The prompter in a theatre is the man who works from the fullest notes of all that is due to happen upon the stage. The actors, having learned their parts by the doing of them, need only to glance at the sequence of situations for the associations to be called to mind. There are several passages in Shakespeare which show his familiarity with the nature of extemporary acting. English companies did not attain fame on the strength of this principle alone, as did certain Italian troupes. But the spirit of improvisation was behind the expression, as always, and was present in some degree. Hamlet does not confound the artless gags of the clowns, which he would suppress, with the skilled efforts of judicious improvisers. When the court breaks up in disorder after the performance of the play within the play, the prince, on the spur of the moment, is supposed to extemporise four lines of verse. He then appeals to Horatio as to whether this, his skill as an improvisatory actor, would not procure him a fellowship with a cry of players. Horatio votes him only half a share; whereupon Hamlet tries again, to fail deliberately with the final rime. Hamlet's valuable but academic advice to the players received an entertaining reply, calculated to restore the balance of opinion on this important matter, in 'The Extemporary Players' Advice to Hamlet' (*The Mask*, vol. iii.). Molière undoubtedly made a close study of the material which Italian extemporary players had evolved, tested, and found good.

Criticism of acting during the 18th century was still puzzled as to the relative parts played by instinct, or natural sensibility, and by judgment. In 1750 *The Actor: A Treatise on the Art of Playing* appeared. The author was John Hill, M.D., self-styled Sir John Hill. A free translation of this, with many additions, was made by Antonio Fabio Sticotti, and published in Paris in 1769 under the title *Garrick, ou les Acteurs Anglais*. It was this work which prompted Diderot to write his famous *Paradoxe sur le Comédien*, commenced in 1773 but not published until 1830. The writer of the earlier treatise had propounded the question as to whether natural sensibility, the capacity for feeling, was the chief requisite for success as an actor, and had come to the conclusion that a man who was himself a lover could best portray the sentiment of love; a husband who was of jealous disposition

could best, as an actor, transmit the impression of jealousy, and so on. This argument filled Diderot with intense disgust, for he saw that an expression of nature is not to be confounded with a work of art. The course of his essay is not always quite logical, nor is it easy to follow, because of the shifting value which he gives to the word 'sensibility.' His question is not only the silly-season topic, for the introduction of which the essay is responsible, Should actors feel? It is the more subtle one, Should actors be subject to their natural capacity for feeling at the time when they are acting? His answer is the right one—No. As 'one writes of falling tears but they do not fall while one is polishing one's verse,' so the actor must represent from the image of feeling and not the present actuality. Only the cool head, a profound judgment, and an exquisite taste can enable an actor to approach the state of being an artist, as that term is used of fine writers, painters, and musicians. 'Extreme sensibility makes middling actors; middling sensibility makes the ruck of bad actors; in complete absence of sensibility is the possibility of a sublime actor.' Diderot fancied that the Garricks of the stage have this absolute and sublime mastery of their personal feelings. In both of these treatises it is recognised that whilst inferior players are content to be poor puppets whose strings are pulled by the writer of plays, finer actors are collaborators, and contribute qualities unconceived by the playwright. Talma (1763-1826), in his *Reflections on the Actor's Art*, and Irving, in his introduction to the English translation of Diderot's essay (1883), both discussed the question of the sensibility of the actor, but without making the distinction between feeling as existing in nature and as represented in art which Diderot tried to make. Irving, however, recognised that 'It is necessary to this art that the mind should have, as it were, a double consciousness, in which all the emotions proper to the occasion may have full sway, while the actor is all the time alert for every detail of his method.' These arguments rested here until Edward Gordon Craig carried them a step further with his essay on *The Actor and the Über-Marionette* (1907), in which he shows it to be impossible for the human actor to maintain complete absence of natural sensibility. Mr Craig points to the image as the type of perfection to which the human actor approaches as he advances in power until he reaches a point at which he wishes to be neither the puppet of a writer nor yet the collaborator with one, but himself a creative artist even as other artists, forming his own images and directing their animation, these images to be of 'dead' matter till he gives them the life of art. Only so can the actor make the full transition from natural expression to art expression. This is, in fact, what the actor-dramatist Æschylus did in a great way, and to advance in that direction, however slightly, is still to advance from chaos towards design. A clear appreciation of these distinctions is necessary before the analysis of the possible 'art' of acting can proceed.

Lessing (1729-1781) remarked with sorrow that, 'We have actors, but no mimetic art. If in times past there was such an art, we have it no longer; it is lost; it must be discovered anew. There is enough superficial chatter on the subject in various languages, but special rules, known to every one, pronounced with distinctness and precision, according to which the blame or the praise of an actor can be defined in a particular case, of such I know scarcely two or three.' Schlegel criticised the limitations of Lessing's own theory of dramatic art, *Dramaturgie*; he found also that the *Mimik* of Engel, a disciple of Lessing, failed to provide the complete system of mimicry which its author

supposed it to give. A complete system of mimicry would yet not provide the basis for the criticism of the art of acting, for art passes beyond impersonation or mimicry to the representation of ideas. Since the stage, ideally, is the mirror of nature, it follows that the criterion, of which many have felt the need, will only be arrived at by the perfecting of the all-embracing science of correspondences, correspondences of soul and body, spirit and form, which Swedenborg attempted to recall from the wisdom of the ancients. Dramatic study, in some measure related to the teaching of Swedenborg, was pursued by François Delsarte (1811-1872), who conducted a notable school of research in the Rue de Courcelles, Paris. In regard to acting in particular, he attempted to define scales of movement comparable to the basis to which musicians refer their art. Delsarte realised that as between the lowest note of an octave and the highest there are, theoretically, an infinite number of sounds differing in character, and practically, a large number appreciable by the ear, so an infinite series of expressions lies between any feature (as the eye, the hand, the mouth) being closed and expanded to the extreme. As also musicians select a series of sounds differing from one another by well-defined steps or degrees from which to construct music, Delsarte believed that natural physical expression must be given definition before it could be transmuted into an art comparable with that of music. Eastern dramatic technique is in fact based on such definition. An analysis of the tendency of Delsarte's work, correlated with that of Swedenborg in its dramatic aspect, is given by the present writer in *First Studies in Dramatic Art* (1926). This provides, not a prescription for acting, but a criterion from which to measure individual expression in the theatre.

Gustave Flaubert held that 'Art should be raised above personal affection and nervous susceptibility. It is time to give it the perfection of the physical sciences by means of a pitiless method.' Artists of the theatre, of like conscience, feel the truth of this, but their opponents fail to see that, with the physician, they would be cruel only to be kind.

*The New Movement.*—Since the opening of the present century Mr Edward Gordon Craig, by his productions, writing, and designing, has earned for himself a unique position as 'the first æsthetician of the theatre.' The movement founded by him has for its aim the rejuvenation of the whole fabric of the theatre and recognises its art to lie in the transfiguration of its material. It has exposed the fallacy of the mischievous contention that the words of a drama are its *spiritual* part and the visible realisation its *material* part. It distinguishes the intellectual conception or vision as a spiritual thing which may be materially manifested by whatever signs the peculiar conditions of the theatre allow. Gordon Craig was born in 1872 and, in 1876, made a very youthful appearance on the stage in *Olivia*, at the Court Theatre, London, in which play Ellen Terry, his mother, was acting the name part. From 1889 to 1896 he served an apprenticeship to the theatre, acting most of that time in the company of Henry Irving, the memory of whose acting is always present in the pupil's work. After making a number of experimental productions in London, he went to Berlin on the invitation of Dr Otto Brahm, of the Lessing Theatre, for whom he produced a version of Otway's *Venice Preserved*. In 1905 his theory of production was published in German in an illustrated dialogue, *Die Kunst des Theaters*. An appreciation of the full implication of his point of view required a considerable readjustment of the prevailing mental attitude of the workers in the theatre, whom he principally addressed. Though not aiming at an

exclusive theatre and trusting to the impression of the naive spectator, the appeal to the discernment of the sophisticated required to be negotiated with skill if the whole effort which he intended to make to rediscover the 'lost' art of the theatre were not to be compromised. Mr Craig already had in mind the possibility of using the mobile instrument of light to replace the paint of the studio painter's palette; he wanted one *Scene* with a changeable face, rather than static scenery, which, however proficiently shifted, could yet be improved upon. Taking long views, he advised the foundation of a central school of scenic study which should feed the commercial theatre with tested experiments rather than practice in public. Max Reinhardt, who had been an actor in the company of Otto Brahm, and since 1901 the director of the *Kleines Theater*, invited Gordon Craig to produce for him a number of plays. The firm behind Reinhardt, however, wanted 'quick returns,' which it was not to the artist's purpose to provide. So Reinhardt, becoming the director of the *Neues Theater*, the *Deutsches Theater* (with its turn-table or revolving stage), and the *Kammerspiel*, with the assistance of Ernst Stern as scene and costume designer, carried out his own interpretation of 'Craig's ideas,' as they were called. The Berlin correspondent of *The Stage Year Book*, 1912, said, 'Reinhardt lives as it were what Craig has developed in the idea.' Reinhardt was hailed as the practical man, while Gordon Craig was regarded with impatience as a fine dreamer. Reinhardt organised the production of the wordless plays *Sumurun* and *The Miracle* from Stern's designs. These startled, interested, and even enthralled London when seen there in 1912. Admirers of the earlier productions of Gordon Craig could not discover the fine quality of his work to be present. Mr Craig had in the meantime been invited, in 1910, by Constantin Stanislavski, to visit the Moscow Art Theatre (founded in 1898), which had been developed from a school of amateur enthusiasts. By his thoroughness and generosity of outlook, together with his own and the collected talent of some half-dozen very able assistants, Stanislavski raised his theatre to the foremost position in pre-war Europe. He had a considerable private fortune, and was able to find supporters who were content to wait for ten years for their first very small dividend. The dramatic method followed by Stanislavski is characterised as that of 'the fourth wall,' which means a technique which aims to give spectators the impression that, in looking through the proscenium opening, they are looking through a supposititious fourth wall at actors who are apparently unconscious of their presence and acting as in natural life. In the production of the plays of Anton Tchekhoff, Stanislavski brought this method to its perfection. His direction to his players was, 'Above all there must be no suggestion of theatricality,' using that word in the derogatory sense which has become attached to it. That, however, did not prevent him from providing Gordon Craig with an opportunity of experimenting further with his opposing principle that 'The theatre shall be theatrical and nothing but theatrical'—redeeming the word from its illegitimate use. The theatres of Europe and America to-day, in so far as they have any conscious art, range themselves behind one or other of these two principles. Stanislavski, with the assistance of Vsevolod Meierhold, who had been a member of his company from its commencement, had in 1905 founded a Studio Theatre as a training ground for new talent. Meierhold here demonstrated his divergence from naturalistic methods. From 1906 to 1908 he directed the Komissarjovskaya Theatre in Petrograd. Meierhold then became director of

the imperial theatres in Petrograd, from which position he exercised a wide influence. He gave opportunities to many scenic artists, and in particular to Alexander Golovin. Gordon Craig's designs and writing were well known to this group before his visit to Russia. The growing number of books bringing information about the theatre of the East shows that it had always been a theatre of 'Belief or Make-Believe,' but never of naturalism, until recent western influences made it waver a little. The Moscow Art Theatre put *Hamlet* into rehearsal in 1911, following the directions of Gordon Craig, and it was produced in 1912 in a 'scene for the poetic drama.' This scene was described in the *Times*, 23d Sept. 1911, and more fully by the inventor in his book, *Scene*. It consists of monochrome screens to which a play of light is related, 'as the bow to the violin,' in expressing the changing character of the dramatic environment. The same year Granville Barker, who had made a reputation as a producer of literary drama, notably of the plays of Bernard Shaw, remarked that Craig, like William Blake, was 'good to steal from,' and began producing plays of Shakespeare in the manner which Reinhardt was proving successful. The fore stage or apron with its proscenium entrances, which had been removed from London theatres as useless, had hardly disappeared when its dramatic use was remembered. The *Elizabethan Stage Society*, founded by William Poel, in 1895, had called for its return. Granville Barker restored it in a temporary form at the Savoy Theatre for these productions. It is now rebuilt in a number of theatres.

Isadora Duncan, who had found little encouragement in London, to which she came from her native town of San Francisco in 1900, from 1904 was able to fill theatre after theatre to overflowing in other capitals by dancing alone or with a company of children whom she adopted and trained. Hers was dancing in the ancient sense; besides having a buoyancy and spontaneity which anyone with eyes to see could appreciate, it had a significance which required some initiation into the silent language of the mime. It had a very clear relationship to the teaching of Delsarte, which the dancer had absorbed at an early age. Auguste Rodin, Henri Lavedan, Eugène Carrière, Augustus John, and other artists of great eminence paid tribute to her unique power. The finest dancer of the Russian Imperial Ballet, Nijinski, recognised that she had an immediate effect on the choreography of that company, members of which were selected in childhood and trained, at the expense of the state, in an exacting technique of Italian derivation. Though, in Nijinski's words, Isadora Duncan opened the door of their cell to the prisoners, these dancers were only able to go a little way on her path. She had nothing to learn from them; they indeed demonstrated most of the things which she avoided in the dance. One touch of their artifice would have destroyed the impression of absolute integrity which she gave. When she appeared in London in 1921 it was left to musical critics to pen appreciations; our dramatic critics seem to have thought that, not being verbal expression, it was out of their line; but in that they were mistaken. Yvette Guilbert also demonstrated dramatic principles which are in need of re-affirmation. She proved that an artist of the theatre may be creative, deriving from literature and other arts but forming an utterly distinct art.

Nicholas Evreinoff, who had in 1908 published a book of theory attacking naturalistic theatre production, succeeded Mierhold as director of the Komissarjevskaya Theatre, Moscow. In 1910 he became *régisseur* of the Krivoye Zerkalo Theatre, and he has since been very active in producing his

own plays and a number of books of theory, in which he develops the view that 'monodrama must present the exterior spectacle in correspondence with the internal spectacle.' In 1914 Alexandre Tairoff founded the Kamerny Theatre in friendly opposition to the Moscow Art Theatre, from which some of its actors were drawn. These managements carried on through the time of war, and continue under the Soviet rule.

In Germany, Ernst Toller and Georg Kaiser, following the lead of Frank Wedekind, and in Czechoslovakia, the brothers Karol and Josef Capek, have made reputations as 'expressionist' dramatists of 'stylised' productions. These terms, the delight of some journalists and bane of others, are but tiresome names for a somewhat crude perception of the old truth that art is expression differing in some way from the natural, and calling for a style of its own.

Stanislavski and his company visited some cities of Europe before the war, and again, with an extension to U.S.A., soon after the armistice. The Kamerny Theatre has followed them. The Habimah company, of Moscow, acting in Hebrew and making an impression by studied plastic expression, has toured Europe and America. None of these companies has ventured to London, which has the reputation of giving poor support to theatrical experiment. Even during the darkest days of the war, Max Reinhardt was supplied with funds wherewith to build the Grosses Schauspielhaus to which he transferred a type of production with which he had experimented in the Circus, Berlin. He produced here the *Oresteia* of Aeschylus, but he has had difficulty in finding subsequent productions fitted to the large scale of this building.

Gordon Craig obtained the workshops which he had been asking for, and he constructed a model stage at the Arena Goldoni, Florence, in 1913, but support was withdrawn on the outbreak of war and the work broken up. Claud Lovat Fraser, a student of Mr Craig's teaching, gained a popular success with his designs for a revival of *The Beggar's Opera*, under the direction of Nigel Playfair, at the Lyric Theatre, Hammersmith, London, in 1920. For this production, one scene was built and modified by changing light and symbol, as the action required. An earlier effort of this young artist upset the equanimity of those gathered at Stratford-on-Avon for a Shakespearean Festival. To-day Bridges Adams is encouraged to produce plays there after the same manner, and local eyes have become reconciled. Not only because of his talent in design, but because of his tact in humouring the difficult situations which arise in any attempt at innovation, the early death of Fraser was a loss to the cause of theatrical art in England.

In 1922 Mr Craig was invited to open an International Theatre Exhibition held in the Stedelijk Museum, Amsterdam. The designs for theatre construction, scenes, and costumes, many of which came from young America, showed how wide-spread is the interest in reconstructing the fabric through which the drama may speak. A section of the exhibition was devoted to books provoked by the quickening interest. The collection was subsequently seen at the Victoria and Albert Museum, London, and in municipal galleries in Manchester, Glasgow, and Bradford. Amongst the finest designs shown were those of Adolphe Appia, from Switzerland. Appia had made known his ideas on the art of the theatre in his book, *La Mise en Scène du Drame Wagnérien*, as long ago as 1895 (better known in the German edition of 1899, *Die Musik und die Inszenierung*). In 1923 he was invited to enter the great stronghold of the older conventions, La Scala, Milan, and he attempted to carry out some of his conceptions in a production

of *Tristano e Isotta* (Wagner). It proved to be a case of the fly responding to the invitation of the spider, or of pouring new wine into old bottles, and was a disappointing experience to a fine artist the nobility and beauty of whose designs is undeniable. It showed that a theatre must be of one mind before it can move forward. Appia works on terms of friendship with the Jacques Dalcroze School of Music, Geneva. Like Craig, he holds that the light in which the actor is seen in action may help the actor as it helps the work of a Rembrandt.

Many have now taken up the notion of 'painting with light' in the theatre. An economy of means is discerned from the point of view of the finance department, which sees that one man can work a switchboard and many hands be dispensed with.

The cinematograph has accustomed its patrons' eyes to a moving background of natural scenery which puts to shame the stage pretence of verisimilitude. Those stage electricians who take naturalism as their ideal have determined to rival if not to surpass the cinematograph film. A *cyclorama* (which is only a development of a panorama) is in use on many stages. A painted panoramic cloth, encircling two sides and the back of the stage, carried to a good height and trained on rollers, could be made to pass, for the length of the canvas, before the eyes of the spectators. Beerbohm Tree used such a moving background with his flying witches in *Macbeth*. Side-wings behind the proscenium arch could be dispensed with if desired, and also sky-borders, with the *battens* or lengths of light which they concealed. The cyclorama which is now succeeding this arrangement is in itself uncoloured. It is sometimes a fixture and sometimes removable. It is in some cases given a semi-domed roof. Various new ways of lighting this and the stage in general are now on the market, most of which can be seen in the new demonstration theatre at Magnet House, Kingsway, London. Early experiments in this direction were made at the Herkomer Theatre at Bushy. Mariano Fortuny, of Venice, had mastered his effects by 1907, and he installed his system at La Scala, Milan, 1920. An early article on the installation of the Royal Theatre, Stockholm, appeared in *The Graphic*, 9th July, and another on the Schwabe-Hasait system, a system of German origin, in *The Illustrated London News*, 27th August 1921. A Russian inventor, Samoiloff, was enabled to instal his system of producing changing effects of scene and costume at the London Hippodrome in September of the same year. These are inventions which electrical engineers offer to stage artists. It remains to be seen whether the artists will use them, and how they may be harmonised with the rest of the stage's mediums of expression, and in particular with the action of the actor.

At the invitation of the directors of the State Theatre, Copenhagen, Gordon Craig, who had avoided producing in a public theatre since his work in Moscow, collaborated with the actor, Johannes Poulsen, in the production of *The Pretenders* of Ibsen, 1926.

Henrik Ibsen, in explaining in 1884 his retirement from stage-direction and refusal to resume it, remarked that 'our theatre staff is demoralised, will not submit to discipline and yield absolute obedience; and, moreover, we have a press which is ever ready to support the refractory ones against the leader.' This is still true to-day. Journalists have misunderstood the aim, and have had no realisation of the difficulties of advancing theatrical art. Folly, doctor-like, continues to control skill. Disturbed fancy has seen in the new effort nothing but a danger to dramatic literature. Though tough writers like Bernard Shaw are obviously able to look after their rights, and have indeed

made use of the aid of visual artists, journalists have ridiculously feared that playwrights needed protection, and have kept up a stream of obstructionist articles with such headings as *The Dramatist in Danger*. On the other hand, the effort to divine the basic principles of theatre art (which includes but is not included by the art of dramatic writing) numbers among its friends first-class writers and architects and the younger generation of theatre workers.

*Licensing of Theatres.*—Up to 1843 the only theatres entitled to act regular plays were those which held royal patents—in London, Drury Lane, Covent Garden, and the Haymarket (in summer)—but in that year Bulwer's Act (6 and 7 Vict. chap. 68) established practically free trade in theatricals. By it the Lord Chamberlain was made licensing authority in London and Westminster, Finsbury, Marylebone, Tower Hamlets, Lambeth, and Southwark. Outside his domains the power was vested in the justices of the peace. By the Local Government Act, 1888, the authority of the justices was transferred to the county councils, wherever such existed; but in a very great majority of cases these took advantage of a clause in the act which authorised them to delegate back to the justices their licensing powers. In London at present the licensing authority is divided between the Lord Chamberlain and the County Council. The conditions are from time to time altered by fresh enactments of Parliament.

**Théâtre Français, or COMÉDIE FRANÇAISE.** See THEATRE, p. 68.

**Thebes**, the name of a celebrated Egyptian city, formerly the capital of Southern or Upper Egypt; called by the Hebrews No-Amon, by the Greeks Thebai, and at a later period Diospolis Magna. It lies in the broadest section of the valley of the Nile, in about 26° N. lat., at a spot where the desert on the west sheers away to the girdling range of the Libyan mountains, leaving a broad plain, partly cultivated, on which stand the famous twin statues, one of which is known as the 'vocal Memnon' (q.v.), and behind them the temples grouped about the modern districts of Kurna and Medinet-Habṭ. The Nile divides this western part or Necropolis of Thebes, anciently called the 'Libyan suburb,' from the extensive

ruins now known by the names of the villages Luxor (el-Uksur, 'the palaces') and Karnak which stand on the eastern bank, with the low range of the Arabian hills for a background. The traditional foundation of Thebes goes back to the 1st dynasty, but no buildings have hitherto been found earlier than the temple of Mentuhotep III. of the 11th dynasty, on the west bank of the Nile, and some remains, also of the 11th dynasty, on the east bank, apparently part of the original temple of the god Amon. Its most flourishing period was under the 18th, 19th, and 20th dynasties, or from about 1600 to 1100, when it had supplanted Memphis, the ancient capital of the Pharaohs. The central situation of Thebes secured it from the attacks of the northern enemies of Egypt, and contributed to its prosperity; and here the worship of Amon arose in all its splendour; magnificent palaces and temples were built in its different quarters by the great monarchs of the Theban dynasties, and were added to by later kings, down to the time of the Ptolemies and Antonines, to the 2d century A.D. It was enriched by the spoils of Asia and the tributes of Ethiopia, and its fame and reputation had reached the early Greeks. Homer describes it by the epithet of Hundred-gated (*ἐκατομύδαι ὄψθαι*), doubtless in allusion to the gates or pylons of its temples, for Thebes was never a walled or fortified city. In the plenitude of its power it sent forth an army of 20,000 war-chariots; but about 1100 B.C. the Bubastite and Tanite dynasties removed the capital again to the north, to Sais and Memphis, and thenceforth Thebes declined in importance. At the Persian conquest in the 6th century B.C. Cambyzes obtained a spoil of nearly £2,000,000 from the city, and destroyed many of its noblest monuments. The foundation of Alexandria still further injured it; and at the time of Strabo Thebes was only a cluster of small villages. Its temples, tombs, and ruins were frequently visited by Greek and Roman travellers, including the Emperor Hadrian. At a later period a considerable Christian population lived there under the empire; but at the Arab invasion the inhabitants fled to Esné. Thebes is now inhabited only by Fellahin, by a few officials, and by the migratory visitors to the hotels at Luxor.

Of the monuments on the west or Libyan side the principal are the three temples of Seti I., Rameses II., and Rameses III., known respectively as El-Kurna, the Rameseum (or Memnonium), and Medinet-Habû. Close to the Rameseum is the fallen and broken colossus of the founder, the largest statue in Egypt, originally nearly 60 feet high, celebrated in Shelley's sonnet as that of Osymandyas, whose palace the temple was believed to represent. Near by are also some remains of two temples of Amenhotep III., whose two colossal statues still survey the green fields in front. Some way behind the Rameseum, on a spur of the hills, is the terraced temple of Queen Hatshepsut (18th dynasty), known as Deyr-el-Bahri, near which a remarkable series of thirty-nine royal and priestly mummies, papyri, &c., were found in 1881. At Medinet-Habû is a pile of buildings, of which the chief is the great temple of Rameses III., with sculptures representing his victories over the Philistines, the life in his harem, the riches of his treasury, and a calendar with inscriptions dated in the twelfth year of his reign. Near here, to the north-west, are the cemeteries of the sacred apes, and further on the Valley of the Tombs of the Queens, consisting of seventeen sepulchres, supposed to be the tombs of the Pallacides of Amen, mentioned by Diodorus and Strabo. Near them, among the hills, are the Bibân-el-Mulâk, or Tombs of the Kings of the 18th to 20th dynasties, sixteen

in number, the most interesting of which are those of Tut-ankh-Amon, discovered by Lord Carnarvon and Mr Howard Carter; of Seti I., called Belzoni's, after its discoverer; and of Rameses III., named by Bruce the 'Harper's tomb.'

On the east bank the chief monuments are at Luxor, the beautiful temple of Amenhotep III. (18th dynasty), added to by Rameses II., with its well-known obelisk, the fellow of which was removed to the Place de la Concorde at Paris; and the still more magnificent temple, or rather group of temples, at Karnak, the sanctuary of which, built by Senusert I. of the 12th dynasty, was added to by the monarchs of the 18th. The most remarkable part of this wonderful mass of pylons, courts, and obelisks is the great hall, 170 feet by 329 feet, built in the 18th dynasty, and finished by Seti I. and Rameses II., with its central avenue of twelve massive columns, 62 feet high and 12 feet in diameter, and its 122 other columns, and two obelisks (originally four), one of which is the tallest in Egypt, 108 feet high. On the walls the sculptures tell the glorious history of the warrior kings of Egypt, how they fought against the Hittites, the Rutennu, the Syrians, and the people of the Euphrates valley, and took from them their strong cities. Here, too, is the so-called Portico of the Bubastites, built by Shishak I., recording his expedition against Jerusalem, 971 B.C.

The Thebaid, the territory of Thebes, was a term applied to various areas at various times, but generally to one of the three main divisions of Egypt. It is specially familiar to us as being a favourite place of retreat for Christian hermits.

**Thebes**, the principal city of Bœotia in ancient Greece, situated on the slopes of Mount Teumessus, and between two streams, the Dirce and the Ismenus, about 44 miles to the north-west of Athens. Its acropolis continued to be called Cadmeia from the legend that it was founded by a colony of Phœnicians under Cadmus. Here were born Dionysus and Herakles, Tiresias and Amphion; this was the scene of the dark tragedy of Œdipus, the war of the Seven against Thebes (see *ADRASTUS*), the terrible vengeance of the Epigoni. But the story of the city enters the world of history in the dispute between Thebes and another Bœotian city, Plataea, which involved the former in an unsuccessful war with Athens, and began that bitter enmity that never died out till the death of Greek liberty itself. During the Persian war Thebes sided with the Asiatic invader, but Sparta, jealous of Athens, interfered to restore Theban supremacy over the other Bœotian cities. When the Peloponnesian war broke out Thebes took part with Sparta, and at its close was eager for the destruction of Athens; but it soon began to dread the overgrown power of its ally, and sheltered the Athenian exiles from the rule of the Thirty Tyrants. Hence arose a bitter antagonism between Thebes and Sparta, and a varying struggle, which closed with a short period of Theban supremacy over all Greece, won by the glorious victory of Epaminondas at Leuctra (371), but ended by the hero's death in the moment of victory at Mantinea (362). The eloquence of Demosthenes induced Thebes to unite in opposition to the encroachments of Philip of Macedon; but it was too late, and in 338 B.C. the battle of Chæronea crushed the liberties of Greece. After Philip's death the Thebans made a fierce but unsuccessful effort to regain their freedom, but their city was taken by Alexander, levelled to the ground, and the entire population sold into slavery (336). In 316 it was rebuilt by Cassander (whose walls were traced by E. Fabricius in 1888); and it was taken by Demetrius Poliorcetes in 290. It was plundered by Sulla, and in Strabo's time was a miserable village. During the 11th and 12th

centuries it revived through its silk manufacture, but under the Turks again declined, though its modern representative, Thiva, has still a population of about 4000. See E. Fabricius, *Theben* (1891).

**Thecla**, a virgin saint of the early church, a member of a noble family of Iconium in Lycaonia, where she was converted by the preaching of St Paul, and, having devoted herself to a life of virginity, suffered a series of persecutions from her intended bridegroom, as well as from her parents. She is said to have died at the age of ninety in Seleucia. The apocryphal *Acts of Paul and Thecla* were edited by Tischendorf in the *Acta Apostolorum Apocrypha* (Leip. 1851). See Lipsius on the Apocryphal Acts (Brunswick, 1886), the monograph by Schlan (Leip. 1877) and Holzey, *Die Theklaakten* (Munich, 1905).

**Theed**, WILLIAM (1804-91), sculptor, (son of William Theed, R.A., sculptor, 1764-1817), is known by the statues of Newton at Grantham, Lord Derby at Liverpool, Peel at Huddersfield, and the Africa group on the Albert Memorial.

**Theft** is the unlawful taking away of another man's property. To constitute the crime three things are necessary—the *animus furandi*, or intent to steal, the *asportavit*, that is, the goods must be removed from the owner's possession, and this must be done *domino invito*, against his will. The thing stolen need not be in the possession of the owner; thus, if a man finds lost property, and, knowing to whom it belongs, converts it to his own use, he is guilty of the offence. Again, if a man receives an article for a special and temporary purpose and appropriates it he commits theft. A guest at an inn making off with the vessels or plate brought to him during a meal is an example. Again, the owner may be induced to part with the property by a false pretence; this would be theft according as he did not or did intend to transfer the right to the goods. Thus, if A got from B a horse on the pretext that he wished to show it to a possible customer, A would be guilty of theft if he kept the animal; but if he obtained possession by representing that he wanted it for himself and would pay for it next day, a payment he could not and did not intend to make, he would be guilty of obtaining goods by false pretences. Both parties may in the first instance be deceived or mistaken, but the subsequent conduct of one may make him a thief. Thus, A agreed to lend B a shilling; the coin that passed was a sovereign. B finding this out later kept it; after some doubt he was found guilty of theft. If an article is pledged it is theft if either of the two parties to the contract take possession of it to the detriment of the other; so the partner of a firm or the member of a corporation may steal the partnership or corporation property, but a married woman living with her husband does not commit theft when she converts his property to her own use. If the theft be from the person, and accompanied by violence or threats, it is robbery; if committed by a clerk or servant, upon property received by him on account of his master, it is embezzlement. To buy or accept, knowingly, stolen goods is not theft, but receiving—a crime punishable with fourteen years' penal servitude or less, according to the nature of the theft. The following cannot be stolen: Land and things permanently attached thereto; running or standing water not stored for use (gas and electricity may be stolen); animals running wild, corpses, and things abandoned by their owners. Child-stealing, viz. the abduction of children under the age of puberty, is an offence, but as committed against the person is not properly theft. In England formerly theft was either *grand* or *petit* larceny. The latter was restricted to the taking of property

to the value of one shilling or less. If the value was greater it was the former, and was punishable between the time of Edward I. and 1827 with death. Very severe sentences may still be inflicted for various kinds of theft. Thus, to steal a will or a letter in the custody of the post-office is punishable with penal servitude for life.

**Theine**. See CAFFEINE, TEA.

**Theism** (Gr. *theos*, 'god'), etymologically equivalent to belief in a god or gods, and as such opposed to Atheism (q.v.), is now usually understood to mean the doctrine of the one, supreme, personal God, 'in whom we live, and move, and have our being'—as distinguished from polytheism, which recognises more gods than one; from Pantheism (q.v.), which denies the divine personality; from Agnosticism (q.v.), which denies that we can know anything of God; and from Deism (q.v.), which, etymologically equivalent to Theism, is generally defined as recognising the personality of God, but denying his providence and active presence in the life of the world (though it should be remembered that many deists would not have admitted that this was their doctrine). Deism further explicitly rejects revelation and trinitarian conceptions of the godhead, while Theism may or may not accept these doctrines. But the term theism was often used as equivalent to deism with its negative postulates; and when the Brahma-Samāj is called the 'Theistic Church of India,' or a book is published with such a title as *Theistic Devotions*, that kind of theism is also meant which either denies or at least does not include Trinity, incarnation, inspired and infallible revelation, or miracle.

Various views of the origin of the notion of God, and the relation of the monotheistic religions to nature-worship, animism, spiritism, and polytheism, have been indicated in the article Religion (q.v.); together with several definitions of religion as man's attitude towards God.

Theism as the doctrine of the nature and attributes of God covers a large part of the field of theology and speculative philosophy. But in practice it is usually restricted to the maintenance of the thesis that God may be known; the history of the origin and development of the idea of God; and the statement, criticism, and defence of the arguments for the existence of God. The main part of its work is apologetic, in opposition to the hostile systems and theories, rather than a scheme of systematic Theology (q.v.). No competent apologist now stakes the existence of God on any one argument, or exhibits the proof as a series of syllogisms. It is rather maintained that the study of human history, of human nature especially on its moral and spiritual side, and of the world as far as science reveals it to us make for the existence of a God, demand such a postulate as the key to the universe, and render the belief in a personal God greatly more probable than any other thesis—a subject vastly too wide for discussion here. But it is necessary to name what are often referred to as the four great arguments for the existence of God. (1) The *ontological* argument first formulated by St Anselm proceeds from the notion of a most perfect being to infer his existence; without actual existence the idea would fall short of perfection. The argument was re-stated in a different shape by Descartes (q.v.) and by Samuel Clarke, and, though very contemptuously treated by Kant, is still an element of the argument that without a God the world is a chaos.

(2) The *cosmological* argument, employed by Aristotle, Aquinas, and a host of Christian authors, is an application of the principle of Causality

(q.v.). We cannot conceive an infinite regression of finite causes; therefore beyond the last or first of the finite causes is the Infinite. From motion the argument is to a mover.

(3) The *teleological* argument, or argument from design, proceeds from the order and arrangement of the universe, the reign of law and beauty and adaptation, to the intelligent and supreme fountain of order. This is the most familiar of the arguments, especially on the lines laid down by Paley.

(4) The *moral* argument was that relied on by Kant (q.v.) when he destructively criticised the other three, and forms a part of most modern theistic arguments. God is a postulate of our moral nature; and the moral law in us implies a lawgiver without us.

See, besides general works on apologetics and dogmatic theology, Professor Flint's *Theism* (1877; 4th ed. revised, 1889); Harris, *The Philosophical Basis of Theism* (New York, 1888); *The Grounds of Theistic and Christian Belief* (New York, 1883); the Duke of Argyll, *The Reign of Law* (1866); Kant's *Critique of Pure Reason*; Mill's *Three Essays*; Janet's *Final Causes* (trans. 1878); J. T. Merz, *History of European Thought in the 19th Century* (4 vols. 1896-1914); and the Gifford Lectures (1888 et seq.).

**Theiss** (Hun. *Tisza*; Serb. *Tisa*), an important affluent of the Danube, and the chief river of east Hungary, rises by two streams, the Black Theiss and the White Theiss, in the Carpathian Mountains. It winds 750 miles north-west, south-west, and finally southward, joining the Danube in Yugoslavia after running parallel to it for 300 miles. The Theiss, itself navigable for steamers during the last 200 miles of its course, has several large and navigable affluents, as the Maros and Bodrog. The lower part of its course is sluggish, and it has often inundated the plains, flooding the cities on its banks, such as Szegedin (q.v.). Much has been done to regulate the course and drain the marshes on its banks. The Theiss is extraordinarily rich in fish.

**Thellusson, PETER**, the son of Isaac de Thellusson, ambassador of Geneva at the court of Louis XV., was born in Paris, 27th June 1737, and settling in London as a merchant in 1762, acquired enormous wealth, which at his death (27th July 1797) he disposed of by a will that led to a special act of parliament and much litigation. After bequeathing large fortunes to all the members of his family, he left the residue of his wealth (estates worth £4500 a year and personal property to the amount of £600,000) to trustees, to accumulate during the lives of his three sons and of all their sons. The accumulated fund (estimated to be likely to produce some £19,000,000) was then to be used to purchase estates for the eldest lineal descendants of his three sons. The will was contested by the heirs at law, but affirmed in the House of Lords in 1805; though meanwhile the Thellusson Act (see PERPETUITY) had been passed (1800), restraining testators from devising their property for accumulation for more than twenty-one years. Thellusson's last grandson died in 1856; and there was then a lawsuit as to the interpretation of the will. It was finally adjudged on appeal to the House of Lords in 1859 to Lord Rendlesham and a grandson of Peter's third son; but by reason of expenses the sum inherited did not much exceed the original bequest.

**Thelwall, JOHN** (1764-1834), son of a London silk-merchant, forsook his father's business, tailoring, and law for literary work, publishing poems and editing a magazine. In 1790 he joined the 'Friends of the People,' supported Horne Tooke (q.v.), and with him was tried in 1794 and acquitted. He published more poems, lectured on Roman history,

and became an authority on elocution, the cure of defects of utterance, and English metre, as well as on social and political reform. See *Life* by his widow (1837) and C. Cestre (1906); also Hobbhouse's *Liberalism* (1911).

**Thelygonum**, a genus consisting of one species, puzzling in its affinities, which has been made a family by itself (Thelygonaceæ or Cynocrambaceæ). *T. Cynocrambe* is a small edible herb growing on rocks and old walls in the Mediterranean region as far east as Persia. Opposite-leaved below, it becomes sympodial, with alternate leaves above, each leaf in this part having a group of male flowers opposite it, and in its axil the continuation shoot and another bearing female flowers.

**Themis**, daughter of Uranus and Gæ, bore to Zeus the Horæ—Eunomia ('Equity'), Dikē ('Justice') and Eirēnē ('Peace'); also the Moirai or Fates. She was regarded as the personification of order and justice, and in art Themis holds a cornucopia and a pair of scales.

**Themistocles**, the great Athenian general and statesman, was born about 520 B.C. His father, Neocles, belonged to an undistinguished family of the middle class; his mother was a Carian. Ambitious from his cradle, he used his archonship of 493 for the promotion of his political plans. He saw what was best for Athens when he turned the attention of his countrymen to the sea and convinced them that a powerful fleet was absolutely necessary for their welfare. A large sum of money, the produce of the silver-mines of Laurium, which it was proposed to divide among the people, was devoted to its construction. During the war with Persia which followed Themistocles, commander of the Athenian squadron, which numbered 200 of the 324 vessels engaged, to avoid dissension was content to serve under the Spartan Eurybiades, a man of narrow mind and hopeless obstinacy. On the eve of Salamis it required all the influence of Themistocles' vehement personality and threats to induce his timid superior and colleagues to await the attack of the enemy. In his eagerness to precipitate a collision, he sent by night a messenger to urge the Persian generals to make an immediate attack, as the Greeks had resolved on retreat. He thus provided for himself, whatever the issue might be. Intimation of the Persian advance was brought at nightfall by his rival Aristides, who had been ostracised in 483 B.C. The Peloponnesians refused to continue the pursuit of the Persians beyond Andros. From that place Themistocles sent a second message to Xerxes urging him to hasten back before the Greeks carried out their project of breaking down the bridges. Though later Themistocles may have found it convenient to interpret this act differently, it was honestly sent at the time with the intention of inducing Xerxes to leave Attica. The victor of Salamis was now the foremost name in the minds and mouths of men. The rebuilding of the walls of Athens by his advice on a scale far larger than anything in existence aroused great uneasiness among the allies of Sparta, but, by a series of adroit stratagems, Themistocles succeeded in cajoling the ephors till the walls had reached a height sufficient for defence. But his popularity was now waning, and the Spartan faction in Athens was plotting his ruin. Plutarch tells us that he provoked the anger and resentment of the citizens by his insufferable arrogance. In or about 471 B.C. ostracism was demanded, and he was banished from Athens. Argos was his first retreat, but so long as he remained there Sparta could have no security or peace. His condemnation on the charge of implication in the treason of Pausanias drove him from Argos. He fled to Coreyra, and after a series of hairbreadth escapes was compelled

to seek shelter in Asia. Artaxerxes received his suppliant with the greatest favour, and listened with attention to his schemes for the subjugation of Greece. It is said that the young king was so affected with joy that he was heard at night to cry thrice in his dreams, 'Themistocles the Athenian is mine.' After the Persian fashion, the town of Lampsacus was appointed to supply him with wine, Magnesia with bread, and Myus with other provisions. At Magnesia he lived securely till about 450 B.C.

'In a word,' says Thucydides, 'Themistocles, by natural force of mind and with the least preparation, was of all men the best able to extemporise the right thing to be done.' Of his moral character the great historian says nothing. But if his patriotism seems at times to have been but a larger kind of selfishness, it must be remembered that Themistocles was possessed of the conviction that no one could realise the dream of a great Athenian empire but himself. The sentence passed upon him, due to Spartan jealousy, was a bitter return for the unparalleled services he had rendered his country. Whether he ever intended to carry out his promises to the Persians is questioned.

See the histories of Greece by Grote, Abbot (1892), Bury (1902), Stobart (1912); *Cambridge Ancient History*, iv. and v. (1926-27).

**Thénard, Louis Jacques** (1777-1857), French chemist, was born at Louptière, studied pharmacy at Paris, became professor of chemistry at the Collège de France, the École Polytechnique, and the Faculté des Sciences, and was subsequently ennobled. He carried out numerous researches, discovered hydrogen peroxide (1818), and wrote *Traité de Chimie élémentaire, théorique et pratique* (4 vols. 1813-16).

**Theobald, Lewis**, an early Shakespearian critic, was born about 1683, the son of an attorney at Sittingbourne in Kent, and was bred to his father's business, but early took to literature, publishing in 1714 a tragedy entitled *Electra*, followed by twenty equally forgotten dramas. He published thirty papers under the name of 'Censor' in *Mist's Journal* (1715), and eighteen months later commenced the *Censor* as a separate tri-weekly paper, which extended to sixty-six more numbers. In 1726 he published his pamphlet, *Shakspeare Restored, or a Specimen of the many Errors committed as well as unamended by Mr Pope in his late edition of this poet*, which the poet repaid by immortalising him as the original hero of the *Dunciad*. Theobald could not compete with his adversary in wit, but he proved himself a much more competent editor of Shakspeare by his edition in 1733 (7 vols.), which quite extinguished that of his rival. He died in September 1744. Theobald was often very happy in his suggested emendations, and had much higher respect for his text than many much more brilliant men. See Churton Collins, *Essays and Studies* (1895), and a study by R. F. Jones (1919).

**Theobalds**, in Hertfordshire, near Waltham Cross, 13 miles N. of London, a mansion built about 1560 by Lord Burghley, who here often entertained Elizabeth. Exchanged for Hatfield (q.v.) in 1607 by his son the Earl of Salisbury with James I., whose favourite residence it was, and who died here, it was demolished in 1650 and 1762. The present Theobalds Park, on the other side of the New River, is an 18th-century mansion, the seat of the Meux family. Here Temple Bar (q.v.) was re-erected in 1878.

**Theobroma, Theobromine.** See COCOA.

**Theocracy**, literally, 'government by God,' is the name given to that constitution of a state in which the Almighty is regarded as the sole sovereign, and the laws of the realm as divine commands

rather than human ordinances. Under such a view the priesthood necessarily become the promulgators and interpreters of the 'divine commands,' and act as the officers of the invisible Ruler. The typical example of a theocracy is that established by Moses among the Hebrews.

**Theocritus**, the pastoral poet of Greece, was born about the close of the 4th century B.C., most probably in Syracuse. What we know of his life is largely a matter of conjecture and inference from his own works. He was educated at Cos under Philetas, a poet and critic then famous, of whom Theocritus speaks with high respect (Id. vi.). Theocritus repeatedly mentions, either by their own or by disguised names, friends of his own, who seem to have formed a literary coterie in Cos; such were Nikias, Asclepiades, Alexander, Leonidas, and others. From Cos he probably returned to Sicily, where he spent a number of years. About 275 he seems to have repaired to the court of Ptolemy Philadelphus in Alexandria. There he resided a few years—perhaps till about 270 B.C.—thereafter returning to Cos. Whether he died there or at Syracuse it is impossible to say. In his pastoral poems Theocritus struck out an entirely new form of literature, which lives and is fresh for ever. Many of the poems which Suidas attributes to him are lost, and those which we have appear to be a selection from his writings. There is some question as to the authenticity of some of the thirty poems which we have. Reasoning both from external and internal evidence, modern scholarship has rejected some half-dozen or more of them, viz. xix., xx., xxi., xxiii., xxv., xxvii., xxxi., and the *Megara* (an anonymous poem on the wife of Herakles), though the evidence is not convincing for xxv. and the *Megara*. His poems fall under several classes—half-epic or epic-Idyll, mimic, idyllic or pastoral, and lyric; there are also a number of epigrams or 'inscriptions.' The form of poetry most popular in Theocritus's day was the epic, as the *Alexandra* of Lycophron and the *Argonautica* of Apollonius Rhodius, both contemporaries of his, survive to show us. Theocritus shows himself influenced to some extent by the tendency of the time in his series of poems dealing with heroic legend, the infant Hercules and the snakes, Hercules at the stables of Augeas, his encounter with the Nemean lion, the episode of the Argonautic expedition when Hercules lost his young squire Hylas, and that of the fight between the Greek hero, Polydeuces (a kinsman of Hercules), and the barbarian giant who is defeated in boxing, and made to promise to respect the rites of hospitality for the future; the combat is described with the utmost spirit. These poems are full of the spirit of Greek chivalry, and show Theocritus to be a Hellene at heart. Of the other poems, Idylls ii., xiv., and xv. are dramatic scenes, and have been called mimie because they closely resemble in form the mimes of the Syracusan poet Sophron (Plato's favourite author), who wrote with great dramatic power dialogues probably in rhythmical prose, with male and female characters. Theocritus's famous Idyll xv., *The Ladies of Syracuse*, is said to be copied from Sophron. It describes the visit of a Syracusan lady and her friend, both living in Alexandria, to the festival of Adonis. Nothing could be more natural than this poem. Lang says truly, 'the chatter of the women has changed no more in 2000 years than the song of birds.' A graceful lyrical strain is heard in xxviii., xxix., xxx.: the first accompanies a gift of an ivory distaff to the wife of his friend Nikias; the others are love-poems.

The Doric settlers in Sicily delighted in poetry resembling the ballads, love-songs, and dirges, and the improvised poems in answering couplets which are still sung in Sicily and in Southern Italy.

Theocritus raised this rude pastoral poetry into a new and perfect form of literature. His short poems dealing with pastoral subjects, and, like paintings, representing a single scene, came to be called Idylls (*eidylla*) or 'little pictures,' a name probably not used by Theocritus himself. He has had many imitators; but in their hands the pastoral has degenerated; they have used rural scenery merely as stage machinery, whereas Theocritus writes of the country because he loves it. His countrymen are not mere lay-figures dressed up with crook in hand. They are genuine country-folks, and show that combination of simplicity and love of nature with shrewdness in making a bargain which is found in the peasant everywhere. Every touch in these poems is natural and lifelike. After reading Theocritus the *Eclogues* of Virgil strike us as artificial. Take, for instance, the *Journey to the Feast*, which tells how the poet and two friends took their way from Syracuse to join a harvest-home party. On the road they overtake Lycidas, a goat-herd. To beguile the way Lycidas and Theocritus recite short poems of their own composition. Keats has written nothing more luscious than the description of the orchard-nook where the feast is held, which concludes the poem: verses which exhale the very mellowness and scent of summer. 'All things breathed the rich scent of summer, the scent of the time of ripe fruits.' Strange power is shown in the idyll on the love of Polyphemus the Cyclops for Galatea. Nothing could seem further from love than the Cyclops, yet Theocritus makes us feel for the monster and pity him in the humility of his love and his hopeless passion. Hardly anywhere is there truer pathos than this poem contains. One of Theocritus's greatest charms is his power of landscape-painting. His landscapes bask in full sunlight. Kingsley says truly, 'Theocritus floods the whole scene with the gorgeous Sicilian airlike one of Titian's pictures.' When Theocritus lived, Greek national life had ceased to be; imperial Athens was no longer; Greek religion had lost its vitality. No poet of Pericles's day could have written the fulsome eulogy on Ptolemy's repulsive marriage in the xvii. Idyll. Had Theocritus lived in the age of Pericles, no doubt a stronger and more bracing air would have blown through his Arcadia, which remains for us a country good to wander in, a sunny realm where men labour without care, and where life is undisturbed by anxious questionings. Dealing with pastoral life, Theocritus comes most into comparison with Robert Burns, who has far more depth, humour, and passion, but is without Theocritus's sense of beauty. Compared with the Scottish poet, Theocritus stands out at once as the man not only of genius but also of highest culture, accustomed to refined city ways, while the comparative roughness of Burns shows him as the man born and bred from earliest years in the 'pastoral world far from city and mart.' The power of Theocritus is seen in his influence over other poets. Virgil imitates him closely in his *Eclogues*. Tennyson was deeply influenced by him: poems like *Eoë* and the idylls of country life remind us both in form and spirit of the Greek poet.

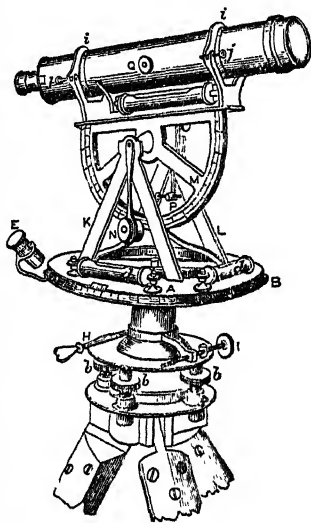

There are editions by Ahrens (1855), Meineke (1856), Fritzsche (1857 and 1869), Wordsworth (2d ed. 1877), Ziegler (1879), and R. J. Cholmeley (1901 and 1919), Wilamowitz-Möllendorf (Oxford, 1907); verse translations by Chapman (1866), Calverley (1869), J. H. Hallard (1894; 4th ed. 1924), and R. C. Trevelyan (1925). Idylls vii. and xi. were exquisitely translated by Leigh Hunt (*Jar of Honey*). And there is a prose translation by Andrew Lang (1889), and another in an edition by J. M. Edmonds (1912).

**Theodectes**, a Greek tragedian of the 4th century B.C., wrote fifty tragedies, of which some

fragments survive, and a treatise on rhetoric, now lost.

**Theodicy** (Gr. *theos*, 'God,' and *dikē*, 'justice'), a name given to the exposition of the theory of Divine Providence, with a view especially to the vindication of the attributes, and particularly of the sanctity and justice of God in establishing the present order of things, in which evil, moral as well as physical, so largely appears to prevail. The name is of modern origin, dating from the close of the 17th century, or the beginning of the 18th; but the theory, as well as the mysterious problem which it is meant to resolve, is as old as philosophy itself (see EVIL). The first to consider the question in its integrity was the celebrated Leibniz (q.v.); and see OPTIMISM.

**Theodolite**, an instrument much employed in land-surveying for the measurement of angles horizontal and vertical, is neither more nor less than an altitude and azimuth instrument, proportioned and constructed so as to be conveniently portable. As in all instruments in very general use, the variations in its construction are almost numberless; but its main characteristics continue unaltered in all forms. It consists essentially of two

Theodolite:

A, B, the horizontal limbs; *d, d*, spirit levels; E, a magnifier to read off the degrees; *a, a, a*, milled screws to adjust the instrument, and set in level; H, a clamping screw; I, a slow-motion screw, by which the instrument is moved more exactly than could be done by the hand; *i, i*, clips, to reverse the telescope by screws, *j, j*; K, L, frames into which the pivots are placed, on which the vertical arc, M, is turned round, and on which the telescope is fixed; N, a microscope for reading off the degrees; P, a slow-motion screw, by which the vertical arc and telescope are moved; Q, a milled screw for moving the object-glass of the telescope.

For these purposes the outer of the horizontal circles is graduated, and the inner carries the index-point and the verniers (see VERNIER); the vertical circle is also graduated, and the graduations are generally read off by an index-point and vernier firmly attached to the supports. The upper horizontal is furnished with two levels placed at right angles to each other, for purposes of adjustment, and has a compass-box let into it at its centre. The stand

consists of a circular plate supported on three legs, and connected with the lower horizontal by means of a ball-and-socket joint; the horizontal adjustment of the instrument being effected by means of three or four (the latter number is the better) upright screws placed at equal distances between the plates. The telescope is so fixed as to be reversible, and the adjustments are in great part similar to those of other telescopic instruments, but are too numerous and minute to be here detailed. Both horizontal plates being made, by means of the screws and levels, truly level, the telescope is pointed at one object, and the horizontal angles read off; it is then turned to another object, and the readings-off from the graduated circle again performed; and by the difference of the readings, the angular horizontal deviation is given; and when vertical angles are required, the readings are taken from the vertical circle in a similar manner. For the much-disputed but unknown etymology, see the note in the *New English Dictionary*.

**Theodora**, the famous consort of the Byzantine emperor Justinian I., was, according to the dubious evidence of Procopius, the daughter of Acacius, a bear-ward at Constantinople, and had already been by turns actress, dancer, and shameless harlot, when she won the heart of the austere and ambitious Justinian, to become in succession his mistress, his wife, and the sharer of his throne (527). There was a law which forbade a member of the senate to marry an actress, but Justinian cleared the way by repealing it. Theodora was of less than middle height, and her complexion was pale, but such was her beauty that Procopius tells us 'it was impossible for mere man to describe her comeliness in words, or imitate it in art.' Never thereafter did the breath of scandal touch her name; she became Justinian's trustiest counsellor, bore a chief share in the work of government, and saved the throne by her high courage at the crisis of the Nika riots (532). 'Now every man must die once,' said she in council, 'and for a king death is better than dethronement and exile. . . . If you wish, O emperor, to save your life, nothing is easier: there are your ships and the sea. But I agree with the old saying that "empire is the best winding-sheet."' She lavished her bounty on the poor, and especially upon the unfortunate of her own sex, and died at forty (548), her slender and graceful frame worn out by the anxieties of state. Her character descended to history unspotted until the appearance (1623) of the *Secret History* of Procopius, the work of a man who had enjoyed the full favour and confidence of the court, and had in his other writings openly extolled the triumphs and the wisdom of Justinian and Theodora, whose reputation he was the while labouring in secret to destroy. His stories satisfied his first editor, Nicholas Ale-mannus, and later Gibbon and Dahn; but it may be remembered that there is not a word of Theodora's profligacy in Evagrius or Zonaras, and moreover that, when a man owns that elsewhere he has purposely denied or concealed the truth, it may at least be said that we are entitled to hesitate about the value of his testimony at all.

See the article JUSTINIAN I.; also Antonin Débidour, *L'Impératrice Théodora* (Paris, 1885); C. E. Mallet's article in *Eng. Hist. Rev.* (vol. ii. 1887); F. Dahn, *Procopius von Cäsarea* (Berlin, 1865); Bury, *Later Roman Empire* (1889); Holmes, *Age of Justinian and Theodora* (1905-7); Diehl, *Byzantine Portraits* (trans. 1927).

**Theodore of MOPSUESTIA**, a great exegete of the early church, was born at Antioch about the middle of the 4th century. He was the friend of Chrysostom and the pupil of Libanius, but it was Diodorus of Tarsus from whom he imbibed his zeal

for biblical studies. About the year 383 he became a presbyter in Antioch, and about 392 he was chosen Bishop of Mopsuestia in Cilicia. Theodore, very probably the teacher of Nestorius, died at peace with all men in 428 or 429. Theodore wrote commentaries on almost all the books of Scripture, of which only remain, in the Greek, that on the Minor Prophets; in Latin translations, those on the lesser epistles of Paul, besides many fragments, especially on the epistle to the Romans. As an exegete he eschews the allegorical method, adopting the literal meaning, and he takes into consideration also the historical circumstances of the composition, and assumes varying degrees of inspiration. When the Nestorian controversy broke out his polemical writings, which seem to have offended by a characteristically sober tone, were attacked, and after a century of fanatical agitation were formally condemned by Justinian in the *Tria Capitula* (544). The fifth œcumenical council—that of Constantinople in 553—confirmed the emperor's condemnation, and Theodore's name vanished from the list of orthodox writers.

Theodore's works were included by Migne in the Greek series of his *Patrologia* (lxvi.). The Greek fragments of his New Testament commentaries were collected by Fritzsche (1847). The Pauline commentaries were edited by Swete, with admirable prolegomena (Camb. 1880-82). The commentary on the Minor Prophets was edited by Wegner (1834) and Mai (1832, 1854), the Syriac remains by Sachau (1869). See Kihn, *Theod. von Mopsuestia u. Junilius Afric., als Exegeten* (Freib. 1880); L. Patterson, *Theodore of Mopsuestia and Modern Thought* (1927).

**Theodore of STUDIUM**, Greek theologian, born in 759 at Constantinople, became forty years later the head of the Studium monastery at that city. A stout supporter of image-worship, Theodore was banished several times for his views, and died in proscription on the peninsula of Tryphon in 826. He was subsequently canonised. His writings include some 550 letters, the *Catechesis Magna* and *Catechesis Parva*, polemics, epigrams, and hymns. See A. Gardner, *Theodore of Studium: his Life and Times* (1905).

**Theodore of TARSUS**, seventh archbishop of Canterbury, was born about 602 A.D. at Tarsus in Cilicia, and studied at Athens. Consecrated in 668 by Pope Vitalian to the primacy of the English church, Theodore set off for Canterbury and arrived there exactly a year later (May 669), having been delayed in France. The task before him was no light one for a man already advanced in years. A tour of his province revealed a church without unity or organisation; the dioceses corresponding to the various kingdoms were too large, and many sees stood empty. Theodore began by filling the vacant sees wherever possible, and in 673 called at Hertford the first national synod of the church, which accepted articles of guidance propounded by him, and determined upon annual synods to be held thereafter at Clovesho. Although Theodore's proposal to divide the overlarge dioceses did not meet with the approval of the assembly, many of his remaining years were devoted to this great task. His summary treatment of Wilfrid (q.v.), the bishop of Northumbria, whose diocese he quartered, occasioned the famous quarrel between the two, which lasted a number of years. Theodore died on the 19th September 690, and was buried at St Augustine's Abbey, Canterbury. He was no saint in the ordinary sense, and he was more than an ecclesiastical statesman. 'It is difficult,' writes Stubbs, 'if not impossible, to overstate the debt which England, Europe, and Christian civilisation owe to the work of Theodore. He was the real organiser of the administrative system of the English church, and in that work laid the founda-

tion of English national unity.' The synod of the church in 873 was, indeed, a pattern for the later witanagemots and parliaments. To practical genius Theodore added an accomplished scholarship, and under his direction Canterbury became an important centre of culture. His *Penitential* was first edited in its accepted form by Wasserschleben (Halle, 1851).

See Bede, *Historia Ecclesiastica* (ed. Plummer, 1896); Hadden and Stubbs, *Councils and Ecclesiastical Documents*, iii. (1871); Stubbs, 'Theodorus' in the *Dictionary of Christian Biography* (1887); Bright, *Early English Church History* (3d ed. 1897); Browne, *Theodore and Wulfred* (1897).

**Theodore**, 'king of Corsica,' otherwise Baron Theodor von Neuhoff, son of a Westphalian noble in the French service, was born at Metz in 1686, was himself successively in the French, Swedish, and Spanish service, was ruined in Law's speculations, and after leading an adventurer's life settled at Florence in 1732. Thrice he headed Corsican risings against the Genoese and was indeed crowned Theodore I. in 1736. But each time he was driven to flight, and after many wanderings he settled in London in 1749, and died there 11th December 1756. In Spain he had married an Irish lady, daughter of the Earl of Kilmallock. His only son by her, known as Colonel Frederick, wrote a book on Corsica, and at the age of about seventy-two shot himself in the porch of Westminster Abbey, 1st February 1797. See Fitzgerald, *King Theodore of Corsica* (1890).

**Theodore**. See ABYSSINIA.

**Theodoret**, church historian, was born at Antioch about 390, early entered a monastery, and in 423 became Bishop of Cyrus, a city of Syria. Here he laboured with the utmost zeal, and he himself claims to have converted over a thousand Marcionites. As a foremost representative of the school of Antioch he became deeply involved in the great Nestorian and Eutychian controversies, and was finally deposed by the celebrated Robber-council of Ephesus in 449. This was reversed by the general council of Chalcedon in 451, but Theodoret did not long survive his restoration, dying about 457.

His works were edited by Schulze and Nösselt (Halle, 1769-74), and consist of commentaries on Canticles, the Prophets, Psalms, and the whole of St Paul's Epistles; a *History of the Church*, from 325 to 429 A.D., in five books, ed. by T. Gaisford (1854), trans., with Evagrius (1851); *Religious History*, being the lives of the so-called Fathers of the Desert, a series of most curious and interesting pictures of early ascetic life; the *Evangelistes*, a dialogue against Eutychianism; *A Concise History of Heresies*, together with orations and nearly 200 letters. See Binder, *Études sur Théodoret* (Geneva, 1844); Specht, *Theodor von Mopsuestia und Theodoret von Cyrus* (Mun. 1871); Roos, *De Theodoro Clementis et Eusebii compilatore* (Halle, 1883); A. Bertram, *Theodoret's Doctrina Christologica* (Hildesheim, 1883); and Gildenpenning, *Die Kirchengeschichte des Theodoret von Kyrrhos* (Halle, 1889).

**Theodoric**, or THEODERIC (455-526 A.D.), surnamed THE GREAT, was the founder of the Ostrogothic monarchy. The history of his reign (from 474) is given at GOTHS, p. 329. He was buried in a magnificent tomb at Ravenna. 'The blessed Pope Gregory,' however, as Salimbene puts it, 'when he came hither, caused his bones to be torn from the tomb of porphyry (which is shown empty unto this day) and thrown upon the dunghill and into the cesspool.' For Theodoric was an Arian. To the Germans he is known as Dietrich von Bern (Bern being the German name for Verona, one of his principal residences), and he is one of the great heroes of old Germanic legend, figuring in the second part of the *Nibelungenlied*. In some of the

legends the historical element predominates (his expulsion from Italy and sojourn with Attila and his Huns, &c.); in others he is mixed up with giants, dwarfs, and dragons, so that it seems likely that the series comprise, along with tales of the king Theodoric, mythological elements that properly belonged to the god Thor. See Hodgkin, *Theodoric* (1891, new ed. 1923).

**Theodosia**. See KAFFA.

**Theodosius THE ELDER**, a Spaniard by birth and a skilful Roman general, was sent to Britain in 367 A.D. to repel the inroads of the Caledonians and restore order to the diocese. He made London his headquarters, and was so successful in his undertaking that he formed the country between Hadrian's Wall and the Forth and Clyde into a new province of the empire, called *Valentia* in honour of the reigning emperors. After a victorious campaign on the Upper Danube against the Alemanni he quelled a formidable revolt in Africa under Firmus the Moor, and was executed at Carthage in 376 upon some uncertain and probably groundless charge.

**Theodosius I., THE GREAT**, son of Theodosius the Elder, was one of the most notable and most capable of the later Roman emperors. Born about 346 at Cauca in the north-west of Spain, he served under his father in Britain, Germany, and Africa, and won fame as a general by his exploits in Moesia. Upon his father's death he retired to his native farm, whence he was summoned by Gratian to become his colleague in the purple and emperor in the East (379). It was a critical time. The Goths (q.v.), too numerous and formidable to be attacked *en masse*, flushed too with their recent Cannæ-like victory at Adrianople and the total defeat of his predecessor Valens, were roaming the country at will, unchecked masters of the situation. His military reputation was equal to the strain. He made Thessalonica his headquarters, and within four years, through patience and tact, after reviving the spirits of the imperial troops by small but decisive victories, he broke up the vast Gothic army, attached many of its members to the empire as faithful soldiers and allies under their own chiefs, and restored tranquillity to the troubled country south of the Danube. A serious illness in 380 led to his baptism as a Trinitarian, and, as a consequence, to the restoration of the religious unity of the empire and the promulgation of various edicts against Arianism and other heresies. He appointed Gregory Nazianzen Archbishop of Constantinople, and summoned the second general council, which met there (381) to supplement the labours of Nicaea. The murder of Gratian at Lyons, the advance towards Italy of the upstart Maximus, proclaimed emperor in Britain, and the arrival of Valentinian II. (with his mother Justina and his sister Galla) begging for help led to Theodosius' marriage with Galla, to his victory at Aquileia (388), and to the restoration of his youthful colleague. Hereafter for some years Theodosius lived at Milan enjoying the friendship and respect of its bishop, St Ambrose. The relationship of those two great men—foremost respectively in state and church—honourable to both and dramatic in its climax, is one of the most interesting features of Theodosius' reign. Theodosius was able, just, even generous, virtuous, and religious, but inclined to indolence and of a passionate temper. He had cancelled, upon the entreaties of its bishop and the penitence and humiliation of its leading citizens, the severe measures meted out to Antioch after a riot (387) in which the imperial statues had been contemptuously overthrown; but in 390, when the governor of Thessalonica was lynched by a circus mob for his

punishment of a brutal but favourite charioteer, Theodosius, in spite of expostulations, ordered the people of the city to be invited into the circus and there massacred. At least 7000 were thus put to death. Thereupon Ambrose wrote to Theodosius upbraiding him with the deed, and even after some time had elapsed fearlessly withstood his attempt to enter the church at Milan. The bishop only readmitted the emperor to the sacrament after eight months' retirement and public penance performed in the face of the whole congregation. In 392 Valentinian II. was murdered, and in 394 Theodosius, then at Constantinople, again marched westwards, this time against the Frankish general Arbogast and his puppet emperor Eugenius. After a stubborn fight at the river Frigidus, lasting two days, Theodosius gained a complete victory, and for four months ruled as sole Roman emperor. He expired in the arms of Ambrose on 17th January 395—a date memorable in the history of the later Roman empire, for almost immediately thereafter followed the barbarian invasions of Greece and Italy, which led directly to the subsequent Teutonic settlements in the south and indirectly to the formation of the kingdoms of modern Europe. See Hodgkin, *Italy and Her Invaders* (1892). For Theodosius II. (408–50), see BYZANTINE EMPIRE.

**Theodule Pass.** See ZERMATT.

**Theognis**, a Dorian noble of Megara, flourished about the middle or in the latter half of the 6th century B.C. The overthrow of the tyrant Theagenes brought oligarchy and democracy face to face, and produced a period of confusion and struggle, during which Theognis was driven from his native city. Before his return he may have visited Eubœa and Sicily. Under his name two books of elegiacs have come down to us numbering together about 1400 lines, but it is probable that these include some work not by Theognis. Most of his political verses are addressed to a young Megarian noble named Cyrnus, on whom he seeks to impress the orthodox doctrines of Dorian aristocracy. The oligarchs are the 'good'; the commons the 'bad.' At dinner Cyrnus must sit as near as possible to a good man, so as to carry off some benefit from what he says. The growing influence of wealth disturbs his vision of the future. 'Money mixes race;' but such marriages are the bane of the city. His conclusion is that 'the best thing for a man is not to be born into the world at all, and the next best thing is to die at once.' His social verses present him in a less melancholy mood. Here too the didactic element plays a large part, though his wisdom is more worldly than moral. It is a disgrace to be drunk when the company are sober, but also a disgrace to be sober when the company are drunk, and the ideal stage is that of being 'no longer sober and yet not very drunk.' Cyrnus must suit his demeanour to his company. 'Amongst the uproarious,' says Theognis, 'I am very uproarious, and amongst the proper no man more proper than I.' Cyrnus must 'exceed in nothing; the mean is best in all things.'

For beauty of thought, expression, or imagery we must look elsewhere than in the elegiacs of Theognis. Passion there is none, nor do the profound problems of life which filled the drama of a later age seem to have touched the poet's simple Dorian mind. But his shrewd common sense recommended him to conservative fathers as an authority for their children's instruction, and his wise sayings were so well known that it became a proverb, 'I knew that before Theognis was born.' There are works by Bekker (1815), and Welcker (1826); see also Hookham Frere, *Theognis Restitutus* (Malta, 1842); E. Harrison, *Studies in*

*Theognis* (1902), and the edition of the *Elegies* by T. Hudson-Williams (1910).

**Theogony**, the name given in ancient Greece to a class of poems recounting the genealogy of the gods. Musæus (q.v.) is said to have written the earliest Theogony; but his work, as well as the Theogonies of Orpheus (q.v.) and others, have perished, that of Hesiod (q.v.) being the only one that has come down to us. The story of Creation (q.v.) is on the other hand called COSMOGONY.

**Theolocopuli.** See GRECO (EL).

**Theology** (Gr. *θεός* and *λόγος*, the doctrine concerning the nature of God and his relation to the universe). The word first occurs in Plato and Aristotle, who understand by it the doctrine concerning the Greek gods, and apply the term 'theologian' (*θεολόγος*) to Homer, Hesiod, and Orpheus, owing to the religious teaching in their poetry. From Plato and Aristotle the word passed into Christian usage, and was in the 3d and 4th centuries A.D. applied to the apologists and thinkers who made use of the doctrine of the Logos in their exposition of the Christian faith.

In modern times the word is used with a wide range of meanings. In its broadest sense it covers the whole field of inquiry connected with the science of religion. A university faculty of theology, for instance, generally at the present time embraces within its scope all the multifarious forms of study which have a bearing on the origin, history, and beliefs of the different forms of religion which have exercised any influence upon the world. A book like Macculloch's *Comparative Theology* attempts to institute a comparison between the beliefs that have been held in different forms of religion on the main issues of religious faith. It is not too much to say that the scope of theology covers a territory which extends from Frazer's *Golden Bough* at the one extreme to Calvin's *Institutes* at the other.

The methods of theology may not unfairly be compared with those of natural science. (1) Theology first of all has to collect and tabulate its facts—and its facts cover the whole phenomena of religion from the crudest forms of belief that are found in savage tribes to the highly developed faith of the Christian religion. (2) Then it has to collate and interpret these facts, and attempt to find an explanation of them; and it is because of this necessity that the comparative study of religion has become so important a field of investigation in modern times. (3) Lastly, it has to construct a philosophy of religion which will unify and systematise the facts, relate them to each other, and estimate their final value.

But though theology is generally used to-day with this wider connotation and this larger function, up till comparatively recently the area of its operation was restricted to the Christian religion, and its main task was concerned with the exposition and elucidation of the chief elements in the Christian faith. The methods of its working have varied in different ages. (a) From the 3d and 4th centuries onward its main function was to defend the Christian religion from attack, to expound its beliefs in reply to heresy, and to formulate its credal statements. (b) In the mediæval period the scholastics attempted to articulate the Christian faith and expound it in terms of Platonism, as in the case of John Scotus Erigena, or of Aristotelianism, as in the case of Thomas Aquinas. (c) With the Reformation a revolution took place in its *modus operandi*. The Bible became for Protestants the authoritative and only source of doctrine, and the task of theology was to weave the contents of its textual statements into a connected whole, and transform them into an ordered

system of belief. In fact, it may be said that the period from Luther up to Schleiermacher is the golden age of systematic or dogmatic theology. To this period belong such well-known classics as Calvin's *Institutes* and Melancthon's *Loci Communes*. (d) A further revolution was introduced by Schleiermacher, whose *Glaubenslehre* was to theology what Bacon's *Novum Organum* was to natural science. According to Schleiermacher, the essence of religion is to be found in feeling and experience, and it is this feeling and this experience that constitutes the ultimate data of theology. This means, of course, that theology rests no longer upon credal statements or biblical texts, but upon a psychological basis. The inevitable result of Schleiermacher's position was the discovery that Christian doctrine grows out of Christian experience, and depends for its truth and value on the validity of the experience and the correctness of its interpretation. The task of theology, therefore, to-day may be defined as the analysis of the phenomena of religious experience (more particularly Christian experience), the interpretation of that experience, and the erection on the basis of that experience of a constructive statement of the content of religious truth.

The recognition that the facts of religious experience form the ultimate data of theology has of course affected the line of approach to the subject, for by experience is not meant merely the experience of the present day alone, but the Christian experience of the past as well. This means that the study of the history of religious experience is a vital part of the method, and the historical study falls into two parts: (1) *Biblical theology*, which gives an account of the religious experience of the prophets and psalmists and seers of the Old Testament, and of the contemporaries of Jesus and the apostolic leaders in the New Testament. The significance of this experience is that for the most part it is primary and original—the first experience of its kind, and therefore the source of the secondary experiences which are based upon it in later times. Moreover, biblical theology involves not only the study of the primary experience, but the study also of the first attempts that were made to interpret that experience. (2) *Historical theology*, which deals with the continued religious experience in the lives of individuals and in the fellowship of the Christian community, and with the attempts which were made at different times to form doctrines on the basis of that experience and give a philosophical explanation of it. The most elaborate attempt to cover this ground is to be found in Harnack's monumental work on the *History of Doctrine* (7 vols.). Having obtained its analysis of the religious experience of the past from the Bible and church history, theology will then proceed to compare it with the experience of the present day. It will not necessarily reject elements which have no place in modern experience, since it will remember that the law of uniformity does not apply to religious experience and that different ages seem to have reacted in different ways to the divine impact.

Theology has many sub-divisions. *Theology* proper deals with the doctrine of God. *Christology* with the doctrine of the Person of Christ. *Anthropology* with the doctrine of the nature of man. *Soteriology* with the doctrine of redemption. *Pneumatology* with the doctrine of the Holy Spirit. *Ecclesiology* with the doctrine of the church. *Eschatology* with the doctrine of the future life.

The most important modern books on dogmatic or systematic theology are Biedermann, *Dogmatik* (1884); Seeberg, *Zur systematischen Theologie* (1909); Haering, *The Christian Faith* (Eng. trans. 1913); Schlatter, *Das christliche Dogma* (1911); Nitzsch, *Lehrbuch der Evan-*

*gelisten Dogmatik* (1912); Wernle, *Einführung in das theologische Studium* (1911); Kähler, *Ausgewandte Dogmen* (1908); W. N. Clarke, *Outline of Christian Theology* (7th ed. 1900); W. A. Brown, *Christian Theology in Outline* (1912). Among the older books may be mentioned Rothe, *Dogmatik* (1870), and Martensen, *Christian Dogmatics* (Eng. trans. 1871).

For books of general reference see Hastings, *Encyclopædia of Religion and Ethics* (1908-1926); Herzog-Hauck, *Realencyklopädie* (1896-1909); *The Jewish Encyclopædia* (1901-1912); *The Catholic Encyclopædia* (1908-1915).

The titles of many other theological treatises, besides those above mentioned, will be found in the lists appended to CHURCH HISTORY and ROMAN CATHOLIC CHURCH. See also the articles on the several books of the Bible; those on Jesus Christ, Paul and the other apostles, and on the great Christian teachers; those on great theologians such as Schleiermacher, Baur, Rosmini, Newman, Ritschl; the paragraphs on the churches of the several countries; and the following:

**Theophanes**, Greek monk and chronicler, was born at Constantinople about 758 A.D. He founded an abbey near Sigriano, but his support of image-worship led to imprisonment. He died in exile at Samothrace in 817. His *Chronicle* (edited by de Boor, Leipzig, 1883-85) covers the period 284-813, and, though inaccurate, affords much valuable information.

**Theophany** (Gr., 'appearance of God'), specially the appearance of God to the patriarchs in the form of an angel or in human form; also the incarnation and second coming of Christ.

**Theophilanthropism**, a deistical system of religion drawn up under the French Directory in 1796, and designed to take the place of Christianity, which had been abolished by the Convention. God, virtue, and the immortality of the soul were the main elements of the creed; the services were simple to baldness. The system disappeared about 1802. Attempts at resuscitation during the 19th century met with little success. See A. Mathiez, *La Théophilanthropie* (1903), *Contributions à l'histoire religieuse de la révolution* (1907).

**Theophilus**, a legendary coadjutor-bishop at Adana in Cilicia, who, when deposed from his office through slanders, gave his soul in bond to the devil, and consequently was reinstated the next morning. But he was soon overtaken with remorse, and through forty days' fasting and prayers prevailed on the Virgin to make intercession for him. She tore the bond from the devil, and laid it upon the breast of the repentant sinner as he lay asleep in the church. Theophilus then made a public confession of his crime and of the mercy of the Virgin, and died three days after. This forerunner of the Faust legend must have reached the West during the 10th century. It was treated by Roswitha, by Hildebert of Tours, and in a 14th-century Dutch metrical version (published by Blommaert, Ghent, 1836). The first dramatic handling of the subject was in French by Rutebeuf (q.v.); then repeatedly during the 14th and 15th centuries in Low-German (*Theophilus, in Icelandic, Low-German, and other Tongues*, by Dasent, Lond. 1845). See A. Ebert, *Allgemeine Geschichte der Literatur des Mittelalters*, iii.

**Theophilus**, Bishop of Antioch from 168, wrote (180-181) in three books, addressed to a pagan

friend Autolykus, an apology for Christianity (ed. by Otto in *Corpus Apologetarum*, vol. viii. Jena, 1861). The genuineness of a commentary on the gospels is defended by Zahn, assailed by Harnack and others.

**Theophilus** OF ALEXANDRIA, succeeded as 22d bishop of the see in 385 A.D., and showed himself a man of great contentiousness as well as learning. He strove with the pagans of Alexandria and destroyed their temple of Serapis (q.v.); he quarrelled with his archpresbyter Isidore, an Origenist, and later condemned Origenism in general; and finally he was concerned in the events which led to the deposition of St John Chrysostom. Theophilus died 'of lethargy' 15th October 412. His writings, which are unimportant, include several 'Easter Letters' and a work against Origen. See CHRYSOSTOM, ORIGEN.

**Theophrastus**, naturalist, essayist, and philosopher, born at Eresos, in the island of Lesbos, probably 373 or 368 B.C., repaired, after an excellent education, to Athens, where he heard Plato and Aristotle, attaching himself particularly to the latter, whose intimate friend and successor he became. He accompanied his master to Stagira, and inherited, by will, the whole Aristotelian library, the largest then known, including the philosopher's original manuscripts and unpublished writings. As head of the Peripatetic school he displayed an all-round versatility not unworthy of Aristotle himself, and was the reputed author of 227 works. His authority remained for many years paramount in logic, psychology, ethics, politics, rhetoric, physics, and metaphysics, in all of which subjects he preserved the lines of his predecessor, while supplementing most of them wherever they seemed defective. His writings are in great part lost, particularly the valuable zoological series in which he dealt with the instincts and habits of animals; but we still possess his *History of Plants*, his *Causes of Plants*, his treatises on *Stones*, on *Fire*, and on *The Senses*. In his hands ancient botany attained its highest development, and after him it seems to have been cultivated only in its relation to medicine. His *XXX. Characters* is another of his extant works—a masterly delineation of moral types, which, however, some scholars assume to be a later compilation from a more discursive original of his. He died about 287 B.C., after directing for a whole generation the Peripatetic school, which attracted many disciples from all parts of the Hellenic world. As its permanent seat of instruction he bequeathed to it his house, garden, and colonnades.

For his position in Botany, see Berendes, *Die Pharmacie bei den alten Kulturvölkern* (vol. i. 1891), and Greene, *Landmarks of Botanical History* (vol. i. 1909); in Ethics the masterly edition of the *Characters*, with introduction and trans. by Sir R. Jebb (1878; new ed. 1909); in Psychology the edition and translation of *The Senses* by G. M. Stratton (1917); and in Literature the articles CHARACTERS, LA BRUYÈRE. See also Usener's *Collectanea Theophrastea*.

**Theophylact**, a famous Greek exegete, a native of Eriupis in Euboea, who became Archbishop of Achrida in Bulgaria in 1078, and died after 1107. He wrote commentaries on almost the whole Bible, printed in Venice (3 vols. 1754-58).

**Theopompus**, a Greek historian and orator of the 4th century B.C., was a native of Chios. In the twelve books of his *Hellenica* he told the story of Greece from 411 to 394. One of the Oxyrhynchus papyri (published by Grenfell and Hunt, 1908) is accounted by some a fragment of the *Hellenica*, but by others is attributed to another historian Cratippus (q.v.). The digressive style of Theopompus is well illustrated in the fifty-eight books of his *History of Philip*, which afforded material

for later writers including Plutarch and Photius. An edition of the extant works of Theopompus was issued in 1909.

**Theorbo.** See LUTE.

**Theosophy**, literally divine wisdom (*theos*, *sophia*), is a name that since the time of Ammonius Saccas, in the third century after Christ, has been used in the West to cover various schools of religious philosophy, which all unite in the fundamental conception that man, in his innermost nature, is a spiritual being, one in his essence with the Universal Spirit manifested in and through the universe. In this general sense it has been taken to include mystics differing widely from each other in details; among these are the Simonian, Ophite, and Valentinian schools of so-called Gnosticism; the Neoplatonist of Ammonius Saccas, Porphyry, Plotinus, Iamblichus, and Longinus; the great Hermetic and Rosicrucian orders, which kept an unbroken tradition through mediæval and modern Europe; together with the teachings of men like Jakob Boehme, Henry Vaughan, and Law. These may be taken as representing the Occidental stream of Theosophical thought, which has naturally acquired a Christian tone in its symbolism, whereas the Oriental has utilised the symbolism of the great eastern religions. In the East the system now called Theosophy has been known for ages under the titles of *Ātmā Vidyā* ('spirit science'), *Brahmavidyā* ('science of Brahma'), *Gupta Vidyā* ('secret science'), and other similar names. All alike, in East and West, draw their inspiration and their methods from the 'Wisdom Religion,' the ancient esoteric philosophy. This claims among its initiates the men who have given to the world fragments of the teaching as basis for world-religions, men like Buddha, Confucius, Zarathustra, Pythagoras, Plato, Jesus, to say nothing of yet more ancient sages, Manu, Nārada, and other great Rishis. In the 16th century Paracelsus and Giordano Bruno are among its grandest exponents, and in our own day its messenger was a woman of Russian birth, Helena Petrovna Blavatsky (1831-91), who was initiated in Tibet, and whose works form the most complete exposition of the esoteric philosophy.

The Esoteric Philosophy, or Wisdom Religion, is a body of teaching, philosophical, scientific, and religious, which is believed to be preserved from generation to generation by a brotherhood of initiates scattered over the world, but preserving close and intimate relations with each other. It is to a group of these now stationed in Tibet that the founding of the Theosophical Society in 1875 is ascribed, and it is these who are constantly referred to in Theosophical literature as Mahātmās, Arhats, Masters, Brothers, or Adepts. They are living men, who have evolved the spiritual nature until the physical body and brain-consciousness have become ductile instruments for the spiritual intelligence; and who, by virtue of this evolution, are said to have gained a control over natural forces, which enables them to bring about results that appear to be miraculous. The possibility of this evolution, and the nature of the powers inherent in the highly evolved man, derive inevitably from the postulates of the esoteric philosophy.

This philosophy teaches as basic principles an eternal existence beyond human cognition, existence *per se*, absoluteness or 'be-ness.' This is manifest as the LOGOS, or WORD, existence made articulate, the Source of Life in a universe; emanated by him, he is immanent in it, as its root substance, matter on its negative, and spirit on its positive side. Spirit and matter are therefore not separable, but are merely the opposed poles of the one root-substance, and are present in every

particle, as the poles in each fragment of a broken magnet. Evolution consists in the gradual densifying of the root-substance through seven stages or planes of differentiated existence, the matter aspect becoming more and more prominent as the evolution proceeds, and the spirit aspect becoming more and more hidden; thus matter reaches its fullest differentiation, evolving the whole of its capacities as a vehicle. From this point of completest materiality begins the returning curve, during which matter becomes translucent to spirit, and spirit becomes individualised and self-conscious on all planes; having manifested itself as brain-intellect on the most material plane, it manifests all its subtler super-intellectual powers on the ascending arc, but always with the addition of self-consciousness and individuality, until, at the completion of the cycle, matter has become a perfect objective presentment of spirit, a perfect vehicle of spiritual activity.

The seven stages of cosmical evolution, aspects of the universal Divine consciousness, correspond with seven stages of human evolution, aspects of the human consciousness, by each of which man can cognise directly the corresponding cosmic state. The two highest of these, the Divine World, are the habitat of highest spirit, beyond the limits of our system; there dwell the Monads, 'the spirits of just men made perfect,' in conscious union with the Logos. In the five remaining we have the stages of the unfolding human consciousness: (1) the embodied spirit; (2) the spiritual soul, or pure reason; (3) the intellect, or ego; these are the immortal part of man. The perishable part, which hands on its experiences to the imperishable, in the form of intellectual and moral capacities, is: (4) the lower mind working in mental matter, or mind-stuff; (5) the emotions, passions, and appetites working in astral matter; (6) the vitality, working in physical ether; (7) the waking consciousness, working in the brain and nervous system. These seven are really but the aspects of the embodied spirit, working in matter of different densities, which modify the expression of his own inherent capacities. Another way of looking at the same facts is to see the spirit as inherently triple—an image of the triplicity of Divine consciousness—and as manifesting as (1) will; (2) wisdom; (3) activity, the functional aspects of the embodied spirit, the pure reason, and the intellect; these, modified by expression in denser matter, are the before-named mind, emotions, and vitality; the mind, the lower form of intellect; the emotions, evolving towards unity, and therefore towards wisdom; the vitality, the will to live; these unite in the waking consciousness, enshrined in the physical body.

At death the dense body, which was the home of the waking consciousness, disintegrates, and is followed by the dispersion of the etheric double, the vehicle of vitality; the man himself, with the memory of his earth-life remains awhile in the intermediate, or astral, world. When the grosser part of his emotional nature drops away from him he goes on into the heaven world, and there all his higher emotions and his thoughts and memories are transmuted into qualities, during a long period of bliss. These qualities, the fruits of his experiences on earth and his memories of the past, are taken up into the immortal ego, and the lower mind fades away. The length of the heavenly life depends on the mental and moral activities of the earthly life, for all these must be assimilated before return is possible. Then the consciousness again becomes embodied in the denser matter of the heavenly, intermediate, and physical worlds, enriched with the faculties gained in the past, to gather fresh experience for further progress.

For the method of evolution, according to Theosophy, is Reincarnation. The reincarnation ego is the agent in progress. In the far-off past, when physical evolution, guided by the indwelling spirit, had produced man's physical form, the ego first became incarnate therein, and has since reincarnated after each heavenly interlude. Throughout each incarnation he labours to evolve in the body he inhabits the capacity to respond to his impulses, but it is through the moulding of successive bodies that he accomplishes his task of human elevation. The thoughts produced by his activity are real *things* on the mental plane, made of subtle matter, 'thought-stuff,' a form of ether. The thoughts of each life ultimate in a thought-body, that expresses the result of that incarnation. The 'innate character' which the child brings into the world is this result of its own past, and is physically expressed in its brain and nervous organisation. The reincarnating ego is drawn by affinity to the nation and family fitted to supply the most suitable physical material and psychical environment. The physical particles thence supplied are stamped with the racial and family characteristics, bodily and mental, but their arrangement is dominated by the thought-body resulting as above stated. Thus mental and moral capacities gained by struggle in one or many incarnations become innate qualities, exercised 'naturally,' without effort, in a later incarnation, and thus progress is secured. This law, by which all causes work out their due effects, is called Karma (the Sanskrit word for action), and according to this all thoughts, good and bad, leave their traces on the thought-body and reappear as tendencies in future lives. No escape from this sequence of cause and effect is possible; all our past *must* work itself out, but as the same agent that made the past is making the present it sets up fresh causes in meeting the effects of the past. Thus a trouble, generated by past action, is inevitable; it is in our Karma. But we may meet it badly, and so set up fresh cause for bad Karma in the future; or we may meet it well, and so generate good Karma. We made our present destiny in our past, and we are making our future destiny in our present.

The teaching of Reincarnation as the method, and Karma as the law, of evolution leads to the doctrine of universal brotherhood, which it is the object of Theosophy to realise. Offspring of the universal life which is the soul of the universe, bound inextricably together by the ties of Karma, evolving to one common goal of perfect humanity, how should men be aught but brothers? Reincarnation crushes out all differences of race, sex, class; Karma so interweaves human lives that each can only find happiness and perfection as all find it. These facts in nature yield, it is claimed by Theosophy, a scientific basis for ethics, and make the practical recognition of human brotherhood a necessary condition of accelerated evolution.

**Thera.** See SANTORIN.

**Theramenes**, an Athenian statesman, constitutionalist and trimmer, of the 5th century B.C. He became unpopular by seeking to temper the extremities of oligarchy and democracy, and, while a member of the government of the Thirty Tyrants, incurred the hatred of the most cruel of the thirty, Critias (q.v.), whose health he drank in the hemlock cup (403 B.C.).

**Therapeutæ** (Gr. 'worshippers'), an ascetic sect, mentioned in the *De Vita Contemplativa* of Philo, and living chiefly by Lake Mareotis, near Alexandria. The Therapeutæ were formerly regarded as a branch of the Essenes, but Harnack (*New Schaff-Herzog*, 1911, xi. 411) rightly contests this view. The two sects resembled each other in

discipline, but the regulations of the Therapeutæ were more severe in regard to food and in preferring the solitary life to the common fellowship. Throughout the week each member lived in his lonely dwelling (*μοναστήριον*), but on the Sabbath they assembled for joint worship. The importance assigned by them to the number seven is shown by the institution of a festival once every seven weeks. This festival culminated in the *παννυχis*, when solemn dancing and choric singing were practised all through the night by bands of men and women. Their method of conducting services is carefully described by Philo. The Therapeutæ made a renunciation of the world, not because they deemed the world, *per se*, evil, but because 'they abjured money rather than matter' (J. Moffatt, Hastings, *E.R.E.*, xii. 316 b) and hated avarice. In their mysticism they were by no means antinomian, but they combined a devotion to the Law with a quiet life of philosophic prayer and meditation.

In view of the fact that the sole authority for the Therapeutæ is Philo, first cited by Eusebius, the existence of this sect has been challenged altogether or relegated to a much later date. The remarkable similarity between the asceticism of the Therapeutæ and Christian monasticism has been regarded as explicable only if the Therapeutæ were a Christian order; the account attributed to Philo would then be spurious. These theories were finally and most effectively defended by P. Lucius (*Die Therapeuten*, Strassburg, 1879), but since F. C. Conybeare's *Philo about the Contemplative Life* (Oxford, 1895), the credibility of Philo may be held to be generally conceded. W. Bacher (*Jewish Quarterly Review*, vii. 703) accepts the identification by Harkavy of the Therapeutæ with the *Maghārīyah*, 'men of the cave,' mentioned by the Karaite Kirkisani in the 10th century, but Poznansky (*Rev. Et. Juives*, 1905, 19-23) thinks this uncertain.

On account of the controversy about the authenticity of Philo's description of the Therapeutæ great care is necessary in selecting literature on this subject. The reader is advised to follow the lines laid down by J. Moffatt (*cit. supra*), and to consult the bibliography which he furnishes.

**Therapeutics** (Gr. *therapeuō*, 'I heal') is that division of the science of medicine which treats of the various actions of remedies upon the diseased animal system, or the means by which nature may be aided in her return to health. 'Suggestive Therapeutics' is a term for Hypnotism (q.v.) employed as a sanative agency.

**Therapia**, a small Turkish town, finely situated on the Bosphorus, 15 miles N.E. of Constantinople, is a favourite summer residence.

**Theresa, St.** See TERESA.

**Theresiopol.** See SUBOTICA.

**Therezina**, capital of the Brazilian state of Piahy, on the Parnahyba, about 200 miles SSE. of Maranhao, with which it is connected by rail.

**Thermidor**, i.e. the 'Hot Month,' formed, in the calendar of the first French Republic, the 11th month, and lasted from the 19th July to the 18th August. The 9th Thermidor of the Republican year 2 (July 27, 1794) is historically memorable as the date of Robespierre's fall, and the termination of the Reign of Terror. The name Thermidorians was given to all those who took part in this *coup d'état*, but more particularly to those who were desirous of restoring the monarchy.

**Thermionic Valve.** See WIRELESS TELEGRAPHY, WIRELESS TELEPHONY.

**Thermit**, a mixture of finely divided aluminium with ferric oxide, used to produce very high temperatures in welding. The reaction is  $\text{Fe}_2\text{O}_3 + 2\text{Al} = 2\text{Fe} + \text{Al}_2\text{O}_3$ .

**Thermodynamics** is the branch of physical science which discusses the relation between heat and work. It forms the kernel of the modern doctrine of Energy (q.v.); for it was by the discovery that heat was energy and not matter that the conservation principle was established in its widest generality. Towards the end of the 18th century Davy and Rumford had independently shown that the caloric theory of heat was untenable. But it was not till thirty or forty years later that the scientific mind began to emancipate itself from this theory which regarded heat as an imponderable substance effecting thermal changes by combination with ordinary ponderable matter. With the early development of the true theory the names of Colding, Hirn, Joule, and Mayer are closely associated. The labours of Joule (q.v.) were particularly valuable, as he it was who first in 1843 obtained a really good measurement of the mechanical or dynamical equivalent of heat—that is, the amount of dynamical work which is equivalent to a given quantity of heat. This equivalent is commonly called Joule's Equivalent. By demonstrating experimentally that wherever energy in the dynamical form is lost an exact equivalent of heat is always obtained, Joule established what is known as the First Law of Thermodynamics. Briefly put, this law is the statement that heat is energy, and can be measured in the same units. When during any transformation of energy heat is generated, it is at the expense of an exact equivalence of energy in some other form. Or when, on the other hand, there is a disappearance of heat, an exact equivalence of energy in some other form or forms will appear.

It is a familiar fact that relative motion is destroyed by friction. But destruction of motion means loss of kinetic energy; and it is this lost energy which is transformed into the heat invariably produced by friction. There is no difficulty in effecting the transformation of other forms of energy into heat. It is impossible, indeed, to prevent some of the energy taking the form of heat whenever a transformation is effected—when, in other words, any change of physical conditions occurs. But whatever be the manner of the transformation, the first law of thermodynamics is found to be always fulfilled, the amount of heat generated is equivalent to the energy, in other forms, which has disappeared. Joule's earliest determination of the dynamical equivalent of heat differed by only  $\frac{1}{4}$  per cent. from his latest (1878). According to it the quantity of heat capable of raising the temperature of a pound of water, weighed *in vacuo*, from 60° to 61° Fahrenheit requires for its evolution an expenditure of work represented by the fall of 772.55 pounds through a distance of one foot at the sea-level at the latitude of Greenwich; or the dynamical equivalent of the unit of heat defined as above is 772.55 foot-pounds at Greenwich. The scientific unit of heat is now taken to be the amount of heat required to raise 1 gramme of water from 0° to 1° centigrade. Hence, reducing to the lower temperature and taking account of the change of thermometric scale, we get for the value of Joule's Equivalent 1391.8 foot-grammes or 42422 centimetre-grammes or  $4.1623 \times 10^7$  ergs. More recently the researches of Rowland and Griffiths have raised this last figure to  $4.194 \times 10^7$ .

To convert work into heat is an easy matter; but not so the reverse operation, to convert heat into work. This, however, is the function of all our heat engines, using the term in its widest sense as including steam-engines, gas-engines, and all machines which do work by combustion of fuel. It has long been recognised that such machines can work only when there is a difference of

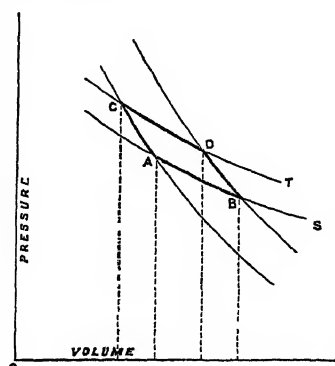

temperature. It matters not how much heat may be stored up in a body, it is practically impossible to utilise that heat as working energy unless we have a neighbouring body of lower temperature. But when a difference of temperature exists there is a constant passing of heat from the warmer to the colder body, so that the temperatures tend to become equalised. And thus the very nature of heat is such as to make it lose more and more of its availability for being transformed into useful work. Suppose, however, that it was possible to prevent heat from passing by conduction or diffusion from the warmer to the colder body, and that whatever heat was taken from the system during a suitable series of operations was altogether transformed into work, how does this transformability of the heat depend upon the temperatures? This is the question which is answered by the Second Law of Thermodynamics, the development of which is closely associated with the names of Carnot, Rankine, Clausius, and Thomson (Lord Kelvin).

Sadi Carnot (q.v.), in his famous *Réflexions sur la Puissance du Feu* (1824), clearly laid down the lines along which the complete theory must be developed. His own argument was vitiated by the assumption of the then accepted caloric theory of heat. But we know from his posthumous papers published in 1878 that Carnot himself had, before his premature death in 1832, recognised that heat was energy, and had fully enunciated the First Law of Thermodynamics.

Besides sketching out a series of experiments almost identical with the valuable researches subsequently made by Joule and Kelvin, Carnot made an estimate of the dynamical equivalent of heat, which, though one-sixth too small, was more accurate than Mayer's made in 1842. Carnot is now recognised as one of the greatest scientific men of the century; and had he survived there is no doubt that the theory of heat would have been established nearly thirty years earlier than it was. Carnot's methods, as given in his book, were not appreciated till Kelvin in 1848 drew attention to them. Soon after Clausius, correcting the one flaw in Carnot's reasoning, established the Second Law on its modern basis. To Kelvin we owe the doctrine of the dissipation of energy and the definition of the absolute thermometric scale. By this is meant an energy method of measuring temperature, independent, that is, of the kind of substance used. See TEMPERATURE and THERMOMETER. To make this scale intelligible involves the discussion of Carnot's principle, which is virtually the second law.

The novel feature of Carnot's method was the invention of the cycle of operations, and especially the reversible cycle. An engine or working substance will have passed through a cycle of operations when all its parts have recovered exactly those physical conditions (volume, pressure, temperature, and the like) which they had at the beginning. It is only when such a cycle has been completed that we have any right to reason about the transformations of energy which have taken place during the progress of the operations which constitute the cycle. For simplicity take as working substance a definite quantity of air contained in a chamber, whose volume may be varied indefinitely by the outward or inward motion of a piston. We shall assume that the walls of this chamber can be made either perfectly impervious to heat or perfectly diathermanous. When in this latter condition the substance is to be kept in contact with another substance at the same constant temperature. Volume and pressure changes, which take place in this condition in the working substance, take place *isothermally*, there being no

change of temperature. On the other hand, when the impervious condition is realised, whatever

changes take place in the working substance take place *adiabatically*, there being no loss or gain of heat. When the temperature of air is kept constant we know by Boyle's law that the pressure varies inversely as the volume. This relation and all similar relations may

be represented graphically by means of a curve, every point of which denotes a definite state of pressure and volume. Such a curve is called an *isothermal* line. For any given mass of gas or air there will be a different isothermal line for each different temperature. If we trace a series of isothermals, we can at a glance determine any one of the quantities, temperature, pressure, and volume, when the other two are given. In the figure two isothermals, AB, CD, corresponding to temperatures S and T, are shown. T is supposed to be the higher temperature. Volume is measured horizontally from the origin O, and pressure vertically. The lines CA, DB are supposed to be *adiabatic* lines. They show how volume and pressure vary with one another when heat is allowed neither to leave nor to enter the substance. Just as along each isothermal the temperature is constant, so along each adiabatic there is a quantity called the entropy, which remains constant. Adiabatic lines are also called *isentropic*. To pass from one isotherm to another we must change the temperature. In like manner, to pass from one adiabatic to another we must change the entropy.

Begin with the working substance in the state A—i.e. with volume Oa, pressure aA, and temperature S. Compress adiabatically till the temperature rises to T and the state C is reached. In this first operation a definite amount of work is done, but no heat is gained or lost. Next, let the substance expand isothermally to any state D, doing work and at the same time taking in heat from the source, which is kept permanently at the temperature T. In the third operation let the substance expand adiabatically until the temperature falls to S and the state B is reached. In this operation a definite amount of work is done by the substance. Finally, compress the substance isothermally until the original state A is reached. Here work is done on the substance, and heat is given out to the refrigerator, which is kept permanently at temperature S. The cycle is now complete. The work done by the working substance or engine is represented by the area ACDB; and this work done must be equivalent to the heat which has disappeared. If  $Q$  units of heat are taken in in the second operation (CD), and  $q$  units of heat given out in the fourth (BA),  $Q$  must be greater than  $q$ , and the difference ( $Q - q$ ) will be dynamically equivalent to the work ( $W$ ) done by the engine. Now if the engine is reversible in Carnot's sense, it will be possible to go round the cycle in the opposite direction, reversing all the physical processes involved, and generating ( $Q - q$ ) units of heat by the expenditure of  $W$  units of work. Carnot's principle is that this reversibility is the test of a perfect engine. A more efficient engine than the reversible engine cannot

exist. To prove this, let  $N$  be the reversible engine, and suppose that  $M$  is a more efficient engine than  $N$ . In other words,  $M$  can, with a given supply of heat, do more work than  $N$ . The  $(Q - q)$  units of heat taken in by  $M$  during the cycle will be transformed into  $(W + w)$  units of work; and of these  $W$  units will be changed back into  $(Q - q)$  units of heat by the reversible engine,  $N$ , working backwards. Thus in a complete double cycle  $w$  units of work will be done, while the heat originally taken from the source at temperature  $T$  has been restored to it. To account for this overplus of work we must suppose an equivalent of heat to be taken from the refrigerator at temperature  $S$ . Hence if a more efficient engine than the reversible engine existed it would be possible to do work by means of heat taken from the refrigerator. By taking as refrigerator any limited part of the universe, we should be able to cool that part until all heat was removed from it, and so to obtain from it useful work. Such a result is contradicted by all our experience. Hence we conclude that the reversible engine is the perfect engine.

Returning to the cycle of operations, we see that  $Q$  units of heat are taken in at the temperature  $T$ , and  $q$  units given out at the temperature  $S$ ; and by experience we know that  $Q$  and  $T$  are greater than  $q$  and  $S$  respectively. Kelvin's absolute scale of temperature is obtained by defining  $T$  and  $S$  such that their ratio is the same as  $Q$  and  $q$ , or

$$q : Q = S : T;$$

this gives  $Q - q : Q = T - S : T$ .

Now  $(Q - q)/Q$  is the ratio of the usefully transformed heat to the whole heat supplied, and is called the efficiency of the engine. Hence the greatest possible efficiency of a heat engine is measured by the ratio of the difference of temperatures of the source and refrigerator to the temperature of the source. This absolute scale is found to be in close accordance with the scale of the air thermometer; and its zero, as determined by Kelvin and Joule, lies  $274^\circ$  centigrade below the freezing-point of water. Thus a perfect engine working between temperatures  $0^\circ$  to  $100^\circ$  C. would have an efficiency of  $\frac{3}{4}$ , or little more than one-fourth. Practically it will hardly exceed half this value.

Now looking back to the diagram we see that  $Q$  is the heat taken in as we pass from the adiabatic CA to the adiabatic DB along the isotherm  $T$ , and similarly that  $q$  is the heat taken in as we pass between the same adiabatics along the isotherm  $S$ . But  $Q/T = q/S$ , and the same ratio is given by whatever isotherm—i.e. at whatever temperature—we may pass between the adiabatics. We may therefore take this ratio to be the amount by which the entropy increases as we pass from the one adiabatic to the other. The universal tendency of heat is to pass by conduction or radiation from the warmer to the colder body. If, then,  $H$  units of heat pass from a body at temperature  $T$  to a body at temperature  $S$ , the warmer body will lose entropy to the amount  $H/T$ , and the colder will gain entropy  $H/S$ .  $S$  being smaller than  $T$ , the gain will be greater than the loss, and hence the entropy of the system will increase by the amount  $H(S^{-1} - T^{-1})$ . Thus we have Clausius' theorem that the entropy of the universe tends to a maximum. Kelvin's view is slightly different. His doctrine of the dissipation or degradation of energy, otherwise the loss of motivity, will be found discussed under ENERGY. Maxwell has pointed out that if we could deal with the individual molecules of gaseous matter, it would be possible without expenditure of work to raise the temperature of one region and lower that of another, in contradiction to the second law of thermodynamics. Thus it appears that the second law stands on a distinctly different footing

from the first law. Its basis is really to be found in the fact that we can deal with molecules of matter only in the aggregate and statistically, and not individually. That it is, nevertheless, essentially involved in many of the processes of nature is shown by the remarkable results which have been obtained by its means. Its consequences have been developed by Rankine, James Thomson, Kelvin, and Clausius, and in later times by Massieu, Gibbs, Helmholtz, and others. Thermo-electricity, radiation, capillarity, the conditions of equilibrium of heterogeneous bodies, the co-existence of different states of the same body, and generally the inter-relations of electricity, magnetism, heat, and light, all give interesting illustrations of the second law of thermodynamics.

See Maxwell's *Theory of Heat* and Tait's *Heat* for elementary discussion of the subject, and Tait's *Thermodynamics* for the historical aspect. Bayne's *Thermodynamics* and Parker's *Elementary Thermodynamics* (1891) may be named, and Planck's *Treatise* (trans. 1903). J. J. Thomson's *Applications of Dynamics to Physics and Chemistry* (1888) contains the solution of many complex problems. Clausius' and Kelvin's original papers are still the most important in all thermodynamic literature.

**Thermo-electricity.** See ELECTRICITY, p. 271.

**Thermometer** is a name which, though applicable to any instrument for measuring change of temperature, is usually restricted to such instruments as measure by means of the expansion of substances, and more especially of liquid substances. The ordinary thermometer consists of a glass tube of very narrow bore, which opens out into a bulb at one end. This bulb and part of the capillary tube are filled with the thermometric substance, generally mercury, sometimes alcohol or other liquid, but never water. Mercury is pre-eminently suitable for thermometric purposes. Its freezing-point is lower than the temperatures with which we have usually to deal; and its boiling-point is much higher than that of any other substance which is liquid at ordinary atmospheric temperatures. Throughout a long range it expands very steadily as heat is applied to it. By defining degrees of temperature in terms of equal successive increments of volume of mercury, we get a very serviceable scale, differing but slightly from the scale of degrees as defined thermodynamically by Lord Kelvin (see TEMPERATURE, THERMODYNAMICS). Mercury again is opaque, and does not wet the surface of the glass with which it is in contact. Alcohol and water, on the other hand, are transparent, so that when the former is used as the thermometric substance it has to be coloured. The peculiar behaviour of water near its freezing-point quite condemns its use in thermometry, even if it were suitable in other respects (see HEAT). It would, however, be highly inconvenient otherwise, inasmuch as its freezing and boiling points lie well within the range of easily attainable temperatures. As regards its boiling-point, alcohol has the same disadvantage. It is in the measurement of very low temperatures that alcohol and ether thermometers are particularly valuable. These substances have also the further merit of having a high expansibility.

When the capillary tube and bulb have been constructed, the first operation is to fill in a sufficient quantity of liquid. This is effected by first heating the bulb to expand the air contained in it, and then plunging the open end of the tube into the liquid, which gradually rises through the bore as the air in the bulb cools. The tube is then set with the bulb down and tapped until most of the liquid is shaken out of the tube into the bulb. A second heating of the bulb until the

liquid boils still further diminishes the amount of air inside; and more liquid is introduced as in the first operation. The manipulation requires great skill; and the first stage is reached when at ordinary temperatures the required quantity of liquid fills the bulb and part of the tube. The next stage is to seal hermetically the upper end of the tube when it is quite free of air, a condition which is attained by heating the upper surface of the liquid to the boiling-point and so driving out the air. When the sealing is effected the tube and bulb are filled almost entirely with the thermometric substance and its vapour. Probably no thermometer is quite clear of air, for it is difficult, if not impossible, to get rid *absolutely* of the air held in solution in liquids; but the quantity mingled with the liquid or its vapour is excessively minute in the best thermometers.

It now remains to graduate the instrument so that its indications may be capable of interpretation. The most delicate thermometers have an arbitrary scale engraved on the tube before the operation of filling is begun; and afterwards certain definite and known temperatures are measured in terms of it, so that its indications become known. For all ordinary and most scientific purposes it is sufficient to engrave the scale on the stem after the positions of the liquid column have been determined for the two chosen standard temperatures. Thermometers with *attached* scales engraved on ivory or brass are useless for other than the roughest determinations.

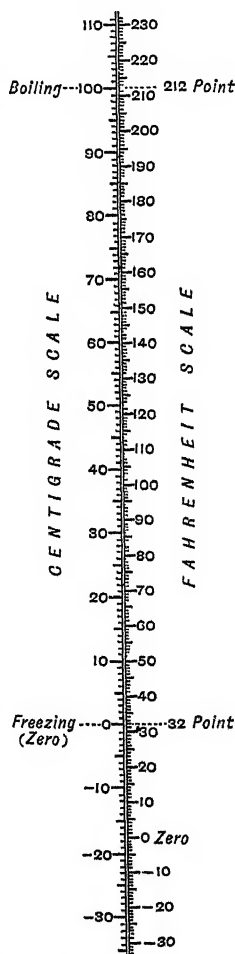

The two standard temperatures universally used in graduating a thermometer are the freezing and boiling points of water. Previous to the discovery that these, under given conditions, correspond to definite temperatures, thermometry could hardly be said to exist. In Newton's scale of temperature (1701) the freezing-point of water is taken as zero, and the temperature of the human body as 12°. Fahrenheit, who first made (1721) a mercury thermometer, took as his zero the lowest temperature then obtainable (from a mixture of salt and ice), and called the temperature of the human body 8°. Each degree was subdivided into twelve parts; and subsequently these twelfths were taken as the degrees. This made the temperature of the body 96°; and it was found that the freezing-point of water was 32°. When shortly afterwards it was discovered that the boiling-point of water was always the same under the same barometric pressure, a second and easily determinable standard temperature was obtained. Thenceforward this boiling-point, under a pressure of 30 inches, was fixed at 212° on the Fahrenheit scale, the freezing-point being as before 32°. With these as standard, the temperature of the body is 98°; so that the present Fahrenheit scale is not exactly that which Fahrenheit himself adopted. Celsius in 1742 suggested that the boiling-point be called zero, and the freezing-point 100°. In the modern centigrade scale, commonly called the Celsius scale on the Continent, the freezing-point is taken at zero and the boiling-point under 760 millimetres pressure (29.92 inches) at 100°. Réaumur divided the interval between the freezing and boiling points into eighty divisions, from 0° to 80° Réaumur.

The centigrade scale is used almost exclusively for scientific purposes. British and American meteorologists, however, prefer the Fahrenheit scale, which has two distinct merits as compared with the centigrade. Its degree is smaller, so that by reading to tenths the observer has a more delicate instrument. To attain the same accuracy with the centigrade the observer must read to half-tenths. Again, the freezing-point being at 32°, it is only under severe wintry conditions that *negative* Fahrenheit temperatures are met with.

So inconvenient is the constant occurrence of negative temperatures on the centigrade scale that it is very usual in continental observatories to write -1°, -2°, -3°, &c. in the form 99°, 98°, 97°, making the freezing-point practically 100°, and the boiling-point 200°. For temperatures above the freezing-point the 'hundred' may be omitted without any fear of confusion.

It is often necessary to transform temperature readings from one scale to another, and more especially from centigrade to Fahrenheit, since the latter scale is the more familiar to English readers. The simplest rule is: Double the centigrade number, diminish it by one-tenth of itself, and add 32. The converse rule for changing Fahrenheit into centigrade is: Subtract 32, increase the remainder by one-ninth of itself, and take the half. In the figure the Fahrenheit and centigrade scales are shown side by side. To reduce Réaumur to Fahrenheit, multiply by  $2\frac{1}{4}$  and add 32. To reduce Réaumur to centigrade, increase the number by one-fourth of itself. These rules are simply expressions of the truth that 9 degrees on the Fahrenheit scale, 5 degrees on the centigrade, and 4 degrees on the Réaumur all measure the same temperature interval.

Various modified forms of thermometer are used for particular purposes. Thus the measurement of the humidity of the atmosphere is effected by means of the *wet-bulb* thermometer. In this instrument the bulb is covered with a woollen material kept constantly wet by the capillary action of its hanging ends, which dip into a vessel of water. When the air is saturated with moisture (see *Dew*) there will be no evaporation from the moist surface covering the bulb, and the wet-bulb thermometer will give the same indication as the ordinary dry-bulb. In a dry and warm air the water surrounding the bulb will evaporate at a rate depending on the dryness and the temperature. This evaporation is accompanied by a cooling of the evaporating substance and the bulb in contact with it, so that the wet-bulb thermometer will indicate a temperature lower than the temperature of the air as shown by the dry-bulb thermometer. The less humid the air is at a given temperature the greater is the difference

The Fahrenheit and Centigrade Thermometer Scales.

of readings on the wet- and dry-bulb thermometers. *Maximum* and *minimum* thermometers belong to the self-registering class of instrument. The ordinary clinical thermometer for taking the temperature of the body is one form of maximum thermometer. In it a constriction above the bulb

prevents the mercury column flowing back of *itself* into the bulb. Thus the upper end of the column continues to indicate the highest temperature reached until it is shaken down by the operator. For meteorological purposes maximum and minimum thermometers are usually laid horizontal or nearly so. In one form of maximum thermometer the mercury pushes a small index in front of it, which remains indicating the highest point reached after the mercury has contracted because of cooling. In the minimum thermometer the index is set in the alcohol which is used as the thermometric substance. As the alcohol contracts it drags with it the index, whose upper end indicates the lowest point reached by the curved capillary surface of the liquid. For measuring the temperatures at different depths of the sea various devices have been used by which the temperature at any required point can be registered, so that it matters not through what temperatures, high or low, the instrument has to pass before it comes into the hands of the observer. The form used so successfully in the *Challenger* expedition will be found described in the first volume of the *Physical and Chemical Reports*.

Instruments for continuous registration of successive temperatures, or for self-registration of temperatures at short intervals of time, form an indispensable part of the equipment of complete meteorological observatories. The photographic method is the simplest in which a mercurial thermometer can be employed. Things are so arranged that the sensitive paper, kept steadily moving by clockwork behind the thermometer, can receive only light which has passed through the small bore of the tube above the mercury. When the record has been taken, any point on the line which separates the part of the paper that has been exposed to the light from the part not affected corresponds to the height of the mercury column in the tube at the very instant at which that point on the line lay behind the thermometer. From this record, therefore, any temperature can be picked out at leisure long after the registering of it.

For general convenience and for the certainty of its indications the mercurial thermometer is pre-eminent. Historically older, however, and scientifically superior is the *air* thermometer. As shown in the article *GAS*, &c. (q.v.), the product (*p v*) of the pressure and volume of a gas is very nearly proportional to the absolute temperature. Hence if we keep the pressure constant, the change of volume will be a direct measure of the change of temperature. The practical difficulty is to keep the pressure constant. It requires indeed a skilful experimenter to manipulate satisfactorily an air thermometer. Such a thermometer is, however, indispensable for measuring the very low temperatures that must be reached before the ordinary gases can be liquefied under great pressure. Leslie's differential thermometer is virtually a U-tube terminated by two balls, whose air contents are separated by spirits of wine filling the bend. In its day it was perhaps the most delicate instrument of its kind; but thermo-electricity (see *ELECTRICITY*) has now provided us with much more delicate methods of measuring minute changes of temperature.

For the measurement of very high temperatures it is necessary to make use of the expansion of solids. Such an instrument is generally called a *Pyrometer* (see *PYROMETRY*). By suitable contrivances the very small changes of length for moderate ranges of temperature may be so magnified as to make such a metallic thermometer serviceable for ordinary purposes. Certain forms

of self-registering instruments used in meteorology are constructed on this principle. A particularly delicate form of metallic thermometer is Bréguet's. It consists of two thin strips of differently expansible metals soldered together, bent into the form of a helix and fixed at its upper end. A horizontal index is attached to the lower end. When the temperature changes, the one strip expands or contracts more than the other and the helix twists or untwists through an angle nearly proportional to the change.

**Thermopylæ** (lit., 'the hot gates'), a famous pass leading from Thessaly into Locris, and the only road by which an invading army can penetrate from northern into southern Greece. It lies south of the present course of the river Spercheius, between Mount Cæta and what was anciently an impassable morass bordering on the Maliac Gulf. In the pass are several hot springs, from which Thermopylæ probably received the first part of its name. Thermopylæ has won an eternal celebrity as the scene of the heroic death of Leonidas (q.v.) and his 300 Spartans in their attempt to stem the tide of Persian invasion (480 B.C.). Again, in 279 B.C., Brennus, at the head of a Gallic host, succeeded, through the same treachery that had secured a victory to Xerxes, in forcing the united Greeks to withdraw from the pass.

**Thersites**, son of Agrius, whom Homer, in the *Iliad*, makes the ugliest and most impudent of the Greeks before Troy. His name became a synonym for dastardly impudence. Later poets say he was slain by Achilles for calumniating him.

**Thesaurus**. See *DICTIONARY*.

**Theseus**, the great legendary hero of Attica, son of Ægeus, king of Athens, by Æthra, daughter of Pittheus, king of Troezen, at whose court he was brought up. On reaching manhood he proceeded to Athens, and was recognised by Ægeus as his son and successor. He captured the Marathonian bull, and next delivered Athens from its dreadful tribute of youths and maidens to the Cretan Minotaur, aided by the Cretan princess, Ariadne. When king he consolidated the twelve petty commonwealths of Attica into one state, reorganised the Pan-Athenaic festival, and founded the Isthmian games. He fought the Amazons, and carried off their queen, Antiope or Hippolyta, and after her death married Phædra. Further legends make him take part in the Argonautic expedition, join in the Calydonian hunt, help Peirithous and the Lapithæ against the Centaurs, and join in the attempt to rescue Proserpine from the lower world—an act of monstrous audacity for which he was kept there in close imprisonment till delivered by Hercules. Returning to Athens, he failed to re-establish his authority, and withdrew to Scyros, where he was treacherously destroyed by King Lycomedes; but his shade appeared to aid the Athenians in the fight at Marathon. His bones were removed to Athens in the year 469, but the tradition that the Theseum (see *ATHENS*, p. 544) marks their resting-place is not now accepted. See *ÆGEUS*, *ARIADNE*, *MINOTAUR*.

**Thesiger**. See *CHELMSFORD*.

**Thesium**, a genus of Santalacæ (q.v.). *T. humifusum*, the Bastard Toadflax, the only British representative of the family, is parasitic on roots of pasture plants on chalky hills.

**Thesmophoria**. See *MYSTERIES*.

**Thespis**, the reputed founder (about 540 B.C.) of Greek dramatic representation. See *THEATRE*.

**Thessalonians**, *THE EPISTLES TO THE*. The first epistle to the Thessalonians is probably the earliest extant epistle of St Paul and is usually

dated 52-53. It was written a few months after Paul had been compelled by the politarchs to leave Thessalonica. While he was staying at Athens, Paul felt so much anxiety about the fate of the newly-founded church at Thessalonica in the persecution which had arisen, that he felt compelled to send Timothy to find out what had happened to the Christians in the city and to encourage them to stand firm in the faith. Timothy returned, and met Paul in Corinth with a four-fold message from Thessalonica: (a) The church had remained steadfast in the face of the most bitter opposition; (b) Paul's character had been traduced by his opponents, who had charged him with being a wandering sophist making money out of his profession; (c) some of the Thessalonian Christians had died in the interval, and the question had been raised, Would their death rob them of a share in the glory of the promised Parousia (second coming) of Christ? (d) there was a tendency on the part of some Christians in view of the Parousia to give up their ordinary avocations, and some amount of demoralisation had therefore crept into the church. It was as a reply to this four-fold message that Paul wrote the first epistle. The authenticity of the epistle is accepted by the majority of modern scholars. In former times its genuineness was challenged by the Tübingen school of criticism, chiefly on the ground that it lacked the characteristic marks of the theology of the later epistles; but this objection has been removed by later investigation, which has pointed out that the absence of these later characteristics 'may be explained partly by the circumstances which called for a letter of practical exhortation and not for theological discussion, and partly by the fact that the epistle was written before the theological controversy had become acute.' The epistle is accepted by scholars of such different schools as Pileiderer, Holtzmann, Harnack, Jülicher, Zahn, Moffatt, and von Döbschutz.

The problems connected with the second epistle are more intricate. The crux of the difficulty centres round the eschatological passage in ii. 1-12, in which Paul details the circumstances which must precede the Parousia. Before the Parousia can take place, the 'apostasy' must occur, and the revelation of 'the man of sin.' At present, however, there is a restraining power at work which makes the revelation impossible. When the restraining power is withdrawn, the 'lawless one' will appear, and then Christ will return and slay him 'with the breath of his mouth.' Two sets of questions arise in connection with this statement: (1) There is first of all the problem, Could Paul have written such a paragraph in the light of the comparative absence of apocalyptic elements from his epistles and in the light of his teaching with regard to the Parousia in the first epistle? The first objection is not really valid—because there are apocalyptic passages in other epistles, especially in 1 Cor. xv., and in view of the general prevalence of the belief in Antichrist at the time, there is no ground for believing that such ideas could not have found their way into Pauline theology, especially in its early stages. The discrepancy between the two epistles is more apparent than real. The statement that the second epistle postpones the Parousia while the first regards it as imminent is not strictly true. 1 Thessalonians does not say that the Parousia will happen immediately. It lays the stress rather on its 'suddenness'—and there is nothing in 2 Thessalonians which denies that the Parousia is to come suddenly and unexpectedly. (2) There is the problem of interpretation. What is meant by 'the man of sin,' 'the apostasy,' and 'the restraining power'? There seems to be general agreement that by 'the

restraining power' Paul means the Roman Empire, and especially the Emperor Claudius. The interpretation of 'the man of sin' is more in dispute. Opinion is divided as to whether Paul expected Antichrist to arise from the Jewish or the pagan world. Probably the latter view is to be preferred—and it is not impossible that there may be an allusion in the passage to Caligula's attempt to profane the temple and to the rising influence of the cult of Caesar-worship. In view of the difficulties connected with this passage and other apparent differences between the two epistles, the genuineness of the epistle has been called in question by many modern scholars—including Weizsäcker, Holtzmann, Hollman, and Wrede, but its authenticity has been ably and earnestly defended by scholars of such different critical schools as Zahn, Wohlenberg, Jülicher, Bacon, McGiffert, and Moffatt. It is generally admitted that the trend of modern scholarship is increasingly in favour of recognising it, in spite of the difficulties, as a genuine Pauline epistle.

The best modern commentaries are by Jowett, Adeney (Cent. Bible), Milligan, Moffatt (Expositor's Greek Testament), Frame (International Critical Commentary), Schmiedel, and von Döbschutz. See also studies by Harnack (who thinks that 2 Thess. was addressed to the Jewish element in the church and 1 Thess. to the Greek), von Soden (1 Thess.), Spitta (2 Thess.); and Lake, *The Earlier Epistles of St Paul*.

**Thessalonika.** See SALONIKA.

**Thessaly**, a district of Central Greece and the largest division of ancient Greece, lies south of Macedonia and east of Epirus, being separated from the latter by Mount Pindus, and from the former by the Cambunian Mountains, while the Maliac Gulf and Mount Œta bound it on the S. It is a vast plain shut in on every side by mountains; on the N. and W. by those already named, on the S. by Mount Othrys, and on the E. by Mounts Pelion and Ossa, the only opening being the Vale of Tempe in the north-east, between Ossa and Olympus. The passes through the mountains of Thessaly were of great importance in Greek history. There were four principal ones: one in the NE. beside Olympus, two in the W. through the Pindus chain, and one in the S. at Mount Othrys. The Thessalian plain is drained chiefly by the river Peneus (now *Salambria*) and its tributaries, and is the most fertile in all Greece. Thessaly was originally inhabited by so-called Pelasgians, who, however, were either expelled or reduced to slavery by Dorian immigrants from the more rugged region of Epirus about 1000 B.C. (see GREECE, Vol. V. p. 386). The Penestæ, descendants of the old inhabitants, held a position analogous to that of the Helots (q.v.) in Sparta. There were four districts—Hestizæotis, Pelasgiotis, Thessaliotis, and Phthiotis; Magnesia on the coast being a minor division. The government appears to have been oligarchical in the separate cities—of which Pharsalus, Larissa, Heracleum, and Phæræ were the chief—the principal power being in the hands of the two great families of the Aleuads and Scopads. About 374 B.C. Jason, tyrant of Phæræ, was elected Tagus (chief magistrate) of all Thessaly. The rule of Jason's successors became so unbearable that aid was sought from Philip of Macedon, who in 344 subjected the country to Macedonia. Thessaly remained subject to the Macedonian kings till the victory of Cynoscephalæ, in 197 B.C., brought it under the protection of Rome. Under the emperors Thessaly was united with Macedonia, but after Constantine it was a separate province. In 1204 A.D., with other portions of the Eastern empire, it came under the dominion of the Venetians, and in 1355 was taken by the Turks. The restoration of Greece of Thessaly south of the Salambria was

recommended by the Berlin Congress in 1878; and in 1881, after war between Greece and Turkey had seemed imminent, Turkey agreed to cede Thessaly south of the Salambria watershed, the most fertile section. The Turkish part was invaded by the Greeks in 1897. By the war of 1912-13 Greece obtained the whole of Thessaly. The only important seaport is Volo (pop. 30,000), situated on the Gulf of Volo; other towns are Larissa (21,000), and Trikkala (20,000).

**Thetford**, a market-town on the border of Norfolk and Suffolk, at the Thet's confluence with the Little Ouse, 31 miles SW. of Norwich and 12 N. of Bury St Edmunds. Doubtfully identified with the Roman *Sitomagus*, it was the capital of Saxon East Anglia, the seat from 1070 of a bishopric, transferred to Norwich in 1094; suffered much from the Danes between 870 and 1010; and in Edward III.'s time had eight monasteries and twenty churches (now only three). The steep Castle Hill, 100 feet high and 1000 feet in circumference, is one of the largest earthworks in the kingdom; and there are considerable remains of Roger Bigot's Cluniac priory (1104). The guildhall (1337) was rebuilt in 1680 and again in 1800; it was completely reconstructed in 1902. The boys' grammar-school (1566) was rebuilt in 1880; the girls' grammar-school was opened in 1886. The Ancient House, a picturesque timbered structure (15th century), was presented to the town in 1921 by Prince Frederick Duleep Singh (died 1926) for the purposes of a museum, and as such it was opened in 1924. The prince bequeathed his collection of 91 Norfolk and Suffolk portraits, and they have been hung in the guildhall. The industries include brewing, tanning, and the manufacture of farming machinery. From 1894 to 1926 it had a bishop suffragan under Norwich. 'Honest' Tom Martin, the antiquary, and Tom Paine were natives. First incorporated in 1573, Thetford returned two members till 1867 and one till 1868. Pop. 4706 (1921 census). See works by Martin (1779), A. L. Hunt (1870), and W. G. Clarke (*Guide to Thetford*, 3d ed. 1923).

**Thetis**, daughter of Nereus and Doris, was married against her will by the gods to Peleus, and became the mother of Achilles. She dwelt in the depths of the sea with her father, and had, like Proteus, the power of changing her shape.

**Theuriet**, **ANDRÉ**, French poet and romancer, was born in 1833 at Marly le Roi, near Paris, studied law in Paris, and received in 1857 a place in the office of the minister of finance. In 1867 appeared *Le Chemin des Bois*, a volume of poems full of the charm of woodland. Later poems were the so-called epic *Les Paysans de l'Argonne*, 1792 (1871), and *Le Bleu et le Noir* (1872), styled poems of real life. But Theuriet is best known by his novels, which are ever touched with melancholy and sometimes recall in their feeling for the poetic sides of nature the subtler touch of George Sand. They include *Mademoiselle Guignon* (1874), *Le Mariage de Gérard*, *Une Ondine* (1875), *Raymonde* (1877), *Le Filleul d'un Marquis* (1878), *Le Fils Maugars* (1879), *La Maison des deux Barbeaux* (1879), *Sauvageonne* (1880), *Tante Aurélie* (1884), *L'Amoureux de la Préfète* (1888), *Reine des Bois* (1890), *Nos Enfants* (1892), *La Chanoinesse* (1893), *Flavie* (1895), *Villa tranquille* (1899), *Le Manuscrit du chanoine* (1902). Theuriet was admitted to the Academy in 1896, and died 23d April 1907.

**Thian Shan**. See **TIAN SHAN**, ASIA.

**Thibault**, **JACQUES ANATOLE**. See **FRANCE** (**ANATOLE**).

**Thibaut**, **ANTON FRIEDRICH JUSTUS**, German jurist, was born at Hameln (Hanover) in 1774, and studied law at the universities of Göttingen, Kön-

igsberg (under Kant), and Kiel. He became professor of civil law at Kiel in 1798, and subsequently filled similar appointments at Jena and at Heidelberg, where he died in 1840. Thibaut was one of the most prominent civilians of his day, and his *System des Pandektenrechts* (1803) was long a standard work. Important also were his *Versuche über einzelne Theile der Theorie des Rechts* (1798), *Theorie der logischen Auslegung des römischen Rechts* (1799), *Civilistische Abhandlungen* (1814); and a work on old music, *Über die Reinheit der Tonkunst* (1824).

**Thibaut IV.**, count of Champagne and king of Navarre, was the son of Thibaut III. of Champagne and Blanche of Navarre, sister of Sancho VII., king of Navarre (whom he succeeded in 1234). He led a crusade to Palestine in 1239, but was unsuccessful, and abandoned it the following year. He died in 1253. Thibaut was one of the foremost French lyricists of the 13th century, and his fame passed into Italy, for both Dante and Petrarch praised him. His poems, over sixty in number, are full of melody and grace, and are mostly love-songs, though his crusade songs and *jeux-partis* (debating songs) are important.

**Thibet**. See **TIBET**.

**Thick-knee** (*Oedienemus*), a genus of birds, typical of the family Oedienemidae or Stone-plovers, connecting Plovers and Bustards. They are semi-nocturnal birds (as the large eyes suggest), long-legged quick runners, strong in flight, feeding on small animals such as worms, slugs, insects, and even field-mice. Two stone-coloured eggs are laid on the ground or among stones. The loud whistling cry, chiefly heard after dusk, resembles that of the Golden Plover. The family is widely represented, chiefly in the temperate and tropical parts of the Old World and in Central and South America; it includes the Australian Thick-knee (*Burhinus grallarius*) and the Large-billed Thick-knees (*Orthorhamphus magnirostris*) from the Malay Archipelago to Australia. The only European form is *Oedienemus scolopax*, a summer visitor to Britain, occasionally spending the winter in southern counties. It is known as Stone-curlew, Norfolk Plover, or Thick-knee, the last name referring to a swelling at the knee-joints in young birds. It frequents chalk downs, open heaths, and warrens. Its length is 16 inches, its colour light-brown and buff, and its general appearance like a large plover.

**Thielt**, a town of Belgium, 18 miles SE. of Bruges by rail, with manufactures of lace, linens, and oil. Pop. 11,000.

**Thienen**. See **TIRLEMONT**.

**Thiepval**, once a small village of NE. France, situated in the valley of the river Ancre, 20 miles SSW. of Arras. A German stronghold in the Great War, it was the scene of desperate fighting during the summer of 1916.

**Thierry**, **JACQUES NICOLAS AUGUSTIN**, French historian, born at Blois, 10th May 1795. His father, who became town-librarian, was his first instructor; while yet young he obtained a 'bourse' at the college of his native town, and in 1811 entered the *École Normale*. In 1814 he completed his courses and joined the ranks of the Parisian Liberals. Soon after appeared his first book, entitled *De la Réorganisation de la Société Européenne*. In this and subsequent treatises he considered the notion of one government for the whole of Europe without the destruction of national characteristics. These works were inspired by Saint-Simon (q.v.), whose secretary Thierry became, and with whom he lived for three years. In 1817, however, he and Saint-Simon no longer agreed; and Thierry joined Comte, who had not then fallen under the influence

of Saint-Simon (see COMTE). Jointly with Dunoyer Thierry aided for three years in the *Censeur Européen*, where he found plenty of practice as a student and exponent of history. In 1820, however, he contributed his 'Letters on the History of France' to the *Courrier Français*, and showed a new influence acting on his own mind, and destined in turn to act largely on his future readers; bringing history, in fact, to practical application. Thierry dwelt on the principle of race, and attributed the establishment of the feudal system (with the evils which he ascribed to it) to the subjugation of western Europe by the Germans and Scandinavians. In 1825 he published his masterpiece, the *Conquest of England*, followed in 1827 by a new series of 'Letters on History'; but the labour cost him his eyesight. In 1828 he went to the south of France for the benefit of his health; and here he met Julie de Quéréngal, a lady of considerable literary accomplishment, whom he married. In 1835 he became librarian at the Palais Royal, and published his *Dix Ans d'Etudes*, the introduction to which is famed for its eloquence, and in 1840 his *Récits des temps mérovingiens*. In 1840 he received the 'Gobert' prize, which the Academy made perpetual in his favour. His last work was on the *Tiers Etat*, published in 1853; and three years later his laborious life was closed by paralysis, 22d May 1856. He may be called the father of romantic history, and a disciple of the school of Sir Walter Scott, whom he regarded as the 'great master of historical divination'; he also described himself as indebted for inspiration to Chateaubriand's *Martyrs*. After Michelet he is the greatest artist of his class. See monographs by Aubineau (2d ed. 1879) and A. A. Thierry (Paris, 1922).—A younger and less talented brother, AMÉDÉE SIMON DOMINIQUE THIERRY (1797-1873), was likewise a Liberal and a historian, his chief works histories of Gaul and Atila.

**Thiers**, a manufacturing town in the French dept. of Puy-de-Dôme, on the right bank of the Durole, 23 miles ENE. of Clermont by rail. Its manufactures of cutlery, paper, and playing-cards gave to the town a certain importance in the 17th century, and it is still important for its cutlery and 'Toledo' blades. Pop. 16,000.

**Thiers**, LOUIS ADOLPHE, French historian, politician, and patriot, was born at Marseilles on April 16, 1797. His father, who seems to have belonged to a family in decayed circumstances, was a locksmith. Through the influence of his mother, who was a Chénier, he received a good education, first at the Lycée in his native city, and subsequently (1815) at Aix, whither he was sent to study law. At Aix he made the acquaintance of Mignet, cultivated literature rather than the law, and won a prize for a dissertation on Vauvenargues. Called to the bar at the age of twenty-three, he set off for Paris in the company of Mignet. His prospects did not seem brilliant, and his almost ludicrously squat figure and plain face were not recommendations to Parisian society. His industry and belief in himself were, however, unbounded, and an introduction to Lafitte, of the *Constitutionnel*, then the leading organ of the French Liberals, gave him the chance of showing his capacity as a public writer. His articles in the *Constitutionnel*, chiefly on political and literary subjects, gained him the entry into the most influential salons of the opposition. At this time he made the acquaintance of Talleyrand, Casimir Périer, the Comte de Flahault, and Baron Louis the financier. Meanwhile he was rapidly—indeed too rapidly—preparing his *Histoire de la Révolution Française*. The first two volumes—there were ten in all—appeared in 1823. This work, although it

has been demonstrated to be very untrustworthy and inaccurate, more especially in its estimates of persons, gave its author a prominent place among French politicians and men of letters. About this time, too, the gift by his admirer, Cotta, the German publisher, of a share in the *Constitutionnel* raised him to comparative affluence. In January 1830 he, along with Armand Carrel, Mignet, and other friends, started the *National*, and in its columns waged relentless war on the Polignac administration. The ministry met the opposition it had provoked by the Ordonnances of July. Among the other repressive measures that were taken was the sending of a commissary of police to the office of the *National* interdicting its publication. Its conductors, with Thiers at their head, defied the ministry, and the result was the revolution which drove Charles X. into exile.

Thiers now entered on an active career as a politician. He was elected deputy for the town of Aix, and was appointed Secretary-general to the minister of Finance. His first appearance in the Chamber of Deputies gave no promise of his subsequent distinction. His diminutive person, his small face, encumbered with a pair of huge spectacles, and his whole exterior presenting something of the ludicrous, the new deputy, full of the impassioned eloquence of the revolutionary orators, attempted to impart the thrilling emotions affected by Mirabeau. The attempt provoked derision; but soon subsiding into the oratory natural to him—simple, easy, rapid, anecdotic—he became one of the most formidable of parliamentary speakers. Almost from the moment of his entrance into public life he and Guizot stood forth in opposition to each other as the champions of Radicalism and Conservatism respectively. But he was a staunch Monarchist, and for a time a favourite with Louis-Philippe. In 1832 he accepted the post of minister of the Interior under Soult, exchanging it subsequently for the ministry of Commerce and Public Affairs, and that in turn for the Foreign Office. He was universally regarded as a stronger man than any of his chiefs during this period; but his public and private actions alike were always marked by a certain fussy quarrelsomeness which prevented him from being ever accounted a statesman of the first rank. The 'spirited foreign policy,' calculated above all things to precipitate a quarrel between France and Great Britain, of which for many years he was the chief advocate, is now allowed to have been a great, and might have been a fatal, mistake. In 1836 he became President of the Council, but in August of the same year he resigned office and became the leader of the opposition. In 1840 he was again summoned to office as President of the Council and Foreign Minister. In a few months he was a terror to the peace of Europe. He refused Lord Palmerston's invitation to enter into an alliance with Britain, Austria, and Prussia, for the preservation of the integrity of the Ottoman Empire, from a sympathy with the principles which dictated the first Napoleon's invasion of Egypt and Syria, and a desire to accomplish by diplomacy with Mehemet Ali what Bonaparte had endeavoured to effect by force of arms—the supremacy of France in these regions. He talked menacingly of setting aside the treaties of 1815 and of extending the French frontier to the Rhine, and is said to have actually spent £8,000,000 on military and naval demonstrations. On his application to the British government, Napoleon's remains were removed from St Helena and brought to the Invalides, 15th Dec. 1840. Meanwhile Thiers, unable to agree with the king, had resigned (29th Oct.), and for years took little part in public affairs. He now returned to the study of French history. The first volume of

his *Histoire du Consulat et de l'Empire* appeared in 1845; it was not completed till 1860. This, the most ambitious of all Thiers's literary enterprises, must be considered a large rather than a great work. It is a monument to its author's industry in reading, and rises here and there to rhetorical brilliance. But that it is inaccurate and unfair has been admitted even by French critics. Thiers greatly overrated Napoleon, and probably to his own hurt.

Thiers was not one of the promoters of the revolution which in 1848 drove Louis-Philippe from the throne. On the contrary, he would, as prime-minister summoned at the eleventh hour, have prevented it if he could. He accepted its consequences in the form of the Republic. He voted for the election of Prince Louis Napoleon as its president. This action brought him much vituperation and ridicule from former political friends. But whatever may have been the motive that inspired it, it certainly did not help him at the time of the *coup d'état* of 1851; he was arrested, imprisoned in Mazas, and banished. Next year, however, he was allowed to return from Switzerland to France. For eight years he was occupied with his *History of the Consulate and Empire*. He re-entered the Chamber in 1863, having been elected Liberal deputy for the department of the Seine in opposition to the Imperialist candidate. Till the fall of the Second Empire he was regarded as the ablest and most formidable of its more moderate and parliamentary opponents. His speeches in the years between 1863 and 1870 were filled with taunts of the Empire on account of the loss of prestige which had marked its history; and these must not be left out of account when blame has to be apportioned among the authors of the war of 1870, although he opposed it when declared by the Ollivier ministry, and predicted defeat.

The collapse of the Second Empire, however, enabled Thiers to play the greatest of all his parts, that of 'liberator of the territory.' He declined, after Sedan, to become a member of the Government of National Defence; but he voluntarily undertook diplomatic journeys to Great Britain, Russia, Austria, and Italy, on behalf of France—a self-imposed mission in which he was unsuccessful, but by which he obtained the gratitude of his countrymen. He was largely instrumental in securing for his country that armistice which permitted the holding of a national assembly with a view to the negotiation of a peace. Twenty constituencies chose him as their deputy. Electing to sit for Paris, he was made head of the provisional government. He had great difficulty in persuading his colleagues of the Assembly, and his countrymen generally, to agree to peace on terms that were practically dictated by Germany. But he succeeded; peace was voted March 1, 1871. No sooner had he accomplished this task than he was face to face with the sanguinary madness of the Commune. But this difficulty also he set himself to surmount with characteristic energy, and succeeded. When the seat of government was once more removed from Versailles to Paris, Thiers was formally elected (August 30) president of the French Republic. He held office only till 1873, but during this brief period he was probably of greater service to his country than at any previous time in his life. He was mainly instrumental in securing the withdrawal of the Germans from France, and the payment of the war indemnity, and in placing both the army and the civil service on a more satisfactory footing. But in course of time the gratitude of the country exhausted itself, and Thiers, who was old-fashioned in many of his opinions, and as opinionative as he was old-

fashioned, did not make any new friends. He was specially detested by the Extreme Left, whose chief, Gambetta, he styled a *fou furieux*. As a result, a coalition of Reactionaries and Radicals was formed expressly, as it seemed, to harass him, and even in the beginning of 1872 he tendered his resignation. It was not accepted; and his opponents for a time suspended their intrigues. They were revived, however, in 1873, and resolved themselves into a resolute effort to limit the powers of the president. This Thiers stoutly resisted. He made an appeal to the country, but this course did not increase the strength of his following. Finally what he interpreted as a vote of no confidence was carried (May 24) by a majority of sixteen. He resigned, and his place was taken by Marshal Mac-Mahon. He lived four years longer, and never ceased to take an interest in politics. In 1877 he took an active part in bringing about the fall of the ministry presided over by the Duc de Broglie. He now leaned to the side of the Left, and was reconciled to Gambetta, and he might once again have played a prominent part in politics had he not died of apoplexy on September 3, 1877, at St Germain-en-Laye. The 19th century produced greater statesmen and much greater historians than Thiers. Yet he was a man of indomitable courage, and his patriotism, if narrow and marred with Chauvinism, was deep and genuine. He was perhaps the most successful of the large class of journalist-politicians that France has produced, and that he was at least a personal power in literature was evidenced by the great influence which he wielded in the Academy, of which he became a member in 1834.

Many editions of his chief works have been issued, his parliamentary speeches fill a score of volumes, and studies of him are innumerable, such as those of Jules Simon, Charles de Mazade, Paul de Rémusat (trans. 1892), and President Poincaré (1913). See also J. M. S. Allison, *Thiers and the French Monarchy, 1797-1848* (1926).

**Thieves' Latin.** See SLANG.

**Thing**, an Old English and Old Norse word (mod. Scand. *ting*) for an assembly, council, parliament or the like. It thus came to mean affair, or business, and so developed the very generalised meaning that the word has in modern English. Its original form is preserved in place-names in those parts of Britain where the Northmen settled, as *Dingwall*.

**Thiocyanates** are prepared by fusing cyanides with sulphur. These salts do not possess the poisonous character of the cyanides. *Thiocyanate of potassium*; KCNS, is anhydrous, but very deliquescent, and occurs in long streaked colourless prisms, somewhat resembling nitre both in appearance and taste; it is extremely soluble in water, and fuses on the application of a gentle heat. The thiocyanate is a white powder which possesses the property of swelling or growing in size to an almost incredible degree when moderately heated. The resulting mass often assumes a most fantastic shape, and is sufficiently coherent to retain its form; it is of a yellow colour externally, but black within. It is this thiocyanate which is the ingredient of the toy known as 'Pharaoh's serpents.' Each serpent consists of a little cone of tinfoil, resembling a pastille in shape, and filled with the above-named compound. On lighting the cone at the apex, there begins to issue from it a thick serpent-like coil, which continues twisting and increasing in length to an extraordinary degree, the serpent-like shape resulting from the salt being burned in the tinfoil cone.

**Thionville** (Ger. *Diedenhofen*), a fortified town of Lorraine (Moselle), 18 miles N. of Metz by rail,

an important railway junction and centre of the Lorraine iron industry. Taken by Condé in 1643, it fell with Lorraine to France, but was besieged, bombarded, and taken by the Germans, 9th-25th Nov. 1870. Pop. 13,400.

**Thiosulphates.** See SULPHUR.

**Third,** in Music. See INTERVAL.

**Thirlage**, an old Servitude (q.v.), or rather service, enjoyed by the proprietor of a mill over specified lands 'thirled' to it, whereby the occupiers of the lands were bound to have their grain ground at that mill, and to pay as 'multure' or duty a certain proportion of the grain ground, varying from a thirtieth to a twelfth of the corn ground. The possessors of thestricted lands were called *suckeners*; the multure paid by those who were not bound, but used the mill, was out-sucken multure. An Act of 1779 (39 Geo. III. c. 55) provided for thirlage being commuted for an annual payment, and since that date this class of burden has tended to disappear. Such a servitude or easement was rare in England.

**Thirlmere**, a narrow sheet of water in the heart of the Lake District (q.v.), lying 533 feet above sea-level, and 3 miles long by  $\frac{1}{2}$  mile wide, between Derwentwater and Grasmere. Since 1894 it has served as a water-supply for Manchester (q.v.); see also AQUEDUCT.

**Thirlwall**, CONNOP, a great English bishop and historian of Greece, was born, of good Northumbrian stock, at Stepney in Middlesex, January 11, 1797. He was a child of almost unexampled precocity, learned Latin at three, read Greek at four, and at eleven published *Primitiæ* (1809), a volume of poems and sermons which in later years he did his best to suppress. He next went to Charterhouse, where Grote, Julius Hare, and Henry Havelock were among his schoolfellows; entered Trinity College, Cambridge, in October 1814, and in the February of the following year carried off the Craven scholarship, which only Porson and Professor Kennedy have done as freshmen. That same year he gained the Bell scholarship; in 1818 he graduated as 22d senior optime—there being yet no classical tripos—but his real rank was better marked by the first Chancellor's classical medal. In October he was elected to a Trinity fellowship, and next spent about a year on the Continent, making fast friendship with Bunsen at Rome. He entered as a law-student at Lincoln's Inn in February 1820, and soon after joined the famous debating society that included Mill, Macaulay, Charles Austin, Romilly, the two Bulwers, Samuel Wilberforce, and later Maurice and John Sterling. He was called to the bar in 1825, but the natural bent of his mind prevailed, and in 1827 he took orders.

Already in 1825 he had translated Schleiermacher's *Essay on St Luke* and written an introduction—a remarkable performance for a barrister. His return to Cambridge was marked by the commencement, in conjunction with his dear friend Julius Hare, of a translation of Niebuhr's *History of Rome* (vol. i. 1828; ii. 1832). Their famous *Philological Museum* (1831-33) saw only six numbers, but contained some remarkable papers, among them Thirlwall's 'On the Irony of Sophocles.' Besides all this he took a full share of college and clerical work—the latter at Over, 8 miles from Cambridge. In 1834 he signed the petition in favour of the admission of dissenters to academic degrees, and in May put forth a weighty pamphlet in defence of the measure. Thirlwall pointed out with characteristic plainness the perfunctory nature of the religious education that existed, and expressed the belief that compulsory chapel services were 'a hindrance and not a help to

the religious life.' The Master of the College, Dr Chr. Wordsworth, now called on him to resign the assistant-tutorship, which he did at once, though under protest. Almost immediately he was presented by Lord Brougham to the quiet Yorkshire living of Kirby-Underdale. Here he wrote for *Lardner's Cyclopædia* his *History of Greece* (8 vols. 1835-47; improved ed. 1847-52). In 1840 Lord Melbourne raised Thirlwall to the see of St David's, and within six months thereafter he preached in perfect Welsh. For thirty-four years he laboured with the utmost diligence in his diocese, building churches, parsonages, and schools, and augmenting poor livings (to the extent of £30,000 from his own pocket); and, though he wrote no great work, his eleven Charges remain an enduring monument of breadth of view and soundness of judgment in reference to all ecclesiastical controversies of one generation. His Primary Charge (1840) was a catholic-spirited apology for the Tractarian party then being vehemently charged against by almost every bishop and archdeacon in England. In later days (Charges of 1866 and 1872) he modified greatly his approval of the spirit that animated the new party, but his grave warnings and protests against their Romanising tendencies rise characteristically into a serenely judicial region far above the heated and vulgar atmosphere of polemical debate. Thirlwall joined in the encyclical letter censuring *Essays and Reviews*, but was one of the four bishops who refused to inhibit Bishop Colenso. He supported the Maynooth grant, the admission of Jews to parliament, and alone amongst the bishops voted for the disestablishment of the Irish Church, although he would have preferred to see a measure of concurrent endowment. He was appointed chairman of the Old Testament Revision Committee, and resigned his see in May 1874, retiring to Bath, where he died, July 27, 1875.

Thirlwall's massive understanding, vast learning, and fundamental breadth and fairness of mind were a combination of enormous value to the Church of England; and no words of epitaph could have been found better than those inscribed on the granite slab over his grave in Westminster Abbey, where he sleeps side by side with his brother-historian Grote: 'Cor sapientis et intelligentis ad discernendum judicium.' He never married, but lived throughout life in the midst of his nephews and their children, and his love for cats rivalled Southey's. And few men have left a more pleasing though unconscious monument of noble character than the beautiful series of letters to a young lady—the *Letters to a Friend*, edited by Dean Stanley in 1881.

His *Remains, Literary and Theological*, fill three volumes (vols. i. and ii. Charges, 1877; vol. iii. Essays, Speeches, Sermons, 1878), edited by Dean (Bishop) Perowne. The *Letters, Literary and Theological*, were edited by Dean Perowne and the Rev. Lewis Stokes in 1881. See the *Edinburgh Review* for April 1876.

**Thirsk**, a town in the North Riding of Yorkshire, in the Vale of Mowbray, on the Cod Beck, an affluent of the Swale, 23 miles NNW. of York. It has a fine Perpendicular church, and carries on manufactures of agricultural implements and saddlery. Thirsk returned two members to parliament till 1832, and then one till 1885.

**Thirst** is a well-known sensation, resulting from a peculiar state of the system, but especially of the mucous membrane of the fauces, usually caused by an insufficient supply of liquid. In cases of extreme thirst there is a peculiar sense of clamminess in the mouth and pharynx, which, with the other disagreeable feelings, is almost immediately relieved by the introduction of liquid into the stomach, where it is absorbed by the veins. That the thirst

is relieved by the absorption of the fluid, and not by its action as it passes over the mucous membrane, which seems to suffer most, is proved by the facts (1) that injection of liquids into the stomach through a tube (in cases of wounded œsophagus), and (2) the injection of thin fluids, as water, into the blood, remove the sensation of thirst. An excessive thirst is often an important morbid symptom. It may arise from two very opposite conditions—one a condition of excitement, and the other of depression. Whenever the blood is in a state requiring dilution, and is too stimulating, as in fevers and inflammations, there is thirst; and, again, in cases of excessive secretion and exhaustion, as for example in cholera and in the two forms of diabetes, there is great thirst, which sometimes also attends the lowest stages of prostration in malignant diseases. When there is a great loss of the watery portion of the blood by profuse perspiration, caused not by disease, but by hard bodily exercise in a hot atmosphere, as in the case of coal-whippers, mowers and reapers, &c., there is always great thirst, and from two to four gallons of beer or cider a day may, in these cases, be taken with apparent impunity. Cold tea, without milk or sugar, is one of the most satisfying drinks in these circumstances. Independently of disease, great thirst may be induced by the use of salted meat or fish, highly-peppered curries, and other stimulating dishes, the ingestion of malt liquors drugged with salt and more pernicious matters, or of gin strengthened with sulphuric acid, &c.

### Thirty-nine Articles. See ARTICLES.

**Thirty Years' War**, a war or rather an uninterrupted succession of wars (1618-48) in Germany, in which Austria, most of the Catholic princes of Germany, and Spain were engaged on the one side throughout, but against different antagonists. This long-continued strife had its origin in the quarrels between the Catholics and Protestants of Germany, and few wars in modern times have caused more slaughter, misery, ruin, and demoralisation. The severe measures taken by the emperor, the head of the Catholic party, against the Protestants' religion led also to restrictions on their civil rights; and it was to protect their political as well as their religious liberties that the Protestants formed a union in 1608. The rival union of the Catholic powers followed in 1609. (1) *Bohemian War* (1618-20). The withdrawal of concessions to the Protestants of Bohemia by the Emperor Rudolf II. led to an insurrection in Prague and the election of Frederick V., the Elector Palatine, as king of Bohemia (1619); and Count Thurn repeatedly routed the imperial troops. But on 8th November 1620 a well-appointed army of 30,000, under Duke Maximilian of Bavaria, totally routed Frederick's motley array at the White Mountain near Prague, while an army of Spaniards under Spinola ravaged the Lower Palatinate. The Bohemians were now subjected to the most frightful tyranny and persecution.

(2) *War of the Palatinate* (1621-24). But the indomitable pertinacity and excellent leadership of three famous partisan leaders, Count Mansfeld, Christian of Brunswick, and George Frederick, margrave of Baden-Durlach, who ravished the territories of the Catholic league, did much to equalise the success of the antagonistic parties. Tilly, however, aided by a Spanish force, eventually overpowered them. Here the war might have ended; but the fearful tyranny of Ferdinand over all the Protestants in his dominions (Hungary excepted) drove them to despair, and the war advanced to its third phase.

(3) *Danish-Saxon War* (1624-30). Christian IV. of Denmark, smarting under some injuries inflicted

on him by the emperor, and aided by a British subsidy, came to the aid of his German co-religionists in 1624, and, being joined by Mansfeld and Christian of Brunswick, advanced into Lower Saxony. But when, by the aid of Wallenstein, a powerful army had been obtained, and the leaguers under Tilly, in co-operation with it, had marched northwards, the rout of the Danes by Tilly at Lutter, and of Mansfeld by Wallenstein at Dessau, again prostrated the Protestants' hopes in the dust; yet a gleam of comfort was obtained from the victorious raid of Mansfeld through Silesia, Moravia, and Hungary. The combined imperialists and leaguers meantime had overrun North Germany and continental Denmark, and ultimately compelled King Christian to conclude the humiliating peace of Lübeck.

(4) *Swedish-German War* (1630-36). Ferdinand, not content with a still more rigorous treatment of the Protestants, and the promulgation of the *Restitution Edict*, which seriously offended even the Catholics, stirred up Poland against Sweden, and insulted Gustavus Adolphus; and the war entered its fourth stage on the landing of the Swedes at Usedom (June 1630), and their conquest of Pomerania and Mecklenburg. Gustavus induced the Elector of Brandenburg to aid him; and though unable to save Magdeburg, he marched to join the Saxons, completely routed Tilly at Breitenfeld (1631), victoriously traversed the Main and Rhine valleys, defeated and mortally wounded Tilly on the Lech (1632), and entered Munich. By the judicious strategy of Wallenstein, who had retired from the conflict but joined in again at the entreaty of the emperor, he was however compelled to retire on Saxony, where he gained the great victory of Lützen (1632); but his death there, depriving the Protestants of the only man who could force the confederate powers to preserve unity of action, was a severe blow to their cause; though the genius and indefatigable zeal of his chancellor, Oxenstjerna, and the brilliant talents of the Swedish generals, preserved the advantages they had gained, till the crushing defeat of Bernhard of Weimar at Nördlingen (1634) again restored to the emperor a preponderating influence in Germany. Saxony now made peace at Prague (1635).

(5) *Swedish-French War* (1636-48). Final success now appeared to demand only one more strenuous effort on the part of Austria; but Oxenstjerna, resolved to preserve to Sweden her German acquisitions, propitiated Richelieu (q.v.) by resigning to him the direction of the war; and the conflict advanced into its final and most extended phase. The emperor, allied with the Lutherans, was now also assailed through his ally, Spain, who was attacked on her own frontier, in the Netherlands, and in Italy; Bernhard of Weimar, fighting independently, opposed the leaguers; while the Swedes, under Banér, held North Germany, and by frequent flying marches into Silesia and Bohemia distracted their opponents, and prevented them, after their successes over Duke Bernhard, from proceeding with the invasion of France. The great victory of Banér over the Austrians and Saxons at Wittstock (1636) restored to Sweden the victor's wreath; and from this time, especially under Torstensson and Königsmark, the Swedes were always successful, adding a second victory of Breitenfeld (1642) and one at Jankau (1645) to their already long list of successes, and carrying devastation and ruin even to the gates of Vienna. On the Rhine the leaguers at first had great success; but after the Spanish power had been thoroughly broken in the Netherlands by Condé the French were reinforced on the Rhine, and under Condé and Turenne rolled back the leaguers through the Palatinate and Bavaria, and avenged at Nördlin-

gen (3d August 1645) the former defeat of the Swedes. The emperor was now deserted by all his allies except the Duke of Bavaria, whose territories were already mostly in the hands of Turenne and Wrangel; and a combined invasion of Austria from the west and north was on the point of being executed when after seven years of diplomatic shuffling, the Peace of Westphalia (q.v.) put an end to this terrible struggle.

See the articles on the principal leaders in the struggle, especially Gustavus Adolphus and Wallenstein, and works there cited; books by A. W. Ward (1869), S. R. Gardiner (1874), H. G. R. Reade (1925), the volume in the 'Cambridge Modern History' (1906); and German works by Schiller, Söhl, Barthold, Gindely, Klopp, Ritter.

**Thisbe.** See PYRAMUS.

**Thistle,** a general name for a group of plants of the Compositæ, found in most of the temperate and cold parts of the northern hemisphere.

Stemless Thistle.

Herbaceous plants of considerable size, they have spinous leaves, imbricated involucre, heads of tubular hermaphrodite flowers (very rarely dioecious), the stamens free, pappus deciduous. The flowers are generally purple, sometimes white or yellowish. The genus *Carduus* of some botanists is by others divided into three: *Cnicus* (with one species *C. benedictus*), *Cirsium* (including those that have a feathery pappus), and *Carduus* (with bristly pappus). Thus the difficulty of distinguishing the many species is increased by confusion of names. However, the specific names are commonly alike, whatever the generic may be, varying only to suit the neuter gender of *Cirsium* or the masculine of *Cnicus* or *Carduus*. *Carduus nutans*, the Musk thistle, has large drooping heads that smell of musk. The creeping Plume Thistle (*Cirsium arvense*), a species about 1 to 3 feet high, with creeping roots, pinnatifid leaves and numerous dioecious flowers, is a very troublesome weed in fields, very common in Britain, and now too common, not only in Europe where it is indigenous, but in America (where it is called Canada Thistle) and other countries to which it has found its way; in Australia the thistle has become a serious plague. *Cirsium lanceolatum* (the Spear or Bur Thistle) and *C. palustre*, both common British plants, are also troublesome weeds. *Cirsium oleraceum* is a native of the north of Europe, but not of Britain. The Blessed Thistle (*Carduus benedictus* of the pharmacopœias, *Cnicus benedictus* of modern botanists) is a native of the Levant and of Persia, resembling in appearance a Centaurea, with yellow flowers enveloped in leaves, and abounding in a gossamer-like down; it is a powerful laxative- tonic medicine. The Cotton Thistle (*Onopordon*) is a distinct genus, known by its receptacles being destitute of bristles, and coarsely and deeply honeycombed. The pappus is rough. The Common Cotton Thistle (*O. Acan-*

*thium*), a native of Europe, is found in England. It is doubtful if it be a true native of Scotland; nevertheless it is generally called by gardeners and others the Scotch Thistle. The national emblem of Scotland is not, in all probability, any one species of thistle in particular, as botanically distinguished; though the Stemless Thistle (*Carduus* or *Cnicus acaulis*, or *Cirsium acaule*) is in many districts of Scotland so designated. The cotton thistle has large elliptic leaves, and a broadly-winged stem. The young fleshy root and stem are boiled and eaten. Plants of the genus *Silybum*, and of the genus *Echinops*, which belongs to a very different section of the Compositæ, are often to be seen in flower-gardens, where they are known as Thistles. The Milk Thistle (*Silybum Marianum*), a biennial, native of Britain and other parts of Europe, attains a height of 4 to 6 feet, and is remarkable for the milky veins of its large waved leaves. Its blanched leaves are used in winter salads; they may also be used as a boiled vegetable, along with the young stalks, and the root is used as salsify. The plant used to be cultivated. The name is also, generally with some addition, very often bestowed upon many plants which have little resemblance to any of these, except in their spinous character. *Centaurea Calceitrapa* is the Star Thistle (see CENTAUREA); the Jersey Thistle is *Centaurea isnerdi*; the Fuller's Thistle is Teasel (q.v.); Torch Thistle, *Melocactus*; and the Golden Thistle, *Protea Scolymus*. And see CARLINE THISTLE, SOW-THISTLE, SAFFLOWER, BURDOCK, &c.

**Thistle,** ORDER OF THE, called also the Order of St Andrew, is of no very ancient date. The earliest known mention of the thistle as the national badge of Scotland is in the inventory of the effects of James III., who probably adopted it as an appropriate illustration of the royal motto, *In defence*. Thistles occur on the coins of James IV., James V., Mary, and James VI.; and

Star, Collar, and St Andrew of the Order of the Thistle.

on those of the last they are for the first time accompanied by the motto, *Nemo me impune lacesset*. A collar of thistles appears on the gold bonnet-pieces of James V. of 1539; and the royal ensigns, as depicted in Sir David Lindsay's armorial

register of 1542, are surrounded by a collar formed entirely of gold thistles, with an oval badge attached. This collar, however, was a mere device until the institution, or, as it is generally but inaccurately called, the revival of the order of the Thistle by James VII. (II. of England), which took place on 29th May 1687. Statutes were issued, and eight knights nominated by James; but the patent for the institution of the order never passed the Great Seal. After falling entirely into abeyance during the reign of William and Mary, the order was revived by Queen Anne, 31st December 1703, and the statutes then issued still, with some changes, govern the order. By them the word '*l'acesset*' in the motto was altered to '*l'acessit*.' The number of knights was originally fixed at twelve, a number raised by George IV. in 1827 to sixteen, at which it now stands. The officers of the order are the Chancellor, the Dean, the Secretary, Lord Lyon King-of-arms, and the Usher of the Green Rod. The Thistle Chapel, in St Giles', Edinburgh, was inaugurated in 1911.

**Thistlewood.** See CATO STREET CONSPIRACY.

**Thlaspi.** See PENNYCRESS.

**Tholen**, an island forming part of the Dutch province of Zeeland. There is a small town of Tholen.

**Tholuck**, FRIEDRICH AUGUST, theologian and preacher, was born at Breslau, 30th March 1799, and studied at Breslau and Berlin. Oriental languages first attracted him, and he somewhat paradoxically maintained the superiority of Mohammedanism to Christianity. The influence of Neander and of a pious nobleman, Von Kottwitz (a Moravian Brother), produced a marked change in his feelings; and by 1825 he was a champion of that fervid but catholic evangelical Christianity to which all his later life, lectures, sermons, and published books were a testimony. In 1824 he was appointed extra-ordinary professor of Oriental Languages at Berlin, as successor to De Wette; in 1826 he was called to Halle as ordinary professor of Theology; and there, save for a year and a half (1827-28) spent by him as chaplain to the Prussian embassy at Rome, where Bunsen was ambassador, he spent the rest of his lovable and laborious life. At first he had difficulties in Halle, the tone of the university being strongly Rationalist, and his colleagues, Gesenius and Wegscheider, were distinctly hostile to Tholuck's pietism; but ultimately he profoundly influenced the whole university in a direction favourable to devoutness, if not to old-fashioned orthodoxy. And his personal relations with the students instilled evangelical fervour into many successive generations of theological students from all parts of Germany, from Britain, and from America. Theologically he was not a strait-laced orthodoxist; he made very considerable concessions to criticism, and his line of thought was highly eclectic, containing elements from Pietism and Moravianism, from Hegel and Schleiermacher, but more still from the pectoral theology of Neander. As a writer and commentator he was rather suggestive and pregnant than profound or exhaustive. Of German theologians he is probably the one who has been most heartily accepted by English-speaking Protestants. He was a powerful preacher, and continued to lecture in spite of advancing years and enfeebled health till shortly before his death, 10th June 1877.

His earliest important work is *Die Wahre Weihe des Zweiflers* ('The True Consecration of the Septic,' published in reply to De Wette's *Theodore* in 1823, and frequently republished and translated with titles such as *Sin and Redemption* and *Guido and Julius*); others are an Anthology of Eastern Mysticism (1825); commen-

taries, which have been some of them translated into English two or three times over, on Romans, John's Gospel, The Sermon on the Mount, Hebrews, and Psalms; a reply to Strauss; *Andachtsstunden* (Eng. trans. 'Hours of Christian Devotion,' 1875); some volumes of sermons; miscellaneous essays; and contributions to church history—*Lutherische Theologen Wittenbergs* (1852), *Das Akademische Leben des 17ten Jahrhunderts* (1852-54), and the first part of a *Geschichte des Rationalismus* (1865, never finished). A complete edition of his works (11 vols.) appeared at Gotha in 1863-72; and he edited Calvin's Institutes and some of his commentaries. See a sketch by Kähler (1877); and a fuller life by Witte (2 vols. 1884-86).

**Thom**, WILLIAM, author of *The Mitherless Bairn* and other poems in the Scottish vernacular, was born at Aberdeen in 1799, worked as a handloom weaver there, at Inverurie, and elsewhere, and, after a life of much poverty and distress, died at Hawhill near Dundee, 28th February 1848. His collected poems were first published in 1845.

**Thomar**, a town of Portugal on the river Nabão (an affluent of the Zézere), contains in the ruined castle of the Templars and the convent palace of the order of Christ important examples of mediæval Portuguese architecture.

**Thomas**, ST., 'the doubting apostle' (see John, xix. 26-29), established the church in Parthia, according to the oldest tradition, and was buried in Edessa. A later tradition based on the apocryphal *Acta Thomae*, a Syriac document probably of Gnostic origin, carried him to India, where he died a martyr's death, his remains being subsequently removed to the West. The *Acta Thomae* was edited and translated by W. Wright (1871), a Greek version by Lipsius and Bonnet (Leipzig, 1891-1903). See APOCRYPHA.—For Thomas à Becket, see BECKET; for Thomas à Kempis, see KEMPIS; and for Thomas Aquinas, see AQUINAS.

**Thomas**, Anglo-Norman poet. See TRISTREM.

**Thomas of Bayeux** (d. 1100) was born in Bayeux, the son of a priest, and was a chaplain to William the Conqueror before being appointed in 1070 to the archbishopric of York. He refused at first to recognise Lanfranc's superiority as archbishop of Canterbury and only submitted under pressure. And even after a council of prelates at Windsor (1072) had decreed the superiority of Canterbury, Thomas stoutly upheld his rights. He had a reputation for learning and for church music, while he carried out numerous church reforms and rebuilt York minster, which had suffered badly in the Conquest.

**Thomas of Celano.** See DIES IRÆ.

**Thomas of Erildoune.** See THOMAS THE RHYMER.

**Thomas**, CHRISTIANS OF ST., or Syrian Church of India, the oldest Christian Church in India, found mainly in the states of Cochin and Travancore on the Malabar coast. The church professes to have been planted by St Thomas, but is doubtless an offshoot of the Nestorian Church of Persia (in the patriarchate of Babylon), transplanted to India about the beginning of the 6th century. Founded by missionary effort, the Indian Church was probably recruited from Persia by the struggles of Christianity with revived Zoroastrianism and the triumph of Islam. Missionaries from Rome failed in the 14th century to persuade the Indian Christians to accept the authority of Rome; but the influence of Jesuit missionaries succeeded at the Synod of Diamper (Udianperur, 12 miles S.E. of Cochin) in 1599 in nominally bringing the sectaries into the Western Church. In 1653 all but a handful broke away; but the Carmelites soon regained much of what the Jesuits had lost, and the 'Romo-

Syrians' are now numerically the strongest section (423,968 in 1921). Under separate administration from 1878, the Catholics of the Syro-Malabar rite have since 1923 had an archbishop at Ernakulam. The independent church appealed to the Nestorian, Coptic, and Jacobite patriarchs. The last alone responded by sending a man. The Christians of St Thomas then threw off Nestorianism, and became monophysite Eutychians, with a metropolitan of their own, not recognising dependence on the patriarch of Antioch, but essentially Jacobite in theology and rites. Their sacred language is Syriac. The clergy are celibate. See GREEK CHURCH; G. M. Rae, *The Syrian Church in India* (1892); *John Rylands Library Bulletin*, January 1927.

**Thomas, AMBROISE**, French composer, was born at Metz, 5th August 1811. He entered the Paris Conservatoire in 1828, and in 1832 gained the Grand Prix for composition. He was a prolific composer, but his first success in opera was with *La Double Échelle* in 1837, followed by *Mina* (1843), *Betty* (1846), *Le Caïd* (1849), *Le Songe d'une Nuit* (1850), *Le Carnaval de Venise* (1853), *Mignon* (1866), *Hamlet* (1868), *Françoise de Rimini* (1882), with innumerable other works, characterised generally by a strong feeling for the dramatic and by good orchestration. Thomas was appointed a member of the Institute in 1851, professor of Composition in 1852, and succeeded Anber as director of the Conservatoire in 1871. He died 12th February 1896.

**Thomas, ARTHUR GORING**, born near Eastbourne, 20th November 1850, was educated for the civil service, but took up the study of music at the Paris Conservatoire (1875-77), and then for three years at the Royal Academy of Music, London, and wrote the operas *Esmeralda* (1883) and *Nadeshda* (1885), the cantata *Sun-worshippers* (1881), and many songs. He committed suicide 22d March 1892.

**Thomas, GEORGE HENRY**, an American general, was born in Virginia in 1816, graduated at West Point and entered the artillery in 1840, gained a brevet for gallantry against the Indians in Florida in 1841, and two others at Monterey and Buena Vista in 1846-47, and in 1855-60 served in Texas as a major of cavalry. In 1861 he was appointed brigadier-general of volunteers, and sent to Kentucky to turn backwoodsmen into soldiers; and with them in January 1862 he won the battle of Mill Springs. He was raised to major-general in April, and in October received the command of five divisions, forming the centre of Rosecrans' army, with which he saved the battle of Stone River (see MURFREESBOROUGH); and at Chickamauga (q.v.) again it was the centre that stood firm, and rendered the victory a barren one for the Confederates. In October 1863 Thomas was given the command of the Army of the Cumberland, and in November led it to the capture of Mission Ridge. In 1864 he commanded the centre in Sherman's advance on Atlanta, and then was sent to oppose Hood in Tennessee; and there in December, with troops that he had had to reorganise, he won the battle of Nashville, and destroyed the last considerable Confederate army in the south-west. For this he was appointed major-general in the United States army, and received the thanks of congress. He afterwards was in command of the military division of the Pacific, and died at San Francisco, 28th March 1870. Thomas was of a nature kindly, gentle, and singularly modest, of unswerving loyalty, and of sterling integrity; a soldier trained in nearly every arm of the service, he won and held without an effort the confidence of all who served under him. There is

a Life by Van Horne (1882), and another by Copee ('Great Commanders' series).

**Thomas, GEORGE JOHN**, born at Tipperary, deserted in India from the navy in 1781, became general to the Begum Somru, and did feats of arms against the Sikhs and French. He died in 1802.

**Thomas, JAMES HENRY**, Labour politician, born 3d October 1875 at Newport, Monmouthshire, was a fireman and engine-driver in the service of the Great Western Railway, but came to devote himself to trade unionism and politics. He was an influential member of Swindon town council, and in 1910 entered parliament as member for Derby. The same year he was made president of the Amalgamated Society of Railway Servants, and in 1911 secretary of the National Union of Railwaymen. Since then he has laboured in the cause of railway unionism, and his name has been prominent in all the great industrial disputes concerning railwaymen, never allied to extremism. Made privy councillor in 1917, he was secretary of state for the colonies in the Labour government of 1924. His idea of Labour's policy is outlined in his *When Labour Rules* (1920).

**Thomas, PHILIP EDWARD** (1878-1917), writer (sometimes under the pseudonym 'Edward Eastaway'), was educated at St Paul's School and Lincoln College, Oxford, and was killed in the Great War. His work—simple and natural, but direct and impressive—includes verse, afterwards published as *Collected Poems* (1920); critical studies, *R. Jefferies* (1909), *Maeterlinck* (1911), *Duke of Marlborough* (1915), &c.; topographical descriptions, *The Icknield Way* (1913), &c.; a novel, *The Happy-go-lucky Morgans* (1913); *Celtic Stories* (1911), and other essays.

**Thomas, SIDNEY GILCHRIST**, metallurgist and inventor, was born 16th April 1850 at London. He had hopes of a medical career, but his father's death in 1867 obliged him to seek an immediate livelihood, and until 1879 he was a police-court clerk. Meanwhile he attended evening lectures on chemistry at the Birkbeck Institute, and was profoundly attracted by the problem of eliminating phosphorus from iron ore, using the Bessemer converter. He propounded a solution in 1875, and, with his cousin Percy Gilchrist, carried out experiments. The invention was patented in 1878, and a paper on the subject read at the Iron and Steel Institute in 1879. The industry at last came to interest itself in the discovery, which became of immense importance, especially on the Continent, where phosphoric ore predominates. Thomas gained a fortune, but lost his health, and died in Paris, 1st February 1885. See IRON AND STEEL, and his *Memoirs* edited by R. W. Burnie (1891).

**Thomasites.** See CHRISTADELPHIANS.

**Thomasius, CHRISTIAN**, a German philosopher and jurist, was born at Leipzig, 1st January 1655, studied at Frankfurt-on-the-Oder (1675-79), and returning to his native town commenced to lecture on law in a style perfectly free from the pedantry of the schools. In 1687, to the astonishment of his Latin-speaking colleagues, he adopted the German language as the vehicle of his expositions, published his programme for the following year in the same tongue, and commenced an unconventional monthly journal. But this work and his advanced views on theological subjects excited so much opposition that he was forced to leave Leipzig, and went first to Berlin, and afterwards (1690) to Halle, where, under the patronage of the Brandenburg court, his lectures were the means of establishing a university since famous. In this university Thomasius became professor of Jurisprudence and rector, and here he died, 23d September 1728. It is to his credit

that he broke away completely from traditional pedantry and mediæval terminology, and introduced better methods into the scientific treatment of various departments of study; and he honourably signalised himself as a courageous opponent of trial for witchcraft and the use of torture. The characteristic features of his mode of thought are contained in his *Gedanken und Erinnerungen* (3 vols. Halle, 1723-26) and in his *Geschichte der Weisheit und Thorheit* (1693). His specialty was international law (*jus naturale*) and ethics. See works on him by Luden (1805), Dernburg (1865), Wagner (1872), Nicoladini (1887), and Landsberg (1894).

**Thomas the Rhymer**, a name given to the earliest poet of Scotland. The history of his life and writings is involved in much obscurity; but it is generally believed that Thomas Rymour of Erchildoune was the person whose poems and prophecies were extensively known among the people of Scotland at an early period. The Rhymer derived his territorial appellation from the village of Erchildoune (now Earlston), in the county of Berwick. The time of his birth is unknown; but he appears to have reached the height of his reputation in 1286, when he is said to have predicted the death of Alexander III. (q.v.), as recorded in Bower's continuation of the *Scotichronicon*. The Earl of Dunbar, having questioned the Rhymer as to what kind of weather was to be on the morrow, was answered that on that day before noon should be the greatest storm of wind that ever was heard in Scotland. Next day towards noon, the weather being calm, Dunbar expressed a doubt as to the truth of the prediction, when the Rhymer said: 'It is not noon yet;' and immediately thereafter a messenger arrived with the tidings of the king's accidental death at Kinghorn on the previous evening. From this and other prophecies the Rhymer became popularly known as 'True Thomas,' and was believed to have derived his skill from his intercourse with the Queen of Fairyland. The legend bears that he was carried off to Fairyland, and after three years' residence there was permitted to revisit the earth, but still remaining bound to return to his royal mistress when she should intimate her pleasure. Accordingly, one day, when a hart and hind were seen pacing the street of the village, the Rhymer instantly rose and followed them to the forest, never to return. (Compare the myth of TANNHÄUSER.)

The earliest historical document referring to Thomas Rymour of Erchildoune is a charter of Petrus de Haga of Benersyde, to which the Rhymer's name is appended as a witness; its date is about 1260-70. Again, in a charter of 1294, Thomas of Erchildoune, describing himself as 'son and heir of Thomas Rymour of Erchildoune,' conveys his lands in the village of Erchildoune to the Trinity House of Soltra (Soutra). From this it has been inferred that the Rhymer was now dead; although Blind Harry, in his *Wallace*, speaks of him in 1296 or 1297 as then 'in to the faile'—the Cluniac priory of Fail in Ayrshire, by Sir J. Murray's conjecture. The Rhymer is also alluded to by Wyntoun in his *Chronicle*. Boece calls him Thomas Learmont, and the Russian poet Lermontoff claimed him for an ancestor; but there is no contemporary authority for this surname. Whether Rymour was a family surname or a personal appellation derived from his poetical reputation has also been discussed. The fact that his son, in the charter above referred to, applies the name to his father, but does not take it himself, seems to favour the latter view.

The Rhymer's prophecies were first collected and published in Edinburgh by Waldegrave in 1603. Sir Walter Scott (so also Mr M'Neill) believed him to be the author of the famous romance of

*Sir Tristrem*, because his name occurs along with that of the romance in an ambiguous passage in the poems of Robert of Brunne (c. 1338). But the romance was founded on that of an earlier Thomas (see TRISTRAM), perhaps early confounded with the Rhymer. Another poem connected with his name is descriptive of his interviews with the Fairy Queen and his adventures in Fairyland; it displays poetical power of a very high order.

See *The Romances and Prophecies of Thomas of Erchildoune*, edited by Sir J. A. H. Murray (E.E.T.S., 1875); editions of *Thomas of Erchildoune* by Alois Brandl (Berlin, 1880); of *Sir Tristrem*, by Scott (1804), by Kolbing (Heilbronn, 1882), by G. P. M'Neill (S.T.S., 1886); Professor Child's *Popular Ballads* (1884); and a study by Burnham (1908).

**Thomasville**, capital of Thomas county, Georgia, 200 miles by rail WSW. of Savannah, with boys' and girls' colleges, foundries, &c. The surrounding district produces cotton, fruit, and grain in abundance. Pop. 8000.

**Thomists**. See AQUINAS.

**Thompson, BENJAMIN**. See RUMFORD.

**Thompson, ELIZABETH**. See BUTLER.

**Thompson, FRANCIS**, the son of a successful physician, who became a Roman Catholic, was born, not at Ashton-under-Lyne, but at Preston, 16th December 1859, and educated at Ushaw and (for medicine) at Owens College. He had no interest in the medical profession, but was obstinate in the ambition to be a poet; and spent years in Bohemian poverty in London, passing his nights perforce in the streets and his days in the Guildhall Library, selling matches at the street corners, and holding horses after the traditional example of Shakespeare. At last some of his verses found their way into a journal, and in 1893, by the help of the Meynells, he contrived to publish a volume of *Poems*, which obtained high praise from Coventry Patmore and Henry D. Traill. They showed an ingenious if somewhat bizarre imagination and faculty of versification, suggesting in some ways the enthusiastic flights of Crashaw or of Donne and the 'metaphysical' poets of the 17th century; and were followed by two other volumes of verse. He lived some time in a Capuchin monastery in Wales, and later at Storrington in Sussex; and died in London 13th November 1907, victim of starvation, persistent ill-health, and frequent alcoholism. Ere his *Works* were published by Mr Wilfred Meynell in 1913 (3 vols.) it was generally recognised that Thompson had earned a place apart, and a high place, amongst English poets; and since it has been said that his 'Anthem of Earth,' 'The Hound of Heaven,' and 'New Year Chimes,' are as sure of immortality as anything written since Shelley sang, and 'as full of the incommensurable quality that marks the highest.' His prose, chiefly reviews and essays, is less important. See a (French) study of Thompson by K. Rooker (1913), Life by Everard Meynell (1913; new ed. 1926), and R. L. Mégroz, *Francis Thompson, the Poet of Earth in Heaven* (1927).

**Thompson, WILLIAM HEPWORTH** (1810-86), was born at York, studied at Trinity College, Cambridge, became regius professor of Greek in 1853, and in 1866 succeeded Whewell as Master of Trinity. A brilliant classical scholar and a profound student of Greek philosophy, he projected a great edition of Plato, but accomplished only the *Phædrus* and *Gorgias*, so that, though by his teaching he left an enduring mark on Cambridge scholarship, he is chiefly remembered by a few incomparable sarcasms.

**Thoms, WILLIAM JOHN** (1803-85), born in Westminster, was successively a clerk in Chelsea

Hospital, and clerk and deputy-librarian to the House of Lords. Secretary of the Camden Society, he was founder of *Notes and Queries* (1849), and its editor down to 1872.

He devised the word 'folk-lore' (1846) for the then new study, and his works include collections of *Early Prose Romances*, of *Lays and Legends*, and of *Anecdotes and Traditions*, besides a *Book of the Court* and a book on *Human Longevity*, a translation of Worsaae, and an edition of Stow's *London*.

**Thomson, SIR CHARLES WYVILLE** (1830-82), born at Bousyde, Linlithgow, was educated at Edinburgh, and was professor at Cork and Belfast, ere in 1870 he came to the chair of Natural History in the university of Edinburgh. He was scientific head of the famous *Challenger Expedition* (q.v.), and was knighted in 1876. His books were *The Depths of the Sea* (1872) and *The Voyage of the Challenger* (1877).

**Thomson, GEORGE** (1757-1851), song-collector and friend of Burns, was born at Limekilns, Fife, and at Edinburgh rose to be principal clerk to the Board of Trustees. In 1792 he formed the idea of collecting every existing Scottish melody, and ultimately published six volumes of Scottish songs, followed by two of Irish songs, and three of Welsh melodies. Campbell, Scott, and Joanna Baillie contributed words to the melodies; but the most prolific writer was Burns, who contributed over 120 songs to the collection. For the musical department Thomson secured the services of Pleyel, Kozeluch, Haydn, Beethoven, Mozart, Weber, Hummel, Hogarth, and Bishop. See his *Life and Correspondence* by Cuthbert Hadden (1898).

**Thomson, JAMES** (1700-48), poet, was one of the nine children of the parish minister of Ednam, Roxburghshire, where he was born 11th September 1700. He was educated first at Jedburgh, and then at the university of Edinburgh, where he studied for the church. From his earliest years he had written poetry, though he is said to have, with uncommon discretion, regularly burned his juvenile efforts. His father died in 1716, and in February 1725, a few weeks before the death of his mother, Thomson set sail from Leith to London. There his theological leanings seem to have receded before his taste for letters, and in 1726 he began with *Winter* the publication of his poem on the *Seasons*. The publisher advanced him only three guineas on it, but Lord Wilmington, to whom it was dedicated, fulfilled the expected duty of a patron by presenting him with twenty guineas. The piece was almost immediately successful, and Thomson's place as a poet was assured. *Summer* and *Spring* followed in the next two years. The second of these is inscribed to the Countess of Hertford, who invited the author to her country-seat 'to hear her verses and assist her studies,' Johnson records that 'he took more delight in carousing with Lord Hertford and his friends,' and that the lady was in consequence exceedingly indignant. In 1730 *Autumn* completed the *Seasons*. It was published with his collected works, which now included a *Poem on the Death of Sir Isaac Newton*, and *Britannia* (1727), a tirade against Spain's interference with English commerce, and a eulogy of Frederick, Prince of Wales, then in opposition to the court. In 1729 his tragedy of *Sophonisba* was produced. The audience was numerous and splendid, but 'nobody was much affected.' One luckless line, 'O Sophonisba, Sophonisba O,' is still remembered for the famous parody, 'O Jemmy Thomson, Jemmy Thomson O,' which, repeated by everybody, killed what little life there was in the piece. His other tragedies were *Agamemnon* (1738), *Edward and Eleonora* (1739), *Tancred and Sigismunda* (1745, in which Garrick and Mrs

Gibber played the principal parts), and *Coriolanus* (produced after his death to pay his debts and aid his sisters). In 1731 Thomson was chosen to accompany Charles Talbot, son of Lord Chancellor Talbot, on the conventional continental tour, then a necessary part of the education of a young man of quality. The travellers visited France, Switzerland, and Italy, and something at least of the improvement in the poet's later work may be ascribed to the fresh impressions received on this delightful journey. On his return Lord Talbot gave him the sinecure office of Secretary of Briefs, but first the son and then the father died (1737), and a new favourite got the appointment. But Thomson was not long destitute, for he was now well-known in the literary sphere. The poem of *Liberty* (1735-36), inspired by his travels, was dedicated to the Prince of Wales, who was induced by Lyttleton to see Thomson. The result of the interview was a pension of £100 a year. He afterwards obtained the appointment of surveyor-general of the Leeward Islands. A deputy did what work there was to be done, and Thomson pocketed £300 a year. In 1740 the *Masque of Alfred* was produced at Cliefden before the Prince and Princess of Wales. It contains the song *Rule Britannia*, still, for want of a better, the popular patriotic ode. Thomson's last years were spent at Richmond, where English scenery is seen at its best. Here he finished his finest work, *The Castle of Indolence*. It was published May 1748. He died on 27th August following. As a man he was kindly, easy, gay, indolent, and of a rare modesty. No wonder he was universally popular. Stanza lxviii. Canto 1 ('written by a friend of the author'—Lord Lyttleton) of his last work pictures him as 'more fat than bard beseeems,' as 'void of envy, guile, and lust of gain,' as all

The world forsaking with a calm disdain,  
Here laughed he careless in his easy seat;  
Here quaff'd encircled with the joyous train,  
Oft moralising sage: his ditty sweet,  
He loathed much to write, nor cared to repeat.

Thomson's poems bear traces of minute and accurate observations of nature at first hand. His impressions were received early, for it is the rustic sights and sounds of the Border that are most prominent in his verse. He was not without a quaint if sometimes coarse humour. He has long passages of pleasing melody, though the exquisite note in his description of the Helrides, 'placed far amid the melancholy main,' is but rarely heard. His thought is usually conventional.

See the editions by Logie Robertson (1891) and Tovey (2 vols. 1897), the *Lives* by Dr Johnson, Gilfillan, W. M. Rossetti, and G. C. Macaulay (1908); and Prof. Léon Morel, *James Thomson: Sa Vie et ses Œuvres* (1895).

**Thomson, JAMES**, the poet of despair, was born a sailor's son at Port-Glasgow on the Clyde, 23d November 1834, and educated in an orphan asylum, where he was trained for service as an army schoolmaster; but through his friend Bradlaugh (q.v.) he became from 1860 onwards a contributor to the *National Reformer*, in which many of his sombre, powerful, and sonorous poems—including 'The City of Dreadful Night' (1874)—first appeared. In 1862 he became a lawyer's clerk; he went to the Rocky Mountains (1872) as a mining agent; was war-correspondent with the Carlists (1873); and from 1875 onward depended for livelihood largely on contributions to a monthly published by a tobacco-firm. Afflicted in body and profoundly gloomy in mind, he suffered sorely from the seductions both of narcotics and stimulants; and he died in University College Hospital, 3d June 1882. *The City of Dreadful Night and Other Poems* was published as a book in 1880,

praised by the critics and read by the public; and was followed by *Vane's Story, Essays and Phantasies, A Voice from the Nile* (1884, with memoir by Bertram Dobell), and *Shelley, a Poem* (1885). Thomson's pessimism was not academic, but the only too real and dark despair of a morbidly gloomy soul; his monotonously melancholy verses, not seldom tediously verbose, are occasionally varied by a burst of sarcasm or a brief dash of preternatural brightness. He wrote under the pseudonym 'Bysshe Vanolis' (often represented only by the initials B. V.), *Bysshe* being in honour of Shelley and *Vanolis* an anagram of Novalis.

See the *Life* by Salt (1889, revised 1914); the edition of the poems by B. Dobell (1895); and the *Biographical and Critical Studies* (1896).

**Thomson, JAMES**, engineer and physicist, elder brother of Lord Kelvin (q.v.).

**Thomson, JOHN**, minister of Duddingston and landscape-painter, was born 1st September 1778 at Dailly in Ayrshire, and, in spite of his wishes to be an artist, was trained to follow the profession of his father and grandfather. He completed his theological studies in Edinburgh, taking some lessons, however, from Nasmyth, the painter, and in 1800 became his father's successor at Dailly. Thence in 1805 he was transferred to the parish of Duddingston, near Edinburgh, where, along with the faithful performances of parochial duties, he found time to paint the large series of landscapes in virtue of which he ranks amongst the best, as he was the first, of Scottish landscapists. His style, though characteristic, reflects the influence of the Dutch, French, and Italian schools. He died 27th October 1840. See books by W. Baird (1895) and R. W. Napier (1919).

**Thomson, JOHN ARTHUR**, biologist, born 8th July 1861 in East Lothian, was educated at the universities of Edinburgh, Jenn, and Berlin, and became professor of natural history at the university of Aberdeen in 1899. His writings, which are very extensive, include *The Study of Animal Life* (1892, revised ed. 1917), *Outlines of Zoology* (7th ed. 1920), *Progress of Science in the Nineteenth Century* (1904), *Hereditity* (1908, 5th ed. 1926), *Darwinism and Human Life* (1910, revised ed. 1916), *Secrets of Animal Life* (1919), *The System of Animate Nature* (Gifford Lectures, 1920), *Science Old and New* (1925), *The Gospel of Evolution* (1925), *The New Natural History* (1925-26). He co-operated with Professor Patrick Geddes in *Evolution* (1911), *Sex* (1914), and *Biology* (1924), and has also written a great deal in journals and works of reference including this encyclopædia.

**Thomson, JOSEPH**, traveller, was born at Penpont in Dumfriesshire in 1858, studied at Edinburgh University, and commanded two expeditions to Africa for the Royal Geographical Society in 1878-79 and 1882, in the second of which he passed through the Masai country and visited Mount Kenya; he afterwards made journeys in the Niger country and in Morocco. He died 2d August 1895. Among his works are *To the Central African Lakes and Back* (1881), *Through Masai Land* (1885), *Travels in the Atlas* (1889), and a *Life of Mungo Park* (1891). See his *Life* by his brother (1896).

**Thomson, SIR JOSEPH JOHN** (knighted 1908), was born near Manchester in 1856, and educated at Owens College and Cambridge. From 1884 to 1918 he was Cavendish professor of Experimental Physics at Cambridge, and from 1905 to 1918 Professor of Physics at the Royal Institution, London. He was awarded the Nobel Physics Prize for 1906, was president of the Royal Society from 1916 to 1920. In 1918 he became Master of Trinity College, Cambridge. His researches

on the ionic theory of electricity, radio-activity, and the electric theory of inertia of matter have been most important. In 1911 he announced a new method of chemical analysis of gases in vacuum tubes. The positive rays, deflected vertically by a magnetic and horizontally by an electric field, strike a photographic plate, on which they print a parabola for each kind of molecule present. Measurement of the parabola gives the atomic weight. His published works dealing with his researches are numerous. See the *History of the Cavendish Laboratory* (1910).

**Thomson, WILLIAM** (1819-90), born at Whitehaven, studied at Shrewsbury and Queen's College, Oxford. Bishop of Gloucester and Bristol for one year, he became in 1862 Archbishop of York. Besides sermons and papers, he published a long-famous *Outline of the Laws of Thought* (1848).

**Thomson, WILLIAM**. See KELVIN.

**Thor**, god of thunder, was the son of Odin and Earth. Thunder was caused by the rolling of his chariot. He was the strongest of gods and men; the gods called in his assistance when they were in straits. He was in particular a terror to the Giants (q.v.), with whom he was perpetually at strife, and whom he struck down with his hammer Mjolner, which had the property of returning to his hand after being hurled. The name of Thor was wide-spread; the English worshipped him as Thunar, the High Germans as Donar. As rude force is the predominating element in Thor, the humorous element of the Scandinavian belief attaches to him. Thus the giants often blinded him by magic, and made fun of him; yet he always shows his extraordinary strength in these cases, and in the long run his opponents are invariably overcome by the hammer. Thursday is so called from Thor; and the name survives in numerous names of places (Thunderfield in Surrey; Thundersley in Essex; Thurso), and also in personal names (Thorburn; in Scand. Thorbjörn, 'son of Thor'). See SCANDINAVIAN MYTHOLOGY.

**Thoracic Duct**. See LYMPHATICS.

**Thorax**. See CHEST.

**Thorbecke, JAN RUDOLF** (1798-1872), Dutch statesman, born at Zwolle (Overijssel), graduated after a distinguished career at Leyden, and eventually became professor of jurisprudence and political science at that university. Thorbecke, who headed the reform party after 1840, left his mark on the constitution of 1848, while his books (*Law and the State*, 1824; *Notes on the Constitution*, 1839) were of considerable importance. His *Historical Essays* appeared in 1860 and 1872.

**Thoreau, HENRY DAVID**, the 'poet-naturalist' and original writer in various departments, was born in Concord, Massachusetts, on the 12th July 1817, and died there on the 6th May 1862. Concord, a pretty rural village about 20 miles NW. of Boston, is noted as having been the home of Emerson, the Alcotts, Hawthorne, and Thoreau, the last, however, being the only one of the group born there. Thoreau's father, John Thoreau, was of French extraction. He was a merchant in Boston, and finally a lead-pencil maker in a small way in Concord, where he died in 1859. He is described as a small, deaf, and unobtrusive man, plainly clad, and minding his own business; very much in contrast with his wife, who was not small, nor unobtrusive, and who did not always succeed in confining her attention to her own business. Henry was the third of four children—John, Helen, Henry, and Sophia—all people of character and mark. 'To meet one of the Thoreaus,' says Sanborn, the biographer of Henry, 'was not the same as to encounter any other person who might cross your

path.' Helen and John were both teachers, and died comparatively young. Helen was evidently a fine nature. It was part of her earnings as teacher that helped to pay Henry's expenses at Harvard College, where he was graduated in 1837.

Henry did not distinguish himself in college. In his senior year he is said to have 'lost rank with his instructors by his indifference to the ordinary college motives for study.' After graduating he became a teacher, and was for a time employed in the academy at Concord where he had been a pupil. He seems to have begun his career as a lecturer when about twenty-one years of age, first appearing before the lyceum of his native village. He soon gave up teaching, and joined his father in making lead-pencils. But to this employment he did not stick. Having mastered the art, Emerson says, he had no further interest in it. He probably began his walks and studies of nature as the serious occupation of his life about this time—i.e. in 1838 or 1839. In August 1839 he made his voyage down the Concord and Merrimack rivers in company with his brother John. Out of this voyage came his first book, *A Week on the Concord and Merrimack Rivers*, published ten years later. The *Week* is a collection of essays on religious literature and philosophical themes, tied together by a slight thread of travel. Thoreau early made the acquaintance of Emerson, and in 1841-43 was a member of his household, having charge of the garden and doing other work for his friend. When Emerson made his visit to England in 1847, Thoreau again lived with the Emerson family. In 1845 Thoreau borrowed Mr Alcott's axe, and went and built himself a shanty in the woods by Walden Pond on land owned by Emerson. He went there, he said, for seclusion and solitude that he might the better study nature and become acquainted with himself. Here he seems to have written much of the *Week*, his essay on Carlyle, and many others of his papers. While here he demonstrated to himself that a man can support himself on less than \$100 per year and have two-thirds of his time to himself. He spent nearly two years at Walden. He says: 'I left the woods for as good a reason as I went there.' Out of his experience has come his most popular book, *Walden, or Life in the Woods* (1854), one of the freshest and most stimulating books in American literature.

After the Walden episode he supported himself in various ways, such as a job here and there at whitewashing, gardening, fence-building, and land-surveying. He also had a call to lecture now and then, and he wrote for the current magazines. He made three trips to the Maine woods in 1846, 1853, and in 1857, where he saw and studied the moose and Indians. His papers which were the outcome of these trips were published in book form after his death (1864), and next to *Walden* form his most valuable and interesting volume. In 1850 he made a trip to Canada with his friend Ellery Channing, out of which trip came his posthumous volume, *A Yankee in Canada* (1866). Thoreau began to keep a daily journal of his walks and observations in 1835. These journals swelled to thirty volumes before he died, and are a complete record of what he saw and what he thought. They seem to have been written and revised with great care, and are rich in fine thoughts, graphic descriptions, and fresh natural history notes. Thoreau died of consumption, sitting-up in bed on a morning in early May, and as gently as if going to sleep. After his death there were published from his lectures and magazine articles *Excursions in Field and Forest*, with a biographical sketch by Emerson (1863), and *Cape Cod* (1865). In 1865 a volume appeared of *Letters*

to Various Persons, which also included nine of his poems. Editions of his works appeared in 1893 (11 vols.) and 1906 (20 vols., including the Journal). See the Lives by Page (1877) and Salt (1890, 1896); Channing, *Thoreau, the Poet Naturalist* (1873); Bazalgette, *Henry Thoreau* (trans. 1925); several studies by F. B. Sanborn (1882, 1901, 1917), and his edition of the *Letters* (1894); also F. H. Allen's *Bibliography* (1908).

**Thorium** (Th; atom. number, 90; atom. weight, 232), a metal resembling aluminium, but taking fire below a red heat, and burning with brilliancy, is the commonest, and in some respects the most interesting, of the radio-active substances, and is largely used in the manufacture of incandescent gas-mantles. Thorium was discovered in 1828 by Berzelius in thorite; it is now obtainable in practically unlimited quantities from monazite sand, found in many places, but especially in Brazil, Canada, Travancore, South Africa, and North Carolina. Its radio-activity was fully demonstrated by Ramsay and Hahn in 1903. See LEAD, p. 564, and RADIUM.

**Thorkelin**, GRÍMUR JÓNSSON (1752-1829) was a notable Icelandic antiquary, who wrote on Icelandic literature, history, and law.

**Thorn**, an Old English and Icelandic letter ( $\theta$ ) taken from the Runic alphabet. See T and Y; and for Eth ( $\eth$ ), see D. See also RUNES.

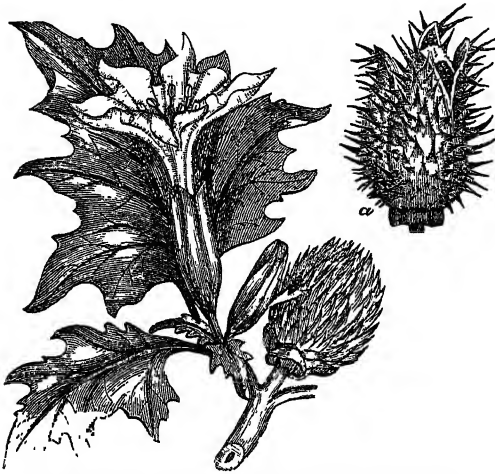

**Thorn.** See THORNS, HAWTHORN, SLOE, BUCKTHORN, CACTACEÆ, ROBINIA.

**Thorn** (Pol. *Toruń*), capital of the Polish voivodeship of Pomorze, till 1919 in the Prussian province of West Prussia, stands on the right bank of the Vistula (here spanned by a viaduct 1100 yards long). Founded by the Teutonic order in 1231, and a member of the Hanseatic League, Thorn became a Polish town in 1454, and was annexed to Prussia in 1815. It was five times besieged between 1629 and 1813; and in 1878 was made a fortress of the first rank by Prussia, the old fortifications being removed, and a series of detached forts built. Copernicus was a native. An active trade in corn and timber is carried on. Pop. (1921) 39,424.—The CONFERENCE OF THORN, an unsuccessful effort to explain away the differences between Catholics and Protestants, with a view to reunion, met in 1645.

**Thornaby-on-Tees.** See STOCKTON.

**Thorn-apple** (*Datura*), a genus of plants of the family Solanaceæ, having a tubular five-cleft calyx, a large funnel-shaped five-lobed corolla, a two-laminated stigma, and an imperfectly four-celled, prickly, or unarmed capsule. The species of the genus are annual herbaceous plants, rarely shrubs or trees; they are in general narcotic, and productive of wild excitement or delirium. The common Thorn-apple, or Stramonium (*D. Stramonium*), is an annual plant, with smooth stem and leaves, white flowers, and erect prickly capsules, a native of the East Indies, but now often met with in Europe, as also in Asia, the north of Africa, and North America. It contains a peculiar alkaloid, *Daturine*, which is practically identical in its action with Atropine (q.v.). The leaves and seeds are employed in medicine (see ASTHMA). The dried leaves have a faintly narcotic smell, and an unpleasant bitter taste; the seeds, which are of a black colour, are still more poisonous. A variety with pale violet flowers and purplish violet stem is frequently cultivated in gardens as an ornamental plant. Still more narcotic is the Soft-haired Thorn-apple (*D. Metel*), a native of the south of Asia and of Africa. The Thugs (q.v.) of India employed it in order to stupefy their victims, or, in other cases, to poison them outright. From its

seeds, along with opium, hemp, and certain spices, a strong intoxicating substance is prepared, which the Mohammedans of India use in order to produce in themselves an indescribable joyfulness and extremely pleasurable feeling for a short time;

Common Thorn-apple (*Datura Stramonium*):  
a, ripe fruit.

but the use of it destroys the constitution. *D. sanguinea*, the red thorn-apple of Peru, is used by the Indians to prepare a very powerful narcotic drink called *tonga*, which stupifies when very diluted, and when strong brings on maniacal excitement. The beautiful *D. fastuosa* has flowers externally of a violet colour, and white within, and is cultivated as an ornamental plant, especially a variety with what are called double flowers, which consist rather of two corollas, one within the other. *D. arborea*, a native of Peru and Colombia, has come to be also very generally cultivated in flower-gardens in Europe. It has very splendid pendulous white flowers, 9 to 12 inches long, which diffuse a sweet smell in the evening and at night. Like those of *D. sanguinea* they are much visited by humming-birds.

**Thornback** (*Raja clavata*), a species of ray or skate, common on most parts of the British coast. It attains a large size; the snout or fronto-nasal

Thornback (*Raja clavata*).

process is short, and the form is nearly rhombic. The upper surface is brown, with lighter spots, the under surface white. The upper surface is rough with minute sharp scales, and has numerous nail-like crooked spines, each with an oval bony base. A few strong spines may also occur on the ventral surface, especially in the female. In the male the

teeth are pointed, in the female flat. The thornback is used as food, particularly in autumn and winter, but is most abundantly captured in spring and summer, when it comes to shore-waters to deposit its eggs, each enclosed in a mermaid's purse.

**Thornbury**, GEORGE WALTER, was born in London, a solicitor's son, in 1828, and, after studying art for a while, at seventeen began writing for the *Bristol Journal*. He soon settled in London, and published between twenty and thirty novels, books of travel, and other works, among them the fiery *Songs of the Cavaliers and Roundheads* (1857), *As the Crow Flies* (1859), *Life of Turner* (1861), *Historical and Legendary Ballads* (1775), and vols. i. and ii. of *Old and New London* (completed by E. Walford, 1872-78). He died 11th June 1876.

**Thornhill**, in the West Riding of Yorkshire, since 1910 part of Dewsbury, has an old church.

**Thornhill**, SIR JAMES (1676-1734), historical painter and sergeant-painter to Queen Anne, decorated the dome of St Paul's, executed paintings for Blenheim, parts of Hampton Court, and Greenwich Hospital. Of his easel-pictures the best known is the view of the House of Commons in 1730; and he executed a few portraits, some etchings, and good copies of Raphael's cartoons. He founded a successful drawing-school, his most famous pupil being Hogarth, who became his son-in-law. Knighted by George I. in 1715, he sat in parliament as member for his native borough of Melcombe Regis.

**Thorns**, or SPINES, may be metamorphosed leaves or parts of leaves, as is shown by their position on plants; for lateral buds occur in their axils. In the Barberry the compound spines are entire metamorphosed leaves; in *Robinia Pseudacacia* the spines are metamorphosed stipules, parts of the leaf-sheaths; in many species of *Caragana* and *Astragalus* they are pointed persistent petioles (leaf-stalks). The thorns of the Blackthorn and Hawthorn are pointed branches; in the Furze (whin) they are both pointed leaves and branches. Adventitious roots form thorns in the palm genus *Acanthorhiza*. Some would appropriate the word prickles to pointed projections of the epidermis, to be compared with hairs and surface-glands. (See HAIRS OF PLANTS.) Spines and prickles tend to disappear from plants under cultivation—i.e. from plants that are growing luxuriantly; and conversely, they tend to increase in plants growing in unfavourable conditions. These and other facts have led to the theory that spines in general are an expression of the 'ebbing vitality of a species,' and not, as is usually thought, the result of a process of natural selection which has caused them to be evolved as protections against mammals. But this theory was severely criticised by Wallace, in his *Darwinism*, who argued that spinous plants are vigorous and have an extensive range; and, further, that they are very rare or entirely absent from those districts, oceanic islands for instance, where there are few or no mammals, which is what the theory of their selection as protective organs would lead one to expect; and genera which have many spinous species in other countries have no such representatives in oceanic islands. But see HOLLY.

**Thornycroft**, SIR WILLIAM HAMO, R.A., sculptor, was born in London, 9th March 1850, and studied at the Royal Academy schools. 'Artemis' (1880) was his first success; then followed 'Teucer' (1881), 'The Mower' (1884), and the portrait statues of General Gordon in London (1885), John Bright at Rochdale (1892), and Cromwell at Westminster. Other works of his were the Colet Memorial at St Paul's school, the Queen Victoria

Memorial at the Royal Exchange, the Gladstone Memorial in the Strand, the Lord Curzon Memorial at Calcutta, and the King Edward Memorial at Karachi. Elected R.A. in 1888, and knighted in 1917, he died 18th December 1925.

**Thorough.** See STRAFFORD.

**Thorough Bass** means either what has, as *figured bass*, been explained at ACCOMPANIMENT—a bass voice-part written at length, with numerals written below (or above) it to indicate the chords of the harmony; or, more loosely, the science of harmonic composition. See HARMONY, COUNTERPOINT.

**Thorpe**, BENJAMIN (born 1782; died at Chiswick, 19th July 1870), edited numerous Old English texts, and was the author of *Northern Mythology* (3 vols. 1852).

**Thorvaldsen** (often in English Thorwaldsen), BERTTEL, sculptor, was born at sea on the 19th November 1770. His father, an Iclander, was on his way to Copenhagen, where he settled as a carver of figure-heads for ships; and the son was brought up to the same profession. From his eleventh year the boy attended art classes, and in 1793 he gained the first gold medal for design at the Academy of Copenhagen, and along with it the privilege of three years' residence abroad for the purpose of study. Accordingly, in 1796 he sailed for Rome, whose collections kindled in him the undying ambition to revive the glories of sculpture as practised by the ancient Greeks. From Canova he had early and generous recognition; and shortly, by the model for a 'Jason,' he secured reputation. No purchaser could, however, be found for it till, in 1803, just as in hopeless disgust the artist was about to return to Copenhagen, he received from 'Anastasius' Hope a commission for its production in marble. From this time forward prosperity and fame flowed upon him in full tide. In 1819 he returned to Denmark, where his reception was triumphal. He remained at home but a year, and then returning to Rome continued to prosecute his art assiduously up to 1838, when he again departed, to pass his remaining years in his own land. Its climate, however, proved no longer suitable to him, and the year 1841 found him once more at Rome. In 1844, having revisited Copenhagen to complete some of his works there, he died suddenly in the theatre, of disease of the heart, on the 24th March. All the works remaining in his possession he bequeathed to his country, to be preserved in a museum bearing his name, for the maintenance of which he also left the bulk of his fortune, reserving a sufficient provision for his natural daughter; and this collection is now one of the chief glories of Copenhagen. Thorvaldsen's strength lay in classical and mythological subjects. His efforts in Christian subjects, even the famous 'Christ and the Twelve Apostles' at Copenhagen, are obviously a less spontaneous outcome of his genius. Of his many works those best known by photography and otherwise are the reliefs 'Night' and 'Morning.' Of his many portrait busts and statues those of Byron, now at Cambridge, and Ehlerschlager are perhaps the most notable. His reputation has considerably fallen off.

See the *Life* by Thiele (3 vols. Leip. 1852-56; Eng. abridgement by Barnard, 1865); and books by Hamme-rich (Gotha, 1876); Eugène Plon (Eng. trans. by Mrs Cashel Hoey, 1874); Sigurd Müller (Copenhagen, 1890 *et seq.*); Rosenberg (1896); and Trier (1903).

**Thoth**, the Egyptian Hermes or Mercury, the mythical inventor of the arts and sciences, music and astronomy, and especially of speech and hieroglyphs or letters, over which he was supposed to preside. He is usually represented by the figure

of an ibis, or by a man with the head of an ibis. The dog-headed baboon was sacred to him. See EGYPT, Vol. IV., p. 236.

**Thou** (Lat. *Thuanus*), JACQUES-AUGUSTE DE, the most famous historian of his time, was born at Paris in 1553. His father and grandfather had both been presidents of the parliament of Paris, so that he inherited connections which smoothed his own way to fame and place. After five years spent at the university of Paris he continued his studies at Orleans, and subsequently at Valence under the famous jurist Cujacius. At Valence, also, he formed a friendship, equally honourable to both, with the younger Scaliger. Returning to Paris, he witnessed the massacre of St Bartholomew (1572), of which, though a good Catholic, he afterwards spoke with the severest reprobation. A journey to Italy extended his knowledge and turned his mind still more decidedly to the writing of his great history, the plan of which he had already conceived. He had originally chosen the church as his profession, and actually became one of the canons of Notre Dame in Paris; but at the instance of his friends, though against his own wish, he eventually followed the law. His own merit and his family interest brought him rapid promotion; and at the age of thirty-five he obtained the reversion of the office of president of the parliament of Paris. During the wars of the League De Thou stood fast by Henry III., though he was fully aware of his shortcomings as a king, and took a prominent part in the intricate diplomacy of the time. He stood equally high in the opinion of Henry IV., under whom he acted as keeper of the Royal Library, a post which brought him into contact with the great scholars of the time, the elder Cusaubon among others. In affairs of state his most distinguished services were rendered in connection with the Edict of Nantes (1598-99), for which his personal character and the esteem in which he was held by Huguenot and Catholic alike eminently fitted him. He died at Paris in 1617.

The great work of De Thou's life was his stupendous history of his own time (1543-1607), written in Latin, filling four closely-printed folios. A complete edition of 138 books was issued by two of his friends three years after his death. The appearance in 1604 of the first eighteen books brought its author a European reputation, and those that followed had equal success. His impartial treatment of heretics, however, did not find favour at Rome; and much to the chagrin of De Thou, who was at heart a pious son of the church, his history was placed on the index of prohibited books. During the 17th and 18th centuries De Thou was ranked with the greatest historians, and he was universally quoted as a master of political wisdom. In England Dr Johnson had serious thoughts of translating him; Pitt paid him a special tribute in the House of Commons; and the best edition of his history was published in London by Samuel Buckley at the expense of Dr Meade, and partly under the superintendence of the historian Carte. His commentaries on his own life and a quantity of Latin verses were De Thou's other contributions to literature.

The following are the chief editions of De Thou's History—11 vols. 8vo, Paris, 1609-14; 4 vols. fol., Frankfurt, 1628; French translation, 10 vols. 8vo, Paris, 1740; edition by Samuel Buckley (7 vols. Lond. 1733). For an account of De Thou's life, see Collinson, *Life of Thuanus* (London, 1807; chiefly based on De Thou's own *Memoirs*); Philartète Chasles, *Discours sur la Vie et les Ouvrages de J.-A. de Thou* (Paris, 1824); HARRISSE, *Le Président de Thou et ses Descendants* (1905).

**Thouars**, a town of France, in the department of Deux-Sèvres, 24 miles by rail south of Saumur.

The town, situated on the river Thouet, has several medieval churches, an imposing stronghold (17th century) now used as a prison, and remains of the old ramparts. There is a trade in wine and agricultural produce, and sabots and furniture are made. Pop. 8000.

**Thought-reading**, or **MIND-READING**, a term which came up in 1881 to designate the act or art of discerning what is passing in another's mind by some direct and unexplained method, depending neither on gesture, facial expression, nor any articulate or other voluntary indication. One explanation offered is that the mind emits waves of thought-force, vibratile nervous energy or the like, which can be received and understood by another mind suitably attuned. Mind and memory reading on the part of so-called fortune-tellers is said to result from the exceptional capacity of the reader for attuning his mind (by a process of self-hypnotism) to that of his subject. The unbelieving theory is that A inevitably, but quite unconsciously, communicates a succession of slight but sufficient muscular indications to B. For telepathy see **APPARITIONS**. See the *Proceedings of the Psychological Research Society*.

**Thourout**, a town in the Belgian province of West Flanders, 11 miles SW. of Bruges. Of great commercial importance in the middle ages, it now manufactures linens and hats, and has horse fairs. Pop. 11,000.

**Thousand Buddhas**, **CAVE OF THE**. See **TUN-HUAN**.

**Thousand Islands**. See **ST LAWRENCE**.

**Thousand Nights and a Night**. See **ARABIAN NIGHTS' ENTERTAINMENTS**.

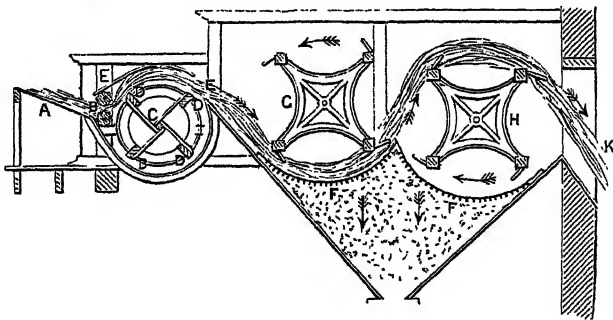

**Thrace**, a name used by the ancients somewhat vaguely for a large region to the west of the Euxine (Black Sea) so as to include the whole country between the Ister (Danube) and the Ægean, and even part of the Scythian country beyond the Ister. Under the Romans, however, part of this vast region was joined to Macedonia; the country between the Ister and the Hæmus (Balkans) became the province of Mœsia (mod. Bulgaria); so that the province of Thracia was the remaining district between the Hæmus and the Propontis, and from the Nestus River (mod. Mesta) to the Euxine; see the map of the Roman empire at **ROME**. Thracia was hilly in surface, Rhodope (q.v.) being the chief mountain-system; the chief river was the Hebrus (Maritza); great part of the area was occupied by forest. Who the ancient Thracians were has been much disputed; their language has perished utterly; but there seems no doubt that they were a branch of the Indo-European stock, and kinsmen, more or less remote, of the Greeks, though they were regarded by the Greeks as barbarians. Thrace never constituted one powerful monarchy, though at times the king of one or other of the Thracian clans extended his power over great part of the country, so as to be formidable to the Athenian colonists or to the Macedonian monarchs. Under Roman suzerainty Thrace long remained half independent; but under Vespasian it became a province of the empire, and its people became Romanised so entirely that it seems not improbable the Thracian provincials were the direct ancestors of the Vlachs, speaking Rumanian, who are still numerous south of the Danube. Goths and Huns overran the country; Bulgarians occupied the north; and after the conquest of Constantinople by the Turks the fortunes of Thrace were largely bound up with those of that city. After the treaty of Berlin (1878) the northern

part of Thrace became the province of Eastern Rumelia, autonomous at first but later under Bulgaria; the rest remained an integral part of the Ottoman empire until the Balkan wars (1912-13) deprived Turkey of all Thrace east of the Maritza and extended the Bulgarian frontier to the Ægean. Further shuffling of territories took place after the Great War, and the treaty of Lausanne (1923) left Greece in possession of Thrace as far as the Maritza, Bulgaria having been deprived of its coastal strip by the treaty of Neuilly (1919).

**Thrale**. See **PIOZZI**.

**Thrashing** is the separating of the grain or seeds of plants from the straw. The earliest method was doubtless the beating out of the grain from the ears with a stick. An improvement on this was the practice of the ancient Egyptians and Israelites of spreading out the loosened sheaves of grain on a circular piece of hard ground 50 to 100 feet in diameter, and driving oxen backwards and forwards over it, so as to tread the grain out; but, as this damaged part of the grain, it was partially superseded by the thrashing-sledge, a heavy frame mounted on three rollers, which was dragged over the heaps of sheaves. Similar methods of thrashing were employed by the Greeks and Romans—the stick, the treading by men or horses, and the thrashing-sledge being found in common use among them. The primitive implement in northern Europe was the stick, and an improved modification of it, the *flail* (two sticks loosely fastened together at one end by stout thongs, has not yet disappeared.

Various attempts were made to supersede the flail by a machine, but with little success, till 1787, when Andrew Meikle, an ingenious Scottish mechanic, produced a thrashing-mill so perfect that even after having run the gauntlet of a century and a half of improvements it is essentially the machine of its original inventor. In Meikle's mill the sheaves are loosened and spread out one by one on the feeding-board, A (see fig.), with the ears towards the machine; they are then pushed forward till caught between two revolving fluted rollers of cast-iron, B; and as soon as one sheaf disappears between the rollers another is presented to them. Behind the rollers is

a rapidly revolving *drum* or cylinder, C, having four *beaters*, D, D, D, D, or spars of wood armed with iron placed along its surface parallel to its axle; and these beaters, striking the heads as they are protruded from between the rollers, detach the seeds and husks. Grain and straw then pass together over the cylinder, the former falling through the wire-work, F, F, while the straw is carried forward by the circular rakes, G, H, and, being by them thoroughly tossed and separated from the grain and chaff, is ejected at K. The grain which has fallen through the wire-work is received into a winnowing-machine, where it is cleansed from chaff, &c., and then is either discharged upon the

barn-floor or, as is the case with the most improved machines, is raised by a series of buckets fixed on an endless web, and again winnowed, to separate the perfect grains from the light and small seeds. Barley is, previous to the second winnowing, subjected to the process of 'hummelling,' by which the awns are removed; but the rest of the process is the same as above.

The earlier alterations upon Meikle's invention were chiefly confined to modifications of the drum; such as diminishing the distance between the drum and its cover, E, E, increasing the number of the beaters, and accelerating the speed of the drum. The speed of the thrashing-machine was next increased, while appliances were attached by means of which at the one operation the grain was thrashed, dressed ready for market, elevated to the granary, and perhaps even sacked, the straw being carried on endless webs or by a series of rakes travelling in a trough-shaped channel to any given part of the straw barn. Blowers for similarly disposing of the chaff, and arrangements for carrying the sheaves forward to the drum and at the same time cutting the bands, are among the latest improvements.

The portable thrashing-machine, now so generally employed in America and England, and to a lesser extent in Scotland, has not the two grooved rollers, the loosened sheaf being at once submitted to the action of the thrashing machinery; the drum, which is a *high-speed drum*, is provided with six or eight beaters, and its cover or concave is capable of being set at any required distance from it by means of screws.

The attention of inventors and manufacturers of thrashing-machines has been turned not only to securing increased speed and more finished work, but also to providing against the risk of accidents to those employed about the mills. The feeding of those high-speed drums which were getting so common was attended with considerable danger, and to prevent this safety-drums of different patterns have been introduced by the various makers. The best of these are so effective that accidents in feeding now rarely occur. Some of the modern machines thrash from 12 to 16 or even more quarters of oats per hour. From 6 to 8 quarters per hour are common quantities even for comparatively small machines.

The driving-power is wind, water, horse-power, steam, or oil; but the first is so very uncertain and unequal in its operation that it has nowadays been mostly superseded by the others. Water-power is always desirable, and when it can be had in sufficient quantity or regularly it is much to be preferred in point of economy, its mode of application to thrashing being either by the ordinary Water-power (q.v.) or by Barker's Mill (q.v.). Horse-power was the agent in most common use in the earlier days of thrashing-mills, the horses being yoked to beams attached to a vertical revolving shaft which communicated motion by means of bevelled gear to the thrashing-machine. But it was found that this kind of work was very trying for the horses, and interfered considerably with the other work of the farm; and accordingly steam-power, as being more economical, extensively superseded horse-labour, engines of 6 to 10 horse-power being generally employed. Latterly oil engines, which are more suitable for intermittent work, and which require less labour and supervision, have largely replaced steam. They are usually of from 15 to 25 horse-power. Portable thrashing mills and engines are thought by many to be more economical, from their saving the labour of transporting the crop from the stack to the barn, and from their adaptability to the requirements of a farmer who may rent more than

one holding in a district. On the other hand, however, some prefer the fixed machine on account of cheapness and diminished liability to derangement. Hand-power thrashing machines are made for use on small holdings. They are hard to drive, but do their work admirably.

**Thrasimene.** See TRASIMENE.

**Thrasylbulus**, Athenian general and statesman, fought in many campaigns at home and abroad, and was a strenuous supporter of the democracy. In 411 B.C. he helped to overthrow the oligarchy of the Four Hundred, and was banished by the Thirty Tyrants, but restored the democracy in 403. He conquered Lesbos, and defended Rhodes, but was slain in 389.

**Thread-cells**, another name for Stinging-cells (q.v.), given on account of the coiled thread or lasso that springs out and stings.

**Thread-manufacture.** Any fibrous substance, such as cotton or flax, when it is to be woven, is first spun into yarn, which is sometimes called thread. Sewing-thread, however, always consists of at least two or more yarns twisted together. In the spinning of yarn the process is the same whether it is to be woven into cloth or twisted into thread (see SPINNING). Beginning with the spun yarn, the stages in the process of manufacturing a six-cord cotton thread (a very common kind) are: (1) The yarn is doubled and wound upon bobbins; (2) the double yarn is then twisted into a two-ply thread; (3) the thread is next rewound on bobbins for the second twist; (4) the thread is twisted a second time on the twisting-frame, three two-ply threads being thus formed into a six-cord thread; (5) the thread is rewound on large bobbins, from which it is reeled into hanks for bleaching or dyeing; (6) the bleached or dyed thread is next rewound on bobbins for spooling; (7) spooling—i.e. winding the thread on small bobbins called spools, reels, or pirns, for use in sewing by hand or machine. Sometimes thread is wound into hanks or balls for crochet, embroidery, or knitting work. The spindles of the spooling-machine run at a speed of 7000 revolutions per minute. See also BOBBINS.

Cotton thread is made at Manchester and in its neighbourhood, as well as at Glasgow. Paisley is, however, the principal seat of the manufacture in Great Britain. The making of thread on an industrial scale was begun in that town in 1722 by Christian Shaw of Bargarran. She had obtained information from Holland about the process of making linen thread, and what she and her friends manufactured was sold at the time under the name of 'Balgarran thread.' The industry did not become of great importance so long as flax was the material used. But in the early part of the 19th century, when the spinning-machines of Hargreaves, Arkwright, and others came largely into use, the manufacture of cotton thread was begun in Paisley, and its progress has been on the whole rapid. This has been especially the case since 1860 through the constantly increasing use of sewing-machines for both domestic and factory purposes. From 10,000 to 12,000 workers are employed at the Paisley thread-mills. In 1896 J. & P. Coats, Limited, employing fully 5000 persons, absorbed the other four leading British thread firms into one great firm, the capital of which is now £20,250,000. The English Sewing Cotton Company, with a capital of £3,000,000, in addition to their English connection, owns all the ordinary stock of the American Thread Company.

Linen thread is made at Johnstone near Paisley, Belfast, Nottingham, and other places. Although a much less quantity of it is manufactured, it is perhaps used for a greater variety of purposes than

cotton thread. Fine kinds are required for lace-making, and strong kinds for sewing heavy fabrics, as well as for shoemakers', saddlers', and bookbinders' use. Silk thread, the stronger kinds of which are called twist, is now used to a very large extent for sewing dyed articles of dress.

**Threadneedle Street**, in the City of London, got its name from the Merchant Taylors' Company, whose present hall is built on an estate acquired by them as early as 1331. It leads from Bishopsgate Street to the Bank of England, which hence is often called the 'Old Lady in Threadneedle Street.'

**Thread-worms**, a popular name for Nematoda, a class of more or less thread-like worms, many of which are parasitic, while others are free-living. The body is unsegmented; there is a well-developed cuticle; there is a complete alimentary canal surrounded anteriorly by a nerve-ring from which six nerves run forward and backward. The sexes are separate, and the life-history is often intricate. Several species are often parasitic in man—*Ascaris lumbricoides*, in the small intestine; *Oxyuris vermicularis*, in the cæcum and large intestine; *Dochmius duodenalis*, in the small intestine; *Filaria sanguinis hominis*, in the blood; *Dracunculus medinensis*, the Guinea-worm; *Trichinella spiralis*; *Trichocephalus dispar*, in the cæcum and large intestine. Not a few are parasitic on plants—e.g. several species of *Tylenchus*, which infest wheat and other crops. Some occur in domesticated animals—e.g. *Strongylus armatus*, the palisade worm, which causes aneurysm in the horse, or *Filaria immitis*, in the heart of the dog, or *Ollulanus*, which passes from mouse to cat. Others live freely in water and putrefying substances—e.g. *Enoplus* and many other genera. Long delicate threads often found in garden soil are species of *Mermis* and its relatives, which spend their larval life as parasites in insects.

See ASCARIS, GUINEA-WORM, PARASITIC ANIMALS, TRICHINA; Leuckart, *Parasites of Man* (trans. 1886); Schneider, *Die Nematoden* (1876); Hamann, *Die Nematodminthen* (1895); Yorke and Maplestone, *Nematode Parasites of Vertebrates* (London, 1926).

**Threats**, considered legally, are intimidation by moral terrorism. Their purpose is to make the person threatened surrender some right, or pay money, or do something to his detriment from fear of a greater evil. The usual form of the crime is sending anonymously or otherwise a threatening letter demanding money or valuable property, under the menace that the victim will be murdered, or his house or property will be destroyed, or his cattle killed or wounded, or that he will be charged with some infamous crime. (The offence is committed though a guilty person be threatened.) To procure the execution of a deed by threats, or to threaten to publish a libel, are varieties of the same offence. In their extreme form such acts are punished with penal servitude for life.

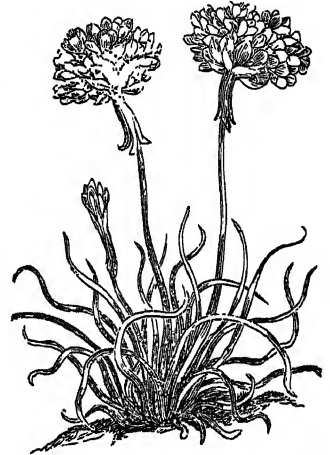

**Three Kings**, FEAST OF THE, a famous mediæval festival, identical with Epiphany or Twelfth Night. For the kings, see MAGI.

**Three Rivers** (*Trois Rivières*), capital of St Maurice county, Quebec, at the confluence of the St Maurice and St Lawrence, 95 miles by rail NE. of Montreal. It is the centre of a lumbering district, and has a large export trade in lumber, grain, cattle, &c.; and it manufactures textile-ware, paper and pulp, iron goods, boots and shoes. Three Rivers was founded by Champlain in 1634; a severe battle fought here on 16th June 1776 proved disastrous to the Americans. The city is the seat of a Roman Catholic bishop. Pop. 22,000. —THREE RIVERS, Michigan, on the St Joseph River, 128 miles by rail E. of Chicago, has valuable mineral springs; pop. 5200.

**Threshing**. See THRASHING.—For Thresher, see FOX-SHARK.

**Thrift**. See ANNUITY, DOMESTIC ECONOMY, FRIENDLY SOCIETIES, INSURANCE, SAVINGS BANKS.

**Thrift** (*Armeria*), a genus of plants of the family Plumbaginaceæ, having the flowers collected into a rounded head, a funnel-shaped, dry, and membranous calyx, five petals united at the base, and narrow, often grass-like, leaves. Two species are included in the British flora, one of them (*A. plantaginea*) only because it is found in Jersey. It is an Atlantic plant, common on the coasts of Spain and France, with some isolated stations elsewhere (Val d'Aosta; Evolène, Valais; near Mainz). The other (*A. maritima*) grows in turf-like tufts, with linear leaves, scapes a few inches high, and beautiful rose-coloured, purple, or white flowers, an ornament of the sea-coasts of Britain and of Europe generally, and also frequently found (in a broader-leaved variety, called *planifolia*) on high mountains. Under the names of thrift and sea-pink it is often planted in gardens as an edging, for which it is very suitable, being of a fresh green all the year, and exhibiting its fine flowers in profusion in July and August; but it requires to be renewed every two or three years, the smallest rootless sets growing, however, with great readiness in the moist weather of spring. The flowers are an active diuretic.

**Thring**, EDWARD, a great educationist, was born at Alford Rectory in Somersetshire, Common Thrift (*Armeria vulgaris*). November 29, 1821, and had his education at Eton and King's College, Cambridge, of which he was elected fellow. He took orders, and served in curacies at Gloucester and elsewhere, but in September 1853 found the work of his life in the appointment to be head-master of Uppingham school. He found it insignificant, but made it one of the healthiest and best equipped among the public schools of England, giving himself for thirty-four years with restless energy to the task of educating his pupils in the highest sense of the word, and imprinting upon their characters a high ideal of duty as the great end of life. The manly fibre of his own nature, his earnestness and honesty, his firm discipline, and his stern denunciation of cowardice and wrong gave a distinctive character to the school. He died 22d October 1887. His works include volumes of school songs and lyrics, an English grammar, a Latin gradual and a construing book; *Thoughts on Life Science*, anonymously (1869), *The Theory and Practice of Teaching* (1883); *Uppingham Sermons* (2 vols. 1886), *Addresses* (1887), *Poems and Translations* (1887), and *Uppingham School Songs and Borth Lyrics* (1887)—Borth was the Cardiganshire village to which the school removed on the outbreak of scarlet fever in 1874.

See J. H. Skrine, *A Memory of Edward Thring* (1889); H. D. Rawnsley, *Edward Thring* (1889); the Biography by Principal Parkin appeared in 1898.

**Thrips**. See CORN INSECTS.

**Throat, AFFECTIONS OF THE.** The term throat is applied somewhat loosely to the back of the mouth and front of the neck; its diseases may therefore be taken to include those of the Larynx (q.v.) and upper part of the trachea, of the upper part of the oesophagus, and of the thyroid gland (see GOITRE). Sore throat, however, as commonly used, refers to inflamed and painful conditions of the tonsils and neighbouring parts (see under PALATE), which are numerous. One of the most important (Quinsy, q.v.) has already been discussed; and those attending diphtheria, measles, scarlet fever, syphilis, and other infectious and contagious diseases are sufficiently referred to under their several headings. Sore throat may also be a result of the gouty or rheumatic diathesis, or of the action of certain drugs (especially belladonna and iodide of potassium). See also THRUSH, MUMPS, &c. A few other conditions remain to be considered here.

The disease known as *granular pharyngitis*, or popularly as *Clergymen's Sore Throat*, is brought on by such causes as obstruction in the nose causing breathing through the mouth, habitual dietetic indiscretion with dyspepsia, too much smoking, and particularly by over-use of the voice for speaking in dusty or badly ventilated places, or when the method of voice-production is faulty. Women are more liable to this affection than men, and persons who are neurotic, anæmic, or debilitated are more troubled than the robust. The condition shows itself by huskiness of the voice with a tendency to coughing, clearing of the throat, and expectoration when the voice is used, and a sense of irritation in the throat. When the back of the throat is examined, the mucous membrane shows dilated veins, and is swollen and covered with small rounded or oval prominences of reddish colour. These are of a structure similar to the adenoids found in children. The treatment consists in rest for a time from public speaking, cultivation of a proper mode of voice-production, attention to the condition of the nose, the use of tonics, change of climate, &c. Locally to the throat, in the early stages, various astringent applications, and later cauterisation of the granules by chromic acid, nitrate of silver, or the galvano-cantery effect a cure.

Simple or *catarrhal sore throat* is usually a slight affection, most common in young persons, and often resulting from cold. The throat is reddened, but little swollen. A day or two in the house is usually sufficient to effect its disappearance; the sucking of astringent lozenges (e.g. tannin or red gum) or chlorate of potash pellets, is also useful. In its chronic form it is more troublesome, but will generally yield to continued use of astringent lozenges, or the application, twice a day with a brush, of glycerine of tannic acid, or a paint composed of iodine 5 grains, iodide of potassium 10 grains, oil of peppermint 2 minims, and glycerine 1 ounce.

*Ulcerated sore throat* is generally the result of unhealthy conditions acting on persons in a weakly state. It is particularly common in nurses and students occupied in hospital work, and is generally speedily recovered from when the patient is placed in healthy surroundings and put upon tonic treatment. The white spots seen on the tonsils in *lacunar tonsillitis*, a more common and slighter affection, are often mistaken for ulcers, but they really consist of excessive and thickened secretion from the recesses of the tonsil. These should be squeezed out, and one of the astringent paints mentioned above should be applied.

*Cutting the throat* is comparatively seldom the result of accident; it is more often due to a murderous attack, and most frequently to an attempt at suicide. The first duty of the surgeon in treating a case of cut throat is to arrest the

flow of blood. Ligatures should be applied to wounded arteries, and steady pressure with the finger (beneath which a small pad of lint is placed) to wounded veins, such as the external jugular. When the bleeding has completely ceased, means may be taken for bringing together the edges of the wound. If the main arteries or veins are cut the wound is rapidly fatal. When the air-passages are wounded there is great risk of the occurrence of bronchitis or pneumonia, and the patient must be kept in a warm room, and care taken to prevent either food or discharges from the wound from passing down the windpipe.

**Throgmorton**, an English family which produced several important members in the 15th and 16th centuries. SIR JOHN (d. 1445) was clerk of the treasury, and later chamberlain of the exchequer and under-treasurer of England. His descendant, SIR NICHOLAS (1515-71), father-in-law of Sir Walter Raleigh, distinguished himself at the battle of Pinkie; was tried (1554) for suspected complicity in Wyatt's rebellion but acquitted; was Queen Elizabeth's ambassador in France, where he was imprisoned as having sided with the Huguenots; and was repeatedly ambassador to Scotland in the troublous period 1561-67. In 1569 he was sent to the Tower for a time as being concerned in the scheme for marrying Mary, Queen of Scots, to the Duke of Norfolk. His brother SIR JOHN (d. 1580) was also involved in the proceedings following Wyatt's rebellion, but was finally released and made chief justice of Chester. His son FRANCIS, the conspirator, was born in 1554, and plotted on the Continent and in London to restore the pope's authority, and to aid Mary, Queen of Scots, in her claim to the English throne. He was arrested in 1583 while writing to Mary, and, after much trial and torture, was executed the following year at Tyburn.

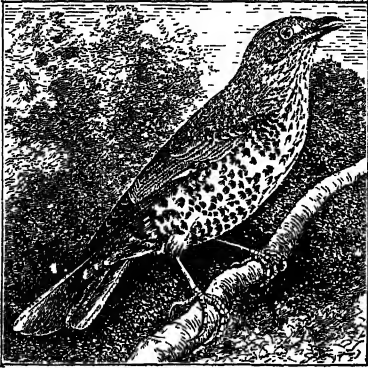

**Thrombosis** (Gr. *thrombos*, 'a clot of blood'), an affection of the blood-vessels (either veins or arteries), which essentially consists in a coagulation of blood (forming a true clot) at a certain fixed spot. Under certain morbid conditions the blood has a tendency to coagulate in its vessels during life on the least provocation. Thus, slight pressure on the side of a vein will sometimes induce this coagulation, while in other cases it is due to inflammation of the tissues which surround a vein, or laceration of a vein (as when the placenta is expelled from the uterus). A clot thus formed in a vessel may increase and extend from one to another, till it reaches and finally fills a large vessel.

**Throndhjem.** See TRONDHEIM.

**Thrush** (*Turdus*), a genus of Passerine birds of the family Turdidae. The bill is of moderate size and slightly convex; the gape is furnished with hairs; the nostrils lie at the base of the bill, partly covered by a membrane; the first wing-feather is very short; and the outer and middle toes are connected at the base. The genus includes numerous species widely distributed throughout temperate and even cold regions. The largest known British species is the Missel Thrush (*T. viscivorus*), sometimes called the 'storm-cock' from its habit of singing before or during wind or rain. It breeds freely throughout the British Islands, but migrates from the colder regions on the approach of winter. It breeds early in the year; its nest is usually in the fork of a tree, and neatly lined with grasses and moss. The adult male measures about 11 inches; the prevailing colour of the upper parts is grayish brown, under parts brownish white, with dark spots.

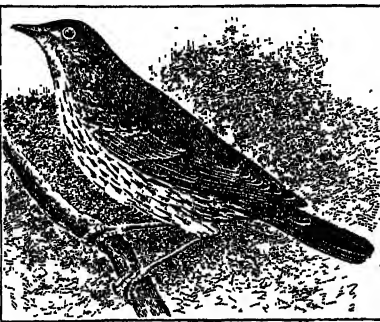

The Song Thrush or Mavis (*T. musicus*) also occurs in almost all parts of Britain. It resembles the missel thrush in general appearance, but is smaller in size, of a more olive-brown

colour, and possesses finer powers of song. The nest of the song thrush is usually composed of roots and grasses, lined with a thin coating of mud, decayed wood, or dung. The eggs are of a greenish-blue colour, with black or brown markings, and in the warmer parts of the country two broods are reared in a season. The food of the

Missel Thrush (*Turdus viscivorus*).

song thrush consists of berries, insects, worms, and small molluscs, the shells of the last being broken by repeated knocking against a stone. Other species either resident in Britain or visiting it for a part of the year are the Blackbird (*T.*

Song Thrush (*Turdus musicus*).

*merula*), the Fieldfare (*T. pilaris*), the Redwing (*T. iliacus*), and the Ring-ouzel (*T. torquatus*), all of which are described in separate articles. The genus *Turdus* is represented in North America by the Wood Thrush (*T. mustelinus*) and several other species. The flesh of all the thrushes is esteemed a delicacy, and they are snared in enormous numbers while they are assembling for their winter migration.

**Thrush**, known also as *Infantile Sore Mouth*, is commonly a disease of early infancy, although it may occur at any age. Its characteristic symptom is the presence of small roundish white specks or patches (Aphthæ, q.v.) on the lining membrane of the cavity of the mouth and throat, on the surface of the tongue, the angles of the lips, &c. In thrush crops of these little patches commonly succeed one another. They render the mouth hot and tender, in consequence of which the act of sucking is accompanied by difficulty and pain. In association with these local symptoms are indications of general constitutional disturbance, such as feverishness, drowsiness, sickness, flatulence, colicky pains, diarrhoea, &c. The complaint sometimes seems to be the result of improper diet, or of imperfect attention to cleanliness of the bottle, &c., if the child is being brought up by hand, or of

unwholesome milk; of bad ventilation, &c.; in any case the direct cause of the patches is the growth of a fungus, the *Oidium albicans*. The disorder usually lasts eight or ten days, and is only attended with danger when the local affection runs into a low form of gangrenous ulceration. As a local application to the patches, glycerine or honey of borax may be applied with a camel-hair pencil; or a pinch of a mixture of powdered borax and loaf-sugar (1 to 8 or 10) may be placed occasionally on the tongue, and the infant allowed to spread it over the mouth. An occasional dose of gray powder may be required; and in some cases a little brandy, or small doses of quinine and iron.

**Thrush**, or **FRUSH**, in the horse, consists in inflammation of the sensitive surfaces within the frog, giving rise to a fetid discharge from the cleft, and sometimes causing lameness. Want of cleanliness is the chief cause. Daily, when the horse returns to his stable, the foot should be washed out with soap and water, carefully dried, and the fissures filled with mineral tar. If amendment does not speedily ensue, a dressing of calomel should be substituted for the tar several times a week. Ragged or loose portions of the frog should be removed by the knife or scissors.

**Thuanus**. See THOU (JACQUES-AUGUSTE DE).

**Thucydides**, the great historian of the Peloponnesian war, born in the deme Halimna most probably about 460 B.C., was the son of Olorus, and was perhaps related to Miltiades and Cimon. It is probable that his literary model was Antiphon, and that he was influenced in his views on philosophy by Anaxagoras. Athenian as he was, of good family, and resident in the most cultivated community in Greece, he must have known Sophocles, Euripides, Aristophanes, Plidias, Protagoras, Gorgias, and possibly Herodotus and Æschylus. He was further possessed, either by inheritance or by acquisition through marriage, of gold-mines in that part of Thrace lying opposite the island of Thasos. We know from himself that he was one of the sufferers from the terrible plague of Athens, and also one of the few who recovered. He held military command, and he had under him an Athenian squadron of seven ships at Thasos, 424 B.C., when he failed to relieve Amphipolis, which fell into the hands of Brasidas. Condemned to death as a traitor, he took refuge in exile and retired to his Thracian estates. His exile enabled him, as he tells us, to associate with the Peloponnesians quite as much as with the Athenians; and he probably spent some time also in Sicily, as we may infer from his minute descriptions of Syracuse and its neighbourhood. According to his own account, he lived in exile twenty years, and probably returned to Athens after the destruction of its walls, in 404. He is said to have spent his last years in Thrace, and to have died there—some say by violence—his remains being brought to Athens. The date is unknown: conjecture places it at 399 B.C.; at all events he did not live long enough to revise book viii. or to bring his history down to the end of the war.

If Herodotus was 'the father of history,' Thucydides was the first of critical historians, and no better account of his methods can be given than is contained in his own words: 'Of the events of the war I have not ventured to speak from any chance information, nor according to any notion of my own; I have described nothing but what I either saw myself or learned from others, of whom I made the most careful and particular inquiry. The task was a laborious one, because eye-witnesses of the same occurrences gave different accounts of them, as they remembered or were interested in the actions of one side or the other' (i. 22). There is hardly a

literary production of which posterity has entertained a more uniformly favourable estimate than the history of Thucydides. This high distinction he owes to his undeviating fidelity and impartiality as a narrator; to the masterly concentration of his work, in which he is content to give in a few simple yet vivid expressions the facts which it must have often taken him weeks or even months to collect, sift, and decide upon; to the sagacity of his political and moral observations, in which he shows the keenest insight into the springs of human action and the mental nature of man; and to the unrivalled descriptive power exemplified in his account of the plague of Athens, and of the Athenian expedition to Sicily. Often, indeed, does the modern student of Greek history share the wish of Grote, that the great writer had been a little more communicative on collateral topics, and that some of his sentences had been expanded into paragraphs, and some of his paragraphs into chapters. But this want cannot have been felt by the contemporaries of Thucydides, while the fate of other ancient historians warns us that had his work, like theirs, been looser in texture, or less severely perfect, it would not have survived, as it has done, the wearing influence of time, or remained the *Itēna es aei*—the 'possession for ever'—it has proved to the world.

It was reserved for the nineteenth century to impeach the credibility, depreciate the matter, and to condemn the style of Thucydides. As these indictments, however, usually conclude with the statement that Thucydides remains nevertheless the greatest of historians, they show that Thucydides' fame is proof against the solvents of modern criticism, and they help us to a more complete understanding of the qualities which have given to Thucydides' work such a wonderful hold over the intellects and imaginations of all his readers and all his critics. As an Athenian comedian remarks, we do not believe a man because he takes an oath—we trust the oath because we believe in the man. And so we believe in Thucydides not because we have external tests to apply (for we have not enough), but because the universal experience of all who read him is a feeling of conviction that his intention was to speak the truth, as far as he could ascertain it. This conviction is ultimately due to the fact that in the man's work we are brought directly into touch with the man, and we judge his character as we judge that of any acquaintance whom we know in the flesh. No man can devote himself for twenty-seven years to composing a work without putting a good deal of himself into the work, or without writing his character down in it—unconsciously but none the less legibly. What then are the qualities of character which impress the reader of Thucydides? First, his constant endeavour to ascertain facts, and to put down as facts nothing but facts. For one thing, he did not choose a period of ancient history, which, being ancient, must be based on vague hearsay or dim tradition. He preferred contemporary history and events which he himself witnessed in part, while he could obtain the evidence of eye-witnesses for the remainder. Nor did he wait until the conclusion of the war before setting about his task; from the very beginning he began collecting his facts. And, except in one or two places which are easily discernible, his love of facts has bred in him a remarkable impartiality. Next, his history is not designed to prove or illustrate any theory. He himself, in the passage quoted above, disclaims all attempt to adapt facts 'to any notion of his own'; and it is evident that beginning to write, as he began, at the commencement of the war, when its course and its issue were yet in the future, he could not have designed to bring its history into

conformity with any pre-conceived or *a priori* theory. Herodotus, writing the history of the past, was in a position to trace the finger of destiny in what had happened, and to explain history by means of final causes. But Thucydides, when he undertook to record the present, thereby deliberately elected to confine himself to efficient causes. This preference for efficient causes and for 'scientific' history, in the best sense of the term, is intimately connected with the 'positive' nature of his history—that is to say, with his perpetual endeavour to record facts and to distinguish them from inferences drawn from facts. A clear consciousness of this difference is involved in one of the most characteristic features of his history—that is, the marked difference between his narrative and the speeches which he introduced into it. The former contains facts and facts only, facts stated with precision and objectivity—e.g. his description of the symptoms of fever in sufferers from the great plague. The speeches, on the other hand, are not what the speakers actually said—but of this Thucydides warns the reader at the beginning, showing clearly at once the distinction he drew between facts and inference, and his anxiety that the reader should realise the distinction.

As for the subject of Thucydides' history, if the Peloponnesian war was not a matter of importance in universal history, it was at least not Thucydides' fault that he was not contemporary with some more important war. But we may beg leave to doubt whether the Peloponnesian war was of inferior interest for the fortunes of mankind. Had it not been for the exhaustion it induced, Greece would not have succumbed to the Macedonian, and consequently Alexander's conquests would never have spread Greek culture over the ancient world. But, apart from this, Thucydides' history is the history of the effects of empire on an imperial state; and, as such, will always be of enthralling interest to citizens of sovereign communities. Finally, Thucydides' style, criticised by Dionysius and condemned by Mure, is in the speeches difficult beyond all possibility of dispute. To throw the blame of this obscurity on the unformed condition of Attic Greek at the time when Thucydides wrote is warrantable indeed, but is no adequate defence. To point, on the other hand, to the tract *On the Athenian Polity* as proof that Attic prose could be translucent in Thucydides' time is beside the point, for Attic, as is well known, could only be written well by those who lived continuously in Athens, and Thucydides was exiled for many a year. But, in truth, the question whether it is Thucydides or the literary age in which he lived that is to be blamed for his obscurity is a wholly irrelevant question. Obscurity, whatever be its cause, is a crime in a writer. But it is a crime which carries its own punishment, for it diminishes the number of an author's readers. The exact amount of criminality is not to be determined on any abstract principles or by the exercise of any mysterious 'taste': it admits of one simple practical test—viz. has the obscurity of his style (in so far as it exists), as a matter of fact, prevented him from attaining fame? In the case of Thucydides it has had no such effect; and that Thucydides has, in spite of his difficulty, always been read is in itself sufficient testimony that there is no other historian to rank with him.

In *Thucydides Mythistoricus* (1907), F. M. Cornford argues that Thucydides reconstructed history on Æschylean principles. See also Wilamowitz-Moellendorf, 'Die Thukydideslegende,' *Hermes* xii. 1878; G. B. Grundy's *Thucydides and the History of his Age* (1911); W. R. M. Lamb, *Clio Enthroned* (1914); J. A. K. Thomson, *The Greek Tradition* (1915); J. B. Bury, *Ancient Greek Historians* (1919); G. F. Abbott, *Thucydides*,

*A Study in Historical Reality* (1926); R. W. Macan in vol. v. of the *Cambr. Anc. Hist.* (1927). The best editions are: in Latin that of Poppo (11 vols. 1821-40), in German that of Classen (8 vols. 1870-78), in English that of H. S. Jones (1900-1)—with Arnold's (1830-35) for historical illustration. The best English translation is by Professor Jowett (with commentary, 2 vols. 1881; 2d ed. 1900); that by the Rev. Thomas Dale is also good (2 vols. 1848), as is that of the speeches by H. M. Wilkins (2d ed. 1873). Foster Smith gives text and translation ('Loeb Library,' 4 vols. 1919-23).

**Thugs** (ultimately from the Sanskrit *sthaga*, 'concealer,' 'deceiver'), the name for a religious fraternity in India, which, in honour of the goddess Kālī, the wife of Siva, who is held to take special delight in human sacrifice, and to whom, despite penal laws, victims have even in recent years been offered, was addicted to the committal of murders, and lived upon the plunder obtained from its victims. Banding together in gangs, they assumed the appearance of ordinary traders, and, insinuating themselves into the confidence of unsuspecting fellow-travellers, killed them by strangling (whence they were often called *phansigars*, 'stranglers'), or by poisoning with datura (see THORN-APPLE). They were bound together by bloody oaths, and carried on systematic assassination on a large scale. They considered their murders pious rites, and their profession highly honourable. The confraternity appears to have come into existence before 1000 A.D.; it flourished under the early Mohammedan rulers of India; and, though the English government frequently apprehended Thugs, it was reserved for Lord William Bentinck, assisted by Captain Sleeman, to adopt such vigorous measures as practically extirpated thuggee (*thagī*). In 1826-35 no fewer than 1562 Thugs were apprehended—mainly by help of accomplices turning informers—of whom 382 were hanged, and most of the rest transported or imprisoned for life. Thuggee by poisoning was still carried on long after strangling was a thing of the past.

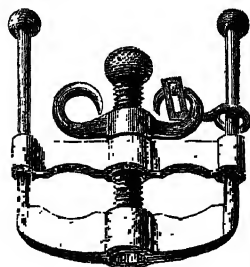

See Col. Meadows-Taylor's graphic tale, *Confessions of a Thug* (1839; new ed. 1879); Capt. Sleeman's *Report* (1840); Hutton's *Thugs and Dacoits* (1857); for thuggee in 1867, Hervey's *Some Records of Crime* (1892); and for their jargon, Sleeman's *Ramaseecana* (1836) and Yule and Burnell's *Hobson-Jobson* (1903).

**Thuja.** See ARBOR VITÆ.

**Thule**, the name generally given by the ancients to the most northerly part of Europe known to them, of which their want of knowledge was eked out by the imagination. According to Pliny it was an island in the northern ocean, discovered by the navigator Pytheas of Massilia, who reached it after six days' sail from the Orcades. Possibly Pytheas followed closely the eastern coast of Great Britain, and only heard reports of the groups of islands farther north—the Orkneys and Shetlands, perhaps Iceland. Nansen (*In Northern Mists*, 1911) insists that the Thule of Pytheas was Norway.

**Thumb, TOM.** See DWARF, PERRAULT.

**Thumbscrew**, or THUMBKINS, an instrument of torture for compressing the thumb, largely made use of by the Inquisition in Spain, and also occasionally examination by torture used in England when was practised there. It was much in use during the brutal persecutions of the Covenanters in

Thumbscrew.

(In Ant. Mus., Edinburgh.)

Scotland, and the famous Carstares (q.v.) was tortured thus for an hour and a half at Holyrood to obtain the secrets of the Argyll party.

**Thun**, a picturesque and ancient town of Switzerland, 19 miles SSE. of Bern by rail. It is an important military post. It stands on the Aar, hardly a mile from the Lake of Thun (12 miles long, 2 broad; greatest depth, 1844 feet), out of which the river rushes past the town in a stream of crystal clearness. A 12th-century castle and a venerable church are the chief buildings. Pop. 6000.

**Thunder.** See LIGHTNING, STORMS. Stone axes (see STONE AGE) are sometimes called thunderbolts, from a notion that they are meteoric stones; and for a like reason Belemnites (q.v.) are called thunder stones. For thunder gods, see THOR, JUPITER, ZEUS. For the Thundering Legion, see AURELIUS.

**Thurgau** (Fr. *Thurgovie*), a frontier canton in the north-east of Switzerland. Area, 381 sq. m.; pop. (1920) 135,933, of whom two-thirds are Protestants. The surface, unlike that of the other cantons of the country, is undulating or hilly, but nowhere mountainous, the chief height being the Hörnli in the extreme south, 3727 feet. The principal river is the Thur, which, flowing WNW. through a broad fertile valley, joins the Rhine in the canton of Zurich. Agriculture, especially vine-growing, is the chief occupation, and there is some cotton-spinning. Capital, Frauenfeld (pop. 8711).

**Thurifer** (Lat. *thus*, 'incense,' and *fero*, 'I carry'), the attendant in the Roman Catholic Church, at solemn mass, vespers, &c., whose duty it is to carry the *thurible*, or incense-vessel, and either to minister incense himself or to present the thurible to the officiating priest. The office is one of those which belong to the so-called 'minor order' of *Acolyte*.

**Thurii**, a city of Magna Græcia, on the Gulf of Tarentum, near the site of Sybaris (q.v.). It was founded in 443 B.C. by colonists sent from Greece by Pericles (among them Herodotus and the orator Lysias), who came to the aid of the exiles from Sybaris, but ultimately expelled them. The city attained to considerable power, and did not acknowledge Athens as its founder owing to the mixed character of its population. It was plundered by Hannibal (204 B.C.); and a Roman colony founded in 194 B.C., probably on the same site, has only insignificant ruins.

**Thuringia** (Ger. *Thüringen*), one of the republics of Germany, comprising the former Saxon Duchies (except Coburg), the two principalities of Reuss, and the two of Schwarzburg. Before 1920 the name Thuringia was vaguely used to denote generally that part of the ancient Saxon area bounded by the Werra, the Saale, the Harz Mountains, and the Thuringian Forest. The republic of Thuringia is scarcely so extensive, its northern border lying considerably south of the Harz Mountains; an 'exclave,' however, lies near the Harz. Except in the east the land is hilly, the chief features being the Thuringian Forest and the valleys of the Werra and of the Elbe tributaries—the Saale, Unstrut, Ilm, and Elster. Thuringia got its name from the Thuringian tribe of Germans, who were found inhabiting it in the 6th century. A duchy of Thuringia was founded in 634, but was abolished by Charles Martel; in 804 Charlemagne made it a margraviate, but in 908 the country was subjected to Saxony for a time. Later it appears governed by a succession of landgraves, and at the division of the lands of the Wettin family in 1485 Thuringia fell to the Ernestine (or elder) branch (see SAXON DUCHIES; SAXONY). After the German revolution of 1918 the several states became

republics. The two divisions of Reuss united in 1919, and soon all the other states were considering a policy of unification. Coburg, however, joined in with Bavaria. The union was recognised by the Reich, 20th April 1920, and the first Diet met on 11th March 1921, and adopted a constitution. There is a single chamber elected by proportional representation; a check on its action is provided by the devices of popular initiative and referendum. The state council has a president, but there is no provision for a president of the republic.

The country is largely agricultural, about half its area being arable; forests cover one-third. Wheat, rye, oats, and potatoes are the chief crops, and fruit and vegetables are grown. Cattle, sheep, and horses are bred, and there is a good deal of mining and industrial activity, the salt mines and manufactures of potassium and glass being important. Bricks, porcelain, textiles, chemicals, toys, &c. are also manufactured.—The area of the republic is 4541 sq. m., and its population (1925) 1,628,398. The capital is Weimar (41,000); other towns of importance are Gera (75,000), Jena (54,000), Gotha (48,500), Eisenach (41,000), Altenburg (41,000).

**Thuringian Forest** (*Thüringerwald*), a chain of wooded hills running NW. and SE. through Thuringia, and occupying a great part of the western portion of the state. It belongs to the Sudetic system, and has a length of some 70 miles, its breadth varying from 6 to 22. The scenery, especially in the NW., where a few of the summits attain a height of 3000 feet, is very picturesque.

**Thurles**, a market town in county Tipperary, Ireland, situated on the river Suir, 87 miles SW. of Dublin by rail. Four miles distant is the beautiful 14th-century ruin of Holy Cross Abbey. Thurles has a (classical) Roman Catholic cathedral, the seat of the archbishopric of Cashel. Pop. 4800.

**ThurLOW, EDWARD, BARON**, was born a clergyman's son in 1731, at Bracon-Ash in Norfolk. He was sent to Canterbury grammar-school, whence he passed to Caius College, Cambridge. Here he was as insolent and insubordinate as at school, and was sent down in 1751 without a degree. He at once entered at the Inner Temple, and was called to the bar in 1754. He was a fellow-pupil in a solicitor's office with the poet Cowper, and still affected idleness, although in reality he worked hard to make himself a good lawyer. His lofty stature, strongly marked features, dark eyes, bushy eyebrows, and look of self-possession led every one with whom he came in contact to attribute to him qualifications he really did not possess—'no man,' said Fox, 'ever was so wise as ThurLOW looked.' An accidental meeting at a coffee-house with the Scottish solicitors in the great Douglas case led to his employment in it as junior counsel, and to his acquaintance with the members of the Douglas family. One of them, the Duchess of Queensberry, by her influence with Lord Bute obtained for him in 1761 the rank of King's Counsel. Soon after this he acquired a still higher reputation by his speech in the Douglas Peerage case—the greatest effort of his life. In 1768 he was returned for Tamworth, and became a zealous supporter of Lord North; in March 1770 he was made Solicitor-general, and the year after Attorney-general. He gained the special favour of George III. by the violent zeal he displayed in supporting his American policy. In 1778 he became Lord Chancellor and Baron ThurLOW, and such was his influence with the king that he was allowed contrary to all precedent to retain the office under the Rockingham administration. He caused great embarrassment by opposing all the measures brought in by that government. Under the coalition ministry of Fox and North he was

compelled to retire, but continued a vigorous opposition, and was restored as Chancellor on Pitt's accession to power. For a time he supported the government; but, relying again on the support of the king, he once more began, first secretly, then openly, to undermine the power of his colleagues. Pitt then intimated that he or ThurLOW must retire, and the king, without any hesitation, consented to his removal (1792). ThurLOW at once sank into obscurity. He amused himself in reading the Latin and Greek classics with his nephews, and spent much of his time in visiting and receiving visits. He died at Brighton, September 12, 1806. ThurLOW was vulgar and arrogant, his profanity and immoralities notorious. Lord Campbell says he can find nothing recorded of him to justify the great reputation for ability he had among his contemporaries, and ascribes it chiefly to his assuming manner; but it should be remembered that he had no Boswell to record his talk, and that it was this that was most admired. It was of no ordinary man that Johnson said, 'I would prepare myself for no man in England but Lord ThurLOW. When I am to meet him, I should wish to know a day before.'

**Thurn and Taxis, PRINCES OF**, a princely house with high rank, hereditary dignities, and possessions in Central Europe, the two chief seats of the family being Ratibon and Lauzin in Bohemia. Descended from the Della Torre of Milan (whence the first part of their name), with a castle of Tasso or De Tassis (whence the second), members of this house have been distinguished in connection with posts. One established posts in Tirol in 1460; another, ennobled in 1512, established the first post between Vienna and Brussels in 1516. His descendant became in 1595 grand-master of the posts of the Holy Roman empire, and secured the right of carrying on the posts of the empire which extended from Hamburg to Rome, and from Paris to Vienna, a right which became a hereditary privilege. In 1681 the principality of Thurn and Taxis in the Netherlands was conferred on the head of the house; and in 1698 the princely rank and title were made hereditary, and passed to all members of the house. The postal privileges were gradually limited by the governments of the various countries; but it was not till 1867 that Prussia secured by treaty with the family the abolition of the monopoly in the territories annexed in 1866.

**Thurot, FRANÇOIS**, was born at Nuits in Côte d'Or, son of a petty innkeeper, 22d July 1726. He grew up a reckless and violent lad, and served on a privateer, but was captured and kept a year in Dover prison. He managed to seize a small boat, and crossed the Channel with a pair of sculls and his shirt as a sail. The Maréchal de Belle-Isle hearing of the exploit enabled him to study navigation, and Thurot, again joining a privateer, rose so rapidly that by 1748 he was able to fit out a merchant-ship. He next spent a few years in England, mostly in London, betwixt music, mathematics, and dissipation, varied by smuggling and perhaps piracy; and in 1753 his ship was seized by the English. The outbreak of war recalled him to France. He was given the command of a squadron of two frigates and two sloops, with which he scoured the Channel, cruised along the east coast of England and Scotland, frightening terribly the townspeople of Banff (5th October 1757), and fought a brisk action with two English frigates at the mouth of the Forth. In October 1759 he again weighed from Dunkirk with a squadron consisting of four frigates, with 1200 soldiers under command of Flobert, and made his way to Lough Foyle, intending a descent on

Londonderry. High gales made it impossible to enter, whereupon he crossed to Islay for supplies, and then sailed for Belfast Lough, intending to make a dash on Belfast. Flobert ruined the plan by insisting on attacking and taking Carrickfergus first (21st February 1760), but refused to move on Belfast. The delay had given time for three English frigates of Hawke's fleet to come up; and Thurot fought till he was struck down. See Langton's *Studies in Naval History* (1887).

**Thursday Island**, one of the smallest of the group of the Torres Straits islands, north of Cape York, and belonging to Queensland. It has an excellent harbour, and is a telegraph station with important wireless installation, a port of call for all mail steamers traversing the Straits, and the centre of pearl and trepang fisheries.

**Thurso**, a police burgh and seaport of Caithness, at the mouth of the Thurso River, by rail (1874) 21 miles NW. of Wick and 154 NNE. of Inverness, with six churches and a town-hall (1870). The harbour at the mouth of the river had got silted up; but extensive improvements were carried out in 1891-92, when also a good pier at Scrabster was extended, on the west side of the bay, where steamers regularly call. Scrabster was the chief port of departure to Scapa Flow, in the Orkney archipelago, when the British fleet was stationed there during the Great War; and from there Lord Kitchener embarked to join H.M.S. *Hampshire* on her ill-fated voyage. The rock scenery around the town is very fine. Paving-stones are prepared and exported, and live-stock and grain shipped. Sir John Sinclair was born here in 1754, and the self-taught geologist, Robert Dick (1811-66), was a baker here from 1830. Pop. 3000.

**Thyatira**. See AK-HISSAR.

**Thylacine** (*Thylacinus*), the largest of the extant predaceous marsupials, represented by one species (*T. cynocephalus*), now restricted to Tasmania, and in process of extermination at the hands of the sheep-farmers, whose folds it is wont to ravage. It is somewhat smaller than a wolf, has a dog-like muzzle, a long tapering tail, and is grayish brown in colour, with black cross bands on the hind part of the back and loins. It is very active and fierce, and is popularly called a 'tiger,' a 'wolf,' or a 'hyæna.'

**Thyme** (*Thymus*), a genus of humble, half-shrubby plants, of the family Labiatae, having a two-lipped calyx and four diverging stamens. Garden Thyme (*T. vulgaris*) is 6 to 10 inches high, with narrow, almost linear leaves, and whitish or reddish flowers, which grow in separate whorls, six in a whorl. It is a native of Mediterranean lands, is very commonly cultivated in gardens on account of its fragrance, and was introduced into Britain about 1548, or very probably at an earlier date. Wild Thyme (*T. Serpyllum*) has a procumbent stem with many branches, forming tufts, low and dense, a few inches to a foot wide, oval leaves and purplish flowers, arranged in whorls, which are united in a head. It is abundant on hills and mountains in Britain and in all parts of Europe and the north of Asia. It is less fragrant than garden thyme, but both species contain an aromatic essential oil. The flowering branches (*Herba Thymi* and *Herba Serpylli*) are used in medicine as a powerful stimulant, and those of garden thyme are also used in cookery for flavouring. There are several other British species. The Lemon Thyme, or Lemon-scented Thyme, of our gardens, is regarded as a variety of *T. Serpyllum*. It is generally of still lower growth than the common garden thyme. No species of thyme is indigenous in America. Thymol, an antiseptic phenol, can be obtained from oil of thyme by dis-

tillation. Commercially it is got from Ajowan seeds (*Carum copticum*).

**Thymeleaceæ**, a family of plants, of which the Mezereon and Spurge Laurel (see DAPHNE) are familiar examples. This family consists chiefly of shrubs, with a few herbaceous plants, natives mostly of the warmer temperate countries. Poisonous properties prevail. The bark is in general very caustic.

**Thymol**. See THYME.

**Thymus Gland**, a gland which begins to form at an early period of embryonic life, and, commencing as an epithelial ingrowth from the throat, extends from the neck right into the chest, where it is placed anteriorly in the mediastinum. It continues to grow for two years after birth, but before adult life is reached it shrivels to a small mass. When examined microscopically it is seen to consist of a tissue very similar to that of a lymphatic gland, and in this tissue are (Hassall's corpuscles) nests of concentrically arranged epithelial cells, probably the remnants of that epithelium of which the gland, at an earlier period, was almost entirely composed. The gland when fully developed is what may be called a blood-gland, for it is connected with the rest of the system by blood-vessels and nerves alone, unlike the liver or kidneys, which are provided with ducts through which their secretion is carried away. Regarding the function of this gland almost nothing is known. It probably is concerned, in some way, in altering the chemical or cellular structure of the blood. Numerous extractives, such as leucin and tyrosin, are found normally in it, and from it a substance can be extracted which acts as a powerful blood coagulant. It is possible, too, that in its substance the blood-cells may to some extent be produced. Its early development and rapid disappearance suggest that its chief activity is called into play during that period of life when growth and tissue formation are most active.

**Thyroid Gland**, a gland which arises in the early human embryo as an ingrowth from the lower part of the pharynx. This extends down to the lower part of the neck, and its original connection with the pharynx is lost. In the adult it is found as a bilobed structure on either side of the windpipe, and joined in front of this tube by an isthmus of gland-tissue. It is ensheathed in connective tissue, which passes into its interior, supporting and separating from one another the delicate structures within. The gland is a ductless gland, but is richly supplied by blood-vessels, which ramify around the tiny glandular capsules of which it is composed. If a section of the gland be examined with the microscope, it is seen that there is a vast number of tiny spherical cavities lined by short cubical cells; and within and entirely filling these cavities, there is a structureless-looking and very insoluble jelly. In the walls of the little cavities the dense Anastomosis (q.v.) of blood-vessels is seen. We are very much in the dark as to the meaning of this structure, and the parts played by the epithelial cells and the jelly in the function of the gland. That the gland is important is proved by the injurious effects which follow its removal, and by the fact that in connection with several diseases the gland is swollen and altered in structure. In some animals, the dog for instance, the jelly within the capsules is often found to contain red blood-corpuscles. The activity of the gland is intimately connected with the presence of iodine in the body, and depends upon a substance known as thyroxin, which has only in recent years been isolated. That the gland has something to do with the blood seems very evident, but what part it exactly plays is not yet

certain. If the gland be excised, in some animals, curious mucous degenerations are found to follow the operation and a tendency to mucous deposits and tumours seems to be associated with disease of the gland. An atrophic state of the gland produces deposits of mucous material throughout the tissues of the body, with feelings of coldness, mental and physical lethargy, and nutritional changes in the skin; this condition is known as myxœdema. A similar set of changes, accompanied by great failure in bodily and mental development, is sometimes found in children, and is associated with defects in this gland: the condition known as cretinism. When the gland hypertrophies, or without great increase in its bulk when its secretory activity is greatly increased, various nervous symptoms, such as tremors in the muscles, excitability, and over-action of the heart, may ensue, the condition being known as exophthalmic goitre. In other cases of enlargement none of these symptoms are present, the condition being then known as simple or endemic goitre. See GOITRE; also CRETINISM, MYXŒDEMA.

**Thyrostraca**, another name for Cirripedes.

**Thysanoptera**, an order of insects with very narrow, fringed wings, and imperfectly suctional biting jaws. They are minute insects that feed on the juices of leaves and flowers, &c., well known by the name of Thrips. See INSECTS (*Classification*).

**Thysanura**, an order of wingless insects of small size. They undergo no metamorphosis. The abdomen usually bears peculiar structures, which seem to be abortive limbs, and the name Thysanura or bristle-tails refers to terminal appendages which are sometimes long and hairy. See SPRING-TAILS; and Sir John Lubbock (Lord Avebury), *Monograph of the Collembola and Thysanura* (Lond. 1873).

**Tian-shan** ('Celestial Mountains'), a great mountain-system, consisting of several ridges, mostly parallel, in central Asia, extends from the Pamir (q.v.) to the north of the Tarim depression in Turkestan, and occupies the frontier region between Russian territory on the north and the Chinese dominions to the south. In Khan Tengri it reaches 22,800 feet. See ASIA, p. 492.

**Tiara**, the triple crown of the pope, which is considered to be symbolical of his temporal, as the keys are of his spiritual authority. It is composed of a high cap of gold cloth, encircled by three coronets, with a mound and cross of gold on the top. The original papal crown consisted of the cap alone, the word *tiara* having long been synonymous with *mitra*. It is not certain when the first and second princely crowns were added; the first is said to have appeared by the beginning of the 12th century, the second to have been added by Boniface VIII. during his pontificate (1294-1303)—though some attribute it to the time of Innocent III. (1198-1216)—while the third is first mentioned in an inventory of 1315, and appears in the effigy of Benedict XII. (d. 1342). See a book by Müntz (Paris, 1898).

Tiara.

**Tibbu**, a people of the Sahara (q.v.).

**Tiber** (Ital. *Tevere*, Lat. *Tiberis*), the chief river of Central Italy, and the most famous in the peninsula, rises in a dell of the Tuscan Apennines (in the province of Arezzo), about 11 miles N. of the village of Pieve Santo Stefano. Its course until it reaches Perugia is south-south-east; thence, as far as Rome, it pursues, along an irregular zigzag line, a southern direction; but when it enters the plain of the Campagna it curves south-

south-west, and enters the Mediterranean by two branches, which enclose the Isola Sacra. Of these the northern was constructed by Claudius when he made his harbour on the right bank of the Tiber (see OSTIA); it was altered by Trajan, and is now called the Fossa Traiana, while the name Fiumicino has been transferred to the little town at its mouth. The northern branch alone is navigable; the Fiumara, the southern branch, is blocked by sandbanks. The entire course of the river is about 260 miles—only 145 direct from source to sea. The most celebrated towns on or near its banks are Perugia, Orvieto, Rome, and Ostia; and its chief affluents are the Nera (with the Velino) and the Aniene (*Anio*) or Teverone from the left, and the Paglia with the Chiana from the right. In its upper course it is rapid and turbid, and of difficult navigation. It is navigable for boats of fifty tons to the confluence of the Nera, 100 miles from its mouth, and small steamers can ascend to within 7 miles of that point. The Tiber is supplied mainly by turbid mountain-torrents, whence its liability to sudden overflowings of its banks; even the oldest Roman myth, that of Romulus, being inseparably associated with an inundation. Its waters, too, are still discoloured with yellow mud, as when Virgil described it—*Vorticibus rapidis et multa flavus arena*—and it brings down so much solid matter that it is rapidly advancing the coastline at and on each side of its mouths—a matter of 13 feet per annum at the northern branch. At the southern mouth there were salt-marshes from early Roman days until 1875 (those on the right bank were probably still older), but the whole area has now been drained. See ROME; and W. Davies, *The Pilgrimage of the Tiber* (2d ed. 1875).

**Tiberias**. See GALILEE.

**Tiberius**, the second emperor of Rome (14-37 A.D.), whose real character remains to this day among the enigmas of history. Tiberius Claudius Nero was the son of T. Claudius Nero and of Livia, and was born 16th November 42 B.C., four years before her complaisant husband yielded Livia to the triumvir Octavianus. He was nine when his father's death transferred him to the tutelage of his step-father, and eleven when that step-father became the undisputed master of the Roman empire. Being now a member of the imperial household, he received a careful education and the same public honours as were paid to the nephew and grandsons of Augustus. At nineteen he filled the quaestorship, became praetor at twenty-five, and consul at twenty-nine. But almost the whole of his first twenty years of manhood were spent in the camp—in Spain, Armenia, Gaul, Pannonia, and Germany. He had the honour of bringing back the standards lost with Crassus; in 15 B.C. he co-operated with his brother Drusus in subduing the Rhæti and Vindelici; warred with the Pannonians (12-9), and in the campaign that followed the death of Drusus traversed Germany between the Rhine and the Elbe. The young Marcellus, nephew of Augustus, had died in 23; Agrippa, son-in-law of Augustus, died suddenly in 12, leaving only two boys of eight and five between the step-son and the succession. Augustus, urged by Livia, compelled (11) Tiberius to divorce his much-loved wife Vipsania Agrippina, daughter of Agrippa by his former wife Pomponia, in order to marry Agrippa's widow Julia, the profligate daughter of Augustus. Hardly was he married than he was sent to crush a revolt in Dalmatia and Pannonia; Drusus died in 9, and Tiberius marched at the head of his funeral train on foot in mid-winter from the Rhine to Rome, returning immediately to the wars in Germany, for the successes in which he was rewarded with the full

*triumph* (9) and other honours. But suddenly in 6 he retired to Rhodes, where for seven years he gave himself to study and to astrology. The open profligacy of the wife who had been forced into his arms was perhaps the most powerful reason which drove him from Rome to the displeasure of the emperor. Before his return (2 A.D.) the infamous Julia was banished to Pandataria (2 B.C.), and within the two years after the deaths of both the young princes Lucius and Gaius (2 and 4 A.D.) paved the way for the adoption of Tiberius as heir to the imperial dignity, the third grandson, Agrippa Postumus, being at once too young and too incompetent for command. He was now formally adopted by Augustus. Tiberius spent the next seven years in active service in north Germany against Maroboduus, in quelling formidable insurrections in Pannonia and Dalmatia, and finally in securing the frontier and taking vengeance upon the enemy who had annihilated the army of Varus in 9 A.D. Along with Germanicus he made two marches into the heart of Germany (9-10), returning to enjoy a splendid triumph (12).

On the death of Augustus at Nola in 14 Tiberius succeeded without opposition. He was fifty-six years old, taciturn, impenetrable, suspicious, beloved by none, yet respected by all for his gravity of demeanour and the reputed severity of his virtue. The first eight years of his reign are treated by Tacitus in the first three books of his *Annals*, and are reluctantly admitted to have been marked by just and moderate government, respect for the laws, frugality, and care for the interests of the provincials. The whole is set down to sustained hypocrisy—a theory of human character hardly to be accepted without hesitation. During this period only twelve state trials for *majestas* ('high treason') are recorded. The next period of the reign, treated in the fourth book of Tacitus, covers the six years 23-28. As yet, according to Tacitus, the evil impulses of Tiberius were restrained by the influence of his still surviving mother. The number of trials for *majestas* has grown to twenty, the espionage of informers has also increased as well as the severity of sentences. His minister Sejanus has grown to vast influence through playing for his own ends upon the morbid suspiciousness of his master. For the last period of the reign, covering eight years and a quarter, we miss the lost fifth book of Tacitus for the years 30-31. The sixth book opens near the close of the year 31, and brings the story of Tiberius through the six years' reign of terror in which 80 to 100 lives perished mostly by direct mandate of the prince down to its shameful close in the foul debaucheries, the gloom, and the insanity of Capræa.

Such is the gloomy drama of the reign of Tiberius in the splendid pages of Tacitus. It only remains to be seen what are the historically reliable elements of the story. In general terms it may be said that the facts are mainly trustworthy, if the motives imputed cannot always be accepted. There is no doubt that for some years Tiberius took, or affected to take, little active part in public affairs, and indeed throughout one of the deepest principles in his Roman nature was regard for constitutional forms. But his care for the real interests of the provincials was an element new to Roman politics, and showed a foresight and statesmanship to which Augustus had not risen. The only important open changes he made were the permanent encampment of the imperial guard close to the city walls, and the abolition of the old *comitia*, the election of public officers being transferred to the subservient senate. But the one fatal feature of the reign was the institution of the *judicia majestatis*, which grew up out of the slavish adulation of the senate, the deep suspicious-

ness of the emperor's own nature, and the subtle manner in which this was fed by Ælius Sejanus, commander of the prætorian guards. *Delation*, or denunciation of individuals by informers, soon grew to great proportions, and men breathed in a constant atmosphere of terror. In 26 Tiberius left Rome for Campania, and the year after took up his abode in Capræa, where Suetonius tells us he wallowed in brutish sensualities. He had given his entire confidence to Sejanus, leaving him the whole control of government; but at length awakened to the ambitious designs of his minister, he struck him down without hesitation (31). Macro, the successor of Sejanus, had all his vices without his talents, and so the state of affairs was even worse than before. The murder of Agrippa Postumus in 14, the mysterious death of Germanicus in the East (19), the poisoning of Tiberius' own son Drusus by Sejanus (23), the banishment of Agrippina and the untimely death of her young sons Nero and Drusus (31 and 33) were some of the dark tragedies that befell the house of Augustus under the reign of Tiberius. In his last years the emperor's mind was darkened by gloom, superstition, and perhaps insanity. The famous words Tacitus has preserved of a letter to the senate (*Ann.* vi. 6) seem like a momentary flash of revelation of more than mere remorse: 'May all the gods and goddesses destroy me more miserably than I feel myself to be daily perishing, if I know at this moment what to write to you, senators, how to write it, or what, in short, not to write.' On the 16th March 37 his worn-out frame fell into a sort of lethargy, in which he is said to have been suffocated by Macro to prevent his recovery.

The original authorities are Tacitus, Suetonius, and Velleius Paterculus. The first admits that the history of Tiberius was 'falsified, while he reigned, through terror, and written after his death with the irritation of a recent hatred.' Whether the portrait he has himself constructed with such consummate literary art is psychologically possible or no, there can be no doubt at least that his own feeling was too bitter to permit of a judicial estimate. Suetonius as a historical writer shows no discrimination in choosing his materials, and his fondness for scandal and gossip was far stronger than his zeal for truth. Velleius Paterculus had served under Tiberius, but his overdone panegyric gives the fatal suggestion of flattery. Dion Cassius again wrote nearly two centuries after Tiberius, and was wise enough to follow Tacitus pretty closely, the character of Tiberius being a study much too complex for his powers of analysis. Dean Merivale in his *History of the Romans under the Empire* defends Tiberius with moderate zeal, believing him at least the victim of much ancient misrepresentation; Professor Beesly (*Catiline, Clodius, and Tiberius*, 1878) repudiates the whole account by Tacitus as a deliberate and malignant libel; and J. O. Tarter in *Tiberius the Tyrant* (1902) treated him as a ruler of great wisdom and benignity, but the most bitterly maligned of men. M. Bossier summed up against him in *L'Opposition sous les Césars* (1875).

Besides these, see Mommsen's *History of Rome*; Furneaux's edition of the *Annals*; Baring-Gould's *Tragedy of the Cæsars*; and books on Tiberius by Pasch (1866), Freytag (1870), Stahr (1873), Ihne (1892), and Tuxen (1896).

**Tibesti**, a fine mountainous country in the east of the Sahara, between 12° and 20° E. long., in an elevated region whose summits reach more than 11,000 feet above the sea. It is inhabited by the pastoral Tebu. See SAHARA, p. 12.

**Tibet**, or THIBET (native name, *Bod*), is the European name for the region of central Asia, the most elevated extensive country in the world. It is bounded on the N. by Chinese Turkestan (Sin-Kiang), the Chinese province of Kansu; on the E. by the Chinese provinces of Kansu, Sze-chwan; on the S. by the Chinese province of Yunnan, Burma, Assam, Bhutan, Sikkim, Nepal; on the W. by

Kashmir and British India. The Chinese claim suzerainty over Tibet, but the Tibetans have asserted their independence since 1912. The isolation of the country has been due partly to its unique geographical position, and partly to the mistrust and dislike shown by the inhabitants towards foreigners in general.

*Physical Features.*—The area of Tibet has been variously estimated from 440,000 to 1,000,000 sq. m. (a very probable figure being 750,000 sq. m.), but not only are the boundaries ill-defined and exact information unobtainable, but certain territories in eastern Tibet are sometimes regarded almost as independent 'marches.' Tibet is a huge tableland with an average altitude of 15,000 feet above sea-level, and with chains of mountains running east and west, and rising to 25,000 feet. There are three main physical divisions. Northern Tibet, where the tablelands are loftiest, covers more than half of the country, and is bounded on the north by the Kuen Lun and Altyn Tagh ranges and by the steppes of Tsai-dam, while on its south side a huge massive range drops to the valley of the Tsangpo river. This arid, cold, and unproductive territory acts as a watershed, the Kiria, Cherchen, and other rivers flowing north into Chinese Turkestan, and there are many lakes dotted about. Southern Tibet includes the valleys of the Indus and Sutlej to the west and of the Tsangpo (known as the Brahmaputra after it enters India) to the east, while eastern Tibet, where rise the Hwango-ho, Yang-tse-kiang, Mekong, and Salwin rivers, is the least elevated and most fertile region. The Himalayas form the great southern boundary. Lakes, with no permanent outlets and often exceedingly salt, are a feature of the country, the largest being those of Koko Nor in the far NE. and Tengri Nor less than 100 miles NW. of Lhasa, with areas of 1630 and 1000 sq. m. respectively, while that of Hora Tso (118 sq. m.) in the NW. is the highest lake in the world, 17,390 feet above sea-level. There is evidence that a process of subsidence has gone on and is continuing. The climate of Tibet is very severe, but on the whole dry, as the Himalayas break the rain- and snow-bearing clouds from the ocean, the limit of perpetual snow being on the average about 20,000 feet. Lhasa has some 14 inches of rain per annum, and the atmosphere is everywhere clear and rarified. The summer is short, and the midday sun, especially in the Tsangpo valley, is exceptionally strong, but the winter and night colds are intense. While the lower lands are bracing, the great northern tableland has a terrible climate, and fierce wind-storms are common. Animals are very abundant everywhere in Tibet, and leopards, bears, wolves, deer, lynxes, foxes, hares are found, as well as yaks, sheep, mules, dogs, goats, and partridges, wild-duck, pheasants, &c. are numerous.

In the inhospitable northern steppes there are no trees, much boggy land, and very little vegetation except some short grasses, but the valleys of the Indus and Tsangpo basins are comparatively fertile, and Himalayan conditions prevail in the SE., where fruits and vegetables are produced to a certain extent, and there are extensive forests. Barley is almost the only crop of any importance, but there is a little wheat, and the southern pastures provide good grazing ground. The mineral resources of Tibet are considerable, especially in the east, and gold, borax, and salt are worked; gold and iron are found more or less everywhere, and oil-wells are supposed to exist; bricks are made from the clay soil, but there is no coal in the country. The Tibetans are good blacksmiths and cutlers, but their chief industrial occupation is the preparation of woollen cloth.

They are active traders, and large caravans, in which yaks, camels, and sheep are the beasts of burden, are constantly traversing the country on their way to the great fairs in Tibet and the entrepôts of the surrounding countries. The exports to China and India include wool, borax, musk, live-stock, and the imports from China include silk and tea, and from India cotton piece goods and grain. The principal trade-routes, all radiating from Lhasa, are as follows: westward through Shigatsé and southern Tibet to Srinagar in Kashmir; northward by the Koko Nor to Urga in Mongolia; eastward by Tachienlu to Peking; southward through Gyantsé, Phari, Yatung to Kalimpong near Dárjiling. This last route carries the heaviest traffic, but there are other routes to India. River transport is only used to a small extent. Since 1922 a telegraph line of some 144 miles connects Lhasa with Gyantsé, where there is a British trade agent (see *History*).

*People and Social Life.*—Estimates of the population of Tibet vary from 1½ to 6 million, but a figure between 4 and 5 millions might be reasonably accepted. The population is largely nomad, but villages and monasteries contain settled communities, south-eastern Tibet being the most populous region. The capital, Lhasa (q.v.), on the river Nyang, is supposed to have a population of 20,000 (largely increased at festivals, pilgrimages, &c.), and the other chief towns are Gyantsé, Shigatsé, both on the river Kyi, with populations of 15,000 each. (The Nyang and the Kyi are tributaries of the Tsangpo.) The Tibetans are a Mongolic race, much more closely allied to the Burmese than to the Chinese or the Mongols proper. They are broad-shouldered and muscular, but short in stature, and present a striking contrast to the weak-calved Hindus. They have Mongol features, but not in an exaggerated form. The Tibetans by race people nearly the whole of Tibet. A few nomads, Mongol and Turkish tribes, have penetrated into the northern steppes, and some Chinese have colonised the south-east. The inhabitants of Ladakh (part of Kashmir) and of Bhutan, and the ruling classes of Sikkim belong ethnographically to Tibet. At the head of the government is the Dalai Lama, residing at the palace of Potala in Lhasa. The election of the Dalai Lama, who wields both spiritual and temporal authority, is curious. He is regarded as one of the reincarnations of the Buddha, and after the death of each Dalai Lama the principal religious authorities in the country seek for divine guidance in the choice of a successor, always a boy of not more than three or four years of age. A regent is appointed to govern till the pontiff comes of age at eighteen. The Dalai Lama is assisted by the *Kashak* or cabinet of ministers, consisting of the *Lönchen* or prime minister and four *Shapés* or secretaries of state. The Kashak also acts as a court of appeal, and has powers of legislation, though the latter theoretically belong to the *Tsongdu* or national assembly, comprising the great and the small assemblies, and consisting mostly of monks. Tibet is divided politically into fifty-three districts, each ruled over by two governors, one a monk, the other a layman. In the provinces almost feudal conditions prevail. The government obtains a revenue from taxing salt, hides, wool, tea, and from the profits of the mint now established at Lhasa, while taxes are often paid in kind, but financial arrangements are still fairly primitive. There is a small army, armed with Lee-Enfield rifles and organised on British models.

Most of the Tibetans belong to the particular type of Buddhism called Lamaism (q.v.), which has its centre in Tibet, and it is estimated that

*lamas* or monks number a fifth to a fourth of the total population. The monks live in monasteries (which may contain anything up to 10,000 inmates), and are bound to a life of celibacy and abstinence, but many of them are said to be quarrelsome, idle, and dissolute. They belong largely to the sect of the 'Yellow Hats' (see *History*). There are also some nunneries. The abbot of Tashilumpo Monastery, near Shigatsé, known as the Tashi Lama, and still the titular king of the province of Tsang, is the second pontiff of Tibet. Nominally the two great lamas have equal privileges, but though the Tashi Lama still retains his spiritual authority he has no political power. In eastern Tibet a form of Shamanism has some adherents, and some Christian missionaries have begun working from China.

The Tibetan language is South Mongolian and related to the Burmese; it has a regular alphabet, but there are three different vocabularies and styles of address corresponding to the social position of the person addressed, and dialects are common. Tibetan as spoken now differs considerably from the old written language. Books abound, and every monastery has its library. The literature, the best of which dates from the 9th to the 14th century, is mostly of a religious nature, consisting largely of translations from Sanskrit, and many of the manuscripts are very valuable. The priesthood are taught to read and write, but there is, of course, a vast amount of illiteracy among the lower classes. In Tibet, owing to its isolation, many archaic customs survive. One of these is polyandry, the husbands of one wife being generally brothers. This custom seems fairly universal among the poor, while some of the rich practise polygyny, but divorces are not unknown. The Tibetans are said to be intelligent, but without initiative; different views have been taken of their moral character, but on the whole they seem to be kindly and truthful, courteous and punctilious on questions of etiquette, but superstitious in many of their beliefs, and filthy in their habits. They are very fond of music and dancing, and the women wear jewelry, especially coral and turquoise. Wool is used for clothing (also silk by the upper classes), while the food mostly consists of mutton, barley, tea, and butter (from yak's milk).

*History.*—The aboriginal Tibetans were a warlike and barbaric race (writing, for instance, being unknown till the 7th century). The earliest date which can be relied on as historical is 639 A.D., when the king Sbrong-tsan-Sgam-po introduced Buddhism from India, and founded Lhasa. His dominions extended from the Himalayas north to the Koko-Nor Lake. Later, the Tibetan country is said in the Chinese annals to have extended to the Gulf of Bengal, then described as the Tibetan Sea. Ti-song De-tsen and Ralpachen were powerful kings in the 8th and 9th centuries respectively. In the 9th century a war broke out with China which terminated in 821, when bilingual tablets still existing were erected at Lhasa. At the end of the 10th century the Tibetan monarchy broke up into provincial kingdoms, but in 1026 the Indian Buddhist Atisha settled in Tibet and promoted the religion enormously. Kublai Khan, who annexed Tibet to his vast empire in 1270, called to his court a Tibetan monk, Phagspa. The latter, who converted his patron and the Mongols to Buddhism, was given the sovereignty of Tibet, and for about seventy years the country was under the rule of a line of priest-kings, to be succeeded by the monarchy founded by Chang-chub Gyal-tsen, which lasted some 300 years. In 1390 the reformer, Tsong Kapa, dissatisfied with the laxness of the Buddhist priesthood, founded the stricter sect of the 'Yellow Hats' (as opposed to the

unreformed 'Red Hats'), and the former have remained paramount from the 15th century to the present day. In the 16th century the titles of Dalai Lama and Tashi Lama emerge. The first four Dalai Lamas were purely religious leaders, but the fifth made himself temporal ruler of Tibet in 1641 with the help of the Tatars. In 1720 the Chinese, after many struggles, finally made Tibet a vassal state, and appointed two *ambans*, or political agents, in Lhasa. The Dalai Lamas (always chosen when children) of the 19th century hardly survived their majority, so that the power rested with the ambans and with the regent, the latter drawn from the ranks of the higher clergy. The thirteenth Dalai Lama (born 1876) has reigned since 1893, and the ambans were dismissed in 1912.

Meanwhile the isolation of Tibet remained the same. Individual Capuchin and Jesuit priests penetrated to Lhasa in the 17th and 18th centuries, while the first Englishman to enter Tibet was Bogle, sent by Warren Hastings in 1774. In 1840 Ladakh was conquered by the Maharaja of Kashmir, and is now a British dependency. In 1854 there was a struggle between Tibet and Nepal which ended in a treaty by which both countries recognised the suzerainty of China. Eleven years later, in consequence of the refusal of the Tibetan authorities to allow Europeans to enter their country, a system was organised in the interest of science, by which pundits or educated Indians were sent as explorers into Tibet. By this means the old maps were corrected, and much valuable geographical knowledge was obtained. Prjevalski and other Russian explorers did for northern Tibet what the pundits did for the south. Sikkim, a frontier state through which passes the important route from India into Tibet, became a British dependency in 1850. In 1888 it was attacked by a Tibetan force, and, as the Chinese government declined to interfere, the invaders were repelled by Anglo-Indian troops. The non-observance by the Tibetans of the Anglo-Chinese Sikkim convention of 1890 (opening a trade 'port' at Yatung), and their refusal to meet commissioners, led to the military mission of 1904 under Sir Francis Younghusband, which penetrated, after sharp fighting, to Lhasa. The Dalai Lama had fled to Mongolia (and later did homage to the emperor at Peking), but the treaties of 1904, 1906, 1907 established trade marts at Yatung, Gyantsé, and Gartok (the last being in the extreme west of Tibet and connecting with Siula), respected the suzerain rights of China, and insisted on the territorial integrity of the country (also indirectly opposing Russian influence, which up to then had been on the increase). The Dalai Lama returned to Lhasa in 1909, but from 1910 to 1912 lived in India, as result of the Chinese efforts to strengthen their diminishing power in Tibet. The Chinese revolution gave the Dalai Lama his chance to sweep away the whole Chinese administration in 1912. The political situation remains uncertain. A conference in 1913 between Britain, China, and Tibet proved abortive, and hostilities between the last two powers were renewed (1917-18). On the two occasions when the Dalai Lama was forced to leave his country, he was officially deposed by the Chinese, and the Tashi Lama set in his place. There has been friction between the courts of the two great lamas, and in 1925 the Tashi Lama fled to Peking. A rapprochement with Britain has been a marked feature of Tibetan history since the Younghusband expedition, but the strip of land that forms the trade-route between Yatung and Gyantsé is the only part of Tibet that is really open for foreigners (Yatung being 8 miles on the Tibetan side of the Tibet-Sikkim frontier).

See LAMAISM, LHASA, and the books there cited. Most of the travellers who have entered Tibet have written books, scientific, descriptive, or official, on the country, and the list of explorers round about the last quarter of the 19th century includes Abbé Desgodins, Bonvalot, Bower, Taylor, Littledale, Wellby, Deasy, Rijnhart, Rawling, and the Russians, Prjevalski, Roborovsky, and Kozlov. But see more especially Abbé Hue (q.v.), *Voyage en Thibet* (1850: new ed. trans. 1898); Markham, *Missions of Bogle in 1774 and Manning in 1811* (1876); Rockhill, *Land of the Lamas* (1891), and other books; Chandra Das, *Journey to Lhasa and Central Tibet* (1899); important books by Sven Hedin (q.v.), including *Adventures in Tibet* (1904), *Trans-Himalaya* (3 vols. 1909-13), *Southern Tibet* (9 vols. 1917-22); Grenard, *Tibet* (trans. 1904); Waddell, *Lhasa and its Mysteries* (1905); Sandberg, *Tibet and the Tibetans* (1906), and other books; Holdich, *Tibet the Mysterious* (1906); Youngusband, *India and Tibet* (1910); Farrer, *On the Eaves of the World* (1917); Ward, *Mystery Rivers of Tibet* (1923); Sir C. Bell, *Tibet* (1924); McGovern, *To Lhasa in Disguise* (1924); Stotzner, *Uns unerforschte Tibet* (Leipzig, 1925); Mrs King, *We Tibetans* (1926); Madame David-Neel, *My Journey to Lhasa* (1927). See also the relevant books cited at (Chinese) TURKESTAN. Both Tibetan-English Dictionaries and Grammars have been published by Cosma de Körös (1834), Jäschke (1881, 1883), Bell (1921), while the *Tibetische Studien* (1851-68) of Schiefner, the Tibetan-English Dictionaries of Ramsay (1890), Chandra Das (1902), the Handbooks by Sandberg (1894), Henderson (1903) are useful; see also Woolf, *Three Tibetan Mystery Plays* (trans. 1924).

### Tibet Dog. See MASTIFF.

**Tibullus**, ALBIUS, was probably born at Gabii about 54 B.C. His prænomen and parentage are unknown; his estate was much reduced in the subsequent confiscations by which Octavian and Antony rewarded their legionaries. His father seems to have died early, but his mother and sister survived him. While still a youth he acquired the friendship of the orator, poet, and statesman, M. Valerius Messala, head of a literary coterie only less attractive than that of Mæcenæas. As in Queen Anne's day, literature was a direct passport to office under government, and the already marked poetic gifts of Tibullus procured him a place on the staff of Messala commissioned by Augustus, 30 B.C., to crush a revolt in Aquitania. In this campaign the poet displayed capacity enough to win him distinction and decorations, but these could not countervail his repugnance to a soldier's life. Accordingly the close of the war found him dividing his time between the society of Rome and the retirement of Pedum at the base of the Tusculan and Sabine hills. He fell in love with a 'grass widow,' Plania by name, whose husband was on service in Cilicia. Under the sobriquet of Delia she is the heroine of his first book of elegies, but his devotion did not survive the deception she practised on him, finding as he did that he was not her only lover. It was during the earlier period of this attachment that, at Messala's instance, he started with that statesman on a mission to Asia; but, having sickened on the voyage, he got no farther than Coreyra. In his second book of elegies 'Delia' is replaced by 'Nemesis'—this *innamorata* being a fashionable courtesan, with many other admirers besides Tibullus, who bemoans his bondage to her and stigmatises her rapacity, but yet cannot bring himself to drop her.

Tibullus died 19 B.C., immediately after Virgil, universally deplored in Rome, and years afterwards the subject of a magnificent elegy by Ovid. Doubt has been thrown on his identity with the Albius of Horace, but we are loth to part with the picture that poet gives of him, pacing pensively his woodland walks at Pedum, blessed with fortune, with personal beauty, and with all the capacities of refined enjoyment. His character, amiable, generous, loyal to his friends and constant to

the mistresses who deceived him, but wanting in strength and energy, is reflected in his poems, which, 'most musical, most melancholy,' by their limpid clearness and their unaffected finish still justify Quintilian in placing him at the head of Roman elegy properly so called. Grace, tenderness, pathos, conveyed in verse smooth without monotony, can, however, only abate, not remove, the impression he leaves of lack of the dramatic force characteristic of Propertius or of the masterly range commanded by Ovid. The third book can hardly, even in part, be considered as his, while the fourth, also by another hand, is yet memorable for the eleven poems on the loves of Sulpicia and Cerinthus—Sulpicia's being unique as specimens of a Roman lady's passionate outburst in verse.

Till Lachmann's edition (1829) not much was done for the text of Tibullus, though his interpretation has advanced but little beyond the older Heyne. The most critical and useful editions are those of Bährens (1878), Muller (1880), Postgate (1905; new ed. 1914). See also Postgate's *Selections* (1903), and Ribbeck's *History of Latin Poetry*; the Rev. James Davies, *Catullus, Tibullus, and Propertius* ('Ancient Classics' series, 1876); Teuffel; and Sellar. The best complete English translation is Dr James Cranston's (Edin. 1872), but there are noble fragments by Elton (1814).

**Tibur.** See TIVOLI.

**Tic Douloureux.** See NEURALGIA.

**Tichborne**, a Hampshire property, 2 miles SSW. of Alresford station and 6½ E. by N. of Winchester. It has from before the Conquest been the seat of the Tichbornes, a Catholic family who received a baronetcy in 1626. After the death of the eleventh baronet, Sir Alfred Joseph Tichborne (1839-66), a butcher from Wagga Wagga in Australia, Thomas Castro, otherwise Arthur Orton of Wapping, came forward to personate an elder brother, Roger Charles Tichborne (1829-54), who had been lost at sea off the coast of America. His case collapsed on 6th March 1872, the 103d day of a trial to assert his claims; and the 'Claimant' was on 28th February 1874, the 188th day of his new trial, whose cost was £55,315, sentenced to fourteen years' imprisonment with hard labour for perjury. He died 1st April 1898. See Sir Alex. Cockburn's *Charge* (2 vols. 1875), Atlay's *Tichborne Case* (1916).

**Ticino**, a river of Switzerland and the north of Italy, rises on the southern slopes of Mount St Gothard, and flows south through Lake Maggiore, and south-south-east through the north of Italy to its junction with the Po, 4 miles below Pavia (which in Roman times took its name from the river). For the last 75 miles of its course, from the point at which it leaves Lake Maggiore, it is navigable. For the battle here in 218 B.C., see HANNIBAL. It gives its name to a Swiss canton (see below).

**Ticino** (Ger. *Tessin*), the southernmost canton of Switzerland, bounded on the W. and S. by Italy, and on the E. by Italy and the canton of Grisons. Area, 1082 sq. m.; pop. (1920) 152,256. Its surface forms a portion of the southern slope of the Alps. In the south the country falls away into hills, and the scenery becomes Italian in character. The principal river is the Ticino (q.v.); and the canton is traversed by the St Gothard railway. In the north cattle-breeding and the preparation of dairy-produce are the chief employments. Further south there are chestnut groves and vineyards. The olive-groves that existed till a century ago have totally disappeared, and fruit culture has been much neglected, the young men preferring work in northern countries and South America. Maize is the staple field crop. The northern part of Lago Maggiore and about one-half of the Lake of

Lugano are included within the canton. The inhabitants speak Italian, and are Catholics. The largest town is Lugano; since 1881 Bellinzona is the capital.

**Tickell**, THOMAS, poet, was born in 1686 at Bridekirk in Cumberland, and had his education at Queen's College, Oxford, a fellowship of which he held (without orders by dispensation) from 1710 till 1726. His complimentary verses on *Rosamond* (in Tonson's Sixth Miscellany, 1709) gained him the favour, his own virtues the friendship of Addison, who introduced him both into the world of letters and public life, and on becoming in 1717 Secretary of State made him his under-secretary. He held the office of secretary to the Lords Justices of Ireland from about 1725 till his death, at Bath, 23d April 1740. He was skilful and timeous in occasional poetry, as in *The Prospect of Peace* under Queen Anne, and *The Royal Progress* at the arrival of George I., and he was puffed with all the partiality of affection in the *Spectator*. The most memorable incident in his life was his translation of the first book of the *Iliad* about the same time as the first part of Pope's *Homer*. Addison declared that the rival versions were both good, but that Tickell's was the best that ever was made. Pope believed, or professed to believe it the work of Addison himself, deliberately prepared to eclipse his version, and wrote in reply the famous satire on Atticus. But there need be no doubt that Tickell made his own translation, although Addison corrected it, as he confessed he did. Tickell's 'letter to Avignon,' says Johnson, 'stands high among party poems; it expresses contempt without coarseness, and superiority without insolence.' His longest poem is *Kensington Gardens*; his most popular, the ballad of *Colin and Lucy*; his finest, the exquisitely sincere elegy on Addison prefixed to his edition of Addison's Works (4 vols. 1721).

**Ticknor**, GEORGE, the historian of Spanish literature, was born in Boston, 1st August 1791, the son of a wealthy New Englander, who was one of the first importers of Merino sheep into the United States. He graduated at Dartmouth College (1807), and was admitted to the bar (1813), but, having practised for a twelvemonth, became convinced that the life of a lawyer would not satisfy his ideas of usefulness or happiness. He accordingly turned his thoughts to plans of study and travel, and, starting for Europe in 1815, for four years resided successively in London, Göttingen, Paris, Geneva, Rome, Venice, Madrid, and Lisbon. Everywhere he mixed in the best society; and his journal is full of the best sort of interviewing, his friends and acquaintances then or afterwards including Joanna Baillie, the Duc de Broglie, Chateaubriand, Miss Edgeworth, Goethe, Guizot, Hallam, Lord Holland, President Jefferson, Jeffrey, Longfellow, Lyell, Macaulay, Metternich, Milman, Prescott, Rogers, Scott, Sydney Smith, Southey, Earl Stanhope, Mme. de Staël, Talleyrand, Thackeray, Daniel Webster, and Wordsworth. Returning to America, he became professor of French and Spanish and of the Belles Lettres in Harvard University. In 1835 he resigned his chair, and went with his family to Europe, where he remained three years, collecting materials for his great *History of Spanish Literature* (3 vols. New York, 1849), an exhaustive and admirable work, which has been translated into Spanish and German. Other works by him were *Lives of Lafayette* (1824) and Prescott (1864), with fourteen reviews and minor writings. He received nearly a score of literary distinctions; in 1856 revisited Europe; and died in Boston, 26th January 1871, in his

eightieth year. See his *Life, Letters, and Journals* (2 vols. 1876).

**Ticks** (Ixodidae and Argasidae), two families of mites (Acarina) the members of which attack man, mammals, birds, and reptiles. They are the largest Acarina, some being an inch long. They seem usually to pass from herbage or brush on to passing animals, and some can live for four years without food. The flattish body has a firm chitinous cuticle; the legs extend laterally and the movements are somewhat crab-like. There is a movable 'false head' or capitulum which bears a pair of sharp cutting chelicerae, a fixing 'hypopharynx' with recurved teeth, and a pair of pedipalps which serve in part as a sheath for the foregoing parts. In the leathery Argasidae both sexes swell up greatly when they gorge themselves with blood. In the Ixodidae there is a hard dorsal shield, absent in Argasidae, which covers the whole body of the male and prevents distention. In the female the shield is a small anterior patch, so that great distention is possible, and with eggs as well as with blood. The males seem to require much less food. In the carefully studied South African 'Bont' tick, *Amblyomma hebraeum*, the female courts the male until he becomes excited and introduces his rostrum into the female aperture. When an egg is extruded by the female Amblyomma's ovipositor, a bi-lobed vesicle appears from beneath the anterior border of the shield, and grips it, manipulating it for some minutes. The vesicle is then withdrawn and the egg is left on the rostrum. Without manipulation the eggs shrivel up. When the satisfied female of Ixodes drops off the host, she returns to the herbage and begins to lay eggs. Dr A. D. Michael says 'she places the eggs one by one in front of her in a pile or round ball, which gradually becomes almost as large as the mother-Ixodes. It is probably this position of the eggs which gave rise to the idea held by some of the earlier writers that the Ixodes laid their eggs through the mouth-opening; the fact being that the genital opening is very near the mouth, and the position during oviposition such that the mouth is not readily seen.' But it must be noted that in Ixodes also there is a 'manipulation' of the eggs and a temporary attachment to the rostrum.

Among the Ixodidae may be noted the common English sheep-tick (*Ixodes ricinus*); the cattle-ticks (*Boophilus*), one of which (*B. annulatus*) transmits Texas fever; *Rhipicephalus sanguineus*, which disseminates a dog disease; and *Amblyomma hebraeum*, which causes 'heart-water' in South African cattle. The Argasidae, which have free leg-like pedipalps and no shield, are represented by the closely related genera Argas and Ornithodoros.

Human 'tick-fever' on the Congo is transmitted by *Ornithodoros moubata*; a disease in poultry is conveyed by *Argas reflexus* and *A. persicus*; the latter also attacks man. As the hasty removal of the tick is certain to leave the

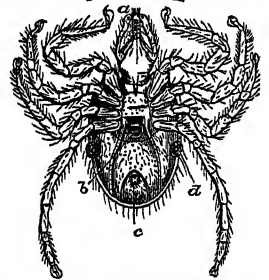

Fig. 1.—*Ixodes ricinus*, fem.: a, mouth; b, opening of oviduct; c, anal valves; d, stigma.

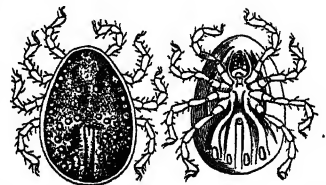

Fig. 2.—Upper and under surfaces of *Argas reflexus*.

rostrum in the wound, the pest should be stimulated with a drop of turpentine or benzole. As these examples show, ticks have turned out to be of unsuspected importance, not so much in themselves, as because of the Protozoan parasites which they disseminate—the result being human diseases like tick-fever and stock-diseases like 'heart-water' in South African cattle.

What is often called sheep-tick (*Melophagus*; see SHEEP-KED) is a Dipterous insect, and to the same order belong the species of *Nycteribia* on bats and of *Ornithomyia* on birds. The 'death-tick' is a popular name for Pseudoneuropterous insects of the family Psocidae—e.g. *Psocus*, *Cæcilia*, and *Clothilla*—or for the little Death-watch (q.v.; *Anobium*).

See ACARINA; also A. Pagenstecher, *Beiträge zur Anatomie der Milben* (Leip. 1860-61); P. Mégnin, *Les Parasites et les Maladies Parasitaires* (Paris, 1880); A. D. Michael, *British Oribatidæ* (1884), and monograph on Ticks by Prof. Nuttall and others (Cambridge, 1908, *et seq.*).

**Ticonderoga**, a township of New York, 100 miles by rail north of Albany on Lake Champlain, and enclosing the outlet of Lake George, whose falls supply water-power. There are manufactures of pulp and paper; black lead and iron are mined; and there is some lumbering; and here the lake steamers start. Pop. 2000. Here the French built a fort in 1755, which, after repulsing a first attack in 1758, they dismantled and abandoned in 1759, along with Crown Point. The English enlarged and strengthened both fortresses at a cost of £2,000,000; but, being garrisoned with only 50 men after the cession of Canada to Great Britain, it was in 1775 surprised and captured by Ethan Allan. In 1777 it was recaptured by Burgoyne, and in 1780 it was again occupied by the British. At the close of the war it fell into ruins, but its restoration was undertaken in 1909. See Cook's *History of Ticonderoga* (1858).

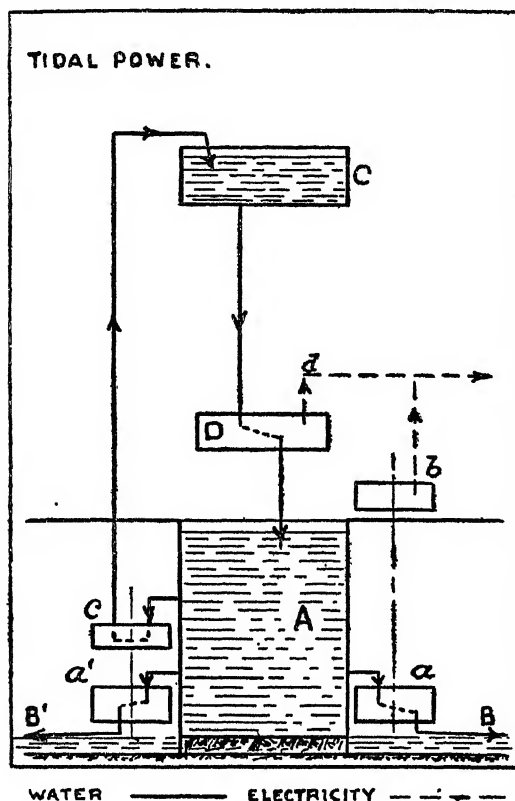

**Tidal Power.** From time immemorial the Tides (q.v.) have done work useful to man in navigation; and the idea of making them do other useful work, in the development of mechanical power, heat, or light, for instance, has often engaged the attention of the scientist and inventor. 'Tide-mills' have indeed been constructed in the past in this country and elsewhere, but they have not been of any practical importance.

The fact of tidal energy, which is a particular manifestation of the energy of the rotation of the earth, is obvious to anyone who watches the tide rise. It is strikingly illustrated in many of the estuaries of this country. In some of these situations it is possible to select a point where, at the time of low-water, the bed of the estuary is exposed, and, in a little more than six hours, find that point covered to a depth of thirty feet or more by tidal water lifted there by the tidal force. If at this stage, that is, at the moment of high-water, and at that point, we could drop across the estuary a screen which would hold up the water above while that below ebbed away in the tidal movement, then in another six hours and a few minutes, that is, at the moment of low-water, there would be left a reservoir of tidal water more than thirty feet deep at the 'screen' and perhaps several square miles in area. Such a body of water, by virtue of its height, at the time of low-water of the tide, above the tide-way below the 'screen,' would represent a certain potential energy; that is to say, the energy is there, stored up, if means can be devised to turn it into useful work. It is not likely that any method will ever be found by which the whole of such apparent potential energy may be utilised, any more than it has been found possible to utilise the whole of the potential energy

of coal or oil in the development of mechanical power; but a large proportion of that potential, tidal, energy may be turned into useful work—mechanical power, heat, light. To attain this end we have but to arrange for as much as possible of the water in the reservoir to be run out through suitable machines—hydraulic turbines—which will transform the potential energy of the stored-up water into mechanical power which, again, may be changed into electricity, heat, or light as desired. Such an elementary tidal-power system, consisting of a tidal reservoir A, and the tide-way BB', is indicated in the diagram appended. It will be clear that so long as there is a free run for the water of the reservoir through the turbines into the tide-way, the turbines may go on developing power until the water in the reservoir has fallen to the level of the turbines, or until the tide, rising below the 'screen' (a dam or barrage), reaches the level of the water in the reservoir, when the system will cease to function—in practice it would cease a little sooner. Nor, in such an elementary power system, can the turbines resume working until the tide, after refilling the reservoir, has fallen sufficiently to provide the necessary 'head' to operate the turbines, that is, a sufficient difference between the level of the water inside and that outside the reservoir. Hence, for a considerable portion of each tidal period of twelve and a half hours, such a system could not function. It is, however, absolutely essential that any public power-station must be able to supply power at any hour of the day or night; and, moreover, must be able to meet a varying demand for power, which rises to a maximum, the 'peak,' about a certain time daily. In a tidal power-station this time will occur periodically, just when the tide cannot provide directly any power at all. Hence, some means of storing tidal energy to carry the power-station over such dead tidal periods must be provided. Here we touch the chief technical difficulty in the utilisation of tidal energy.

Two methods of overcoming this difficulty have been proposed, of which one may be called the multiple tidal reservoir system. Various modifications of the system are possible, and under it the tide may be used both on the flow and on the ebb; but the essential feature of all consists in the provision of space—a spare reservoir or more than one—which is used to receive the discharge from the turbines during those portions of the tidal interval when, as already explained, that discharge can no longer be passed into the tide-way directly. The spare reservoir is emptied in due course when the tide permits; and the water accumulated in it may be used to develop power as it flows away. This system was examined by the Ministry of Transport in 1920, when that authority prepared a tidal-power scheme for the estuary of the Severn, but was abandoned in favour of the other and less complex system. In this latter system, which may be called the high-level storage system, only one tidal reservoir is needed, and while, under it, the tide may be used both ways, the balance of advantage seems to be in favour of using the tide only on the ebb. The distinguishing feature of this system, which is illustrated in the diagram, consists in the provision of one or more storage reservoirs situated conveniently to the tidal works, but at some elevation above them. So long as the tide serves, a certain number of turbines will generate electricity which will pass directly into the distribution system; but at the same time other turbines will be pumping tide-water to the high-level storage which will feed a secondary power-house, D, where electricity will be generated during those portions of the tidal period when the tide does not serve directly. It happens that the pumping of water,

especially on a large scale, is one of the simplest and most highly efficient of mechanical operations; while, at practically every place on our coasts where tides occur that may be worth utilising, sites are available for high-level storage. The system is simple and has many recommendations.

A, Tidal reservoir; B, B', Tideway; C, High-level storage; D, Secondary power station; a, a', Primary power turbines; b, Electricity generator of primary power station; c, Pumps lifting water to high-level storage; d, Electricity from secondary power station.

It permits, for instance, advantage to be taken of abnormally high tides, and even of inland floods, to accumulate power which may be used later as required. It is this system which was particularly in view in the government inquiry set up by the Labour government of 1924, acting on the report of the Water Power Resources Committee, into the possibilities of tidal power in this country, more especially in the estuary of the Severn, where tides range up to more than forty feet, and are only exceeded in height in two other places in the world. There can hardly now be any question that ultimately, and perhaps before long, the tides in this country will be utilised in the development of power. The question is obviously one of great national importance, especially in view of the cheap and abundant water-power which some of our world competitors command. If the tides can be utilised in the development of power, then no other industrial country possesses such favourable conditions for that development as may be found on the coasts of Great Britain. See WATER.

**Tides.** The tides consist in the alternate rising and falling of the surface of the sea and in the associated ebb and flow of the currents. At most places, and speaking roughly, the water

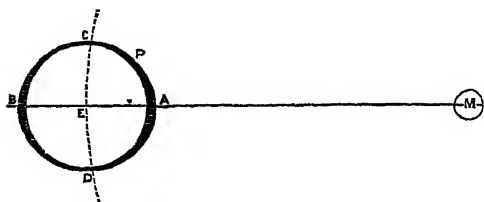

reaches its highest level twice each day and its lowest level at times which are about half-way between those of high-water. At the great majority of places the clock-times of high- and low-water vary from day to day. Thus, if high-water occurs at noon on Sunday, it may occur at about one o'clock on Monday, and shortly before two o'clock on Tuesday. By the following Sunday high-water will occur about six o'clock, and after a second week it will again occur about noon. At such places the average interval of time between two successive high-waters is 12 hours 25 minutes, but the interval varies considerably during the course of the fortnight. The heights of high- and low-water at the same place may also vary much from day to day. For example, on one particular day the water will rise very high and fall very low; a week later the high-water will come considerably short of the highest attainable, and the low-water will not fall as low as the lowest attainable. After the lapse of another week the very high and the very low waters will again occur, and so on. For any one place on the shores of Great Britain, and speaking roughly, tides which occur at the same clock-times will rise and fall to the same heights. In such cases the greatest and least tides are distinguished as *spring*- and *neap*-tides respectively. For the days just before and just after spring-tides, the interval from one high-water to the next will be less than the average, while for the days just before and after neap-tides it will be greater than the average. These phenomena are known as *priming* and *lagging* respectively. At certain places in the East Indian seas high-water occurs at practically the same clock-time every day, while at certain places in the China Sea there is usually only one high-water each day. At many places outside Atlantic waters the two tides of the day reach markedly different heights, a phenomenon called *diurnal inequality*. At London Bridge the range (i.e. the difference in level between successive high- and low-waters) has an average value of 21 ft. at springs, and of 14 ft. 11 in. at neaps. At Leith the corresponding average ranges are 16 ft. 1 in. and 8 ft. 3 in. respectively. At the head of the Bay of Fundy the range reaches 50 ft., while at certain of the Pacific islands and over much of the Mediterranean it never exceeds 2 ft.

For an accurate study of the tides at any one place, a recording machine called a *tide-gauge* is used. When the place is on the coast, the customary form of gauge utilises a float resting on the surface of water in a well to which the sea has access. A cord is attached to the float and transmits the motion to a pencil bearing on a drum which is rotated by clockwork. When the place is off shore, the varying pressure of the load of water on the sea-floor is usually measured.

It is found that the sequence of tides at any one place bears a most intimate relation to the positions of the moon and sun relative to the earth. Thus, the period of 12 hours 25 minutes is half that of the moon's apparent revolution round the earth, while the sequence of tides from springs to neaps is associated with the phases of the moon. At certain places in Canadian waters the chief variation in the range of tide is associated with the varying distance of the moon from the earth, while at others it is associated with the varying declination of the moon. The diurnal inequality is always associated with the declination of the moon or sun. The most complete correlation between the sequence of tides and astronomical variables is provided by the *harmonic analysis* of tidal observations. This consists in decomposing the tides at any place into a number of simple tides, each constituent having a constant period

and range. When the tides at any place have been correlated with astronomical variables, it is possible to make *predictions* regarding future tides at that place. In this way tables of the times and heights of high- and low-water, of the heights of water at all hours, or of the times of minimum tidal current are made. In the construction of these tide-tables the harmonic method is much used, and most of the necessary calculations are made by a special machine first imagined by Lord Kelvin. In this machine there is a pulley corresponding to each harmonic constituent, and the range and phase of the motion of its centre can be adjusted to correspond with the results of the analysis of observations. A cord with one end fixed passes round all the pulleys so that its free end shows the addition of all the constituents.

The physical nature of the forces which generate the tides was first revealed by Newton. Let M be

the centre of the moon and E that of the earth. Then E moves with an acceleration towards M determined by the moon's gravitational force at E, while a particle of water, P, has an acceleration depending on the moon's gravitational force at P, combined with that of the earth itself and the reactions of the sea-floor and neighbouring water. The tides consist in the motion of the water relative to the land, and so we consider the acceleration of P relative to E. For this we require the excess of the moon's attraction at P over that at E, and so the tide-generating force is obtained by combining the moon's attraction at P with a repulsion of direction, ME, and magnitude equal to the moon's attraction at E. This repulsion represents the effect of the inertia of the water owing to the acceleration of the solid earth towards M. Of course the velocity of the solid earth is perpendicular to ME. Imagine a sphere, CD, described with M as centre and passing through E. Then over CAD the tide-generating forces will be attractive, while over CBD they will be repulsive. But owing to the reaction of the sea-floor only the horizontal components of the tide-generating forces will count, and it is clear that over CAD these components will be directed towards A, while over CBD they will be directed towards B. Now the sun as well as the moon will raise tides, and it is a consequence of the law of gravitation that the tide-generating forces due to these two bodies are directly proportional to their masses and inversely proportional to the cubes of their distances from the earth. The separate attractions at E and P are inversely proportional to the squares of the distances ME and MP, but the difference between the two is inversely proportional to the cube of ME, approximately. Now the sun's mass is nearly 27,000,000 times the moon's mass, and the sun's distance is about 390 times the moon's distance. Consequently the sun's tide-generating forces are to the moon's in the ratio of 27,000,000 to 390<sup>3</sup>, i.e. roughly, 5 to 11. The distribution of the disturbing forces over the oceans is most simply specified by a statement of what the tides would be if the water could instantaneously take up a position of equilibrium. The slope of the surface of the water would then be always such that the consequential differences of pressure produced horizontal forces balancing the

tide-generating forces. It is clear that due to the lunar forces the water-surface would slope upwards from CD towards the points A and B, as shown in the figure. The points A and B would follow the moon in its apparent daily course, with the result that twice every lunar day high-water and low-water would be experienced at most points of the ocean. An exception would occur at the North Pole, whose position relative to M is not affected by the diurnal motion of the earth. This specification of forces is known as the *equilibrium-form* of the lunar tides, and a corresponding specification applies to the solar forces.

In considering how far the actual tides will have the properties of the equilibrium-form, we first remark that, owing to inertia, continual balance between pressure-differences and disturbing forces is not possible, and the actual tides are not represented directly by the equilibrium-form. It is a general dynamical principle, however, that forces which alternate in a definite period produce motions which alternate in the same period. This is Laplace's principle, on which Lord Kelvin founded the harmonic methods of analysis and prediction. The periods of the harmonic constituents are calculated from the equilibrium-form, but the ranges and phase-lags are obtained from the actual tides. When solar high-water coincides with lunar high-water we have the phenomenon of spring-tides, and when solar low-water coincides with lunar high-water we have the phenomenon of neap-tides. In the equilibrium-form spring-tides occur at new and full moon and neap-tides at the quarters, but in the actual tides these phenomena usually occur a day or two later. Near springs the shorter solar period shortens the period of the resultant tide and we have the phenomenon of priming. By examining the sequence of the two tides near neaps the reader will easily see the reason for lagging. If at a certain place the lunar tide vanishes and the solar tide does not, then high-water will occur at the same solar time every day. A gradual increase or decrease in the range of the generating forces will produce a gradual increase or decrease in the range of the tides, though the two changes will not in general be simultaneous. We thus see that the magnitudes of the lunar and solar tides will vary with the distances of the moon and sun from the earth. When the moon is not on the equator it is easy to see that the two daily tides of the lunar equilibrium-form will not be equal, since the points A and B will cross the meridian of the place at different distances from the place. It follows that the actual lunar tides will generally experience a diurnal inequality which goes through a period with the moon's declination, and there will be a similar effect in the solar tides. On the harmonic method the diurnal inequality is represented by the introduction of constituents with periods of about a day, and when the diurnal constituents become greater than the semi-diurnal constituents we may have only one high-water each day.

The chief features of the tides of such bodies of water as the Irish Sea and the English Channel have been explained on the principles of dynamics. These tides are largely maintained by those of the ocean and are much influenced by the earth's rotation. For example, when the current flows with its maximum speed north through the southern Irish Channel the surface of the water is 5.7 feet higher on the Welsh coast than on the Irish coast. The effect is reversed when the current flows south, and in consequence the range of tide is 11.4 feet greater on the Welsh side than on the Irish side. In suitable circumstances high-water on one side of a channel may be simultaneous with low-water on the opposite side, an example of which occurs on the opposite coasts of England and Holland.

Tidal currents are resisted by the friction of the sea-floor, and the consequent dissipation of energy occurs principally in shallow seas. The effect is a kind of friction-brake gradually retarding the rate of the earth's rotation, and it has been calculated that in consequence the day has probably been lengthened by a second in the last 120,000 years.

The tide-generating forces are of course operative on the main body of the earth as well as on the water of the oceans. The elastic distortion of the solid earth has been detected and measured in several ways. It is possible that the tidal stresses in the earth's crust may be a minor factor in the production of earthquakes.

In the evolution of worlds tidal action has had a very important influence. When the main body of the earth was fluid, the body-tides would also be resisted by frictional forces. A change in the rate of the earth's rotation must be accompanied by changes in the distance and time of revolution of the moon. Calculating backwards, Sir G. H. Darwin found that the moon must at one time have been much nearer the earth than at present. Previous to the time of its existence as a distinct satellite it is believed that the moon formed part of the earth and that its separation was due to the tidal action of the sun. It is calculated that the joint fluid or partially fluid body would have a time of natural oscillation nearly equal to the tidal period, so that very great oscillations would result until the final separation of the body into two parts. The tidal action of the earth upon the moon has long ago compelled the latter to keep a constant face towards the former. For there can be little doubt that before the moon had cooled down to its present unchangeable condition, very large tides must have been generated in it, and these would act as a friction-brake so long as the period of the moon's axial rotation was shorter than its time of orbital revolution. All satellites whose rotation-periods are known actually keep the same faces towards their primaries, and the planet Mercury has probably had its day made equal to its year by the friction of its solar tides.

The most satisfactory theory of the origin of the planets themselves also appeals to tidal action. It makes the hypothesis that a star passing near the sun raised such enormous tides in the latter that the matter of the present planets was drawn out.

**Tideswell**, a small town of Derbyshire, 6½ miles E. of Buxton, with an old cruciform church, some cotton manufactures, lime-kilns, and stone-quarries. Pop. 2000.

**Tieck**, JOHANN LUDWIG, one of the most prominent champions of Romanticism (q.v.) in Germany, and the friend of Novalis and the Schlegels, was born in Berlin on 31st May 1773. Most of his life was spent in that city, in Dresden, and near Frankfort-on-the-Oder, his life's calling being that of a man of letters; and in Berlin he ended his days, on 28th April 1853. After two or three immature romances, he struck out a new line in clever dramatised versions of the old fairy-tales, such as *Fair Eckbert*, *Puss in Boots*, *The Faithful Eckhart*, *Blue Beard*, and others, which he made the vehicle for some polished satire on contemporary literature. This is Tieck's peculiar groove. He followed up this first success—*Volksmärchen von Peter Lebrecht* (1797)—by publishing the tragedy *Leben und Tod der Heiligen Genoveva* (1800), the comedy *Kaiser Octavianus* (1804), and *Phantasia* (1812-17), a collection of the same class of traditional lore in story and drama. These books became great favourites in Germany, owing to the simple and agreeable style of the narrative, and the dreamy fancy and

delicate irony that pervaded them. Another great favourite was a romance in glorification of old German art, entitled *Franz Sternbalds Wanderungen* (1798). In his later years Tieck wrote several works of a more modern cast, of which *Die Gemälde*, *Die Reisenden*, *Die Verlobung*, *Hexensabbath* are amongst the most highly esteemed. Besides superintending the completion of A. W. Schlegel's translation of Shakespeare's plays—it was long erroneously believed that he had translated them himself—he edited the doubtful plays and wrote a series of essays (*Shakespeares Vor-schule*, 1823-29). *Don Quixote* he did translate with his own hand (1799-1804). He holds an honourable place in the ranks of Germany's dramatic and literary critics, in virtue of his *Dramaturgische Blätter* (2d ed. 1852) and *Kritische Schriften* (1848). Tieck's *Schriften* were published in 20 vols. in 1828-46, his *Novellen* in 12 vols. in 1852-54, and his *Nachgelassene Schriften* in 2 vols. in 1855. There are editions of *Ausgewählte Werke* by Welti (8 vols. 1886-88), Klee (3 vols. 1892; containing a biography), and Witkowski (4 vols. 1903). Some of his fairy-tales and novels were translated into English by Carlyle and Thirlwall. See works by Köpke (1855), Friesen (1871), Stern (1879), Minor (1884), Steiner (1893), Bischof (1897); and Carlyle's *Essays*, vol. i.

**Tiel**, a Dutch town in Guelderland, on the Waal, 60 miles E. by S. of Rotterdam. It has a trade in fruit and cattle. Pop. 10,600.

**Tiele**, CORNELIS PETRUS, Dutch theologian, was born at Leyden, 16th December 1830, studied at the university there and at the Remonstrants' seminary at Amsterdam, and became Remonstrant pastor at Rotterdam (1856), professor in the seminary translated to Leyden (1873), and professor of the History of Religions in the university of Leyden in 1877. From its foundation in 1867 he collaborated with Kuenen, Loman, and Rauwenhoff in editing the well-known *Theologisch Tijdschrift*. Tiele published a long series of important theological works, including *Comparative History of the Egyptian and Mesopotamian Religions* (1869-72; trans. 1882); *Outlines of the History of Religion* (1876; trans. 1878); *Babylonisch-assyrische Geschichte* (1886-87); *West Asia in the Light of Recent Discovery* (1893; trans. 1894); the Edinburgh Gifford Lectures on *The Elements of the Science of Comparative Religion* (1897-99); besides a number of contributions to the *Encyclopædia Britannica* and the *Encyclopædia Biblica*. He died on the 11th January 1902.

**Tienen**. See TIRLEMONT.

**Tien-tsin**, a large city and river-port of China, in the province of Chih-li, on the right bank of the Pei-ho, 34 miles from the mouth of the river, and 80 miles SE. of Peking. It stands at the junction of the Pei-ho and the Grand Canal. The river is generally frozen over for several months each year, but the difficulties of transport are largely surmounted by the use of the railway from Tien-tsin to Taku at the mouth of the river, and by employing ice-breakers. The flooding of the river and of the Grand Canal in 1917 and 1924 caused great havoc in Tien-tsin and in the surrounding districts, but under the River Commission and the Hai-ho Conservancy Board the waterways are being improved and the embankments strengthened. Tien-tsin was connected with Peking by rail in 1897, and stands on the Peking-Mukden and Peking-Nanking lines. It is the principal commercial centre for the six northern provinces of China as well as for large tracts of Chinese Turkestan, Mongolia, and Manchuria. The trade of the town is mostly in raw cotton, wool, hides, furs, carpets, seeds, oil, candles, glass, perfumery, dyes, &c. A spirit,

which is called 'wine,' is distilled on a large scale locally from millet, while other industries are salt-evaporation and cotton-spinning. The city walls were demolished in 1901 and replaced by boulevards, and the city has handsome gardens and a race-course. By the treaty of Tien-tsin, signed here in 1858, the port was declared open; and a British consulate was established in January 1861, while part of the allied troops were still here (see CHINA). Tien-tsin gained an ominous reputation by the ruthless massacre of the French Sisters of Mercy in June 1870. In 1900 the town, taken by the allies, became the base of operations against Boxers and Chinese. The population estimates vary from 800,000 to 2,000,000.

**Tiepolo, GIOVANNI BATTISTA**, the last of the great Venetian school, was born at Venice 5th March 1692, and modelled himself on Paul Veronese. His first works were in the adornment of churches and palaces in and about Venice; in 1750-53 he executed a great series of frescoes in the archiepiscopal palace at Würzburg, and in 1760 was engaged on the palace of Madrid. At Madrid he died, 27th March 1769. He was a most productive painter, rich in colour (especially in his easel pictures), and clear (though incorrect) in drawing. His chief works were the Old Testament histories—the palace at Udine and the frescoes at Madrid. His two sons were also painters, and like their father etchers also. See Molmenti, *Il Carpaccio e il Tiepolo* (Turin, 1885).

**Tierney, GEORGE** (1761-1830), Whig politician, was one of Pitt's most persistent opponents, and fought a bloodless duel with him (1798). He held office in the ministries of Addington, Grenville, Canning, and Goderich. He was a clever debater, notorious for his powers of sarcasm.

**Tierra del Fuego** consists of a group of several large and numerous small islands, lying off the south extremity of South America, in 54° S. lat., 70° W. long., and separated from the continent by the Strait of Magellan. Its farthest south point is formed by Cape Horn. The principal island, Tierra del Fuego, sometimes known as King Charles South Land, is divided between Chile and the Argentine Republic, to the latter of which Staten Island also belongs. All the other islands and islets are included in Chile. The shores of the archipelago are generally much broken by and indented with bays and arms of the sea, with mountains rising abruptly from the water. These fjords, as a rule, contain deep water at their shoreward extremities, with bars, or, more properly, banks at the sea entrances; in this feature, as well as in their scenery, resembling many of the salt-water lochs on the west coast of Scotland. The whole group is mountainous, the mainland (Tierra del Fuego) attaining a height of 7000 feet, the snow-line being 4000 feet above sea-level. There are some dreary plains and a few fertile river-valleys, with areas of marshy ground between Useless and St Sebastian Bays. None of the rivers are important, unless it be the Juárez Celman, which is believed to be navigable for a considerable distance above its mouth. Towards the north the plains produce good pasturage, and attempts at sheep-farming made in the district have since been profitably extended to other parts of the archipelago. Cattle are also raised. Forests of *Nothofagus pumilio*, *N. betuloides*, *N. antarctica*, Winter's bark, *Fitzroya patagonica*, *Libocedrus tetragona* cover large areas, with dense growths of such bushes as *Berberis microphylla* and *B. ilicifolia*, *Escallonia serrata*, *Ribes magellanicum*, *Embothrium coccineum*, *Myrtus Nummularia* on the hill slopes. Lichens grow abundantly at greater heights, and cover much of the low grounds, where apparently

nothing else can flourish. Very characteristic is the xerophytic umbellifer *Azorella glebaria*, which forms the balsam-bogs. It grows in dense, hard, pale yellowish green hemispherical hillocks, which in warm weather give forth a faint aromatic smell, while drops of white gum flow from them. Each mass springs from a single seed, and is the result of perhaps hundreds of years of growth. The more common and old-fashioned English garden flowers come to perfection in the settlers' enclosures in the extreme north. Few island groups situated so close to continental land exhibit a poorer fauna than is here presented, the guanaco, tucu-tucu (a small rodent), dog, fox, and rat being the only quadrupeds, with the exception of the lately introduced farm stock. The dog is semi-domesticated, and is kept by the natives in immense numbers. Birds, however, are abundant and various, including *Vanelhus cayanus*, *Sturnia funerea*, owls, falcons, and a great variety of sea-birds. Seals and sea-lions, once almost innumerable along the shores, have grown scarce and wild, especially in the northern portion.

The land of Tierra del Fuego is rapidly rising, and the coast-line has advanced 3 kilometres since the date of the surveys of Captains King (1826-28) and Fitzroy (1831-36). The rocks are principally volcanic; but sedimentary strata are not uncommon on the principal island, and probably on some others. Granite, syenite, porphyry, quartz, serpentine, trachyte, diorite, and sandstone comprise the principal rocks. Some coal, of a poor description, and a little gold have been found. The situation of the islands exposes them to a series of conditions which render their climate the most tempestuous in the world. The prevailing winds are from the west, beginning to blow with the rise of the sun, and increasing in violence until dusk, when a calm may generally be looked for with confidence. During the short summer the winds blow from the north. Settled weather never lasts for more than a fortnight at a time. December, January, and February are the warmest months. March is exceedingly boisterous always, and during its course occur the most destructive gales.

The people are savages of a low type, divided into three tribes, the Onas (or Aonas), the Yaghans, and the Alakalufs, the Yaghans being now supposed to be the aborigines. The Onas are tall, the others short and stunted in stature. They were estimated at 10,000 in 1870, but are now reduced to about 600. The charge of cannibalism was unfounded. Argentine Tierra del Fuego including Staten Island, forms a territory with some 3000 inhabitants; capital Ushuaia (1000). In Chilean Tierra del Fuego is the small town of Porvenir, opposite Puntas Arenas (pop. with district 2000, largely Yugoslav).

R. Spears, *The Gold Diggings of Cape Horn* (1895); Conway, *Aconcagua and Tierra del Fuego* (1902); de Agostini, *Zehn Jahre im Feuerland* (1924); Koppers, *Unter Feuerland-Indianern* (1925).

**Tiers État.** See STATES GENERAL.

**Tietjens.** See TITIENS.

**Tiffin**, capital of Seneca county, Ohio, on the Sandusky River, 43 miles by rail SSE. of Toledo. It is the seat of Heidelberg College (Reformed Church; 1851), and manufactures machinery, farming implements, bricks, glass, pottery, wagons, &c. The surrounding district is rich agriculturally. Pop. 14,000.

**Tiflis** (Georgian *Tpilis*), capital of the republic of Georgia and of the Transcaucasian federation, formerly of the Russian government of Tiflis, on the banks of the Kûr, 165 miles as the crow flies ESE. of the Black Sea. Since 1883 it has been connected by rail with Batum on the Euxine and Baku on the Caspian, and is the chief centre of trade between Russia and Persia. The old city, which consisted of three distinct parts, and which traces its history as the capital of the Georgian princes back to the 5th century, has been greatly metamorphosed since the Russian occupation in 1795 and annexation in 1802. It is now divided into quarters assigned to the various nationalities, and possesses handsome public buildings, churches, schools, libraries, and observatories. A university was founded in 1918. In the middle ages the metal-workers of Tiflis were famous for their skill in engraving and inlaying, and their influence made itself felt in the brass-work of Venice; and to the present day the silversmiths and gunsmiths of the city maintain their character for excellence. Otherwise its manufactures (carpets and other textiles) are unimportant. In its neighbourhood are naphtha and thermal springs. Pop. 347,000, of whom many are Armenians. See CAUCASUS, GEORGIA.

**Tiger** (*Felis tigris*), a well-known feline Carnivore, belonging to the same genus as lion and leopard, lynx and cat, puma and jaguar. It seems most nearly related to the lion, from which it hardly differs except in superficial characters, such as the colour-stripping and the absence of a mane, and in trivial skeletal features, especially of teeth and skull. In distribution the tiger is exclusively Asiatic, and has been found 'in almost all suitable localities south of a line drawn from the river Euphrates, passing along the southern shores of the Caspian and Sea of Aral by Lake Baikal to the Sea of Okhotsk. Its most northern range is the

tigers over 10 feet long (with the tail), and weighing nearly 500 lb. The predominant colour is bright rufous fawn or tawny yellow, and is barred by dark or black cross stripes; the under parts are whitish. In details the dark markings vary considerably. The favourite haunts of the tiger are grassy plains and jungle swamps, where its colour often harmonises most deceptively with that of the surroundings. The animal takes readily to the water and swims well; it can also, if circumstances press it, climb trees. Like other Felidæ, the tiger is a solitary hunter and stalks its prey stealthily till within the fit distance for making a final spring. It feeds on cattle, deer, wild hogs, pea-fowl, &c., and some old 'man-eaters' haunt the neighbourhood of villages on the outlook for human prey. 'The man-eater,' Mr G. P. Sanderson says, 'is often an old tiger (more frequently a tigress), or an animal that, through having been wounded or otherwise hurt, has been unable to procure its usual food. It is as cowardly as it is cunning, fleeing before an armed man, between whom and a possible victim it discriminates with wonderful sagacity.' Young tigers are said to glut their taste for blood far beyond the limits of hunger, and the same is true of the mother while the young are still her companions. Sir Joseph Fayrer reports that a tiger will in ordinary circumstances destroy one or two cows or buffaloes a week, refraining from fresh attacks until it has consumed the results of one night's work. In attacking a large animal, such as a bullock, the tiger seizes the nape of the neck with its teeth, holds the victim firm with its sharp claws, and with a powerful wrench dislocates the vertebrae. From two to six cubs are born at once, and these the tigress guards, feeds, and trains with all maternal care. They remain with her until nearly full grown, or about the second year. It is said that the male tigers are eager to destroy young male cubs; and apart from this occasional cannibalism is recorded. In some parts of the East tigers are numerous enough to endanger human life very seriously; and tiger-hunting is in these conditions 'a most noble sport.'

For so-called tiger-cats see MARGAY, OCELOT, and SERVAL. The jaguar is the *tigre* of South America. Tiger-wolf is a name given to the spotted hyæna and to the Thylacine. 'Tiger-moth' is any of the Arctiidæ (whose larvæ are 'woolly bears'); and 'tiger-beetle' is a Cicindela (q.v.).

**Tiger-flower** (*Tigridia*), a genus of plants of the family Iridacææ. There are about seven known species, natives of Mexico, Peru, and Chile, all bulbous plants, generally treated as half-hardy or greenhouse plants. The flowers are few, enclosed in a spathe. The perianth has a short tube with a six-parted spreading limb; there are three stamens united in a cylinder, a three-celled ovary with a filiform style which has three

filiform bifid stigmas. The best known of the species in British gardens is *T. Pavonia*, which has been cultivated for 100 years for the beauty of its rather evanescent flowers. The flowers are orange, spotted tiger-like, hence the name.

**Tiger-lily.** See LILY.

**Tiglath-Pileser**, the name of several famous kings of Assyria (q.v.).

**Tigranes.** See ARMENIA, MITHRADATES.

**Tigré**, the northern division of Abyssinia (q.v.).

Tiger (*Felis tigris*).  
(From a Photograph by Gambier Bolton, F.Z.S.)

territory of the Amur, its most southern the islands of Sumatra, Java, and Bali.' Westwards it reaches to Georgia, and eastwards to the island of Sakhalin. 'It is absent, however, from the great elevated plateau of central Asia, nor does it inhabit Ceylon, Borneo, or the other islands of the Indo-Malayan Archipelago, except those above mentioned.' The tiger may exceed the lion in length. Adult males measure  $5\frac{1}{2}$  to  $6\frac{1}{2}$  feet from the nose to the root of the tail, and the tail measures about 3 feet. The females are rather smaller. Blandford gives authentic instances of

**Tigris** (Heb. *Hiddēkel*; *Diklat* of the cuneiform inscriptions; *Tigrā* in Old Persian, 'swift as an arrow,' whence Gr. *Tigris*; Arab. *Dijleh*), a large river of south-western Asia, rises south of Lake Goljik, in the mountains of Kurdistan, within a few miles of the eastern bend of the Euphrates (q.v.), flows south-east to Diarbekir, after which it makes a sharp turn and flows due east for 100 miles to Til. Here it receives from the north a considerable affluent, the Bitlis (united with the Bohtan Su), and once more altering its course runs in a south-easterly direction, mainly through desert wastes and unpeopled pastures, until it falls into the Persian Gulf, after a course estimated at 1150 miles. Its chief tributaries, beside the Bitlis, are the Great and Little Zab, and the Dyalā, all from the left. At Kurna it joins the Euphrates, 90 miles above the mouth of that river in the Persian Gulf, and henceforth the united rivers bear the name of Shat-el-Arab (see EUPHRATES). In the upper part of its course the Tigris is a very swift stream, and it brings down great quantities of mud. The principal places on its banks are Diarbekir, Mosul, Samarra, and Bagdad, with the ruins of Nineveh, Seleucia, and Ctesiphon. The river is navigable for small steamers to Bagdad, and for river-boats to near Mosul.—For the Bocca Tigris, see BOCA TIGRE, and CANTON.

**Tilburg**, a town of Holland, 14 miles ESE. of Breda, is an important railway junction, and has extensive manufactories of calico, cloth, leather, soap, tobacco, &c. Pop. 68,000.

**Tilbury Fort**, in Essex, is situated on the north bank of the Thames, opposite Gravesend, and 22 miles E. of London. Originally erected in the time of Henry VIII. as a block-house, it was converted (1667) into a regular fortification after the bold expedition of De Ruyter into the Thames and Medway, and has been greatly strengthened since 1861. Here on 8th August 1588, more than a week after the dispersal of the Spanish Armada, Elizabeth reviewed her troops. Extensive docks have been constructed at Tilbury since 1882. See DOCK. Pop. (urban district) 6400.

**Tilden**, SAMUEL JONES, American statesman, was born the son of a farmer at New Lebanon, New York, 9th February 1814, studied at the University of New York, and was admitted to the bar in that city, and secured a large and important railway practice. By 1868 he had become the leader of the Democrats in the state, and he strengthened his position by the energy and determination with which he attacked and destroyed Tweed and his fellows (see TAMMANY SOCIETY). In 1874 he was elected governor of New York; in 1876 he was the Democratic candidate for the presidency (for the disputed election, see HAYES), and not only won general admiration, but possibly saved the excited country from something worse than fierce wrangling, by his temperate utterances and unselfish attitude. Twice afterwards his party would have nominated him had he been willing. He died 4th August 1886, leaving great part of his fortune of about \$5,000,000 to found and endow a free library in New York City. There is a *Life* by T. P. Cook (1876), and editions of his writings and speeches by John Bigelow (1885 and 1908).

**Tiles**, plates of baked clay, of various shapes and patterns, according to their use, some being for roofs, some for facing walls, and others for pavements. Formerly, marble and stone slabs for covering roofs were sometimes called tiles. The small cubical pieces of burnt clay, stone, glass, or other material used for mosaic pavements are called *tesserae* (see MOSAICS).

The manufacture of glazed tile-work dates from the ancient Babylonian, Assyrian, and Egyptian

empires, was rather neglected by the Greeks, but was taken up extensively by the Romans especially for roof-tiles, two kinds of which were used together, one consisting of flat slabs and the other of semi-cylindrical ridges.

**WALL TILES** of a highly decorative character were made at least as early as the 12th century in Persia, and very probably for a long time before that. The manufacture was continued into the 17th century before the artistic merit of the designs declined, while the best work is probably to be seen at Isfahan. Many, if not most, of the earlier of these mural tiles have designs of a very effective but simple kind painted in enamel glazes of a coppery or dull golden colour, with sometimes a little blue or other tint added, the whole surface having a quiet but pleasing lustre. Others, perhaps a little later in date, while retaining some of this flat coppery painting, have in addition bold ornament and inscriptions in relief, further picked out from the light ground by deep blue or greenish-blue colour. The tiles of this class were of larger size, and were used for dadoes, large panels, and cornices or friezes, or a combination of both. They have generally a brilliant lustre, which varies their effect when viewed at different angles. Very beautiful wall tiles without lustre and with ornament somewhat different from the above, but still retaining a Persian character, were made at Damascus, Rhodes, and perhaps other places in the 16th century. The mosques of Damascus and other towns in the Levant, as well as those of Cairo, and buildings in Moorish Spain, contain splendid examples of wall-tile decoration; while both decorative and roof tiles were largely used by the Chinese and by the Indians, in the latter case culminating in the splendid work of the 16th and 17th centuries. Coloured tiles are also employed for covering the domes and towers of some churches in Spanish America (see, e.g., MONTEVIDEO).

**ENCAUSTIC TILES**, ornamented tiles made of earthenware and almost exclusively used for pavements, were made extensively over northern Europe from the 12th to the 16th century. Admirable examples are to be found in England, especially at Chertsey Abbey, Surrey, while Rouen and Nürnberg became famous centres of work, and later, the names of Luca della Robbia and Bernard Palissy stand out. In the 17th and 18th centuries, Delft in Holland achieved great renown for its glazed ornamental tiles, but generally speaking, after the 16th century, tiles came to be made by methods similar to those of pottery. With the revival of the industry at Liverpool in the latter half of the 18th century, and the establishment of firms like those of Minton (1844) and Maw (1850), large numbers of tiles were again produced.

Encaustic tiles are made by two quite different processes. By the older of these, which is a revival of that used in mediæval times, the clay is worked in a plastic state first into square blocks. These are cut into square slices or slabs by passing a wire through them; upon a slab so cut is put a facing of fine clay of the colour of the ground of the pattern—another layer of fine clay being added to the bottom to prevent warping. By means of metal containing-frames, fitting into each other, a plaster of Paris mould or reverse is pressed with a screw-press into the face of the soft tile, and thus indents the pattern. Clay of the requisite colour to form the pattern is now poured in a semi-fluid state into this depression, the tile being then set aside until dry enough to have its surface scraped. By this means the superfluous clay is removed, and the pattern is brought out clear and well defined, the two or more colours

of clay forming one smooth flat surface. The tile is then dried and fired.

The other process of making encaustic tiles is by the use of perforated brass plates and a screw-press (following Prosser's patent of 1840), and was patented by Boulton and Worthington in 1863. The device on the tile is first made by pressing clay dust into the perforations of a brass plate laid on a metal block; or if it is of more than one tint, then dust of two or more colours, with as many brass plates, is used to build up the pattern. The plates being removed, the clay powder which is to form the body of the tile is then filled into a mould round the device, and the whole consolidated by pressure, and fired as in the ordinary way.

See POTTERY, TERRA-COTTA; the relevant sections of the articles on the countries mentioned above; W. J. Furnival, *Leadless Decorative Tiles*; L. L. Jewitt, *Ceramic Art of Great Britain*; R. Forrer, *Geschichte der europäischen Fliesen-Keramik*; M. Shurlock, *Tiles from Chertsey Abbey*; L. Lefèvre, *Architectural Pottery* (trans. by K. A. Bird and W. M. Binns); E. Bourry, *Ceramic Industries* (trans. by W. P. Rix).

**Tiliaceæ**, a family of dicotyledonous trees and shrubs, or rarely herbaceous plants, mostly natives of the tropics, though a few are found in the temperate parts of the northern hemisphere. They have simple, alternate leaves, with stipules and axillary flowers. As the characters somewhat correspond with those of Malvaceæ, so do the properties of the family, which are generally mucilaginous and wholesome, the bark fibrous. Some species yield a light and useful timber, as the Lime (q.v.) or Linden tree. The bast of the lime-tree is valuable from its fibrous character; various Indian and American species are useful on this account, but the most important fibrous plants of the family are the species of *Corchorus*, which yield Jute (q.v.). *Spartanum africana* is a favourite hot-house shrub, with sensitive stamens.

**Till.** See BOULDER-CLAY, PLEISTOCENE.

**Tillandsia**, a genus of Bromeliaceæ, some with the general habit of the family, others that of *T. usneoides*, described in the article BROMELIACEÆ.

**Tillemont**, LOUIS SÉBASTIEN LE NAIN DE, ecclesiastical historian, was born in Paris, 30th November 1637, had his education from the Port-Royalists, and early devoted himself to historical studies. He entered the priesthood in 1676, and after the dispersion of the Solitaires in 1679 spent most of the remainder of his life on his estate at Tillemont near Paris. Here he died, 10th January 1698. His chief works are the laborious and solid *Mémoires pour servir à l'Histoire Ecclésiastique des Six Premiers Siècles* (16 vols. 1693-1712) and the *Histoire des Empereurs qui ont régné durant le Six Premiers Siècles de l'Eglise* (6 vols. 1691-1738).

**Tillicoultry**, a manufacturing town of Clackmannanshire, at the base of the Ochils and near the right bank of the Devon, 10 miles ENE. of Stirling and 4 NNE. of Alloa. Woollens have been manufactured here since the 16th century, and since 1824 also shawls and tartans, tweeds and silk fabrics. Pop. 3100.

**Tillodonts.** See EOCENE SYSTEM.

**Tillotson**, JOHN ROBERT, Archbishop of Canterbury, was born the son of a Puritan clothier, at Sowerby in Yorkshire, in October 1630. He studied at Clare Hall, Cambridge, graduated B.A. in 1650, and became a fellow the year after. The writings of Chillingworth influenced him early, not less the conversation of Cudworth, and others of his school. In 1656 he became tutor in the house of Edmund Prideaux, Attorney-general under the Protector. He is said to have received his orders from Sydserf, Bishop of Galloway,

and at any rate he was a preacher by 1661, when we find him ranged among the Presbyterians at the Savoy Conference. He submitted at once to the Act of Uniformity (1662), in December of the same year declined Calamy's church of St Mary Aldermanbury, London; but in 1663 became rector of Keddington in Suffolk, the year after preacher at Lincoln's Inn, where his mild, evangelical, but undoctinal morality was at first little relished—'Since Mr Tillotson came,' said the Benchers, 'Jesus Christ has not been preached among us.' That same year he married a niece of Oliver Cromwell, and became lecturer at St Lawrence's Church in the Jewry. In 1670 he became a prebendary, in 1672 dean, of Canterbury. Along with Burnet he attended Lord Russell on the scaffold (1683). In 1689 he was appointed Clerk of the Closet to King William and dean of St Paul's, and in April 1691 was raised to the see of Canterbury, vacant by the deposition of the Nonjuror Sancroft. He accepted this elevation with the greatest reluctance, nor could all the insults of the Nonjurors to the end of his life extort either complaint or retaliation from the meek and tolerant primate. He died of palsy, 22d November 1694. His *Posthumous Sermons*, edited by his chaplain, Dr Ralph Barker, filled 14 volumes (1694), and for them the booksellers gave the unwonted sum of 2500 guineas. A complete edition of his whole works, including 254 sermons, appeared in 3 vols. folio, 1707-12; with a good Life by Dr Thomas Birch, 1752; and an annotated selection of his sermons by G. W. Weldon (1886). The judgment of Tillotson's preaching by his contemporaries is thus summed up by Burnet: 'He was not only the best preacher of the age, but seemed to have brought preaching to perfection; his sermons were so well heard and liked, and so much read, that all the nation proposed him as a pattern, and studied to copy after him.' Dryden used to say that what talent he had for English prose was due to his familiarity with Tillotson, and Locke recommends him as a model of perspicuity and propriety in language.

**Tilly**, JOHANN TSEKLAES, COUNT OF, a famous general of the Thirty Years' War, was born in 1559, at the castle of Tilly in Brabant. Educated by the Jesuits, he learned the art of war in the Spanish service under Parma, next fought in Hungary against the Turks, and was appointed in 1610 by Duke Maximilian of Bavaria to reorganise his army. He was given the command of the Catholic army at the outbreak of the Thirty Years' War, and in conjunction with Duke Maximilian gained (8th November 1620) the battle of Prague, which dissipated the ambitious dreams of the Elector-Palatine. During the course of this war he separated, by able strategy, the armies of Mansfeld and of the Margrave of Baden, beat the latter at Wimpfen (6th May 1622), expelled Christian of Brunswick from the Palatinate, defeating him at Höchst (20th June 1622) and at the desperate struggle at Stadtlohn (6th August 1623). Created a count of the empire, he next defeated the king of Denmark at Lutter (27th August 1626), and in conjunction with Wallenstein compelled him to sign the shameful treaty of Lübeck (1629). Next year he succeeded Wallenstein as commander-in-chief of the imperial forces, and took by storm the town of Magdeburg (q.v.; 20th May 1631). The unheard-of atrocities which he allowed the Croats and Walloons of his army to perpetrate on this occasion have cast upon his reputation a foul stain not to be blotted out. From this time fortune deserted him, for his next opponent was the great Gustavus Adolphus, who completely routed him at Breitenfeld (17th September 1631); and, though in the following spring he obtained a slight success over the Swedish general Horn, the king speedily

drove him to retreat behind the Lech in Bavaria, and (5th April) forced the passage of the river right in his front, after a desperate conflict, in which Tilly received his death-wound. He was carried to Ingolstadt where he died, 20th April 1632. Tilly was small and meagre, with fierce eyes and a stern countenance, sober and continent, a despiser of luxury and wealth. His zealous support of the Catholic party was entirely founded upon fanatical zeal for the supremacy of a religion which he regarded with more than monkish devotion. See THIRTY YEARS' WAR.

**Til-seed.** See SESAME.

**Tilsit**, a town of the province of East Prussia, on the left bank of the Memel or Niemen, 79 miles N.E. of Königsberg by rail, with some miscellaneous manufactures, and an active trade in timber, corn, hemp, flax, butter, &c. Here was signed, on an island in the river, the treaty of 1807 between Alexander I. of Russia and Napoleon, which marked the lowest depth of Prussia's humiliation, and took away (till 1815) half of her territory (see NAPOLEON). Pop. 51,000.

**Timæus**, Greek historian, was born about the middle of the 4th century B.C. in Sicily, and died there about a century later. For fifty years, however, he lived and wrote in Athens, his great work being a series of *Histories* on Italy, Sicily, Greece, &c. Polybius took him to task for excessive partiality, but Cicero lauded the breadth of his scholarship, and Plutarch and others resorted to his works.

**Timaru**, a port in the south island of New Zealand, 100 miles S.W. of Christchurch. It is the centre of a fertile agricultural district producing wool, flour, and meat. Pop. 16,500.

**Timber.** *Nature of Timber.*—All species of timbers being derived from a living organism are cellular in structure, i.e. are composed of myriads of cell units, of which only the largest are visible to the naked eye. Woody tissues must, therefore, not be conceived as a homogeneous whole, even though at least some timbers present a somewhat uniform appearance throughout. The cells which constitute the tissues of a tree vary in type according to the particular service they render to the living organism. They perform, in fact, very highly specialised functions in the economy of the tree, and consequently show adaptations consonant with the work they are called upon to do. These cell units are frequently bulked under the term 'fibres,' but such a description is not sufficiently precise to convey an adequate idea of the elements of which the trunk of a tree is formed. Of the various units which are to be recognised in anything like a correct representation of the constitution of any piece of timber the following must be distinguished: (a) Parenchymatous cells; (b) tracheids; (c) fibres; and (d) vessels. As in a close examination of timber for diagnostic purposes familiarity with the minute structure is necessary, the reader is at the outset recommended to refer to the article WOOD for a description of the above-mentioned elements and of other structures of which note will have to be taken later on.

**PHYSICAL CHARACTERISTICS.** (a) *Weight.*—Notwithstanding the fact that all wood substance has a specific gravity of about 1.56, the weight per cubic foot of timbers varies within wide limits. The lightest of all weigh about 12 lb. per cubic foot or even less, while the heaviest species attain a weight of about 85 lb. The latter are so heavy that they readily sink in water, as indeed would all species were it not for the occlusion of air in their tissues. All degrees of weight between these limits are represented. It will be readily

appreciated that the weight of a variety may impose a limitation on its utility. As examples of very light timbers may be mentioned Balsa (*Ochroma lagopus*) and *Erythrina*; and of very heavy, *Lignum vitæ* and *Hardwickia binata*.

(b) *Hardness.*—Timbers also vary much in hardness. Some are so hard and intractable that they are exceedingly difficult to work, and impose a severe test on all cutting implements. This must, of course, greatly restrict their general usefulness. Others again are so soft as only to be capable of limited application. Among the very hard timbers may be cited *Lignum vitæ* and some of the Ironwoods, such as *Mesua ferrea*; and among the very soft, *Cochlospermum Gossypium* and *Bombax malabaricum*.

(c) *Grain and Texture.*—The phenomenon of grain in timber is due to a lack of homogeneity, and has reference mainly to the direction and arrangement of the tissues and the width of the annual rings. Descriptions commonly applied to it are coarse, fine, curly, twisted, straight, spiral, &c. The term has acquired a special significance in the phrase silver grain, a name applied to the figuring produced in certain timbers by the prominence, on the radial surface, of the medullary rays. One has a good example in the Common Oak (*Quercus pedunculata*). Texture should refer specifically to the elements in so far as they affect the openness or closeness of the tissues.

(d) *Colour.*—Colour is one of the most helpful features in the identification of timbers; it also often adds much to their value for furniture and ornamental purposes. Among the very beautiful timbers may be mentioned Andaman Padauk (*Pterocarpus dalbergioides*) and Mahogany (*Swietenia Mahogany*). Instances of characteristically coloured timbers are Ebony (*Diospyros Ebenum*), black; *Mesua ferrea*, port-wine hue; Padauk, rich red; *Morus alba*, yellow. Certain timbers can be distinguished from others by the solubility of their colouring matter in common solvents. Apart from their specific hues certain timbers, e.g. Common Oak, Yew (*Taxus*), &c., show a very distinct difference of colour between the inner and outer annual rings (see WOOD). The inner or more central portion of the bole, commonly darker or more deeply coloured, is known as the duramen or heartwood, and the outer or lighter coloured, the alburnum or sapwood. The normal differences between the two areas are sometimes disturbed by the growth of a fungus in the tissues, as when the natural whitish colour of the alburnum in certain conifers assumes a blue colouration.

(e) *Lustre.*—Some timbers as, for example, Sycamore (*Acer Pseudoplatanus*) are highly lustrous, while others, such as Hornbeam (*Carpinus Betulus*) and Ebony are distinctly dull. Beech (*Fagus sylvatica*) and Plane (*Platanus*) may be regarded as intermediate.

(f) *Smell.*—The odours of timbers, like their other characteristics, differ considerably. Some, like Pencil Cedar (*Juniperus virginiana*), have a very pleasant smell. Others may be described as unpleasant or even offensive, and still others as irritating to the nasal organs.

**HOW TO IDENTIFY TIMBERS.**—On the assumption that the article WOOD has been perused for descriptions of the chief components of woody tissues and their other characteristics, we shall proceed to apply this and other information for diagnostic purposes. Recognising that there are some hundreds of species used in one form or another as timber, diagnostic considerations can here only be extended to a few with a view merely to indicating essential points and illustrating methods. All timber trees are divided into two great categories, namely: (1) Dicotyledonous,

deciduous, or broad-leaved trees, which are also frequently called hardwoods. The Oak, Horse-chestnut (*Æsculus Hippocastanum*), and Poplar (*Populus*) may be instanced. (2) Ever-green, needle-leaved, or coniferous trees, also known as softwoods. Among them are Fir (*Abies*), Spruce (*Picea*), Larch (*Larix*), and Yew (*Taxus*). As is so often the case, popular nomenclature is here very unsatisfactory. All trees of group (1) do not shed their leaves annually, and so are not deciduous, neither are they all hard. Nor are all trees of group (2) evergreen or cone-bearing or even soft. With this explanation convenience must justify the employment of terms in common use.

The two great groups are readily distinguished by the simple fact that in hardwoods true vessels are always present, while in softwoods they are invariably absent. Taking first the hardwoods, the following features should be noted in a macroscopic diagnostic study: (1) General colour, appearance, weight, hardness, lustre, smell, &c. (2) Presence or absence of visible duramen. (3) Width of the albumen. (4) Presence or absence of annual rings. (5) Size, number, and distribution of the vessels—whether the vessels in the spring or early wood of each year are disposed in a ring, and how the vessels in the autumn wood are arranged, i.e. whether uniformly, radially, or tangentially, &c. (6) Breadth, number, appearance, depth, and arrangement of the medullary rays. Much information can be got by examining the tangential section. Here it will be seen that in certain species, e.g. *Pongamia*, the rays are always in definite tiers. In Mahogany they are frequently so arranged. In some species they swell perceptibly in crossing the limits of the annual rings. (7) Distribution and amount of parenchyma and prosenchyma. If individual elements are rarely distinguishable, these cells can often be differentiated in the mass, as they frequently constitute definite areas or tissues. Often, too, they have a definite relationship to the vessels, and occasionally they may be seen to alternate in tangential bands so as to give rise to 'false' rings, which must not be confused with annual rings; (8) Colour of pith and its form (round, star-like, &c.) in cross-section. In a few species, e.g. Walnut (*Juglans*), it is chambered. (9) Presence or otherwise of secretory cavities or ducts. While these features are capable of very wide application, they are not adequate for a detailed examination, in which case the use of the microscope is imperative.

As an illustration of how certain of the above characters may be used for diagnostic purposes, we may take a very simple example, based on Hartig's key, from among the commoner British timbers:

#### A. Vessels in the spring wood large.

##### i. Vessels in the autumn wood arranged radially.

(1) Some medullary rays broad—Oak.

(2) All medullary rays fine—Spanish Chestnut (*Castanea vesca*).

##### ii. Vessels in the autumn wood mostly evenly distributed—Ash (*Fraxinus*).

##### iii. Vessels in the autumn wood in concentric wavy lines—Elm (*Ulmus*).

#### B. Vessels in the spring wood neither markedly larger nor more numerous than elsewhere.

##### i. All vessels prominent—Walnut (*Juglans*).

##### ii. All vessels scarcely visible.

(1) Medullary rays numerous and broad—Plane.

(2) Medullary rays of various widths—Beech, Hornbeam, Hazel (*Corylus*).

(3) Broad medullary rays scarce or sometimes absent—Common Alder (*Alnus*).

(4) All medullary rays true but distinct—Sycamore, Lime (*Tilia*), Holly (*Ilex*).

(5) Medullary rays not visible to the naked eye.

(a) Hard Woods—Pear (*Pyrus communis*), Apple (*P. Malus*), Hawthorn (*Crataegus*), Birch (*Betula*).

(b) Soft Woods—Horse-chestnut, Willows (*Salix*), Poplars.

How the help of the microscope may sometimes be requisitioned to distinguish timbers which are almost indistinguishable to the naked eye is well illustrated by the last two genera. *Salix* and *Populus* are most easily differentiated by the fact that in *Salix* the marginal cells of the rays are distinctly deeper than the median ones, while there is not a similar difference in the case of *Populus*.

It is to be noted that the group of characters which may be important for diagnostic purposes in any particular case will depend on the types of timbers to be examined and differentiated, and in the selection of the most appropriate of these to each group of timbers the student will find ample scope for ingenuity. So far as the diagnostic study of coniferous timbers can be prosecuted macroscopically, the points to note are: (1) Presence or absence of differentiated duramen. It is present in most conifers, but absent in *Abies* and *Picea*. (2) Colour of duramen. (3) Width of albumen. (4) Presence or absence of resin ducts. They are present in *Pinus*, *Larix*, *Picea*, and *Pseudotsuga*, but normally absent in all other genera, except perhaps in the first annual ring of *Sequoia*. (5) How resinous the wood is and the colour of the resin. (6) Hardness, weight, and texture. (7) Distribution of knots. They are, according to the genus, either scattered (*Larix*) or in whorls (*Pinus*).

In the case of coniferous timbers microscopic examination is essential in the differentiation of most genera, and should be directed to ascertain: (1) Whether there are tracheids in the medullary rays, as in *Pinus*, &c., or not, as in normal *Sequoia*, &c. (2) The form, size, and number of the pits in the parenchymatous cells of the rays. They are very large in most Pines, and small in Larches, Cedars (*Cedrus*), &c. (3) Whether there is spiral thickening on the walls of the vertical or wood tracheids, as in *Taxus*, *Pseudotsuga*, &c., or not, as in *Abies*, *Sequoia*, &c. (4) What the size and distribution of the bordered pits in the vertical tracheids are. They are, for example, small and grouped in *Dammara* and *Araucaria*. (5) Whether there is any special marking on the torus of the bordered pits of the wood tracheids as in *Cedrus*, where it presents the appearance of a miniature circular saw, and suffices to distinguish this genus. (6) Whether vertical parenchymatous cells are present. (7) Whether there are resin ducts in the wood. (8) The distribution of resin and resin cells. (9) The depth and form of the medullary rays, i.e. whether they are multiseriate or several cells wide, or uniseriate.

SOURCES AND SUPPLIES OF TIMBER.—Although it is difficult to estimate the amount of home-grown timber used for estate purposes, building, pitwood, &c., in the United Kingdom, it is relatively insignificant compared with the import trade. The extent of this overseas trade in timber is not generally realised, and though during the last few years the money value of imported timber has shown a progressive diminution, yet in 1926 its value reached the fabulous sum of close on £40,000,000. In the government publication, *Accounts relating to Trade and Navigation of the United Kingdom for each Month during the Year 1926*, particulars are given of the importations of timber into Great Britain, Northern Ireland, and the Isle of Man. In it Mahogany is classed by itself without any indication of the sources of supply being given, but its total amount was 4,275,562 cubic feet, and its value £1,259,131. So far as the source is specified, the chief supplies of the other timbers came from the following countries, arranged in decreasing order of quantities imported:

*Heavy Hardwoods*....U.S.A., Canada, Finland, British East Indies, Russia.

<i>Hewn Softwoods</i> .....	Russia, Finland, U.S.A., Sweden, Norway, Canada, Germany.
<i>Sawn Hardwoods</i> ....	U.S.A., Canada, British East Indies, Finland, Poland, Japan.
<i>Sawn Softwoods</i> .....	Finland, Sweden, Russia, Poland, Latvia, Canada, U.S.A., Norway, Germany.
<i>Planed or Dressed</i> ....	Sweden, Norway, Finland, U.S.A., Germany.
<i>Pitwood</i> .....	France, Finland, Sweden, Norway, Portugal.

The following were the total quantities of various classes imported during the year 1926, together with their total values:

	Cubic Feet.	Total Value.
<i>Hardwoods (Hewn and Sawn)</i> ...	81,054,194	£7,944,049
<i>Softwoods (Hewn and Sawn)</i> ....	253,492,285	22,961,463
<i>Planed or Dressed</i> .....	80,260,450	8,465,741
<i>Pitwood</i> .....	79,195,950	2,990,886
<i>Other Descriptions</i> .....	16,759,300	1,906,787

**USES OF TIMBER.**—It is questionable whether any material or natural product has been applied to the service of man so universally or for so many purposes as has wood. It was the fuel of primitive man, and early in his career he used it extensively in hunting and warfare. It is still very largely so used, though in a modified form. Modern man begins the day by using wood as fuel, and ends it, as likely as not, in a wooden bed. He sits on wooden chairs; his tables are manufactured from it, and his houses are largely or wholly built of it. A not inconsiderable proportion of ladies' footwear and a very appreciable amount of artificial silk is now manufactured from the same raw material. Paper is also made in large quantities from it. Ships, in great part, are made from it; and so it plays a large and indispensable part in world commerce. Carts, carriages, bodies of motor-cars, parts of machinery, tools, and various implements are derived wholly or in part from the same source. Much of the best in art has been enshrined in it, and nothing lends itself better for decorative purposes. It also contributes extensively to the lighter side of life, being equally indispensable to our games as to the more serious pursuits of life, and we need it for the manufacture of our hockey sticks, cricket bats, racquets, skittles, cues, &c. With such a formidable catalogue of uses, it would be impossible here to do more than touch the fringe of this aspect of the subject.

The particular characteristics of a species largely determine its special uses; and one may ask what some of the factors are, other than supply and cost, which determine the uses to which various woods or individual specimens are put. The following are a few:

(1) *Conditions of Growth.*—Soil, climate, denseness of the forest, and other conditions to a large extent affect the quality and the appearance of timbers. A slow-grown oak, or other broad-leaved timber with a pore-ring, is not so heavy as a wide-ringed specimen, nor so durable.

(2) *Colour.*—Colour is, of course, an exceedingly important consideration in relation to furniture manufacture and ornamental work. The particular hue of a species and the distribution of the colour have a great bearing on its utilisation.

(3) *Arrangement of Tissues.*—This is what largely determines the type of figuring in a board—a factor to be considered in many kinds of work.

(4) *Weight.*—This is a character of paramount importance in certain cases, such as aeroplane construction, where lightness must be combined with strength. The necessity for this combination for so many purposes has resulted in the manufacture of ply-wood for innumerable applications.

(5) *Toughness.*—For cogs of wheels, &c., toughness is an essential feature; it is found, for example, in hornbeam.

(6) *Elasticity.*—This quality is necessary for the handles of certain tools and for shafts of vehicles, and we get it in our native ash.

(7) *Position in a Piece of Furniture or other Work.*—It is clearly not so essential to use such high grade timber for parts which are concealed as for those which are exposed.

(8) *Burrs.*—Burrs on certain trees are highly prized by cabinet-makers.

(9) *Bird's-eye Figure.*—This arises from local, sharp depressions in the outline of the annual rings. In tangentially-sawn timbers and rotary veneers these produce a series of ringlets which to the imaginative mind suggest so many birds' eyes.

The following are the chief uses to which the principal indigenous and a few of the better known exotic timbers are put:

#### HARDWOODS.

American or Canary Whitewood (*Liriodendron Tulipifera*)—Veneer, panels, and general cabinet work.

Andaman Padauk (*Pterocarpus dalbergioides*)—Furniture, parquet floors, railway carriages, decorative work, panelling, &c.

Ash (*Fraxinus excelsior*)—Tool-handles, shafts, and other parts of vehicles, cabinet work, oars, horizontal bars, and other purposes for which elasticity is desirable, as in athletic appliances.

Beech (*Fagus sylvatica*)—Tool and implement handles, brush backs, boot heels, lasts, boot trees, piles, treads of stairs, parts of chairs.

Ebony (*Diospyros Ebenum*)—Turnery, cabinet work (often with ivory and other inlays), brush backs, &c.

Elm (*Ulmus* spp.)—Coffins, chairs, wheels, weather-boards, &c.

Greenheart (*Nectandra Rodioei*)—Piles, bridges, shipbuilding, dock gates, jetties, fishing-rods, &c.

Hornbeam (*Carpinus Betulus*)—Cogs, mallets, agricultural implements, and carriage-making.

Jarrah (*Eucalyptus marginata*)—Shipbuilding, piles, dock gates, furniture, panelling, buildings, paving blocks, telegraph poles, &c.

Lignum vitae (*Guaiacum officinale*)—Pulley blocks, rollers, batons, bowls, croquet mallets, lining of axle cylinders, &c.

Mahogany (*Swietenia*\*)—Furniture, panelling, bank counters, decorative work, &c.

Oak, Common (*Quercus pedunculata*)—Shipbuilding, furniture, structural work, vehicles, wainscoting, fencing posts, &c.

Spanish Chestnut (*Castanea vesca*)—Structural work, fencing posts, piles, hop poles, &c.

Sycamore (*Acer Pseudoplatanus*)—Butter prints, rolling-pins, mangle rollers, bread platters, cabinet work, turnery, calico-mill rollers, &c.

Teak (*Tectona grandis*)—Shipbuilding, railway carriages, garden seats, gates, tops of chemical (laboratory) benches, &c.

Walnut (*Juglans regia*)—Gun stocks, aeroplane propeller blades, furniture, decorative work, veneer, &c.

#### SOFTWOODS.

Californian Redwood (*Sequoia sempervirens*)—Panelling, furniture, and various types of joinery.

Douglas Fir or Oregon Pine (*Pseudotsuga Douglasii*)—Masts, flagstaffs, structural work (including indoor fittings), benches, flooring, &c.

Kauri Pine (*Dammara* or *Agathis australis*)—General joinery and decorative work.

Larch, Common (*Larix europaea*)—Gates, fencing material, sleepers, piles, pit-props, scaffold and wireless poles, &c.

Pitch Pine (*Pinus palustris* or *P. australis*)—Piles, panels, staircases, furniture, pews of churches, structural work, posts, masts, &c.

\*Of the genus *Swietenia*, some five species are known whose timbers are indistinguishable. The product of several other genera is sold in commerce as mahogany.

**Scots Pine (*Pinus sylvestris*)**—Though indigenous, the chief supplies are imported from the Baltic under the name of Baltic Redwood or Yellow Deal. Match-boarding, flooring, and other building work, masts, pit-props, telegraph poles, fencing, railway sleepers, &c.

**Spruce, Common or Norway (*Picea excelsa*)**—Largely imported from North and Central Europe as White Deal or Baltic Whitewood. Paper pulp, scaffold poles, flooring, match-boarding, and other internal work, &c.

**Weymouth or White Pine (*Pinus Strobus*)**—Known in Britain also as Yellow Pine. Much used for interior work in buildings, decks and other flooring, matches, &c.

**SAWING OF TIMBER.**—There are two fundamental directions in which timber is sawn for boards. It may be sawn either tangentially or more or less radially (see Diagram). Timber sawn in the former direction has been variously called plain-sawn, flat-grained, or bastard lumber, while timber sawn in the direction of the rays is de-

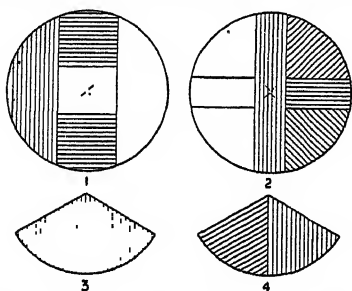

Diagram showing various methods of sawing timber: 1, tangential sawing; 2-4, quarter sawing.

scribed as radially-cut or quartered. In appearance, boards cut in these two directions respectively usually differ greatly. These differences are due to the heterogeneity of the wood structure. In the case of many conifers, especially those with a distinctly marked autumn wood, the appearance is enhanced by sawing tangentially, for in such a case the saw in passing repeatedly from one annual ring to another exposes a surface beautifully marked by an effective alternation of deeply-coloured, dense autumn wood with more open and less resinous spring wood. In many hardwoods, however, the radial section presents a more fascinating aspect, for where the rays are deep and prominent they often add much to the appearance of a board. Oak, e.g., has its beauty much enhanced by the exposure of its medullary rays or silver grain. The rays are beautiful, not merely because they are conspicuous, but also because they differ in colour from the surrounding tissue. For æsthetic reasons there should be a reasonable amount of silver grain showing in the exposed portions of oak furniture. Other factors, however, must be considered in the economic utilisation of a log. It is, e.g., obvious that radial sawing must entail a greater wastage in conversion. One other disadvantage of quartering is that knots when present are cut lengthwise, being 'spiked' rather than round as is the case in a tangential board.

**SEASONING OF TIMBER.**—Seasoning of timber is practised to reduce the cost of handling and transport, to obviate shrinkage and warping after utilisation, to increase its strength, and to minimise danger and loss from the growth of fungi. Timber may be seasoned either

(1) *Naturally*, in which case it is simply stacked in the open or in a semi-open shed, so as to allow free access of air without the aid of artificial heat. In this way it loses a large amount of moisture,

and it is thoroughly air-dried when under favourable conditions of seasoning it ceases to give off moisture.

(2) *Artificially*, when it is enclosed in a dryer for the application of artificial heat. The period of seasoning is thus shortened, and with proper precautions it is claimed that the results may be even more satisfactory than when the seasoning is effected by natural means. This method is now extensively employed. It has the further merit of allowing control of the conditions.

(3) By a combination of methods (1) and (2).

Messrs A. L. Howard and S. Fitzgerald, writing in 1920 on the subject of artificial seasoning, express themselves as follows: 'Relatively little artificial seasoning has formerly been effected in Great Britain, owing to general prejudice and the lack of urgent necessity. Impelling national need during the war caused the process to be then taken up scientifically, and the timber so treated was found to pass the most stringent tests. In the future, those timber merchants and timber users who continue to ignore this factor will be at a great disadvantage in the commercial field compared with those who in a vigorous and enlightened spirit embrace the most modern methods of seasoning their timber; while it must be remembered that competition will not be confined to this country, but will also include the progressive continental peoples.'

**ROTTING OF TIMBER.**—Decay of timber is entirely attributable to living agencies. If kept in the forest too long after felling, especially with the bark on, boring insects and saprophytic fungi may cause serious damage by reducing the value of the converted timber and restricting its uses. Nor is this the only danger to which timber may be subjected. If after conversion it is kept in carelessly-managed or infected yards, or be used in damp, unventilated places, there is grave danger of the development of fungi, which eat into the substance of the wood, destroy its tissues, and greatly reduce its value, or even render it entirely worthless and a danger to other stocks or wooden structures in its vicinity. An instance of such destruction is that due to dry rot, which is to be assigned to the fungus *Merulius lacrymans*. This is perhaps the most familiar example of a wood-destroying fungus, but there are numerous others.

In view of the danger and loss arising from this source it may be well briefly to mention the essential conditions for the growth and development of these disintegrating agencies. Four conditions must be satisfied. There must be a suitable temperature and a sufficiency of air, water, and food. If the temperature be too high or too low, then the fungus, if not killed, becomes dormant, and simply awaits a suitable opportunity for renewing its growth and extending its destruction. If air is completely excluded the fungus cannot thrive, but such a condition is only rarely attained, as when timber is completely immersed in water and has become water-logged or is buried sufficiently deep in clay soil. Similarly, if there be an inadequacy of water danger is eliminated. As to suitable food, even when the starch and other substances in the plant cells have been exhausted, there remain the woody tissues themselves, which provide the necessary pabulum for many wood-destroying organisms. To illustrate how the conditions specified operate, one may take the familiar example of the fencing-post. It is well known that such a post usually decays quickest at the junction of air and earth. Well above ground even after rain the post soon dries, and so resists decay. Below the ground it is kept more constantly wet, and air, especially in damp soil, is more effectively excluded. Just at the ground-level there is an abundance of both air

and water to meet the requirements of growth, and it is here, where all the conditions are most completely satisfied, that rotting most rapidly takes place. The practical bearing of these considerations in constructional work is important. There is little danger, e.g., to the general woodwork of a house and its furniture if the timber used is sound and has been sufficiently dried before use, so long as proper ventilation is ensured to prevent the accumulation of moisture. This need applies especially to flooring and such part of the woodwork as is in contact with the masonry. From the neglect of such elementary precautions dire results often ensue.

**PRESERVATION OF TIMBER.**—The preservation of timber by chemical agencies has been much extended in recent years. It has resulted not only in lengthening the life of higher grade timbers, but has also enabled inferior and less durable types to be used for purposes to which untreated they are regarded as unsuited. It has thus effected a great and much needed conservation of timber when available supplies are in many countries being rapidly exhausted. Among the early attempts at preserving timber may be mentioned painting, tarring, and carbonising or charring. Painting and tarring are effective for many purposes, assuming that the wood is properly seasoned at the time of the first application, that the paint is applied at frequent intervals, and that care is taken to seal joints, &c., so as to prevent the reabsorption of moisture and accessibility of damp air. If the wood be not dry, painting and tarring retard the evaporation of moisture. According to recent American tests, charring of poles and posts has proved ineffective.

Other methods employed may be classified as follows, according to the nature of substances used :

**A. Inorganic Substances.**—These are water-soluble.

- (1) *Kyanising*, by which is meant the treatment of wood with mercuric chloride (corrosive sublimate). This substance, while very toxic to micro-organisms, has the serious drawback of being very poisonous also to animal life and dangerous to handle. It, moreover, attacks iron.
- (2) *Burnettising*. Here zinc chloride is substituted for corrosive sublimate. In America this is the most commonly used of the inorganic substances. Its effect on iron is less than that of mercuric chloride.
- (3) Other processes involve the use of
  - (a) *Copper sulphate* (bluestone). It attacks iron.
  - (b) *Sodium fluoride*, which is apparently effective but costly.

**B. Organic Substances.**

- (1) *Powellising*, which is the name given to the process of boiling timber in a saccharine solution without pressure and drying at a high temperature. It is seemingly effective.
- (2) *Creosoting*, which involves the use of products derived from the distillation of tar from various sources—coal, wood, and petroleum. Of the three types, coal-tar creosote is the one most generally used.

The simplest practice in preserving wood entails steeping or coating only, but other processes involve more elaborate procedure and various practical expedients to ensure the proper penetration of the preservative.

**Timbrel** (Spanish *tamburil*), a small musical instrument, in use in ancient times, notably by

Miriam after the passage of the Red Sea, which was carried in the hand, and was apparently quite similar to the modern Tambourine (q.v.).

**Timbuktu** (native *Tumbutu*, Arab. *Timbukhtu*, French *Tombouctou*), a famous city of Sudan, on the southern edge of the Sahara, lies about 8 miles north of the main stream of the Niger. It stands only a few feet above the level of the river, is about 3 miles in circumference, and at present without walls, though in former times it covered a much greater area, and was defended by walls. The houses are mainly one-story mud-hovels, but one of the three chief mosques is a large and imposing building, dating from 1325. The place stands on an important trade route between the interior and the west and south ; and its importance has increased through the gradual extension of French influence hither (see **SENEGAMBIA**). Articles of trade are gold-dust, salt, kola-nuts, ivory, gums, ostrich-feathers, dates, and tobacco, exchanged for Manchester goods, mirrors, knives, tea, coral, &c. The town stands on the borders of various tribes and kingdoms—Sonrhaj, Berbers, Tuaregs, Fulahs, Mandingoes, &c. ; and amongst the 5000 inhabitants of the place all these are represented, with Arabs, Arabised Africans, and Jews. Timbuktu was apparently founded in the 11th century, and first became known to Europeans in the 14th (Ibn Batuta was there about 1350) ; it had been visited by but six or seven Europeans, including A. G. Laing in 1826, Barth in 1853, Lenz in 1880, when it was occupied by the French in 1894. It has been besung by Tennyson and Thackeray. See **SAHARA**.

**Time.** The earth's axial rotation is the phenomenon by which time is measured everywhere on the earth's surface (see **DAY**). Experiment and observation show that, if we assume the earth to rotate uniformly, there are many other phenomena which are as accurately isochronous in their periodicity. That is to say they pass again and again through all their phases in exactly the same interval of time as measured in terms of the earth's time of rotation. In the pendulum of a clock and the balance-wheel of a watch we have such isochronism very approximately realised (see **HOROLOGY**). A little consideration will convince us that the measurement of time is really a comparison of periodic sequences. We cannot conceive any other mode of marking off time intervals than by some kind of motion of a periodic character. Our practical unit of time is essentially terrestrial. We may, however, measure time in terms of a unit which could be as easily defined anywhere in known space as on the surface of our earth. The periodic time of a particular ray of light emitted by a universally distributed substance like hydrogen would be such a cosmic unit.

It has been long the custom among civilised races to divide the day into twenty-four hours, or rather into two sets of twelve hours, mean solar time (see **DAY**). Twelve o'clock noon corresponds to the meridian passage of the *mean* sun ; and each day begins at twelve midnight. Now as we pass westwards the instant at which the sun crosses the meridian occurs later and later, as measured on a clock keeping, say, Greenwich time. That is, the noons at two places not situated on the same longitude line occur at different instants. Thus the local time of Glasgow is 17 min. 10 sec. later than that of Greenwich. Till the end of the first half of the 19th century local time was largely used in Great Britain. When railways were introduced some places kept 'railway,' i.e. Greenwich, time and others local time. For instance, in 1859 a defendant in a lawsuit at Dorchester arrived at the court at the time fixed for its opening, and

found the case given against him because the court had used Greenwich time while he had used local time. He was granted a new trial, the Court of Exchequer holding that local time was legal time. It was not till 1880 that the Definition of Time Act was passed making Greenwich time the legal time for Great Britain.

After transcontinental railways had been constructed in Canada and the United States it became necessary to co-ordinate the time kept in North America. Time differing by an exact number of hours from Greenwich time was introduced, the whole country being divided into zones 15° in width with the meridians of 75°, 90°, 105°, 120°, &c., in the middle of the zones—the time kept in the several zones differing exactly 5 h., 6 h., 7 h., 8 h., &c., from that at Greenwich. The adoption of zone time throughout the world was largely advanced by an international conference at Washington in 1884 which, with some dissentients, recommended the adoption of Greenwich as Prime Meridian. At a conference held in Paris in 1912 the use of Greenwich time was recommended for time signals sent by wireless telegraphy. At the present time, with very few exceptions, time differing by an exact number of hours or half-hours from Greenwich is used by all civilised countries.

For some purposes it is convenient to count the hours of the day from 0 to 24 and not from 12 to 12 twice. In this case the day begins at midnight, and 16 h. (e.g.) denotes 4 o'clock in the afternoon. Astronomers had for long used a 24-hour day beginning at noon, but in 1925 changed the beginning of their day to midnight so as to be in conformity with civil practice.

Time is earlier or later than Greenwich according as the locality is east or west of Greenwich. Thus places lying close together but on different sides of the longitude line of 180° differ nominally by a whole day in time. Sunday at the one place occurs simultaneously with Monday at the other. A vessel sailing eastwards across the Pacific has two consecutive days of the same name as it crosses the critical meridian, or in other words has one day of nearly 48 hours' length. On the other hand, a vessel sailing westwards in the same longitude drops a day. Until a few years ago the Philippine Islanders held their Sunday on the day which was Monday to the inhabitants of Borneo. This arose from the historic fact that the Philippines were discovered by the Spanish voyagers coming from the east round Cape Horn; whereas Borneo was discovered by the Portuguese coming from the west. The matter is put most simply thus: To the eastward-bound traveller sunrises come at shorter intervals than to the stationary observer, while to the westward-bound traveller they come at longer intervals. Thus after one complete circuit the former traveller has experienced one sunrise more, and the latter one sunrise less, than has the stationary observer in the same lapse of time.

When it is twelve o'clock noon, Greenwich mean time, the hour (local time) at various important places on the globe is as follows:

Auckland, N.Z. 11 h. 39 m. P.M.	New York..... 7 h. 4 m. A.M.
Bombay..... 4 51 P.M.	Paris..... 0 9 P.M.
Calcutta..... 5 58 P.M.	Peking..... 7 46 P.M.
Cape Town..... 1 14 P.M.	Quebec..... 7 15 A.M.
Dublin..... 11 35 A.M.	St Petersburg. 2 1 P.M.
Edinburgh..... 11 47 A.M.	San Francisco. 4 23 A.M.
Melbourne..... 9 40 P.M.	Sydney..... 10 5 P.M.

**Times**, THE, is a London daily paper, frequently spoken of as the leading journal of the world. It was established in 1788 (see NEWS-

PAPERS). The founder, John Walter (1739-1812), was not a printer or journalist by profession, but an underwriter at Lloyd's who had made a fortune and lost it in consequence of the capture by a French squadron of a fleet of merchantmen on which he had taken a large risk. In 1803 the management of the paper was transferred to John Walter (1784-1847), the son of the founder, a man of exceptional talent, energy, and enterprise. He refused to accept the foreign news offered him by the government, and organised a system by which intelligence from abroad was more correctly reported and more rapidly transmitted to London than it ever previously had been. The capitulation of Flushing, the victory of Waterloo, and many other important events were made known to the English public before the arrival of government despatches. The *Times* earned a high reputation for independence by the opposition it offered to the ministry of Pitt. Walter, after overcoming difficulties which would have disheartened most men, succeeded in 1814 in printing the *Times* by steam, a most important event in the history of PRINTING (q.v., p. 389). In 1816 Thomas Barnes (1785-1841) became editor. As a leader-writer he was assisted by John Sterling, 'the thunderer.' Barnes's successor was John T. Delane (q.v., 1817-79), then a young man fresh from Oxford. The new editor wrote no articles, but he read all important matter printed for publication; and one of his chief tasks during the thirty-six years of his editorship was to make the leaders of able specialists reflect the ideas, tone, and language of the best London society. It was he chiefly who obtained for the *Times* leaders the reputation of being models of English style. In 1847 John Walter (1818-94), third of the name, for twelve years member for Nottingham, and then from 1859 till 1885 for Berks, succeeded his father as proprietor. He inherited the enterprising spirit of his family. In his time the railway and electric telegraph revolutionised newspaper management, and no journal so rapidly and successfully adapted itself to the new conditions as the *Times*. The most prominent assistant of Walter in this work was John Macdonald (1822-89), for many years manager of the paper. He combined literary ability, business experience, and great administrative capacity with high inventive talent as a mechanical engineer. Under his able guidance, and at enormous expense, experiments were conducted which brought to perfection in 1860 the art of printing from stereotypes, and in 1866 'the Walter press' (see PRINTING, p. 390). In many ways the *Times* has won the confidence of the mercantile public. In 1841 it was the means of detecting a conspiracy by which London bankers would have been defrauded to the amount of one million sterling, but it had in consequence to defend an action at law. The merchants and bankers of London raised a sum to pay the costs, which, on their offer being declined, was employed to found two scholarships at Oxford and Cambridge. A notable event in the history of the paper was the 'Parnellism and Crime' articles (see PARNELL, p. 778). Delane was succeeded as editor by Thomas Chenery (1826-84; in 1868 appointed professor of Arabic at Oxford), and he on his death by Mr George Earle Buckle (b. 1854). Mr Buckle resigned in 1912, and Mr Geoffrey Robinson, afterwards Dawson (b. 1874), was editor till 1919, and again from 1923, Mr Wickham Steed (b. 1871) having been editor in the interval. A weekly issue was begun in 1877; *Law Reports* in 1884 and a *Literary Supplement* in 1897 (modified in 1901). There are several other supplements and indexes. But since 1895 the *Times* 'has invaded several new fields of enterprise' and issued

atlases, a gazetteer, a reprint of the 9th edition of the *Encyclopædia Britannica* (with supplement), and war histories; besides founding a book club and maintaining a vehement controversy (1905-6) with publishers and booksellers about the early sale of second-hand library volumes. In 1906 the proprietors formed themselves into a limited liability company. See NEWSPAPERS.

**Timgad.** See THAMUGAS.

**Timoleon**, born of a noble family of Corinth at the end of the 5th or early in the 4th century B.C., was in 344 sent to Sicily at the prayer of the Greek cities there to save their liberties and repel the Carthaginians. He landed at Tauromenium, overthrew Hicetas, tyrant of Leontini, who was striving to drive Dionysius out of Syracuse, and by 343 had possession of Syracuse itself. Hicetas now induced the Carthaginians to send a huge army into the island, but Timoleon marched to meet them with 12,000 men, and routed them though seven to one on the river Crimissus (339), the gods themselves showing him signal favour by driving a blinding hail-storm right into the faces of the enemy. The Carthaginians were now fain to make a treaty by which they confined themselves to the west of the Halycus. He next drove out all the tyrants, and restored their freedom to the Greek cities of Sicily, then settled quietly as a private citizen in Syracuse, enjoying the love and admiration of the whole Greek world until his death in 337. Holm, the German historian, calls Timoleon the Garibaldi of antiquity; and the comparison does justice to his daring, his honesty of purpose, and his force of character, hardly to his wisdom and political foresight. His story was written by two contemporary writers, Timæus and Theopompus, who supplied the materials alike to the extant works of Diodorus Siculus and Plutarch. The latter's life is one of his masterpieces. An excellent edition is that by Dr Holden (Camb. 1889).

**Timon**, the misanthrope, was a native of Athens, and a contemporary of Socrates. The little that is known concerning him is learned chiefly from Aristophanes and the other comic writers who attacked him. Disgusted with mankind on account of the ingratitude of his early friends and companions, he lived a life of almost total seclusion from society, his only visitor being Alcibiades. Lucian made him the subject of a dialogue; but his name survives best in Shakespeare's play, the basis of which was the version of the story given in Painter's *Palace of Pleasure*.

This Timon must be distinguished from Timon the *Sillographer*, a Greek poet and philosopher, who was a scholar of Pyrrho, flourished about 280 B.C., lectured at Chalcedon, and spent his latest years at Athens. There are extant some fragments of his *Silloi*, a series of sarcastic hexameters upon Greek philosophers.

**Timor**, the most important of the chain of islands that stretches eastward from Java, has a length of 300 miles, an area of 12,264 sq. m. A chain of wood-clad mountains runs throughout its entire length; one peak, Allas, near the south coast, being 11,500 feet in height. It is less volcanic than its smaller neighbours of the Sunda group, but it contains some quiescent or extinct volcanoes. Magnetic iron, porphyry, gold, copper, and sulphur are found. Otherwise the natural wealth of the island is not great, the comparatively dry climate producing a much less luxuriant vegetation than in Java. The exports are coffee, copra, maize, sandalwood, wax, tortoiseshell, and trepang. Separated from the Australasian region by the Arafura sea, the island shows few Australian

types amongst its fauna and flora, which resemble those of Java, Celebes, and the Moluccas. The population is mainly Papuan, mixed with Malay and other elements. The smaller western portion belongs to the Dutch, with its capital at Kupang; the eastern part with a north-western exclave is Portuguese, capital Deli or Dilli; but native chiefs really govern the island.

**Timor-Laut**, or TENIMBER, a group of three islands, east of Timor, extending about 100 miles in length, and 2263 sq. m. in area. Unlike Timor, these islands are mainly coralline and correspondingly low-lying, though there is one extinct volcano 2000 feet high. Fauna and flora partake of Malay and Australasian characters. The natives are of Papuan stock. The islands belong to the Dutch residency of Amboyna.

**Timotheus**, Athenian general and soldier of fortune, son of Conon, held frequent commands (378-356 B.C.) in various wars of Athens against Sparta, Thebes, &c. He died at Chalcis in 354.

**Timotheus** OF MILETUS (c. 446-357 B.C.), Greek poet, known from Plutarch to have written *The Persians* for performance with the lyre. A papyrus dating from c. 350 B.C. (the oldest Greek MS. extant) was found at Abusir. This fragment of 320 lines of dithyrambic poetry was edited by Wilamowitz-Möllendorff (1903).

**Timothy and Titus**, THE EPISTLES TO. The two epistles to Timothy and the epistle to Titus are generally known as 'The Pastorals,' because they contain advice on the discharge of the pastoral office, the work of the ministry, and the management of the Church.

These epistles are ascribed by tradition to St Paul, but modern criticism since the time of Schleiermacher has called this theory into question. There are many grounds upon which doubt has been cast on the Pauline authorship. (1) The external evidence for the pastorals is weaker than in the case of the other Pauline epistles. We have no testimony to the Pauline authorship before 170. They are omitted by Marcion from his canon of the New Testament, and 1 and 2 Timothy were rejected by Tatian. Marcion and Tatian were, however, heretics, and their judgment may have been affected by their own theories. (2) The linguistic phenomena of the epistles seem to conflict with the Pauline authorship. The epistles contain a very much larger number of *hapax legomena*, i.e. words not found elsewhere in the New Testament, than the other writings of St Paul. No less than 171 words out of a total of 897 are peculiar to the pastoral epistles. More important still is the variation in the construction of sentences. The favourite Pauline connecting particles are almost entirely absent from these epistles, a fact which Marcus Dods regards as 'staggering.' The style and vocabulary of the epistles have much more in common with the patristic writers of the 2d century than with the accepted Pauline epistles. Evidence such as this cannot be lightly set on one side. (3) The historical situation implied in the pastorals cannot be fitted into the scheme of Paul's life as it is sketched in Acts. The epistle to Titus, for instance, records a visit of Paul to Crete, for which there is absolutely no room in the narrative of Acts. The only possible theory upon which the Pauline authorship can be maintained is the supposition that Paul was released after his first imprisonment at Rome, that he went upon further missionary expeditions, and that at the time when the pastorals were written he was in prison at Rome for the second time. There is some amount of support for this hypothesis in the statements of Clement of Rome, the Muratorian Fragment, Chrysostom, and Jerome,

but the evidence is by no means decisive. (4) The theological outlook of the epistles is different from that which we find in the accepted epistles of St Paul. As Sabatier says: 'With the Epistle to the Philippians the living progress ceases; with the pastoral letters the conservative tradition begins. Paul's doctrine is there; but the soul which sustained and vivified it appears already to have left it. . . . We have reached a point of arrest.' 'The writer of the Pastorals,' says Moffatt, 'presents the nucleus of the creed in technical, crystallised phrases, partly rhythmical, partly stereotyped in prose aphorisms, and the outcome is a piety nourished on "good works," with conceptions of reward, a good conscience, and reputation which are stated with more emphasis than Paul would have allowed' (*Introduction to the New Testament*, p. 411). Faith, for instance, is very often used in the objective sense of the *fides quæ creditur*, and refers to the object of belief or creed. (5) The references to the heresy attacked in the pastorals seems to point to a movement which belongs to the 2d century rather than the 1st. The writer, for instance, describes it as 'gnosis falsely so-called' (1 Tim. vi. 20), and alludes to its 'fables and endless genealogies,' a phrase which very aptly describes the later Gnostic systems. Moreover, the polemical method of the author of the pastorals is, as McGiffert has shown, different from that of Paul. 'Instead of demonstrating the falseness of the positions taken up by the heretics, he simply denounces them. . . . The spirit that actuates the pastorals is not the spirit of Paul, but the spirit of 2 John and Polycarp.' (6) The organisation of the Church, implied in these epistles, bears the mark of a later date than the lifetime of the apostle Paul. The Church is conceived not so much as 'the body of Christ,' as in the accepted Pauline epistles, but rather as 'the pillar and ground of the faith' and the guardian of sound doctrine. Great stress is laid upon the appointment of a properly authorised ministry. Elaborate directions are given as to the qualifications necessary in bishops or elders and deacons. It must be admitted, of course, that the organisation falls short of the Ignatian recognition of the 'three orders' of the Christian ministry; but still the epistles leave upon the mind of the reader the feeling that, in the words of Moffatt, 'the unwonted attention paid to the official organisation of the Church marks a development from that freer use of spiritual gifts by the members which Paul never ignored.'

Each of these arguments, taken by itself, can be met, or, at any rate, can be proved to be too weak to carry with it the *onus probandi*—but the cumulative effect of the arguments taken as a whole seems to point decisively against the Pauline authorship, though it must be admitted that the verdict of modern scholarship is not unanimous, and that even so advanced a New Testament critic as Kirsopp Lake is still inclined to admit the possibility that these epistles came from the hand of St Paul. What seems to be the most probable solution of the problem is this: In their present form the pastoral epistles are the work of a 2d century writer, who was very anxious to conserve the orthodox faith of the Church against heresy, and to guard its ministry against corruption and deterioration. He used as a basis certain genuine notes of Paul, written during the course of his missionary travels. These notes are embodied in Titus, iii. 12-14; 2 Tim. iv. 9-12, 14-17, 20-21. Probably also the pastorals included a farewell letter written by Paul, fragments of which are found in 2 Tim. i. 1-5, 16-18, and possibly in some further verses in chapters ii, iii., and iv. The writer worked up this genuine Pauline material, and added to it the passages in which

he urged the Church of his own day to be faithful to the teaching of the great apostle, and to keep itself free from the taint of heresy.

The best modern discussion of the problem of the pastorals is to be found in H. J. Holtzmann, *Pastoral-briefe kritisch u. exegetisch behandelt* (1880); Bertrand, *Essai critique sur l'authenticité des Ép. Past.* (1888); Findlay, appendix to the English translation of Sabatier's *The Apostle Paul* (1899); J. D. James, *Authorship and Genuineness of the Pastoral Epistles* (1906); P. N. Harrison, *The Problem of the Pastoral Epistles* (1921). See also the discussion in the New Testament introductions of Moffatt, Peake, Jülicher, Salmon, Holtzmann, Weiss, &c.; Shaw, *The Epistles of St Paul*; K. Lake, *The Later Epistles of St Paul*; books on the apostolic age by McGiffert, Pfeiderer, Weissäcker, Bartlet, Wernle, &c. The best commentaries are by Von Soden, B. Weiss, Dibelius, Wohlenberg, Bernard, White.

**Timothy Grass**, the name commonly given to *Phleum pratense*, a grass much valued for feeding cattle. It first received the name Timothy Grass in America, from the name of a person who did much to promote its cultivation there. Along with the other species of the genus, it often receives also the English name of Cat's-tail Grass or Meadow Cat's-tail. The genus *Phleum* is distinguished by a panicle so compact as to resemble a close spike, single-flowered spikelets, with two nearly equal acuminate or almostawned glumes, two awnless paleæ, and the seed free. The species are mostly natives of Europe; a number of them are British, but the Timothy Grass alone is of any economical value. It varies very much in size according to soil and situation, succeeding best in moist, rich soils. It is very extensively cultivated both in Britain and in America, either alone or in mixture with clover and other grasses, both for pasture and for hay. It has strong culms, attaining a height of 4 to 5 feet, but is tender and nutritious, and much relished by cattle. It is perennial, but springs up rapidly, even in the year in which it is sown. Its spike-like panicle, from the form of which the name Cat's-tail has been given, is cylindrical, and often of several inches in length. The seed is very small. *Phleum nodosum* is a very similar species, perhaps a mere variety, with the lower part of the culm prostrate and swollen into knots or bulbs, the spike much smaller than in *P. pratense*. It is a very inferior grass, and is found only on dry soils.

Timothy Grass  
(*Phleum pratense*).

**Timur.** See TAMERLANE.

**Tin** (sym. Sn; atom. number, 50; atom. wt. 118.7; sp. gr. 7.3). Either tin itself or an ore of it must have been known from a very early time, as all ancient bronze objects contain a certain proportion of this metal (see BRONZE, and METALLURGY). Ingots of metallic tin and articles made of it have been found in several of the Lake-dwellings (q.v.) discovered on the continent of Europe. It was therefore smelted more than 2000 years ago. Pliny refers to Cornish tin, and the metal is known to have been taken to Italy through Gaul after the Roman conquest of Britain. See also CASSITERIDES.

Tin has a silvery-white colour with a faint yellow tinge, and objects made of it have a brilliant

lustre when new or newly cleaned. It does not tarnish readily. When melted and slowly cooled it is obtained in crystals of considerable size. A bar of the metal with a cross section of say a quarter of an inch in area is easily bent, and during the bending emits a crackling sound due to the crushing together of its crystalline particles. Tin is of greater hardness than lead, but it is softer than gold. It is very malleable, and can be beaten into foil as thin as  $\frac{1}{1000}$  of an inch. Its tenacity is not great, a wire of the metal  $\frac{1}{16}$  of an inch thick breaking with a weight of 56 lb. At the temperature of about 442° F. (228° C.) it becomes brittle enough to be reduced to powder by hammering. At St Petersburg a bar of the metal has been known to break up into small granular particles during a very low winter temperature. The same result may be obtained by lowering its temperature artificially to -39° C.; at least it is very brittle at this temperature. Tin conducts heat and electricity moderately well. Its melting-point is 455° F. (235° C.), being considerably under that of lead. It is volatile, but only at a very high temperature. Among common metals it is least acted on by air and water, hence its utility for a great many purposes. With the exception of nitric, no acid attacks tin vigorously unless with the aid of heat.

There are two oxides of tin—viz. stannous oxide and stannic oxide, with corresponding series of salts. *Protoxide, monoxide, or stannous oxide*,  $\text{SnO}$ , is prepared by first adding to dichloride of tin a solution of carbonate of soda. The white precipitate produced is the hydrated oxide, which absorbs oxygen from the air; but when heated to redness in a current of carbonic acid, or dried in a stream of this gas in the absence of air, anhydrous stannous oxide is obtained as a black powder. The hydrated oxide dissolves readily in acids, but these act more slowly on the anhydrous oxide.

*Dioxide, binoxide, or stannic oxide*,  $\text{SnO}_2$ , forms on the surface of tin kept at a heat above its melting-point with access of air. This is removed as it forms, and again heated to completely oxidise any of the finely divided tin mixed with it. Stannic oxide is also produced when tin is acted on by nitric acid. It is this oxide of tin which, when finely ground, forms the hard white material known as Putty Powder (q.v.), and used for polishing hard stones and other bodies. It also enters into the composition of one kind of opaque white glass. Stannic oxide occurs in nature as the mineral cassiterite, the ordinary ore of tin.

*Hydrated stannic oxide or stannic acid*,  $\text{H}_2\text{SnO}_3$ , is obtained by adding carbonate of lime to tetrachloride of tin; also by adding an acid to stannate of potash or soda. It is a white gelatinous substance, acting as a base by combining with acids, as in tetrachloride of tin, or as an acid combining with bases to form salts, stannate of soda (sodium stannate),  $\text{Na}_2\text{SnO}_3$ , for example. But there is another state in which this acid occurs with quite different properties, when it is termed *metastannic acid*. If tin is placed in nitric acid of about 1.3 sp. gr., it is rapidly converted into a white crystalline powder having the same composition as stannic acid, but represented by the formula of this acid multiplied by five to account for its salts having only  $\frac{1}{5}$  the quantity of base; thus, metastannate of soda is  $\text{H}_2\text{Na}_5\text{Sn}_5\text{O}_{15}$ . Metastannic acid is insoluble in all ordinary acids (except undiluted sulphuric acid), but it is readily soluble in alkalis, and the salts thus formed are converted into stannates by heating with excess of the base. The stannate of soda is used in calico-printing.

*Sulphides of tin*.—The monosulphide of tin, or stannous sulphide,  $\text{SnS}$ , is black, and stannic sulphide,  $\text{SnS}_2$ , yellow, the latter being soluble in sulphide of ammonium. Under the name of *mosaic*

gold stannic sulphide is used as a bronze powder for bronzing articles made of plaster of Paris, wood, &c. There is a native sulphide of tin and copper.

*Dichloride of tin or stannous chloride*,  $\text{SnCl}_2$ , is obtained by boiling the granulated metal with moderately strong hydrochloric acid. It crystallises with two molecules of water. A solution of this salt, unless made slightly acid, soon shows a slimy whitish deposit by which it is easily recognised. It is a powerful deoxidising agent, persalts of iron being converted into protosalts when it is added to their solutions, and with other salts, such as those of mercury, causing a deposit of the metal. It is used as a test for gold in solution, giving a purple colour.

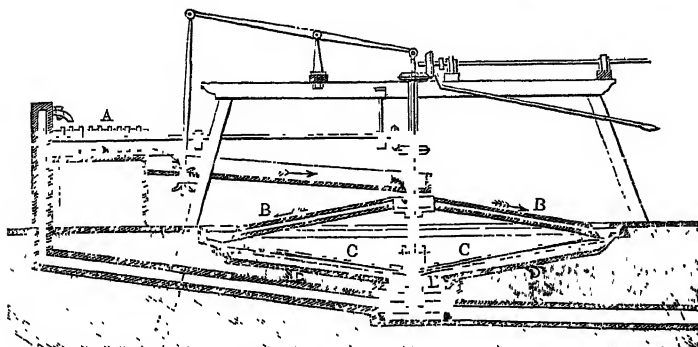

*Tetrachloride of tin or stannic chloride*,  $\text{SnCl}_4$ . This salt is formed when chlorine gas is passed over melted tin. It is also got as an anhydrous volatile liquid when powdered tin is distilled along with corrosive sublimate. It fumes when it meets the air, and has long been known as *fuming liquor of Libavius*. A more or less pure salt of this kind is used by dyers, made by dissolving tin in a mixture of hydrochloric and nitric acids. The chlorides of tin, like the stannate of soda, are used as mordants in dyeing. All the salts of tin give a bead of the metal when heated on charcoal in the inner blowpipe flame.

*Ore and Smelting*.—*Tinstone or cassiterite*, which is the binoxide of tin (often found in a nearly pure state), is the chief ore of the metal. Nearly all the tin of commerce is obtained from it. This mineral is usually of a dark-brown or blackish colour, but it is sometimes yellowish brown or gray. Its specific gravity is high—viz. from 6.3 to 7.1—and it is also very hard. It is found crystallised in quadrangular prisms, terminated by four-sided pyramids, and in more complex forms; and when pure consists of tin 78 and oxygen 22. Tinstone occurs in veins or lodes in granite or granitic rocks, gneiss, clay-slate, and mica-slate.

*Wood-tin or fibrous tin* is a fibrous form of cassiterite occurring in globular, botryoidal, or wedge-shaped fragments, usually of a small size. In colour and structure it has some resemblance to dry wood. *Stream tin* is again the same mineral found in the alluvial debris forming the beds or sides of streams. It has in course of time become separated by the disintegration of the veinstone, and is washed out of the gravel or debris. Cornwall was famous to the ancients for its stream tin, and even to-day a trifling output is obtained from the almost exhausted Cornish alluvium.

The world's normal annual output of the metal is about 125,000 tons, of which the British Empire produces one-half. The main source of tin is the alluvial workings of the Federated Malay States. These workings, which are chiefly in the hands of Chinese, are wrought partly underground and partly as quarries. In the quarries the application of powerful jets of water to break down the gravel (*hydraulic mining*; see under GOLD) is not uncommon. The second producer is Bolivia, where the ore comes principally from veins in the districts of La Paz, Oruro, Potosí and Chorolque. Two islands of the Dutch East Indies, Banka and Bileton, yield important quantities of tin; the diggings are entirely alluvial. Tin is widely distributed in Australia, and all six states produce the metal; the yield is partly from alluvial workings and partly from veins; the largest tin mine in Australia is the Mt. Bischoff mine, Tasmania. The United States, so rich in almost every other important metal, is singularly poor in tin, the annual yield being insignificant. Cornwall still remains an important producer. The veins, which are everywhere associated with granite, are numerous, and in many cases copper is yielded from the upper parts of a vein and tin from the deeper portions.

Tin ore from the mine is subjected to a complicated series of dressing operations. The tinstone of Cornwall especially is associated with a large number of other minerals, of which the chief are wolfram and iron, copper and arsenical pyrites. The ore, being in a very fine state of division, has to be thoroughly pulverised as a preliminary to the process of cleaning and separation which is termed *dressing*. Crushing is done by breakers, followed by stamps. The crude pulverised ore, borne by a plentiful current of water, is then fed to some form of *concentrator* (of which there are many types)

Borlase's Concave Buddle—vertical section :

A, box with agitator: the ore is fed here; B, revolving spouts for distributing the ore at circular ledge; C, arms with sweeps; D, floor on which the washed ore settles; E, well into which waste and slime falls.

by means of which a separation of the worthless material and of the valuable ingredients, one from another, is effected by virtue of their differences of density. The simplest concentrator is the rack-frame, which consists of a plane table set on a slope. The *pulp* (crude ore with water) is fed at the highest part of the frame, and runs down it. The heaviest minerals (e.g. tin-stone and wolfram) settle near the top, and less heavy minerals on the lower parts of the table, while the light worthless *tailings* pass off the table at the bottom. Arrangements are provided automatically to remove the different deposits from the frame at brief intervals. The deposits so obtained have often to be retreated several times on different appliances before they are sufficiently clean. Another concentrator, applied to rather finer material, is the *buddle*, of which one form is here illustrated. The pulp is fed, by the ducts B, all round the circumference of the buddle; the pulp then flows down the conical surface D, towards the centre. The heavy minerals settle on the surface, but the waste flushes into E, whence it is led away. The sweeps hanging from the revolving arms, C, gently brush the surface, prevent it forming into *channels*, and agitate the topmost particles resting thereon. From time to time the buddle is stopped and allowed to dry, when the deposits which have settled upon it can be removed with spades.

Other tables, in which the bed revolves instead of being stationary, and from which the different products are discharged continuously, have been evolved as improvements upon the buddle, and are much used in tin dressing. Another concentrator which is taking the place of the rack-frame has a wide, endless belt, which is given a rapid vibratory movement in addition to a slow travel in the up-hill direction. Still another form is the shaking table. These modern machines are capable of accurate adjustment, and differentiate more precisely between the various products. If arsenic is present, the partially-dressed product containing

that element is roasted in a furnace and the arsenic driven off as the volatile oxide. It is collected in long flues, and forms a valuable by-product. The residue from the furnace is then further dressed to separate iron oxide from tinstone, &c. At a few mines portions of the partially dressed ore is treated with hot, dilute sulphuric acid to remove iron oxide adhering to other mineral particles.

Generally speaking, the processes described allow of the removal of nearly all the valueless minerals, and also yield, in saleable purity, most of the copper pyrites that may be present. The tinstone so obtained is, however, still mixed with wolfram and with small quantities of other substances. The latter mixture is now roasted and then led to a *magnetic separator*, which separates the various minerals, one from another, by virtue of their differences of magnetic properties. Wolfram is slightly magnetic, and by means of a powerful electro-magnet can be withdrawn from cassiterite, which is non-magnetic. Wolfram, which was formerly merely a troublesome mineral to the tin-dresser, is sometimes worth more than tinstone; it is the chief ore of tungsten.

In years of normal trade Cornwall produces 4000 to 6000 tons of 'black tin' (dressed tin ore). The output in 1920 was 4858 tons, valued at £161 per ton. In 1922, the worst year tin mining has ever experienced, the output was only 650 tons, worth £77 per ton.

In England the dressed tin ore is reduced in a reverberatory furnace, somewhat similar to that used for smelting copper (see COPPER). It is mixed with one-fifth of its weight of anthracite coal, broken into small pieces, and a small quantity of lime or fluor spar to combine with siliceous matter in order to form a fusible slag. The heat is slowly raised with as little admission of air as possible, so as to maintain a reducing atmosphere. When the charge has been some hours in the furnace it is occasionally stirred to assist the aggregation and separation of the slag, and in about six hours the metal is ready to be run off. The tin flows out of the furnace by an aperture in the middle of one side—towards which all the rest of the bed slopes—into a cast-iron pot, from which it is cast into bars. The tin at this stage contains other metals, such as arsenic and iron, as impurities, so that it requires to be refined, and this is done by *liquation* and *poling*. The process of liquation consists in placing the bars or tin on the hearth of a furnace, such as has been described, and slowly heating them to just above the fusing-point, when pure or nearly pure tin melts and runs down the sloping furnace-bed into a cast-iron vessel, fresh bars being added until enough of the metal is collected. What remains on the hearth is a less fusible alloy of tin with arsenic, iron, and other metals. The nearly pure tin is kept by a fire in the melted state, and stirred up with a pole of green wood, the operation producing a current of gas that agitates the molten metal and causes a scum to rise to the surface, which is skimmed off. The tin is then run into moulds for the market, *grain-tin* being the name given to the best quality of the metal. It is known by its property of becoming brittle when heated to just below its melting-point, so that when it is then let fall from a height, or struck with a hammer, it breaks up into prismatic fragments. Banca tin is the

purest kind made on a commercial scale, and is nearly chemically pure. English tin comes next to it as regards purity.

**Applications.**—The great consumption of tin is in the formation of alloys, such as bronze, gun-metal, Britannia metal, &c. (see ALLOY), and in the manufacture of tinned iron plates. In the form of an amalgam it is employed for 'silvering' mirrors, and as tinfoil for lining boxes and wrapping up perishable articles. The small gas-pipes of houses are best made of block-tin. Ordinary commercial tin tarnishes very slightly in the air, and is not acted upon by vinegar or the acids of fruits. It is consequently very suitable for coating the inside of cooking vessels, whether made of iron or copper. Large vessels for other purposes formed of these metals are also occasionally coated with tin. In some parts of India vases, jugs, and other useful and ornamental articles are made entirely of tin. The uses of some tin salts are noted above.

See TIN-PLATE, STANNARIES; also following books: Charleston, *Tin Mining* (1884); Memoirs of Geol. Survey, Cornwall and Devon; Annual Report, Secretary for Mines; Rastall's *Geology of the Metalliferous Deposits* (1923); Truscott's *Ore Dressing* (1923).

**Tinamou** (*Tinamus*), a South American genus of birds sometimes called partridges, but really more akin to bustards, and having affinities with the Rhea and Emu. *T. major* or *brasiliensis* is about 18 inches long.

**Tincal.** See BORAX.

**Tinchebrai**, a small town in the extreme north-west of the Norman department of Orne, where Henry I. (q.v.) of England defeated his brother Robert.

**Tincture.** See HERALDRY.

**Tinctures** are defined by Sir Robert Christison to be 'solutions of vegetable and animal drugs, and sometimes of mineral substances in spirituous liquids.' The spirit most commonly employed is proof-spirit (see ALCOHOL); sometimes rectified spirit is used, and occasionally ether. Ammonia is sometimes conjoined with the spirit, in which case the solution is termed an ammoniated tincture. The choice between proof and rectified spirit depends on their respective solvent powers over the active principles of the drugs employed. The ether and ammonia are principally used for their antispasmodic properties.

**Tindal**, MATTHEW, a notable deistical writer, was the son of the rector of Beerferris in South Devon, where he was born in 1656. He was educated at Lincoln and Exeter Colleges, Oxford, took the degree of B.A. in 1676, and was elected fellow of All Souls College. In 1685 he became a Doctor of Law; and after a brief lapse into Romanism during the reign of James II., reverted to Protestantism of a somewhat freethinking type. His first work, *An Essay concerning Obedience to the Supreme Powers* (1693), was followed by others on the powers of the magistrates in religious matters, on the liberty of the press, &c.; but it was not till 1706 that he attracted special notice, when the publication of his treatise on *The Rights of the Christian Church asserted against the Romish and all other Priests* raised a storm of opposition. A perfect torrent of replies and refutations of this statement of state supremacy over the church poured from the press; but even a prosecution failed to prevent the appearance of a fourth edition in 1709, to which a *Defence* was added. On the Continent Tindal's work was quite differently received. Le Clerc praised it as one of the solidest defences of Protestantism ever written. In 1730, when he had nearly reached the age of seventy-three, he published his most celebrated treatise, *Christianity as old as the Creation, or the Gospel a*

*Republication of the Religion of Nature*, which effectually settled the question of his religious creed. The design of the work, which was soon known as 'the Deist's Bible,' is to strip religion 'of the additions which policy, mistake, and the circumstances of the time have made to it'—in other words, to eliminate the supernatural element, and to prove that its morality, which is admitted to be worthy of an 'infinitely wise and good God,' is its true and only claim to the reverence of mankind. Tindal's purpose was rather constructive than destructive; and it was on this account that he called himself a 'Christian Deist.' Answers or refutations were issued by Waterland, Foster, Conybeare (afterwards Bishop of Bristol), Leland (q.v.), and others; the work itself was translated into German. Tindal died at Oxford, still a fellow of his college, on the 16th August 1733. See the article DEISM, and works there cited.

**Tindale**, WILLIAM. See TYNDALE.

**Tinder**, an inflammable material, usually made of half-burned linen. It was one of the chief means of procuring fire before the introduction of chemical matches. The tinder was made to catch the sparks caused by striking a piece of steel with a flint; and the ignited tinder enabled the operator to light a match dipped in sulphur. This intermediate step was necessary in consequence of the impossibility of making the tinder flame. Partially decayed wood, especially that of willows and other similar trees, also affords tinder; and certain fungi furnish the German tinder, or Amadou (q.v.).

**Tinea**, the generic name of certain diseases of the skin caused by the growth of microscopic fungi. See under FAVUS, PITIRIASIS, RINGWORM.—For the clothes moths called Tinea, see MOTHS.

**Tineidæ**, a family of small Moths (q.v.).

**Tinfol.** See FOIL.

**Ting-hai.** See CHUSAN.

**Tinker's Weed** (*Triosteum perfoliatum*, erroneously called Tinkar's-root), the Fever-weed, a plant of a small genus of Caprifoliaceæ, with purgative and emetic properties, so called after an 18th-century New England doctor. It is a perennial plant with white flowers, red berries, and a large woody root. It extends from Ontario to Louisiana and west to Minnesota.

**Tinned Meat.** See PRESERVED PROVISIONS.

**Tinneveli** (*Tiru-nel-veli*), chief town of the district of the same name, in the south of the Madras Presidency, is situated on the left bank of the river Tambraparni. The town of Tinneveli is connected with the town and military station of Pallancotta, on the opposite bank of the river, which is the administrative headquarters of the district. It contains a Sind temple and a Hindu college, and has a cotton-factory. It is an important Protestant missionary centre. Pop. (1921) 53,783.

**Tinnitus Aurium** is the Latin translation of, and ordinary medical term for, ringing in the ears. In most cases it is an unimportant symptom, depending on some local temporary affection of the ear, or on some disturbance of the digestive system with which the part of the brain, from which the auditory nerve springs, sympathises, or which excites the cerebral circulation (as often occurs in the morning after too liberal evening potations); but, as it is also a common symptom of organic disease of the auditory nerve, it may indicate a dangerous condition, or may be a prelude to complete deafness. Hence, although commonly of no consequence, it is a symptom that, especially if permanent, must be carefully watched. It may be readily induced for a few hours by a large dose of quinine, salicin, or their compounds. Tinnitus

is of course the proper pronunciation, but in medicine it is usually called *tinittus*.

**Tino.** See TENOS.

**Tin-plate** is an important branch of the metallic industry of Britain. The art of tinning plate-iron is said to have been invented in Bohemia, about the beginning of the 16th century, although the tinning of copper was known earlier. Tin-plate was first made in England about 1670. Sheet-iron for tin-plates is made either of charcoal-bar or coke-bar, which has been rolled with particular care, in order to avoid scales on the surface. Formerly iron plates only were used in the manufacture of tin-plates, but mild steel has almost superseded iron for the purpose. Before tinning the plates are called 'black plates.' When the sheet has been cut to the required size the plates are 'pickled'—i.e. they are immersed in hot sulphuric or hydrochloric acid which has been diluted by 16 parts of water to 1 of acid, the use of the acid being to remove all oxide. After this the plates require to be washed several times in water, and then annealed. They are next passed two or three times through chilled iron rollers highly polished with emery and oil, to give them a smooth, even surface. Once more they are sent to the annealing furnace, passed again through dilute sulphuric acid, which is followed by another washing, but this time in running water, and then scoured with abrasive. This should leave them quite clean and bright.

Each plate is now put singly into a pot of melted grease or palm oil, and left till it is completely coated, after which the plates are taken in parcels and plunged into a bath of melted tin covered with oil, called the 'tin-pot.' In the high-class qualities the plates remain in successive pots to 'soak,' which results in a more firmly adherent coating of pure tin. The plates are afterwards put in parcels into a vessel, where the coating of pure tin is further built up, and are then withdrawn one by one, and wiped on both sides with a hemp brush, the marks of which are obliterated by another dipping. This last dipping also gives the plates a polish. The superfluous tin is removed by immersing the plates in a pot containing tallow and palm-oil, maintained at a temperature just high enough to allow the tin to run off. The final treatment consists in working the plates separately in troughs of bran with a little meal, and then rubbing them with flannel. Sheet-steel being more readily oxidisable than pure charcoal iron, it is necessary that the tin coating should be impervious and unbroken. Tin plates are generally 20, 22, or 25 inches long by 14, 15, or 17 inches wide, and of 20 to 30 BG (= Birmingham gauge for sheets and hoops) in thickness. To avoid confusion with the different wire gauges the thickness is sometimes also given in 'mils,' 1 mil =  $\frac{1}{1000}$  inch. For further information on gauges, see under WIRE.

Tin-terne may be had in larger sizes and special cut shapes. The sheets are covered with an alloy of lead and tin of proportions from 2 to 1 to 1 to 2, and are suitable for motor-car and railway-carriage panels, and petrol tanks, &c. They can also be supplied in copper-soft qualities for subsequent working up; they are, however, unsuitable for use in contact with food. Lead-coated or terne-finish sheets are used in the same way. There is sufficient tin present to bind the lead alloy to the steel sheet. They can be hammered or bent to shape and the lead surface takes paint, &c., with very little preparation.

**Tinsel.** See FOIL.

**Tintagel Head,** a cliff 300 feet high on the western coast of Cornwall, about 22 miles W. of Launceston, and but 6 miles from Camelford—the Camelot of Arthurian legend. Partly on the main-

land and partly on the so-called island, almost cut off by a deep chasm from the rest of the promontory, stand the imposing ruins of the castle where King Arthur held his court. His spirit still hovers around the scene of his splendour in the form of the red-legged chough, a beautiful Cornish bird already rare in Leland's time. The oldest part of the existing ruins is the keep, apparently of Norman construction, but there need hardly be a doubt that a Saxon, and perhaps earlier a British stronghold occupied the same site. The castle was still habitable in 1360, when we read of its being provisioned.

**Tintern Abbey,** perhaps the most beautiful ruin in England, on the right bank of the Wye, in Monmouthshire, about 5 miles above Chepstow. The abbey was founded in 1131 for Cistercian monks, but the church, the finest part of the ruins, dates from the end of the following century. The length of the building is 228 feet; the style of architecture a transition from Early English to Decorated; the window-tracery is especially fine. But the greatest glory of Tintern Abbey is that its name is associated with Wordsworth's noblest poem, *Lines composed a few Miles above Tintern Abbey*—though, as every reader knows, the abbey itself is not mentioned in it.

**Tintoretto** (in English often shortened into *Tintoret*), a great Italian painter, so called from the fact of his father being a dyer (*Tintore*). His real name was Jacopo Robusti. Born at Venice, 29th September 1518, he studied for a short time under Titian, but appears to have been for the most part self-taught. His motto was 'The design of Michelangelo and the colouring of Titian'; and his aim was obviously to combine the dignity of the Florentine with the romanticism of the Venetian; but, though in the estimation of most of his contemporaries he succeeded, there has subsequently been diversity of opinion as to his merits. One of Ruskin's 'five supreme painters,' he was unquestionably a great master of composition, drawing and colour; he possessed an exuberant imagination, and his conceptions are often grand, his chiaroscuro startlingly effective. Contrast and conflict is the keynote to his work. He was strangely unequal, though he was always a hard and conscientious worker; some of his earlier pictures are very carefully finished, but his later ones are dashed off with a fatal haste that justifies the epithet *Il Furioso*, and the remark of Annibal Caracci, that 'if he was sometimes equal to Titian, he was often inferior to Tintoretto.' His portraits are generally admirable. Many of his pictures are of prodigious size, as he received commissions to decorate the church of the Madonna dell' Orto, the Scuola di S. Marco, the church of S. Rocco, the Ducal Palace, &c. Of the innumerable pictures in the galleries that are attributed to him not a few are by other hands. Most of the examples of his art are to be found in Venice, but there are a number in England, including 'St George and the Dragon,' and 'The Origin of the Milky Way,' in the National Gallery at London. Other famous pictures from his hand are 'Belshazzar's Feast,' and the Writing upon the Wall' (fresco, for the Arsenal at Venice), 'The Tiburtine Sibyl,' 'The Last Supper and the Washing of the Disciples' Feet,' 'The Crucifixion,' 'The Worship of the Golden Calf,' 'The Last Judgment' (the last two immense pictures 50 feet high, and very splendid in conception), 'St Agnes restoring to Life the Son of a Prefect,' 'The Miracle of St Mark,' 'The Resurrection,' 'The Slaughter of the Innocents,' and the largest picture on canvas by any great master, the 'Paradise' (1588) of the Ducal Palace at Venice, 34 feet high by 74 long, and containing over 100 figures. Tintoretto, who ranks as

the head of the later Venetian school, married Faustina de' Vescovi, and had two sons and five daughters. He lived practically all his life in Venice, and died there of fever, 31st May 1594.

See Crowe and Cavalcaselle's *Titian* (1876) and Ruskin's *Stones of Venice* (1851-53); monographs on Tintoretto by Osler (1879), Stearns (New York, 1895), Thode (in Ger. 1901), Holborn (1903), Mrs Bell (1905), E. M. Philipps (1911).

**Tinworth**, GEORGE (1843-1913), artist in terra-cotta, was born in London, the son of a poor wheelwright, and while working in his father's shop took to wood-carving of his own accord. In 1861 he found opportunity to get lessons in an art school at Lambeth, and in 1864 entered the Royal Academy schools. He soon began exhibiting figures and groups of figures at the Royal Academy, and in 1867 obtained a permanent appointment in the great Doulton art pottery. The works by which he became famous were mainly terra-cotta panels with groups of figures in high relief illustrating scenes from sacred history, which happily combine grace, strength, and dignity with originality of design, dramatic effectiveness, and devout feeling. An important example is the *redos* in York Minster, with twenty-eight terra-cotta panels.

See an *Essay on the Life and Works of G. Tinworth*, by E. W. Gosse (1883).

**Tippecanoe**, a river of Indiana, which rises in the northern part of the state, flows WSW. and S. 200 miles, and empties into the Wabash 10 miles above Lafayette. It is famous for the battle fought near its mouth, November 7, 1811, in which the Indians, under Tecumseh's brother, the prophet, were defeated by General Harrison.

**Tipperah** (*Tipura*), a district of the division of Chittagong (q.v.); Hill Tipperah being a small tributary state on its borders.

**Tipperary**, an inland county of the Irish province of Munster, touching Galway on the north and King's County, Queen's County, and Kilkenny on the east. Area, 1644 sq. m., or 1,051,904 acres, of which four-fifths are arable. The county of Tipperary for the most part lies in the basin of the river Suir (total length 85 miles); the Shannon touches the north-west border. The surface is generally level, but is diversified by several mountain ridges or groups. These mountains are the Gailees, rising to 3008 feet, Knockmeledown (2609 feet high), and Slievenaman on the south; Keeper Mountain on the west; and the Slievardagh Hills on the east. There is one very curious isolated height called the Devil's Bit, to which many popular legends attach. The soil of the plain is a rich calcareous loam, singularly fertile and productive, especially the district called the Golden Vale, in which stands the town of Tipperary. In geological formation the plain belongs to the great central Carboniferous Limestone district. Anthracite coal is worked; copper, lead, and zinc occur in smaller quantities; and slates and pipeclay are available. The principal occupation is agriculture, especially dairy-farming. The county is divided into two ridings, North and South, each of which is subdivided into six baronies. Pop. (1841) 435,553; (1871) 216,713; (1881) 199,612; (1901) 160,232; (1911) 152,433, all but 8000 Roman Catholics; (1926) 140,946. The county town is Clonmel.

Anciently Tipperary formed part of the two distinct principalities of Ormond, or North Munster, and Desmond, or South Munster. After the English invasion it was formed into a county by King John in 1210; but the authority of the conquerors was long little more than nominal. Eventually it came to be divided between the Anglo-Norman families of Butler, which held Ormond, and Geraldine, to whom a portion of

Desmond fell. The antiquities are numerous, as well Celtic as Anglo-Norman. In the latter the city of Cashel (q.v.) is specially rich; and Holy Cross is a noble monastic ruin, whilst the castle of Cahir is a fine specimen of baronial architecture. There is a series of caves near the border of the county of Cork.

**Tipperary**, a town of County Tipperary, is 110 miles SW. of Dublin by rail, with a Catholic and a Protestant church, and a 13th century priory gateway. Various milk products are manufactured. Pop. (1926) 5554. In 1890, under the 'Plan of Campaign,' a 'New Tipperary' was founded to thwart the proprietor of the land on which Tipperary town is built, and opened on 12th April; but the scheme wholly collapsed in the course of the following year, though the suburb remains.

**Tippermuir**. See MONTROSE.

**Tipppoo Sahib** (more correctly *Tipu Sultan*), sultan of Mysore, and son of Hyder Ali (q.v.), was born in 1749. Efforts were made to instruct him carefully in the various branches of learning cultivated by Mohammedans; but Tippoo much preferred the practice of athletic exercises, and the companionship of the French officers in his father's service, from whom he acquired a considerable acquaintance with European military tactics. This knowledge he put to effective use during his father's various wars, by completely routing Colonel Bailey (1780 and 1782), and Colonel Braithwaite on the banks of the Coleroon (1782), though these were his only important engagements with the British forces in which he could boast of success. On the death of his father he was crowned with little ceremony, returning at once to the head of his army, which was then engaged with the British near Arcot. In 1783 he captured and put to death most of the garrison of Bednur; but news of the peace between France and England having reached his French allies, they retired from active service, and Tippoo ultimately agreed to a treaty (1784) stipulating for the *status quo* before the war. During the continuance of this peace he occupied himself in regulating the internal administration of Mysore, sent ambassadors in 1787 to France to stir up a war with Britain, and, failing in this, at length so far allowed his inveterate hatred of the English to overcome his judgment as to invade (1789) the protected state of Travancore. In the ensuing war (1790-92) the British, under Colonel Stuart and Lord Cornwallis, were aided by the Mahrattas and the Nizam, who detested their powerful and aggressive neighbour; and though the tactics of the sultan in laying waste the Carnatic almost to the very gates of Madras baffled his opponents for a time, he was ultimately compelled (1792) to resign one-half of his dominions, pay an indemnity of 3030 lakhs of rupees, restore all prisoners, and give his two sons as hostages for his fidelity. Nevertheless his secret intrigues in India against the British were almost immediately resumed; another embassy was sent to the French; and the invasion of Egypt by the latter in 1798 and Tippoo's machinations having become known to the governor-general almost simultaneously, it was resolved to punish the perfidious sultan. Hostilities commenced in March 1799, and two months after Tippoo was driven from the open field, attacked in his capital of Seringapatam, and after a month's siege slain in the breach at the storming of the fort (4th May). He was buried, during an appalling thunderstorm, in the mausoleum he had built for his father. His government of Mysore after 1792 was most oppressive, yet Tippoo was extremely popular, and was esteemed by the Mohammedans as a martyr. See L. B. Bowring, *Haider Ali and Tipu Sultan* (1893).

**Tipton**, a town of Staffordshire,  $4\frac{1}{2}$  miles SSE. of Wolverhampton and  $8\frac{1}{2}$  NW. of Birmingham, since 1918 part of Wednesbury parliamentary borough. It has important iron manufactures. Pop. 34,000.

**Tipula**. See DADDY-LONG-LEGS.

**Tiraboschi**, GIROLAMO, the historian of Italian literature, was born at Bergamo, 28th December 1731, studied at Monza, became a Jesuit, and was afterwards appointed to a chair of Rhetoric at Milan, and in 1770 became librarian to the Duke of Modena. Here he wrote his *Storia della Letteratura Italiana* (13 vols. 1772-82), an elaborate, accurate, and exhaustive survey down to the close of the 17th century. A continuation embracing the literature of the 18th century was written by Lombardi. Tiraboschi died at Modena, 3rd June 1794. Other works are *Vetera Humiliatorum Monumenta* (3 vols. 1766-68), *Biblioteca Modenese* (1781-86), and *Memorie Storiche Modenesi* (1793).

**Tirah**, a mountainous district of the North-West Frontier Province of India, and the scene of the Tirah Expedition (1897-98) against the Afridi and Orakzai tribes.

**Tirana**, capital of Albania, lies inland, 20 miles E. of Durazzo, with which it is connected by rail. Pop. 14,000.—The treaty of Tirana between Albania and Italy in 1926 caused a commotion among the Serbs.

**Tiree**. See TYREE.

**Tiresias**, in Greek Mythology, figures as a famous prophet, who, according to one legend, was struck blind by the goddess Athena, because he had seen her bathing. Another legend represents Hera as depriving him of his sight because, being made arbiter in a dispute between her and Zeus, he had decided in favour of the latter; when Zeus as a compensation granted him the inner vision of prophecy, and prolonged his life for several generations. He is consequently prominent in many of the mythical stories of Greece, but at last found death after drinking from the well of Tiphosia. Tiresias is the theme of a fine poem by Tennyson (1885).

**Tirhut**, formerly a district of Bengal, but divided into the districts of Darbhanga and Muzaffarpur, now in Bihar and Orissa.

**Tirlemont** (Flemish *Thienen*), a town of Belgium, in South Brabant, on the Great Geete, 30 miles ESE. of Brussels by rail. It has two fine churches of the 12th and 13th centuries, and manufactures of machinery, hosiery, flannel, leather, sugar, &c. Once a large and prosperous city, Tirlemont was ravaged by Marlborough in 1705; and here the French, under Dumouriez, defeated the Austrians in 1793. Pop. 20,000.

**Tirnova**. See TRNOVO.

**Tirol** (in English often *the Tyrol*), was a crownland of the Austrian Empire till its dissolution, when it was divided, the smaller northern part remaining a land of the Austrian republic, while the greater southern part was given to Italy by the treaty of Saint Germain (1919, ratified 1920). It is a mountainous country, traversed from east to west by the three chains of the Alps, whereof the southern chain is crossed by the Stelvio Pass (q.v.), while the central chain (11,000 to 12,000 feet) crossed by the Brenner Pass (q.v.) has been made the frontier. A German population, however, in language and sympathies, with a small proportion of Ladins, extends southwards to Salurn, between Bozen (Ital. *Bolzano*), and Trent, and has been subjected to a process of forcible Italianisation. The Tirolese are noted for their fidelity to the Catholic faith and their devotion to their country, but are somewhat backward in education. The

romantic mountain scenery attracts thousands of visitors. The more important valleys are formed by the river Inn (flowing north to the Danube) and the Adige (going south to the Adriatic), and their tributaries. Pastoral pursuits furnish the chief occupations, though some grain is grown, and considerable attention is paid to the cultivation of the forests (about half of the area), and of fruit, wine, and silkworms. The mines were formerly of great value; but little is now extracted, except of salt (at Hall), anthracite, and a little iron. Metal industries flourish in German Tirol, and silk in Italian. The Austrian land of Tirol has an area of 4882 sq. m. and a population (1923) of 314,836. The capital is Innsbruck (q.v.), with a university (1677).

Venezia Tridentina, often called the Trentino, the territory gained to Italy by the St Germain treaty, was in 1926 formed into two provinces, Bolzano, mostly German-speaking (2831 sq. m.; pop. in 1921, 235,487), and Trento, Italian-speaking (2539; 406,260). The principal towns in the former are Bozen and Meran (Ital. *Merano*). Near Meran is the castle of Tirol (Ital. *Tirolo*) from which the whole takes its name; and not far off is Andreas Hofer's home. Trento or Trent is the subject of a separate article.

Tirol, the ancient Rætia, was conquered by the Romans under the Emperor Augustus. After the fall of the empire it was occupied by the Boiardi (Bavarians) and Langobardi. During the middle ages the most important rulers in Tirol were the counts of Tirol and the bishops of Trent and Brixen. In 1363 the counts bequeathed their possessions to the Duke of Austria, and except during the short period 1806-14, a period made memorable by the patriotic resistance of Andreas Hofer (q.v.) and his associates against French and Bavarians, they formed an appanage of the House of Hapsburg to its fall. The division of Tirol under the treaty of Saint Germain has been described above. By plebiscite in 1921 Austrian Tirol declared almost unanimously for union with Germany, which was vetoed by the Entente Powers. German-speaking South Tirol has protested against Italian domination and the suppression of the German language.

See Miss Busk, *Valleys of the Tyrol* (1874); Zingerle *Sagen aus Tirol* (1859); W. D. MacCracken, *The Tyrol* (1909); Baedeker; and histories by Egger (1872-80) and Jäger (1880-91); Herford, *The Case of German South Tyrol* (1927).

**Tironensians**, or TYRONENSIANS, a congregation of Benedictines (q.v.).

**Tironian Notes**. See SHORTHAND.

**Tirpitz**, ALFRED P. FRIEDRICH VON, born at Küstrin in 1849, entered the Prussian navy in 1865, was ennobled in 1900, and rose to be Lord High Admiral (1911). As Secretary of State for the Imperial Navy (1897-1916) he piloted the German navy laws (1900, &c.) and raised a fleet to challenge British supremacy of the seas. A ruthless upholder of 'frightfulness,' he commanded the German navy from August 1914 to March 1916. He wrote *Memoirs* (1919) and *Germany's Impotence in the World War* (1926). He entered the Reichstag in 1924 as a member of the German National Party.

**Tirso de Molina**. See TELLEZ.

**Tiryas**, an ancient city of Argolis, in the Peloponnese, situated a short distance SE. of Argos, about 3 miles from the head of the Argolic Gulf. In fable it was founded by Prætus, brother of Acrisius, and predecessor of Perseus, and here the early life of Herakles (*Tirynthius*) was spent. About 468 B.C. the city was destroyed by the Argives, but the ruined walls of the citadel re-

mained the wonder of later ages. The Cyclopean walls of Tiryns and of the neighbouring city of Mycenæ are the grandest in Greece. The citadel was built on an oval-shaped rock, 330 yards long by 112 at its widest, fringed by a wall, 30 to 40 feet thick, and about 50 feet high (from the outside base), composed of blocks, bedded in clay, 10 feet long by  $3\frac{1}{2}$  wide. The area of the city was divided into three parts at successive levels, and one of these was completely excavated by Schliemann in 1884-85, thus exposing the complete plan of a Greek palace of the 11th or 10th century B.C. An older palace was excavated in 1914.

**Tischendorf**, LOBEGOTT FRIEDRICH KONSTANTIN VON, a very eminent biblical scholar, was born at Lengenfeld in Saxony on January 18, 1815, and studied theology and philology at Leipzig, where in 1839 he became a university lecturer. His labours in search of the best and most ancient MSS. of the New Testament, in which he was liberally assisted by the Saxon and Russian governments, were exceedingly valuable, especially those in 1844, 1853, and 1859, which resulted in the discovery of the Sinaitic Codex (see CODEX) at the monastery on Mount Sinai; those journeys he described in *Reise in den Orient* (2 vols. 1846; Eng. trans. 1847) and *Aus dem Heiligen Lande* (1862). Among the most important of his numerous works are the editions of the Sinaitic (1862; in fac-simile in 1863) and many other MSS. of the New Testament; the *Eighth Critical Edition of the New Testament* (1864-72), and several other editions of the New Testament text; an edition of the Septuagint; and the *Monumenta Sacra Inedita* (1846-71). The pamphlet *When were our Gospels Written?* defending the genuineness and authenticity of the four gospels, was translated into English in 1866. After being an extra-ordinary and ordinary professor at Leipzig from 1845, he became professor of Theology and of Biblical Palæography in 1859, a chair in the latter subject having been instituted for him. He was created a Count of the Russian empire, an LL.D. of Cambridge, a D.C.L. of Oxford, &c. He died on December 1, 1874. There is a sketch of his life by Volbeding (1862).

**Tissandier**, GASTON. See BALLOONS AND AEROPLANES.

**Tissaphernes**, Persian general, son of Hydarnes, played off Athens against Sparta when satrap of Lydia and Caria in 413 B.C., but was deprived of the former province in favour of Cyrus in 407. Three years later he denounced Cyrus to the new king Artaxerxes, and was mainly responsible for the victory of Cunaxa in 401, when Cyrus was killed (see XENOPHON). Tissaphernes was loaded with honours, tried to destroy by treachery the Greek mercenaries who now began the famous March of the Ten Thousand, but in the war with Sparta was beaten by Agesilaus. He was put to death through the instigation of the mother of Cyrus in 395.

**Tissues**, aggregates of cells which have certain characters in common. They may be classified in various ways according as attention is directed to their structural, functional, or developmental characters. Thus, in an animal, 'cellular tissues,' in which the unit elements retain their distinctness, may be distinguished from those of muscle and nerve, in which there is usually much modification and integration of the component cells. Or, in plants, 'cellular tissues' may be distinguished from 'vascular tissues,' in which the component cells are fused to form vessels. In these distinctions only structural characters are considered. Again, we may distinguish in an animal nervous tissues, muscular tissues, glandular tissues, skeletal tissues, and so on, the classification here depending

on the function. In the same way the tissues of a plant may be distinguished as absorptive, assimilative, conductive, glandular, skeletal, protective, and so on. In short, the physiological conception of a tissue is that of an aggregate of cells in which by division of labour within the body there has come to be a predominance of one function. Or, if we consider the origin of the several tissues from the different layers of the embryo, we distinguish the ectodermic or epiblastic, the mesodermic or mesoblastic, the endodermic or hypoblastic tissues of animals, and similarly in higher plants we distinguish those which arise from the dermatogen, periblem, and plerome of the embryo or growing-point. The commonest classification of animal tissues is perhaps that which distinguishes four sets—(a) epithelial, including covering and lining layers of cells, and their secretory or other modifications; (b) muscular; (c) nervous; (d) connective tissues; but the last includes a great variety—e.g. bone, cartilage, ligaments, and ensheathing membranes. One of the most convenient classifications of vegetable tissue is that which distinguishes (a) cellular tissues—epidermis, parenchyma, prosenchyma; (b) vascular tissues—wood and bast vessels, and laticiferous vessels.

See the articles BARK, BAST, BICHAT, BONE, BRAIN, CELL, CIRCULATION, DIGESTION, EMBRYOLOGY, EPIDERMIS, EPITHELIUM, HORN, KIDNEYS, LEAF, MUSCLE, NERVOUS SYSTEM, PHYSIOLOGY, REPRODUCTION, RESPIRATION, SKIN, WOOD, &c.

**Tisza**, KALMAN (1830-1902), Hungarian statesman, was premier and virtually dictator from 1875 to 1890.—His son, COUNT STEPHEN TISZA (1861-1918), a chauvinistic Magyar, premier of Hungary 1903-5, 1913-17, supported Germany, and was assassinated.

**Tit**, or TITMOUSE, a name given to several genera of Passerine birds in the family Paridæ. The typical tits are small birds, of which there are over sixty species, widely distributed throughout Europe, Asia, Africa, and North America. They are more numerous in cold and temperate than in tropical regions, those which are found within the tropics being mostly inhabitants of elevated mountainous districts. The bill is small, short, somewhat conical, the tip entire, the base beset with hairs, and the nostrils generally concealed by feathers. The wings are not very long; the tail is rounded or even; the legs rather short, slender, scaled in front, the inner toe shortest, the claws long and curved. The plumage is soft, lax, and fluffy, often gay. The popular name Titmouse is

Blue Tit (*Parus caeruleus*).

derived from Old English *mæse*, a small bird (*tit*, 'small'). The tits are bold sprightly birds, extremely active, flitting from branch to branch, running rapidly along branches in quest of insects,

and often clinging back-downwards to the under side of branches. They feed not only on insects but on grain and seeds. They are very pugnacious, and the female tit shows great courage in defence of her nest, often continuing to sit when the nest is approached, and vigorously assailing the intruding hand with her bill. In winter many of the species gather into small flocks, and approach houses and villages, competing with sparrows and chaffinches for a share of the food of domestic poultry. Most of the tits lay at least six eggs, some of them twelve or more, and even in temperate countries they often produce two broods in a year. They generally build in holes in trees &c. The young are fed chiefly on caterpillars. A pair of blue tits have been observed to carry a caterpillar to their nest, on an average, every two minutes during the day, so that these birds must be extremely useful in preventing the multiplication of noxious insects. Six species are found in Britain, but one of them, the Crested Tit (*Parus cristatus*), is very local, being almost entirely confined to a few old pine-forests in Scotland. The Great Tit (*P. major*) is the largest European species. It is common in almost all parts of Europe. It is not quite six inches long; the head and throat are black; the cheeks are white; the breast and sides yellowish; the wings and tail grayish. Its usual note is a kind of chatter, but it sometimes imitates the notes of other birds. The Blue Tit (*P. ceruleus*) and the Cole Tit (*P. ater*) are very common in Britain. The blue tit is perhaps the most pert and audacious of all the British species. It very generally receives the familiar name of *Tomtit*. The upper part of the head is light blue, and a bluish tinge prevails in the plumage. The Long-tailed Tit (*Acredula caudata*), common in Britain, has the tail about as long as the body. Its crown is white, contrasting beautifully with the deep black of the back; the tail is also black, with white edges. The nest of this bird is a beautiful structure, of moss and wool externally covered with lichens, and profusely lined with feathers, nearly oval, with a small hole in the upper part of one side. Still more interesting is the nest of the Penduline Tit (*Aegithalus pendulinus*) of the south of Europe, which in form resembles a flask, and is generally suspended at the end of a flexible twig, in a situation near to or overhanging water. It is nicely woven of fibres of bark

Long-tailed Tit (*Acredula caudata*).

and the down of willow or poplar catkins, and the opening is in the side. The Chickadee or Black-cap Tit (*P. atricapillus*) is very common in North America. The Tufted Tit (*P. bicolor*) is the largest American species. British specimens of the Cole and Long-tailed Tits differ somewhat from

continental examples. The so-called Bearded Tit (*Panurus biarmicus*) belongs to a distinct family (Panuridae). It frequents reed and osier beds, and the male is tawny, with gray head and black moustaches, which ornaments are absent in the female. It is now restricted to the Norfolk Broads and one locality in Devon. See Coward's *Birds of the British Isles* (1920).

**Titania.** See MAB, OBERON.

**Titanium** (sym. Ti; atom. number 22; atom. wt. 48.1) is a comparatively rare metal, which, according to the method by which it is procured, occurs as a gray, heavy, iron-like powder, which burns with brilliant scintillations in the air, forming titanium dioxide and nitride. It decomposes water at the boiling-point and is soluble in hydrochloric acid. Present as the dioxide in Rutile (q.v.), brookite, and anatase, it is now used in the purification of iron and steel in process of manufacture, and has been employed as an electrode in arc-lighting, and for making white paint. It readily combines with nitrogen under the influence of heat.—*Titanite*, or sphene, is a soft mineral, green, yellow, or yellowish green, has strong refractive and dispersive power on light, with brilliant diamond-like colour-effects. It is often present in Syenite (q.v.).

**Titanosaurus.** See ATLANTOSAURUS.

**Titans**, in Greek Mythology, were the sons and daughters of Uranus (Heaven) and Gæa (Earth), amongst whom were Kronos (see SATURN), Oceanus, Rhea, &c. Instigated by their mother, the Titans, headed by Kronos, rose against their father, emasculated and deposed him, and liberated their brothers, the Hecatoncheires (Hundred-handed) and the Cyclopes (q.v.), from Tartarus. Kronos, being made king, married his sister Rhea. Zeus, the son of Kronos and Rhea, waged against his father and the other Titans a ten years' war, in which the Titans were defeated and hurled into Tartarus. During the war Zeus and his allies occupied Mount Olympus in Thessaly, his opponents being encamped on Mount Othrys. The name of Titans is also given to the descendants of the Titans, such as Prometheus, Hecate, Helios, Selene, &c. See GRANTS, ZEUS.

**Tithe**, 'the tenth part of the increase yearly arising from the profits of lands, stocks upon lands, and the industry of the parishioners, payable for the maintenance of the parish priest, by everyone who has things titheable, if he cannot show a special exemption.' Tithes were classified into 'predial,' such as arose directly from the soil, e.g. corn, hay; 'mixed,' the produce of animals nurtured upon the lands, e.g. calves, milk, eggs; and 'personal,' arising wholly from the labour and industry of man, e.g. tithes of mills and fishing. 'Personal' tithes included much more originally; but, as they soon fell practically into desuetude, the matter need not be elaborated here.

The term 'tithes' is now a misnomer, inasmuch as by the Commutation Act, 1836, the system of payment in kind was displaced by a tithe rent-charge in money upon the hitherto titheable lands. The former system, which obtained from very ancient times, was so complicated and vexatious that it led to constant friction in most parishes, and the courts were frequently called upon to adjudicate upon some dispute between the tithe-owner and the tithepayer. One instance must suffice, which, however, will show how easily disputes could arise. The court had to settle whether or not the tenth meal of milk meant both morning and evening, and whether or not such milk must be fetched from the farm! This system of tithing in kind had become so irritating that previous to the legislation in 1836 a composition in money had

been substituted therefor in a large number of parishes by voluntary agreement between the two parties concerned. The Commutation Act made monetary payments universal, compulsory, and permanently obligatory. The value of the rent-charge, in lieu of tithes in kind, was based upon the seven years' averages of wheat, barley and oats. These values varied from year to year (1836-1918). It was once as high as £112, 15s. 6<sup>3</sup>/<sub>4</sub>d. (1875), and once as low as £66, 10s. 9<sup>3</sup>/<sub>4</sub>d. (1901). The average value of £100, as commuted, during the above period, was £91, 19s. 9<sup>3</sup>/<sub>4</sub>d.

The early history of tithes is wrapped in considerable obscurity. Their payment was originally based upon religious duty, and was enforced, as such, by ecclesiastical measures and discipline, as far as that was possible. In course of time, their payment became legally obligatory. This does not mean that the state instituted the payment of tithes, only that after such payment had become customary, it gave legal sanction thereto. 'It created no new burden; it appropriated no part of what hitherto had been a public fund or public revenue.' Thus, the payment of tithes passed from a merely moral duty to a legal duty also. That stage commenced in England in 970 A.D., and it has continued as such ever since. It is sometimes affirmed that the tithes were to be divided into three parts, one of which was to be devoted to the maintenance of poor parishioners; but the late E. A. Freeman, regius professor of Modern History at Oxford (1884-92), averred that he 'knew nothing of any English authority for the threefold division of tithe.'

The definite parochial system did not come into existence before the end of the 12th century. Previously, the tithes had been paid to corporations sole, e.g. the bishops, or to corporations aggregate, e.g. deans and chapters, and monasteries. But when the parochial system obtained, landowners were encouraged to set apart tithes for particular parishes in which they were interested. It became the practice of monastic houses to get the tithes attached to them, and to provide for the spiritual ministrations in parishes by the appointment of vicars. Such attachments are technically termed 'appropriations.' By the 16th century more than one-third of all the parishes in England were thus 'appropriated.' The parishes were often ill-served, and the vicars compelled, in many cases, to exist on a mere pittance doled out to them by the 'appropriators.' The Act 15, Richard II. (A.D. 1391), was passed to secure more adequate payments to vicars.

At the dissolution of the monasteries in Henry VIII's reign, the appropriations belonging to them would have been disappropriated, had not a clause been inserted in the relative statutes to give them to the king. Many of these 'appropriations' passed into the hands of lay-persons by grant from the crown, and such owners are called 'impropriators,' and the tithes in their possession, 'impropriate tithes.' These are a definite form of property, as tithes attached to the benefice (spiritual tithes) are; and as teinds in Scotland are. We have seen that the payment of tithes in kind continued during the period down to 1836, with the exceptions noted above. Since then it is proper to speak of tithe rent-charge, and the payment entered upon a new era or stage. From 1836 to 1918 various statutes dealt with this charge in various ways, some thirteen dealing with, among other matters, the extinguishment of the charge by redemption. The Act of 1891 made the landowner responsible for the payment of the charge, as had, apparently, been the intention of the Act of 1836; but in practice it became customary for the charge to be collected from the occupier.

In 1914 the benefice-tithe of the Church in Wales

was alienated therefrom, and handed over to Welsh Church Commissioners for other purposes, just as in 1869, the rent-charge belonging to the Church of Ireland was transferred to Commissioners of Church-temporalities. The value of the tithe rent-charge in the hands of the former is, approximately, £210,000 per annum.

We have seen that from 1836 the annual values of tithe varied, but in 1918 there came a change in that respect. Owing to war-conditions, the annual values rose from £75, 16s. 4d. gradually to £109, 3s. 11d. in 1918, and as there was every prospect of it rising still higher, the legislature passed an act which, amongst other things, stabilised the value at that figure for the next seven years. How true the forecast was as to a further rise is seen from the facts that, but for that restriction, the values would have been, in nearest pounds, £123 in 1919; £140 in 1920; £162 in 1921; £172 in 1922; £171 in 1923; £165 in 1924; £155 in 1925; £146 in 1926.

It is estimated that ecclesiastical tithe-owners lost by that restriction an aggregate sum of about six million pounds, and of course impropriators lost proportionately on their similar property of about £796,000 per annum. Ecclesiastical tithe-owners hold tithe rent-charge of some £2,005,000 per annum; and the Ecclesiastical Commissioners, for church purposes, about £276,000 per annum.

It was admitted by the minister in charge of the bill in 1918 that 'when the tithe rent-charge rises, even if it rises to £182, the tithe-owner only gets that which the Commutation Act intended him to get... the clergy could not rightly be called profiteers.' The Act of 1918 altered the seven years' average to fifteen years', and it has been found that the value of the charge would have been £133 in 1927. It was not allowed to reach that figure, as will be seen below.

Another thing that this act did was that it facilitated the redemption of the charge. Such procedure had been possible since 1846; very little however, was redeemed; but, in consequence of the provisions of the Act of 1918, the volume increased very largely. From 1846 to 1918 only £70,000 worth had been redeemed; but from 1919 to 1923 the amount thus extinguished was £271,000. These official figures speak for themselves.

We come now to the last stage in the history of this charge under brief review. It was anticipated, rightly, that the value even under a fifteen years' average would exceed the value as stabilised in 1918. Partly in consequence of such forecast, and partly for other reasons, the legislature passed the Act of 1925, after consultation had with the various interested parties.

This act did three things chiefly. (1) It stabilised the value of all tithe rent-charge at £105; (2) It vested all ecclesiastical tithe rent-charge in the Governors of Queen Anne's Bounty, who became the owner-trustees of the charge; (3) it provided a compulsory scheme for the ultimate extinguishment of ecclesiastical tithe rent-charge by forming an annual sinking-fund of £4, 10s. for every £100 as commuted. By such scheme, benefice-tithe will be extinguished in 85 years, and that held by ecclesiastical corporations in 81½ years. Tithe-payers, thus, pay in respect of these two rent-charges £105 plus the sinking fund (£4, 10s.) per annum, and in respect of impropriated tithe, £105 per annum. It may be added that each of these holders is subject, in varying degrees, to the payment of local rates on the charge.

Since the passing of the act, machinery has been evolved for dealing with ecclesiastical tithe rent-charge in the 7500 or so parishes concerned. The chief of these methods is the one set up by the act, viz. area-committees, 15 in number, which are

responsible for the collection of the charge in cases where incumbents are not continued as collectors. These number at present 1818; but their number will diminish as benefices fall void by death or removal. It has been impossible within our compass to say anything on the vexed matter of the rating of ecclesiastical tithe rent-charge; but Acts in 1899 and 1920 mitigated in some degree the incidence of such, which an eminent legal journal described as 'an anomaly and eccentricity of the law of rating, which is in effect a second income tax, as income is rated locally as well as taxed. Of the £105 stabilised value, tithe-owning incumbents contribute £5 toward the local rates levied on the charge, and ecclesiastical corporations £16, in respect of each £105. The remainder is discharged by the Inland Revenue Board.

See ANDERSON, TENDS; works on the history of tithes by Easterby, Edwards-Jones, Lord Selborne (1886); Phillimore, *Ecclesiastical Law* (new ed. 1895); and on the Tithe Acts, Leach, Millard (1926), and Lord Erle in the 1892 edition of *Chambers's Encyclopedia*.

**Tithing.** See FRANK-PLEDGE, HUNDRED.

**Tithonus**, son of Laomedon, brother of Priam, and spouse of Eos, the goddess of Morn. The story is that Eos, in asking immortality for her spouse, forgot to ask at the same time eternal youth, so that in his old age he became completely shrunk and decrepit, whereby his 'cruel immortality' was rendered a burden to him.

**Titian** is by many reputed the greatest painter of the world. His life was the longest in the biographies of artists, and it was also one of the most productive, as he worked quickly and energetically, enjoyed almost perfectly regular health, and produced regularly, except when his labours were occasionally interrupted by festivities or by travel. The consequence is that the biography of Titian is one of the most difficult to write laconically. If too much compressed, it would become a mere list of dates. In this brief notice there must be many omissions. It will be divided into three parts, treating separately of the artist's life, his patrons, and his works.

The Anglicised form of the name is obtained by dropping the final *o* from *Titiano*, which was the artist's most common signature, though he sometimes wrote *Tiziano*, occasionally *Ticiano*, and rarely *Tician*. The English form, therefore, is nearer to the most frequent signature than the French *Titian*. The modern Italians have preferred *Tiziano*. The painter's contemporaries gave various forms to his name from uncertainty or carelessness, as for instance *Tuciano*.

Titiano Vecellio was descended from a respectable but not wealthy family. The surname Vecellio or Vecelli appears to have been originally a Christian name, *Guccello*, but at the time of the painter's birth it was fixed as a surname, and *Tiziano* afterwards became common in the family. The date of the painter's birth is not quite positively fixed, except that the year is indicated by his own statement on August 1, 1571, that he was then an old man of ninety-five, so he cannot have been born later than 1477. His birthplace was close to the castle of Cadore, in a very mountainous region, and his continued attachment to the country of his birth is proved by his frequent visits to it, and by his numerous sketches of its scenery. Titian's father, Gregorio Vecellio, was a brave officer who filled various important civil functions in his native place, and was greatly respected both for wisdom and valour, but he was a poor gentleman. Gregorio sent his little son to Venice at the age of ten, to the house of an uncle, who saw that he had a turn for art, and sent him to Zuccato, a mosaicist, and afterwards to Gentile

Bellini. That painter disapproved of his pupil's rapidity, so the boy (who seems to have enjoyed a good deal of independence for his years) first went to Giovanni Bellini, and afterwards to Giorgione. This is evidence that as a quick and intelligent little boy and an observant youth Titian actually saw the transition from comparatively primitive to advanced art at the moment when it took place, and that he adopted without hesitation for himself what were then the most modern and advanced principles.

The rapidity with which Titian absorbed all that was known at Venice about the art of painting is proved by the simple fact that he produced a masterpiece at twenty-three, and very soon had plenty of employment, both in fresco on public edifices and in oil. In 1511 he was painting fresco at Padua, and in 1516 he made his first visit to Ferrara. There are no events in his life outside of his work till 1524, when he had a fever that prostrated him and threatened to become chronic. The date of Titian's marriage is unknown, but the birth of his eldest son, Pomponio, is believed to have occurred in 1525. All we know is that he had a wife whose name was Cecilia. He contrived, by influence, to obtain ecclesiastical preferment for Pomponio though a mere child, the work being done by a curate. Afterwards he had two other children, Orazio and Lavinia. Pomponio turned out badly; Orazio, a painter, survived Titian a few months; and Lavinia married. Titian's wife died in 1530, to his intense grief. In the year following he went to live in the fields to the north-east of Venice, where he had a large house with a fine garden, probably going down to the water's edge, and a view of the lagoon. The year 1532 is of importance, as Titian became acquainted with the Emperor Charles V., who made him a count palatine, with other titles, a rank which empowered him to appoint notaries and judges, and legitimise the illegitimate offspring of persons beneath baronial rank. He was also made a Knight of the Golden Spur, with insignia, and the *entrée* at court, and his children were all ennobled. In 1536 he went with the Duke of Mantua to greet Charles V. at Asti. In 1543 Titian met Pope Paul III. and Charles V. at Busseto, where he was the guest of Cardinal Farnese. Two years afterwards he visited Rome, where he was welcomed by Paul III., and in 1546 he returned to Venice. His vigour at the age of seventy was proved by a winter journey across the Alps to Augsburg, where he joined the court of Charles V. He returned to the court at Augsburg in 1550, and probably followed it to Innsbruck in 1551. In 1554 the troubles with his son Pomponio reached a climax, and Titian asked to substitute a nephew for him in the sinecure canonry of Medole. An interesting example of the protection of copyright is a patent granted in 1566 by the Council of Ten, recognising Titian's copyright in prints from his own works. The later part of his life was chiefly occupied in working at Venice for Philip II. of Spain. He still retained energy for work, as is proved by his undertaking in 1576 a large picture for the Franciscans. In the same year he died of the plague, at the age of ninety-nine, and was buried with much public honour, and by daylight, in the chapel of the Crucified Saviour at Frari, a striking exception to the usual practice with regard to persons dead of the plague. Titian's son, Orazio, died of the same disease a few months later in a hospital.

Titian was extremely fortunate in his patrons. The Venetian government acted generously towards him, and on the whole with great indulgence, considering his negligence and delays. He had a great love of pensions, privileges, and sine-

cures—though it has been suggested that many of them were more nominal than remunerative—and was always trying to get them for himself or his relations. He was perpetually begging, and his access to great people gave him excellent opportunities. He was patronised by people of the highest rank, including Doges of Venice, reigning Dukes of Ferrara and Mantua, several cardinals, princes, kings, Pope Paul III., and the great Emperor Charles V. All these personages treated Titian with the greatest kindness and consideration, but although a gentleman in his manners, and a courtier in his correspondence, he sometimes, by negligence, tested their patience very severely. His friendship with Charles V. was intimate, and lasted, in spite of distance, until the emperor's death. Titian's character was not comparable in dignity to that of Michelangelo; it was the nature of a polished self-seeking courtier; but he was an affectionate husband and father, an amiable and sociable companion, and a warm friend. There is no evidence that Titian had much learning—his art would not leave time for that; but he had derived a rare and valuable culture from his immense experience of the world.

Titian's works are so numerous that it is impossible to catalogue them here. He was much in request as portrait-painter, and painted most of the great people he knew, several of them repeatedly. His religious pictures are numerous and magnificent, some of them on a large scale, and like other artists of the Renaissance he frequently chose mythological subjects. Some of his finest works are poetical or allegorical. The supreme rank amongst painters is sometimes assigned to Raphael and sometimes to Titian. Raphael's claim to it is in the extreme grace and refinement of his mental conceptions and in the beauty of his style as a draughtsman; Titian's claim is founded more essentially on the pictorial qualities, and especially on the technical excellence of his painting, which combines in a most extraordinary degree the richest surface with the most magnificent colour. These technical qualities were accompanied by much grandeur of conception and nobility of style. The following is a chronological list of some of Titian's most important works.

'Sacred and Profane Love,' about 1500; the 'Pesaro Altarpiece,' at Antwerp, about 1503; 'Doge Marc'ello,' at the Vatican, 1508; 'Christ of the Tribute-money,' Dresden, 1508; 'The Three Ages,' Ellesmere Collection, 1518; 'Noli me Tangere,' National Gallery, 1518; 'Bacchus and Ariadne,' National Gallery, 1520; 'Titian and his Mistress' (so called), 1523; 'Altarpiece of St Peter Martyr,' 1530, destroyed by fire at Venice in 1867; 'The Rest in Egypt,' Louvre, 1530; 'A Summer Storm,' Buckingham Palace, 1534; 'The Battle of Cadore,' for the council-chamber at Venice, 1537, destroyed by fire in 1577; 'The Farnese Family Picture,' 1545; 'The Danae of Naples,' 1545; 'The Farnese Venus and Adonis,' 1547; portraits of Philip of Spain, 1550; 'Venus and Adonis,' National Gallery, 1554; 'Martyrdom of St Lawrence,' Gesuiti, Venice, 1558; 'Jupiter and Antiope,' Louvre, 1561; a second 'Peter Martyr,' 1567.

Titian is well but not extensively represented in the National Gallery and in the Louvre. Other public collections, such as those of Dresden, Vienna, Madrid, the Escorial, are rich in Titians. His drawings are interesting, especially his numerous pen-sketches, executed in a bold and simple but very expressive style of his own. They afford strong evidence that his lines, which were intended to be vertical, inclined very much to the right. In all his finished works he corrected this tendency with the plummet.

Many biographies of Titian have been written since

that of Vasari, but although the materials were in reality abundant, they were scattered till Crowe and Cavalcaselle brought them together for their invaluable work, the *Life and Times of Titian* (1877). Between Vasari and Crowe we have a biography by Ridolfi, condensed by Sir A. Hume in an English edition, published in 1829. A descendant of the Vecelli family, Taddeo Jacobi, collected great wealth of materials for their history; these he transferred to Stefano Ticozzi, who published his book in 1817. That of Northcote (2 vols. 1830) and all later ones are founded upon it. See also the monographs by Claude Phillips (1897, 1898), Knackfuss (1897), Gronau (1900; trans. 1904), and Ricketts (1910); Gilbert, *Cadore, or Titian's Country* (1869).

**Titicaca, LAKE.** See PERU, BOLIVIA.

**Titians, or TIETJENS, TERESA**, one of the greatest of modern operatic singers. She was born at Hamburg, of Hungarian parents, 18th July 1831, and made her début at Alfona in the character of Lucrezia Borgia in 1849, taking at once a very high position on the lyric stage; at Frankfort and Vienna she was even more warmly received; and her first appearance in London in 1858 was quite a triumph. Among her most famous impersonations were Norma, Semiramide, Fidelio, Margarita, and Ortrud (in *Lohengrin*). She visited America in 1875. The great volume and purity of her voice, and her energetic but dignified acting, combined to make her an unrivalled representative of strong dramatic parts. She was almost equally admirable in oratorio; Sir Julius Benedict wrote *St Cecilia* and other works specially for her. She sang for the last time in public in May 1877 in *Il Trovatore*, and died 3d October of the same year.

**Titlark.** See PIPIT.

**Title-deeds** are the evidences of ownership of real property. Each owner is supposed to be in possession of his own, either by himself or his solicitors; and the ownership of the title-deeds passes along with that of the lands themselves. See REGISTRATION.

**Titles**, designations to which certain persons are legally entitled, in consequence of possessing particular dignities or offices; see ADDRESS (FORMS OF), PRECEDENCE, MAJESTY, ROYAL FAMILY, DUKE, MARQUIS, &c.; also COURTESY TITLES. Though several foreign countries have their dukes, marquises, counts, viscounts, and barons, these often differ considerably in rank from the seemingly corresponding titles in Britain, and the English rules and practices regarding title are not applicable abroad. The complicated system of titles by law, and still more by courtesy, which prevails in England is a source of endless perplexity to such foreigners as endeavour to make themselves acquainted with British usages. For a title to Orders, see ORDERS (HOLY); and for the subject of titles generally, see Edward Solly's *Index of Hereditary Titles of Honour* (Index Soc. 1879).

**Titmouse.** See TIT.

**Titular**, one who enjoys the bare title of an office, without the actual possession of that office. Thus, the English kings styled themselves kings of France from the time of Henry IV. down to 1800. In English Ecclesiastical Law a titular is a person invested with a title in virtue of which he holds a benefice, whether he performs its duties or not. In Scotland the term was used by laymen invested at the Reformation with church lands; see TEINDS. Leo XIII. altered to 'titular bishops' the old title of bishops *In Partibus Infidelium* (q.v.).

**Titus**, the Roman prænomen but the usual name for the eleventh of the twelve Cæsars, Titus Flavius Sabinus Vespasianus, the eldest son of Vespasian and Flavia Domitilla, born at Rome, 30th December 40 A.D. He was brought up at the court of Nero along with Britannicus, and early

served with credit as tribune in Germany and Britain, and in Judæa under his father. On Vespasian's elevation to the throne Titus was left to prosecute the Jewish war, which he brought to a close by the capture of Jerusalem after a long siege (70). Both father and son enjoyed a joint triumph in 71. About this time Titus received the title of Cæsar, and took a share in the work of government. He gave himself up to pleasure, and his attachment to Berenice, the daughter of Herod Agrippa I., grievously offended the Romans. But no sooner had Titus assumed the weight of undivided power (79) than his whole character became changed. The very first act of his reign was to put a stop to all prosecutions for *lesa majestas*, and to decree heavy punishments against informers. He assumed the office of Pontifex Maximus in order to keep his hands free from blood. He completed the Colosseum and built the baths which bear his name, and lavished his beneficence upon the sufferers from the great eruption of Vesuvius, which overwhelmed Herculaneum and Pompeii (79), and the great three days' fire at Rome, followed by pestilence the year after. Titus was now the idol of his subjects, the 'love and delight of mankind.' He loved to give, and the characteristic story is told that one night he exclaimed 'I have lost a day' when he remembered that he had given nothing away that day. But unhappily he died suddenly at his patrimonial villa in the Sabine country (September 13, 81), not without the suspicion that he had been poisoned by his younger brother Domitian.

**Titus**, one of the companions of the apostle Paul, is (apart from the epistle with which his name is associated) mentioned only in 2 Cor. and Gal. He was a Greek, and remained uncircumcised after his conversion. He accompanied the apostle from Antioch to Jerusalem, where the latter took part in the church council held to discuss the Christian privileges of Gentiles. He was thrice sent to Corinth: on the first occasion, from Ephesus, as bearer of a no longer extant epistle (2 Cor. ii. 3, 4; vii. 8, 12); afterwards, from Macedonia, with the second canonical epistle; and a third time to promote the collection in Corinth for the poor Christians of Judæa. According to Tit. i. 5 he accompanied the apostle to Crete, and was left by him there. Ecclesiastical tradition makes Titus 'bishop' of Crete. For the canonical epistle to Titus, and works thereon, see TIMOTHY AND TITUS (EPISTLES TO).

**Titusville**, a city of Pennsylvania, on Oil Creek, 120 miles by rail SSW. of Buffalo. It contains oil wells and refineries, and, though it possesses also iron and steel works, &c., its prosperity is mainly dependent on the oil-trade. In June 1892 it suffered much from a great flood. Pop. 8000.

**Tiumen**, a town and important commercial centre of western Siberia, 90 miles SW. of Tobolsk, on the Tura, an affluent of the Tobol, and so of the Irtish and Obi. Connected by rail with Perm and the Russian system, it is on several important trade routes both by land and water; and large quantities of leather, carpets, soap, candles, and pottery are manufactured and exported throughout Siberia, the Ural countries, the Kirghiz Steppes, Khokand, Bokhara, and China. It has a large scientific and technical school, and there is a great fair in January. Tiumen contained an important exile forwarding prison (see books cited at SIBERIA). Pop. 44,000.

**Tiverton**, a municipal borough of Devonshire, 14½ miles N. by E. of Exeter, stands pleasantly on an eminence between the confluent Exe and Loman, and got the name *Twy-ford-ton* from two fords upon those two rivers. Little save the gateway

remains of the castle of the Earls of Devon, built in 1106, and dismantled after its capture by Fairfax in 1645. St Peter's, a Perpendicular church of the 15th century, was mostly rebuilt in 1855; and other edifices are the town-hall (1864), late Venetian in style, with a tower 80 feet high, the market-house (1830), the infirmary (1852), the Greenway almshouses (1517), Waldron's almshouses (1579), and the grammar-school (1604), which was founded by Peter Blundell (1520-1601), and has an endowment of £1100 a year. Among its scholars have been Bishops Bull, Hayter, Conybeare, Archbishop Temple, A. Hayward, R. D. Blackmore, and his hero, John Ridd. New school buildings in the Tudor style were erected in 1880. Tiverton was a great seat of the woollen trade from 1353 till 1700 and afterwards, but lace-making is now its staple industry, the lace-factory having been established in 1816 by John Heathcoat (1783-1861), inventor of the bobbin-net frame. Cosway, the painter, and Mrs Cowley, dramatist, were natives; whilst Lord Palmerston for thirty years (1835-65) represented Tiverton, which was chartered by James I., but lost its two members in 1885. Pop. (1851) 11,144; (1871) 10,025; (1911) 10,205; (1921) 9715. See works by M. Dunsford (1790), W. Harding (2 vols. 1844-47), and F. J. Snell (1893).

**Tivoli** (the ancient *Tibur*), a town and episcopal see of Central Italy, 18 miles E. of Rome by steam tramway (which follows the highroad) and 25 by rail. Tibur was certainly a city of considerable power in early days, though there is no reliable information as to its foundation. It did not lose its independence, wisely becoming an ally of Rome; and it possessed a great sanctuary of Hercules, which (like the temple of Fortune at Palestrina) extended up the slope of the hill on which the mediæval town (which contains some interesting old churches and houses) is built. In the Augustan age the imperial house shared these divine honours. There are considerable remains of this sanctuary; but the two famous temples of Tivoli (one round, one rectangular), above the old waterfall, are of uncertain attribution. In the late republican period and under the empire Tivoli was a favourite resort of wealthy Romans, and on the hills near the town are a very large number of ruins of Roman villas. Horace, his friend Quintilius Varus, Mæcenas, and Augustus himself, and many others had villas here, though only those of the first two can be identified with any certainty, and the traditional names are generally misleading. In low ground below the town is the vast villa of Hadrian, most magnificent of any of the villas: it has produced a very large number of sculptures and other works of art, which now adorn the various museums of Europe: its structural remains are of great interest; they have been for the most part excavated, and are in the hands of the government. The famous Villa d'Este, begun by Pirro Ligorio in 1549, is built on terraces on the ancient principle; it was decorated with numerous fountains and adorned with classical sculptures (now dispersed among other collections), but is probably far more beautiful in its picturesque decay. The waterfalls of Tivoli were gradually eating back the cliff and threatening the town with destruction; two new tunnels were therefore built in 1826-35, and the new fall (Cascata Grande) formed. The smaller falls (Cascatelle) pass through the town, and furnish power for paper and rag mills, and for the first power-station (1892) for electric lighting and trams in Rome itself, now supplemented by others farther up the Anio valley and as far away as Terni. The territory of Tivoli is very fertile. Vines, fruit-trees, and olives flourish; the last attain a great age, and add to the beauty of the

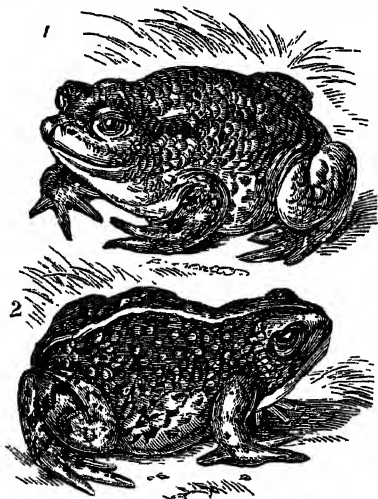

landscape. The magnificent view across the Campagna to Rome and the sea is not the least of the attractions of the place. Pop. (1921) 16,387.

**Tlaxcala**, the smallest state of Mexico, on the plateau of Anahuac, nearly surrounded by Puebla, and touching Mexico state on the west. In Aztec days Tlaxcala was the seat of an independent republic, which survived for a time under the protection of the Spaniards. Area, 1506 sq. m.; pop. 200,000. The capital, Tlaxcala, stands 7300 feet above the sea, and has some manufactures of woollens; pop. 5000.

**Tlemcen**, a town of Algeria, 80 miles SW. of Oran, stands on a rock in an undulating country, with a delightful climate, and surrounded by olive-plantations and vineyards. Pop. (1926) 26,758.

**Toad** (*Bufo*), a genus of tailless Amphibians (Anura), marked by the absence of teeth on the jaws, a very glandular skin, usually warty, a pear-shaped protrusible tongue, fixed in front and free behind. The genus is represented all over the world except in Australia and Madagascar. The Common Toad (*Bufo vulgaris*), whose range extends over Europe except in the south, and over Asia north of the Indian region, may be distinguished from the common frog by its warty gray-brown skin, by having no teeth on the jaws, by its less-developed web between the toes, by its crawling and climbing instead of jumping, by being more terrestrial, by its nocturnal habits, by laying its eggs in strings, not in clumps, and in many other ways. But all the species of *Bufo* are not like the common toad; thus the African Jerboa toad has long slender legs. Moreover, some burrowing frogs are very toad-like.

The common toad shows many colour-varieties, and an individual can change colour considerably according to its moods and haunts, the inciting influence being apparently a hormone from the

1. Common Toad (*Bufo vulgaris*); 2. Natterjack (*Bufo calamita*).

pituitary body. This chemical messenger is carried by the blood to the colour-cells or chromatophores of the skin, which contract or expand. In many cases the colour is olive-gray to dark brown above, with whitish underparts which often show a brown, yellow, or reddish tinge. The eyes are peculiarly fine, with a red or coppery iris. In its movements the toad is rather slow, usually crawling, occasionally taking a short hop; it can climb well on a steep bank, and some of its relatives are arboreal. At the breeding time it swims strongly. It shoots out its tongue on an insect, and the fingers are

used to poke a gripped earthworm or the moulted outermost layer of skin into the mouth. The moulting takes place every few weeks in summer. The toad hides in holes during the day, and comes out at dusk to hunt for insects, earthworms, and small slugs. In winter it passes into a state of coma, buried in loose dry earth or in the midst of withered leaves, perhaps in the hollow stump of a tree.

The pairing takes place in early spring, often about the beginning of April, and the toads have often to make a considerable journey to find a suitable pool. The ardent males, who are far more numerous than the females, fight with one another for possession, and are very prolonged in their sexual embrace. Their cry has been compared to 'the distant barking of a little dog,' while the female's weak response, which goes on day and night, has been likened to 'the whining bleating of a lamb.' The eggs, which may number 2000-7000, are laid in two double strings of albumen, sometimes ten feet long. The eggs are fertilised externally by the male, just as they pass out from the female; and the long strings are entangled among water-plants by the movements of the coupled pair. In about three weeks the tadpoles emerge from the albuminous jelly, and their life-history is much the same as in the case of frogs. In about three months the tadpoles have become miniature toads, about three-quarters of an inch in length, and more agile than their parents. They hide among grass and in little holes in the ground, and the sudden appearance of large numbers when rain comes after prolonged drought has given rise to stories about 'showers of toads.'

Many misunderstandings have clustered round the toad. Thus it is said to be 'a slimy creature spitting venom,' but it is rather dry-skinned, and it cannot spit. The glands, called parotoid, that are seen as prominent swellings behind the eye, as well as smaller glands distributed over the skin, secrete a volatile poison (phrynin) that inflames the lips and mouth of any animal that tackles a toad. This greatly reduces the number of the toad's enemies. Other qualities that secure survival are its quiet and elusive ways, its crepuscular activities, and its capacity for lying low without food in the winter. The toad is not an animal of much intelligence, but it is tameable, and seems to be able to recognise its keeper.

The other British toad, the Natterjack (*Bufo calamita*) is a much smaller animal with large vocal sacs, a very loud croak, prominent yellow eyes, and handsome colouring. Its hind-legs are so short that it cannot hop at all, but it can walk or even run at a fair speed. Unlike the common toad, it occurs in Ireland (on the coast at Dingle Bay), as well as in Great Britain, but it is not a common animal. It has a very distinct odour. Among the other toads may be mentioned the North American *Bufo lentiginosus*, the South American giant *Bufo marinus*, which is often six inches long, the European Green Toad (*B. viridis*), and the beautiful Pantherine Toad (*B. mauritanicus*) of Africa. See Hans Gadow, 'Amphibia and Reptiles,' vol. viii. of *Cambridge Natural History* (1901).

**Toadflax** (*Linaria*), a genus of plants of the family Scrophulariaceae, very closely allied to Snapdragon (q.v.), from which genus it is distinguished chiefly by the spur at the base of the corolla, and the capsule opening by valves or teeth, not by pores. The species are herbaceous perennials or annuals, natives chiefly of the colder and temperate parts of the Old World. Some of them are natives of Britain, of which the most common is *L. vulgaris*, a species with erect stem 1 to 3 feet high, glaucous linear-lanceolate leaves which thickly cover the stem, and terminal spikes of yellow flowers. It grows in hedges, the borders

of cornfields, &c. It possesses purgative and diuretic properties, and a decoction of it is used as a fly-poison; but it is regarded as a troublesome weed by farmers. It has found its way, probably along with grain or other grass seeds, into the United States. A very remarkable monstrosity is sometimes seen in this plant, to which the name *Peloria* has been given, the flower presenting five spurs and five usually imperfect stamens. *L. Cymbalaria*, the Ivy-leaved Toadflax, or the Mother of Thousands, a favourite window-plant with cottagers, known to Gerard as a garden flower, escaped from the Physic Garden at Chelsea, and is now quite naturalised on old walls in Britain.

**Toadstool**, a name for almost any large umbrella-shaped Fungus, but as a rule understood to refer to a poisonous form as distinguished from a Mushroom (q.v.). See FUNGI.

**Toast** (Late Lat. *tosta*, 'a piece of toast,' from *tostus*, 'scorched' or 'parched') is the name given to bread dried and browned before the fire. So early as the 16th century toasted bread formed a favourite addition to English drinks. Sack was drunk with toast, and so was punch. The practice of drinking healths, particularly that of an entertainer, is one so natural, so likely to spring up spontaneously, that it is impossible to say when it began. Certain it is, however, that it received an artificial development owing to the prevalence of convivial habits in the 17th century. Then it became the fashion to drink not to the health of entertainers only, but to that of each guest, of absent friends, and more especially of the unmarried woman whose attractions were most generally acknowledged. It also became the custom to describe a woman whose health was so drunk as herself 'a toast'—a custom whimsically referred to one particular incident in the *Tatler*, No. 24 (1709). Whatever may be the origin of the use of the word 'toast' in this sense, we now apply it not only to any person, but to any sentiment mentioned with honour before drinking. Both French and Germans have adopted the word from us. See Chambers's *Book of Days*; Valpy's *History of Toasting* (1881); lists of toasts and sentiments in *Notes and Queries* for 1888; A. Gray's *Toasts and Tributes* (1904); *Prosit* (San Francisco, 1904); and Chase and French's *Waes Hael* (1904).

**Tobacco** is a name believed to have been derived from *tabaco* or *tabac*, the Haytian or Carib name of the instrument in which the leaves were smoked by the natives. The plant belongs to the genus *Nicotiana*, family Solanaceæ. The various species are mostly herbaceous, rarely shrubby, generally with large broad leaves, and covered all over with small clammy hairs. There are said to be in all about fifty species of the plant, with many varieties belonging to each, but of these three stand out in importance apart from the rest. The first of them is *Nicotiana Tabacum*, or American tobacco, which furnishes the bulk of the tobacco of commerce. It is a handsome plant, standing sometimes 6 or 7 feet high, with large oblong leaves which embrace the stem at their base, and with a pink or rose-coloured flower. It is now grown in all parts of the world, and the commercial American tobacco is almost exclusively of this species, although the varieties differ so widely as sometimes to give rise to a doubt whether they are not of different species. It includes, amongst other kinds, the famous Virginian, Kentucky, Maryland, and Havana tobaccos.

*N. rustica* is a smaller plant, about 3 or 4 feet in height, with leaves of a more ovate form which are attached to the stem by stalks, and with a green flower. It is a native of America, but is now cultivated chiefly in Europe, Asia, and Africa,

and furnishes the Turkish, Syrian, and probably the Latakia tobaccos of commerce. It is a hardy plant, and ripens earlier than *N. Tabacum*. It is called green tobacco, because the leaves in drying do not entirely change to brown.

*N. persica*, which furnishes the famous mild Shiraz tobacco is grown in Persia, and has oblong stem-leaves and a white flower. *N. glauca*, popular in the private gardens of England, is often a long straggling plant with small leaves widely separated, but by continually nipping the stem it may be made to assume a bushy form. The flower is white and droops somewhat during the day, but towards sunset it opens out, becomes firm, and then emits for the remainder of the evening a powerful and delicious perfume, which is, of course, quite unlike that of prepared tobacco.

**History.**—It is a matter of conjecture whether the use of tobacco as a narcotic was known in the East before the discovery of America. It is believed that it was long cultivated in New Guinea before Europeans found their way there.

It is possible that the Chinese had long been accustomed to smoking it. The habit, however, did not spread to surrounding countries; whereas on the introduction of tobacco into Europe from America its use rapidly extended and soon became very prevalent in Oriental countries. The custom was in full force in America when that continent was first discovered by Columbus. The natives of the West Indies at that time made the tobacco into cylindrical rolls wrapped in maize-leaf.

Fra Romano Pane, whom Columbus had left behind in Hayti, in 1496 wrote Peter Martyr an account of tobacco; but an exact description of the plant was first given in 1525 by Gonzalo Hernandez de Oviedo, viceroy of San Domingo, who also introduced it into Europe, and cultivated it as an ornamental plant in Spain. Its medicinal properties caused its cultivation to spread to other European countries. Jean Nicot, French ambas-

Fig. 1.—American Tobacco (*Nicotiana Tabacum*).

Fig. 2.—Syrian Tobacco (*Nicotiana rustica*).

sador at Lisbon, purchased some seed there which had just been brought over from Florida, and sent some of it home. In 1561, upon his return, he presented some of the plants to Catharine de' Medici. Various names were given to the plant at this time, but finally it was designated *Nicotiana*, and this word, which has been retained by botanists, gives rise to Nicotine, the name of the characteristic alkaloid of the plant. The custom of smoking the dried leaves quickly succeeded the cultivation, to be followed soon after by the habit of snuffing—luxuries at first confined to the wealthy. Therewith commenced a literary warfare, not yet ended, in which the vituperators of the 'stinking habit' produced most of the writings. Popes Urban VIII. and Innocent XI. issued decrees. Sultans of Turkey made smoking a crime punishable by the offenders having their pipes thrust through their noses. In Russia the noses of smokers were cut off. Into England tobacco was, according to some, first brought by Sir John Hawkins in or about 1565. Probably Sir Walter Raleigh had much to do with its popularity by encouraging its growth in 1586, but he was not the introducer; nor was Ralph Lane of the Virginia expedition of 1585, though he too may have helped to spread the habit of 'drinking' or 'taking' tobacco, as it was called. We read in Lobel's *Stirpium Adversaria Nova* (Lond. 1571) that tobacco was at that time successfully cultivated in England and Scotland.

Shakespeare makes no reference to the use of tobacco, but many passages could be culled from Ben Jonson, Dekker, and the other dramatists. Bobadill in *Every Man in his Humour* (III. v.) professes to have received in the Indies 'no other nutriment in the world for the space of one and twenty weeks but the fume of this simple only. Therefore it cannot be but 'his most divine.' 'Divine' is Spenser's word also (*Faerie Queene*, III. v. 32), and was, indeed, the stock epithet among those who approved of its virtues whether for the healing of wounds or 'the expulsion of rheums, raw humours, crudities, obstructions, with a thousand of this kind,' or for closing 'the orifice of the stomach' when one cannot come by a dinner. We hear the other side from Cob in the same scene, from the Citizen's Wife in *The Knight of the Burning Pestle* (I. ii.), and from Clare in *Westward Hoe* (v. i.). 'Filthy,' 'roguish,' and 'stinking' are the favourite adjectives; and much is made of the deadly soot with which the tobacco-drinker's body is choked. Smoking was at this time a mark of the man of fashion, and was surrounded with a ceremony and a special jargon like fencing or heraldry. In *Every Man out of his Humour* (III. i.), Sogliardo, who wishes to be a 'gentleman,' is instructed in the mysteries by Master Shift, who professes to teach his pupil 'to know all the delicate sweet forms for the assumption of it; as also the rare corollary and practice of the Cuban ebolition, the Euripus, and whiff, which he shall receive or take in here at London and evaporate at Uxbridge or farther if it please him.' In the early days of smoking, when the price of tobacco was high, it was usual to expel the smoke through the nostrils, as is still the custom of some cigarette-smokers. Sogliardo even uses a 'poking-stick' to widen his nostrils.

The first book against tobacco seems to have been *Opinions of the late and best Physicians concerning Tobacco* (1595), followed in 1602 by *Work for Chimney Sweepers*. In the latter year came *A Defence of Tobacco*, and in 1604 the famous *Counterblast to Tobacco* of James I., in which that monarch expressed his disapproval of smoking in the following terms: 'A custom loathsome to the eye, hateful to the nose, harmful to the brain, dangerous to the lungs, and in the black, stinking fume thereof

nearest resembling the horrible Stygian smoke of the pit that is bottomless.' In 1614 the Star-chamber imposed a tax on tobacco, and at about this time stipulations began to appear in respect to responsible appointments, one of the necessary qualifications of a teacher being that he should be 'no puffer of tobacco.' All this proved of little or no avail, and plantations sprang up in all parts of the country. Under Charles I. denunciations continued. Charles II. placed a duty on imported tobacco and forbade cultivation.

Cigar-smoking, though practised by the Indians and Spaniards, was rare in northern Europe. The first cigar-shop in Germany was opened in Hamburg in 1788. French soldiers brought the habit from Spain early in the 19th century. Cigarette-smoking was brought to Britain by the soldiers who fought in the Crimean war, but Ruskin denounced it as 'enabling a man to do nothing without being ashamed of himself.' In the United States the use of chewing-gum has partly superseded that of tobacco.

*Cultivation.*—Although the tobacco-plant is essentially a tropical one, it readily acclimatizes itself to temperate regions, and the hardier kinds can be easily cultivated in comparatively cold climates; but the produce is less valuable the farther north we go, and in some countries, as in Germany, tobacco deteriorates if continually grown from its own seed. Unquestionably the best varieties are those of the tropical countries. One of the most remarkable characteristics of the plant is its rapacious appetite for mineral constituents or what ultimately becomes the ash; and it very soon drains the soil of all its nourishing food. The plant is not over particular as to the quality of the mineral constituents, which, nevertheless, materially affect the quality of the leaf. For instance, if salt is employed as a fertiliser the plant will take up enormous quantities of its chlorine—an element with which it can do without almost entirely—and will be ruined by this as regards its burning properties. Then again, a lime soil will produce a large crop, but the general quality will be somewhat impaired by it. The size of the leaf or the fullness of the crop is no guarantee that that crop will produce a good tobacco. The best kind of soil is an alluvial or a light sandy one containing plenty of potash. In America it is found that on new land the plant has larger stems and fibres than on old, the leaves have a coarse texture, and the tobacco a strong acid taste, although at the same time the yield is larger. Generally speaking, old soil is preferred, not only because it produces a sweeter tobacco, but because it is more easily prepared. The soil should be watched and deficiencies made good. Potash should be present in larger quantity than is necessary for ordinary agriculture, and when deficient should be added in the form of sulphate. In growing the small garden plant the ash of smoked tobacco may be advantageously used by throwing it on the adjacent mould.

The details of the cultivation vary of necessity according to the climate and the country in which it is carried on, but the following is a general description of what usually takes place. The seed-bed, which should be a light friable soil, is well broken up to a depth of 1½ foot some months before sowing. A drain is dug round it after the style of an asparagus-bed, and a brush heap is burned over the ground to kill weeds and supply potash. The seed, which is very small (one ounce containing about 100,000), is mixed with wood-ashes or sand to assist in its even distribution, and is sown in America between the middle of March and the early part of April. About half an ounce of seed is usually required to produce

plants necessary for an acre. In cold climates the seeds are sown in hotbeds. When the seed has been sown the bed is covered first with a thin layer of manure, then with a sprinkling of ashes to keep off ants, and finally with cut straw and small branches of trees to protect the seedlings from cold. In India protection from sun and rain is necessary. The soil is kept moist but not wet, and the plants, which appear in about a week, require frequent but gentle watering. They are thinned out after two or three weeks, and in about seven or eight they are transplanted into the fields. The field is prepared by several ploughings, and by being ridged or raised into hillocks about 2 or 3 feet apart. These ridges or hillocks are flattened at the top and the seedlings planted in small hollows on them, one seedling to each hillock, or, in the case of the ridges, about 3 feet apart. If the weather is dry the plants should be watered night and morning. They rapidly shoot up, and are then watched carefully for insects—in some parts a flock of turkeys being kept for this purpose. When the flower begins to shoot it is nipped off, so that it shall not take away from the leaves any of the nutriment of the plant. This 'topping' is not done in Turkey and some eastern countries where small leaves are required, and where leaves, buds, and flowers are all used. Generally the leaves are classified into three sorts—the strongest nearest the roots, the medium in the middle of the plant, and the mild at the top. The number and the quality of the leaves may be regulated by nipping off the stem at any desired stage of its growth. Thus a plant may be made to yield eight or ten leaves of a strong flavour, a few more than this of a medium strength, or a still larger number of a mild kind. After the plant has been nipped 'suckers' begin to appear, and must be removed as quickly and as completely as possible. This, together with the removal of worms, can only be adequately performed by a daily examination. Nothing else is now required to be done until the leaves are sufficiently ripe for the harvest, which generally takes place in August or the early part of September. In some places a uniform quality of leaves is aimed at by first cutting a few of them nearest the roots, then leaving the plant eight or ten days for the other leaves to strengthen, cutting a few more of the lower ones, and so on, until the stem is stripped. Another plan is to bring down the whole plant at once by cutting the stem close to the ground.

In India, Ceylon, and some other eastern countries the leaves are simply sun-dried and sent into the market, while in Europe artificial drying is resorted to in the shape of drying-houses heated generally to a temperature of about 70° to 90° F. In America both natural and artificial methods are adopted, nearly always conjointly. Sometimes the leaves are hung in sheds till the spring and then bulked, but more often they are dried in the drying-house, after perhaps being partly sun-dried, then placed in heaps, covered over, and left for a week or two to ferment, with occasional turning to prevent excessive fermentation and firing. The leaves are then sorted, tied into bundles of about a dozen, called 'hands,' and packed under pressure in barrels or hogsheads.

**Manufacture.**—Tobacco may be selected on account of its colour, its aroma, its body, or its drinking power—i.e. its power of absorbing and retaining water without becoming too wet, a very useful kind of tobacco to some manufacturers in past years. Again, it may be chosen as a fiery tobacco which is used to mix with other kinds difficult of burning, while a material like Chinese tobacco, which is of a very light yellow colour, without body and almost flavourless, is bought

solely for producing variety of colour in mixtures. Leaves for cigar-making must be of a good colour and fair body, possess a pleasant aroma to begin with, emit an agreeable odour on burning, have a fairly fine texture, a certain amount of toughness, the ribs and veins must be small, and finally, they must answer the burning test, which is that the leaves should continue to smoulder after they have once been lighted.

Tobacco is imported always tightly compressed and apparently quite dry and crisp. Sometimes it is in the full leaf in bundles tied round by one of its own leaves; sometimes the midribs have been removed—when the material is then known as 'strips.' American varieties are exported in these conditions roughly and tightly packed in hogsheads. The more tender kinds, such as Turkish, Chinese, and Ceylon, are carefully packed leaf upon leaf. The names of some of the better known varieties in the market are those of Virginia, Kentucky, Maryland, Big Frederick, Western (leaf and strips), Indiana, &c. from America; Java, Japan, China, India, and Ceylon from the East; and Turkish and German from Europe. The dry-looking imported article contains from 10 to 20 per cent. of water, or on an average about 14 per cent.; but before manufacture it must be impregnated with more water and steamed, when the leaves rapidly become flaccid and easily open out.

In the manufacture of cigars the leaves, after being thus treated, are stripped of their midribs, smoothed and sorted, the perfect half-leaves being put on one side to be used as wrappers. One of these strips is cut into the shape of a balloon gore, and fragments of imperfect leaves and cuttings, known as the 'fillers,' being placed at one end, the strip is wrapped round them. Over this is then wound spirally a long narrow rectangular slip called the 'wrapper,' commencing at the lighting end and finishing at the pointed or mouth end. The cigars are then gauged and cut to length, dried and packed. Cheroots differ from cigars only in the matter of shape, being open at both ends, generally with one of them much broader than the other. Good cigars should consist of the same tobacco throughout, but very often the seductive wrapper conceals an inferior and even bad material. Cigars are rarely adulterated; the interior is at worst nearly always tobacco of a cheap kind. The best Havana cigars all come from Cuba; but it is a common practice to place home-made cigars in imitation foreign boxes. Cheroots come chiefly from the Philippine Islands. Mexican tobacco has met with much favour of recent years for cigar-making. The high import duty for cigars has fostered the practice of importing the leaves, on which less duty is paid, and manufacturing them in England. The difference between the foreign and British made articles is easily detected, and, as a rule, the latter are more glossy, better made, and more uniform in their appearance than the former. In the United States cigar-making is an important industry, and the best brands of 'domestics' bring a good price. Cigarettes, at first made only by hand, as they are often still, are now made mechanically by various methods. The machine may wrap the paper round the tobacco and gum it up; or it may first make a paper tube, and force the tobacco in.

The greater portion of the imported leaves, however, is manufactured into pipe tobacco, of which there are two classes—the *cut* and the *cake* or *twist*. As a rule, for the former class the leaves are stripped of the midrib, damped, allowed to ferment a little, and are then placed in a square iron box and pressed into a large cake. The dark-coloured liquor which is squeezed out is used as 'sauce' for a stronger product. The cake is then cut in a

cutting machine into shreds of the desired fineness. The cuttings are gently steamed, pulled, well mixed, and scented if desired. *Shag* is prepared in this way from a rather strong variety of leaf. In the case of *Bird's-eye* the midribs are not removed. *Returns* is so called from being prepared from broken and rejected pieces and siftings.

In the second class there are also many kinds, such as *Cavendish*, *Negrohead*, *Pigtail*, *Bogie*, &c. The strongest kinds of leaf are employed in their preparation, and generally plenty of sauce is mixed in. For *Cavendish* the leaves are stripped, sauced, fermented, and are then laid one upon another and pressed into cakes of the desired size. They are sometimes made into sticks about 9 inches long and 1 inch thick, which are then laid across each other equally and pressed together: this kind is called *Negrohead*. In the case of twist tobacco the stripped fermented leaves are twisted either by hand or by a spinning-wheel after the style of making string. The rope so obtained, if thin, is known as *Pigtail*, and if thick, generally as *Bogie*. It is wound into balls or reels. All these kinds are oiled with sweet-oil, which prevents them from sticking together and from becoming too dry. In America mild cakes are impregnated with molasses or liquorice to give them a sweet flavour in chewing, but in England the sale of such tobacco is illegal. Cigarettes are usually made of the Syrian species, such as fine-cut Turkish, Salonica, &c.; but American tobacco has of late years been rather extensively used.

When the British duty on tobacco was reduced in 1887 there was a limit placed on the amount of water to be allowed in the manufactured article. The adulterants of tobacco are legion. All kinds of vegetable substances, gums, saccharin, and mineral matters have at different times been detected. Manufacturers in Britain are prohibited, under a penalty of £200, not only from using but from having in their possession sugar, honey, molasses, treacle, leaves, herbs, or plants, powdered wood, weeds, ground or unground, roasted grain, chicory, lime, sand, umber, ochre, or anything capable of being used to increase the weight of tobacco and snuff.

Snuff used to be made from tobacco leaves, but now it is prepared almost entirely from the stalks and ribs which are not used by the tobacco-manufacturer. The dry snuffs include the well-known Welsh, Scotch, and Irish varieties, and are prepared by finely grinding the stalks in a mortar after they have been allowed to ferment. The characteristic odour of the Irish and Welsh kinds is obtained by gently roasting the stalks previous to grinding. The moist snuffs include most of the preparations with fanciful names. These are generally made by grinding the stalks wet, allowing the fermentation to take place after grinding, mixing with various salts sanctioned by the excise, scenting and moistening to the desired degree. Snuff has been, and is sometimes now, adulterated to an enormous extent. It is no uncommon thing at the present day for the tobacco-manufacturer to add the sweepings of his whole factory to the parcel of scrap pieces intended for the snuff-maker. Besides this, many adulterants are purposely added, including many kinds of vegetable matter, salts, red-lead, chromate of lead, and oxide of iron.

**Constituents.**—The green leaf, and even the bulk of the dry imported leaf, contains a large ratio of complex organic bodies which retard combustion, and which, on forcing the burning, give off very objectionable odours. It is the processes of curing, fermenting, and manufacturing which get rid of or modify these objectionable bodies, and so render the material fit for use. Excessive fermentation has to be avoided, especially with cigar

tobacco, because it blackens the leaves and produces ammonia compounds. Some leaves, especially those grown in tropical climates, do not require fermentation. The mineral constituents remain the same throughout, except in their combination with the organic substances, and on burning they constitute the incombustible residue or ash. The ash should be white or grayish white in colour, and not excessive in quantity—generally between 12 and 20 per cent. of the dry leaf; redness denotes iron in the soil, and blackness is due to carbon, the result of imperfect combustion. The characteristic constituent, however, of all tobacco is the alkaloid *nicotine*, which varies in quantity from about 1 to 9 per cent. The best flavoured kinds, such as Havana and Manila, contain only about 2 to 3 per cent., while some of the commoner varieties of French and German run up to 9 per cent. American Virginia and Kentucky average about 4 or 5 per cent. It is believed by many that the spotted appearance is a good indication. The origin of these spots has given rise to many opinions; but it is now understood that the pale spots are formed by the sun's heat being concentrated by transparent globules on to the leaf and locally burning.

**Consumption and Use.**—The consumption of tobacco at the present time is greater than it ever was. Thus the annual consumption per head of population in England was 11·7 oz. in 1821, 16·3 oz. in 1851, 23·3 oz. in 1881, and 30·2 oz. in 1901. By 1918 it had grown to about 2½ lb. The average for the whole of Europe in 1892 was calculated at 2½ lb. for each inhabitant, which is of course 3 oz. per month. A large quantity of tobacco used to be disposed of as snuff, but the habit of snuffing has decreased very rapidly, and 'plugging' or stuffing the nostrils with quids of tobacco has died out altogether. Chewing is now practised by Englishmen chiefly as a consequence of restrictions placed upon smoking, as, for instance, by sailors at sea and by workmen during working hours; it is comparatively common in the United States.

**Commerce.**—The revenue of Great Britain from the import duty on tobacco in 1891 constituted for the first time more than half the whole revenue of the customs department. In 1925-26, out of £103,300,000 of customs receipts, some £53,500,000 came from tobacco. This is, of course, because it is taxed so enormously out of proportion to its own value, and so much more heavily than the other articles. The disproportionate tax naturally offers a strong temptation for surreptitious trading or *smuggling* (q.v.). The authorities keep up a rigorous supervision to prevent it.

Most of the world's tobacco comes from the United States. Other countries in which it is grown are Cuba, Mexico, Egypt, Syria, Macedonia, Asia Minor, India, Japan, China, and the Dutch Indies. Cigars are chiefly brought from the West Indies, Philippine Islands, Germany, and Mexico.

**Physiological Effects.**—Tobacco acts in various ways on the system, depending, first, on the individual, and, secondly, on the time and circumstances of its being consumed. It acts most frequently as a sedative or a narcotic. In some instances it will rouse the sluggish mind into activity, while in others it will moderate excessive mental excitement. It will often correct the disagreeable effects of nervousness; while, on the other hand, it will likewise act as a laxative. The most noticeable characteristics perhaps are the effects of smoking on the nervous system in such cases as those in which it is upset by mental distress or anxiety. At the same time it must not be forgotten that there are persons whose nerves are disarranged and quite upset by smoking. By such people the habit should be tabued altogether.

Others again are only inconvenienced after an excess, while there are those who can stand any amount. Consequently, if the use of tobacco is ever to be governed by a single law, it will be by that of common-sense. The amount to be consumed must be regulated by the individual who consumes it. Although even excess has never been known to originate a specific disease, still it reduces the system to a low condition, and unfits it to fight against ailments brought on by other causes. Until the system is near maturity, tobacco should be only lightly indulged in, or avoided *in toto*, as it acts prejudicially, even in small doses, in early life, and if used in excess is liable to have a permanent ill effect. The immediate effects of tobacco-poisoning are very transitory, and they soon work off.

The usual effects of an overdose of tobacco are faintness, nausea, giddiness, general relaxation of the muscular system, loss of power of the limbs, cold perspiration, and vomiting. In some cases there is purging, and in others a sense of sinking or depression in the region of the heart. Attendant on these symptoms are a dilatation of the pupils, dimness of sight, weak pulse, and difficulty of breathing. In mild cases a little stimulant and fresh air are the best remedies. Some of these disturbances of the functions are occasionally felt by the inveterate smoker, who also is liable to suffer from what is known as 'smoker's sore throat.' This makes itself evident by an irritable state of the mucous membrane at the back of the throat, with dryness, producing a tendency to cough and an enlarged, soft, sore condition of the tonsils, which renders it painful to swallow. It may exist without detection for a long time; but if a damp, cold, foggy state of the air arises, the throat becomes troublesome and painful, enlargement of the tonsils is detected, and the symptoms become much aggravated by any attempt to smoke. When smoking is altogether suspended it soon disappears, but it is incurable while the habit is persisted in, although the more troublesome symptoms may be temporarily alleviated.

The combustion of tobacco in smoking is never complete. While there are large quantities of carbonic acid and water—the ultimate products of complete combustion—produced, there are also many organic substances which are formed or become released by the heat, and which distil over with the gaseous bodies. It is the condensation of these volatile substances in very minute particles, in a similar manner to the condensation of steam at the kettle-spout, which gives rise to the appearance of smoke. The colour of the smoke is dependent on the quantity of these substances present, and the rapidity with which they are condensed. The burning of tobacco should be free, with a clean ash, but not too rapid. If it is retarded from any cause, such as the improper fermentation of the leaf, or the presence of wrong mineral constituents, then objectionable products are obtained which possess a disagreeable taste and odour. Moreover, carbonic oxide—a distinctly poisonous gas—is produced in considerable amount. All these substances tend to create the unpleasantness so often experienced with a badly burning cigar. A large proportion of the nicotine is consumed or destroyed in the burning, the ratio depending on the freeness or completeness of the combustion. The bulk of it, therefore, is not absorbed into the system, as some would make out. Indeed, it is impossible for it to be so, as one ordinary cigar contains enough nicotine to poison two men. A tenth of a grain will kill a medium-sized dog, so that a quarter of an ounce of mild tobacco would contain enough to poison twenty or thirty dogs. The other prin-

cipal products of the burning are ammonia and its compounds, an empyreumatic oil, and a dark, bitter, resinous substance. The first named is very objectionable both to taste and smell if in undue proportion. The last two are very evident, the former in the odour of stale tobacco, and the other in the bitter taste of the oil in the stem of a foul pipe, and both largely impregnate the smoke. These organic substances begin to be deposited directly they are formed, so that some remains in the mouth, and if the smoke is swallowed or passed through the nostrils, much more will be retained and absorbed into the system—certainly an undesirable result.

It will be quite evident that the least harmful method of smoking is the use of a long pipe made of an absorbing material, such as clay or meerschau. After this a short pipe, then the cigar and cigarette. In the progress of smoking a cigar the oils, &c., partly become condensed in it, and are at the same time drawn along until the end becomes nearly saturated with them. This end piece is often consumed with great eagerness and relish, but it is the most harmful part, and is liable to produce dyspepsia, especially with an empty stomach. The specifically deleterious effects sometimes due to cigarette-smoking may depend on poisonous substances used in preparing the cigarette-papers. The best time for smoking is unquestionably after a meal, and it should not be indulged in immediately before one. The habit of snuff-taking is perhaps the least harmful of the varied uses of tobacco, as the amount consumed must be within reasonable limit. Chewing, on the other hand, is doubtless the most deleterious. Owing to the rapid growth of cigarette-smoking, laws have been passed in the United Kingdom and most of the United States prohibiting smoking by youths.

**Other Uses.**—Although on its introduction into Europe the cultivation of the plant was advocated on account of its medicinal virtues, it is now very little used for them. It has been found effective in spasmodic cases, but at the present time there is only one preparation in the British Pharmacopœia—an infusion of the leaf in water—and this is rarely used. Nicotine is an antidote in poisoning by strychnine, and *vice versa* strychnine will act as an antidote to nicotine. During convalescence after diseases such as meningitis (where the throat has been attacked by a germ), tobacco-smoking is sometimes recommended on account of its antiseptic qualities. An infusion of tobacco is an excellent insect-destroyer, and the spraying of the leaves of a plant with water containing it is very effectual. The juice or 'sauce' squeezed out of the leaves in their preparation for tobacco is occasionally sold and used as a sheep-wash.

**British-grown Tobacco.**—From the time of its introduction down to nearly the end of the 18th century, when it was altogether banished, the successful cultivation had always more or less been carried on. James I. and Charles I., of course, prohibited it, but without effect. Charles II., when he commenced to derive revenue from the imported leaves, imposed so heavy a tax on the home-grown article as it was hoped would stop its cultivation. The surreptitious growth was continued, in spite of all laws to the contrary, right down to the reign of George III., when it was stopped by an act passed in 1782. The plantations in Yorkshire were then destroyed, and the planters imprisoned and heavily fined. Since 1886 experiments have been made with success, though not without opposition, due to considerations of excise; and a little tobacco is grown in Hants and Surrey. More is done in Ireland, where tobacco-growing, prohibited in 1660, was revived in 1779, and stopped again in 1831, but is now permitted in various places by arrangement.

**TOBACCO-PIPES.**—The oldest tobacco-pipes known

are those which have been found in the ancient grave-mounds of the Mississippi Valley. These are in various kinds of stone, some being carved into the form of human heads and others into the shape of various animals, but the most common kind has a plain, more or less conical bowl. All have a short, broad, slightly curved, perforated stem, forming a sort of base for the bowl. Among the animals represented are the beaver, the bear, the seal, the frog, and various kinds of birds. But the most interesting of all are what are called 'elephant-pipes' (fig. 3, *f*), of which two have been found. These unmistakably represent an animal like the elephant, only the tusks are wanting. This is not the only apparent representation of the elephant in American antiquities. The matter has given rise to animated controversy among archaeologists.

Of modern or comparatively modern American pipes, the most interesting are the Calumet (q.v.) or pipe of peace, the tomahawk-pipe (see TOMAHAWK) or war-pipe, and the elaborately and grotesquely carved stone-pipes made by the Indians of the North Pacific coast, which at first

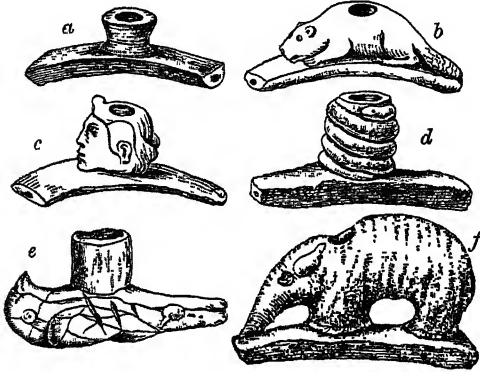

Fig. 3.—Mound Pipes :

glance do not look like tobacco-pipes at all. The pipes of wood and whale's bone made by the Stickeen Indians, in the form of boats bearing houses, are also very curious.

Except what were made in earlier times in America, there are, of course, no tobacco-pipes of a date prior to the end of the 16th century. Nevertheless it is possible that some prehistoric and Roman objects may be pipes that have been used for smoking; for, besides tobacco, many other substances are or have been smoked—willow-bark, various roots, mushrooms, sawdust, coltsfoot, opium, hemp, leaves of rose, chestnut, beetroot, maize. Some of these are in common use in the East (see OPIUM, for instance), and have made their way to some extent in Europe and America. Others are known in the West among those to whom economic, legal, or parental obstacles have debarred the use of tobacco, or unmixed tobacco. The first common clay-pipes manufactured in Europe were perhaps those of England and Holland. Some of them, of small size, are known as Elfin Celtic, or fairy pipes. Pipes of baked clay show great diversity of shape and ornament. The finest kinds of these were made during the latter half of the 18th century at Sevres, Chelsea, Dresden, Vienna, and other famous European porcelain-works, many clever artists having been employed in decorating them. Porcelain pipes, but mostly of a plain kind, are still largely made in Germany

and in the Tirol. Modern French clay-pipes often display skilful modelling. Meerschaum-pipes, many of which are exquisitely carved, are made in large numbers in Austria, and artificial meerschaums in much greater quantities. The ordinary 'briar-root' pipes are cut out of the wood of the tree heath (*Erica arborea*; Fr. *bruyère*), which grows in southern France (including Corsica) and Italy, but cherry-wood is also used.

A great variety of other materials are or have

Fig. 4.—Indian Calumet.

been used for tobacco-pipes. Among these may be mentioned silver, brass, and other metals, glass, ivory, horn, cane, bamboo, corn-cobs, calabashes, and various kinds of stone. Equally numerous have been the ways of decorating their stems and bowls, such as by enamelling, chasing, engraving, carving, and inlaying. The same thing may be said of pipe-cases and tobacco-boxes. In some parts of the world tobacco-pouches are beautifully embroidered. The Hookah (q.v.) or narghileh bowls of India and Persia are often most elaborately ornamented. Pipes made by the Kookies (Manipur) have reservoirs for collecting the tobacco-juice, which is afterwards put into the mouth. The pipes used by the Kirghiz, or at least some of them, have three bowls. Some singular forms of tobacco-pipes are found in uncivilised countries. In New Guinea they consist of capacious hollow cylinders of bamboo, the large volume of smoke which these contain being drawn into the mouth by an aperture at the end. In the Zambezi district of East Africa the stems are formed of an antelope's entire horn, from the middle of which a vertical piece of wood rises, carrying the bowl. The western Eskimo uses pipes with remarkably small metal bowls, and such pipes, though different in form, occur also in China and Japan.

See Fairholt, *Tobacco, its History and Associations* (new ed. 1876); Wagner, *Tabakultur* (new ed. 1888); Killebrew and Myrick, *Tobacco Leaf, its Culture, &c.* (1897); Tanner, *Tobacco: from Grower to Smoker* (1912); Dunhill, *The Pipe Book* (1925); Machen, *The Anatomy of Tobacco* (1926); and Bragge, *Bibliotheca Nicotiana* (1880).

**Tobago**, geographically the most southerly of the Windward Islands, lies about 20 miles NE. of Trinidad, is 26 miles long, from 6 to 7½ broad, and 114 sq. m. in area. The island was discovered by Columbus in 1498, and named by him Assumption; the name of Tobago is supposed to have arisen from the free use of tobacco by the Caribs when first visited by Europeans, or, according to others, from the shape of the island, resembling a Carib pipe (*tabaco*). Frequently contested between Dutch, English, and French, it came permanently into British possession in 1803. The island is volcanic, its surface being irregular and picturesque, and abounding in conical hills and spurs, all connected by a ridge running through the interior, the greatest elevation of which is 1800 feet above the level of the sea. From the high ridge descend deep and narrow ravines, which terminate in small alluvial plains. About a third of the island is densely forested. Scarborough (pop. 800) is its capital, pleasantly situated on the south side, and at the base of a conical hill (425 feet), crowned by Fort King

George, now without garrison. Its delightful climate makes Tobago a health and holiday resort. The chief exports are coconuts, copra, cocoa, sugar, rum, molasses, live-stock, and of late rubber, tobacco, and cotton. Pop. 25,000. The island was united with the colony of Trinidad in 1889, and in 1899 was made one of the wards of Trinidad.

**Tobermory**, a town in the north of the island of Mull, Argyllshire, 28 miles WNW. of Oban, was founded in 1788 at the head of its sheltered harbour. It has fish industries. A ship of the Spanish Armada sunk there has occasioned much treasure-hunting, not altogether without success. Pop. 850.

**Tobin**, JOHN (1770-1804), was an unlucky dramatist who spent weary years in trying to get his plays accepted, and seeing them successively rejected till the very year of his death, when his *Honey Moon*, his fourteenth piece, was not merely accepted at Drury Lane, but secured a success it maintained for twenty years. Tobin, born in Salisbury, was articulated to a solicitor in Lincoln's Inn, and practised law there while writing his plays. His *Honey Moon*, a comedy mostly in verse, was translated into French by Charles Nodier; other comedies in prose or verse were *The Curfew*, *The Connoisseur*, and *The Faro Table*. A volume of his plays was published in 1820, with a Life by Miss Bengier.

**Tobit**, THE BOOK OF, one of the most curious and interesting of the Old Testament apocrypha, tells of Tobit and Tobias, his son. Tobit was a pious, upright, and God-fearing Israelite of the tribe of Naphtali, who had been carried captive to Nineveh by 'Enemassar' (Shalmaneser). Among his many good works was the practice of defying the prohibition of the Assyrian kings by secretly burying the bodies of his slain fellow-countrymen. He was at last discovered, and deprived of all his goods in consequence. To add to his misfortune, through an accident that befell him as he slept in the open air one night, he became blind. In his poverty and distress he resolves to send his son Tobias to Rhagæ (Rai) in Media to recover an old debt from a friend. Tobias finds a companion for the long journey in an unknown youth (really the archangel Raphael) who on the journey gives him much valuable information and advice. Acting on this, he catches a great 'fish' in the Tigris, and secures its heart, liver, and gall. By means of the first two he is able to deliver from the power of the evil spirit Asmodeus his lovely cousin Sara, daughter of Raguel, at Ecbatana, whom he marries and, after recovering the debt for which he had been sent, leads back to his father's house. Arrived at home, he is able with the gall of the fish to cure his father's blindness. The book closes with Tobit's psalm of thanksgiving, and relates how he enjoyed a hundred years' happiness after these events, Tobias also living to see the age of 127. The Book of Tobit exists in Greek, Latin, Syriac, Aramaic, and Hebrew. There is a great deal to be said in favour of the view that the original language was Greek; but there are traces of several recensions of the book, and several different sources have been drawn upon by the author or later editors. In particular, i. 21 *seq.*, ii. 10, xi. 18, xiv. 10, 15, refer to the ancient and widespread Story of Ahikar (see the edition by Rendel Harris), an Aramaic version of which was current at least among the Jews of Elephantine in Upper Egypt in the 5th century B.C. But the present book can hardly have been written before the 3d century B.C., and it can perhaps be most appropriately assigned to the period of the Jewish struggles for independence, when, for example, it was the complaint of the faithful that their

oppressor had cast out many unburied (2 Macc. v. 10). Again, if originally written in Greek, it probably had its origin in Egypt. In fact, it has never been widely known in the Syrian Church; its author's acquaintance with the eastern localities he names is superficial and not always accurate; and it has been pointed out that the 'fish' caught in the Tigris is most probably in reality the Egyptian crocodile, of which we know from ancient medical writers that the smoke of its liver used to be regarded as a cure for epilepsy, and its gall for leucemia. But those who trace the story to a Persian origin are also so far justified by certain facts. Asmodeus is manifestly the Persian evil spirit Aeshmâ Daeva, and Raphael has the attributes of the protecting spirit C̄raosha. The presence of the dog, too, who goes out and returns with Tobias and Raphael denotes rather a Persian than a pure Hebrew source, the Jews regarding that animal as unclean, while with the Iranians it is sacred, and the companion of C̄raosha.

See D. C. Simpson in Charles's *Apocrypha and Pseudepigrapha* (1913), i. 174-241 (full discussion and bibliography), and art. APOCRYPHA.

**Tobogganing**. See SLEDGES.

**Tobolsk**, a town of western Siberia, in the Ural region, stands at the confluence of the Irtysh and the Tobol, nearly 2000 miles east of Leningrad. Its situation north of the great main route between Russia and Siberia is unfavourable for the development of commerce. Pop. 15,000.

**Tobo'so**, EL, a small town (pop. 2000) in the Spanish district of La Mancha, 60 miles SE. of Toledo, the home of Don Quixote's peerless Dulcinea del Toboso.

**Tobruk**, a port with a small but deep and well-sheltered port on the north coast of Barca, 80 miles from the Egyptian frontier, occupied by the Italians in October 1911; pop. 4000.

**Tocantins**, an important river of Brazil, rises in the state of Goyaz, flows north through the state of Pará, and finally, after a course of 1500 miles, widens into the Pará (q.v.), 138 miles from the Atlantic. Its principal affluent is the Araguay (1600 miles), which joins it at the northern extremity of Goyaz, and bears along a greater volume of water than the stream to which it is tributary. The Tocantins is traversed by steamers to 400 miles from the sea; and above the line of falls and rapids 400 miles more is navigable.

**Toccata**, primarily, a composition designed to exhibit the performer's touch on a keyboard instrument, or one in which he seems to try the touch of the instrument in a series of runs and chords before breaking into a fugue. The term came to be used somewhat loosely, sometimes for a sort of overture. See the section on *Fantasia* in the article MUSIC.

**Tocharish**. See TOKHARISH.

**Tocqueville**, ALEXIS CHARLES HENRI CLÉREL DE, was born at Verneuil, in the department of Seine-et-Oise, 29th July 1805. His father, the head of the ancient family of Tocqueville in Normandy, whose wife was a granddaughter of Malesherbes, narrowly escaped the guillotine, but did not emigrate, and, having preserved his property, reassumed in 1815 the title of Count. Young Tocqueville was called to the bar at Paris in 1825, and after a short tour in Italy became an assistant magistrate at Versailles. Sent in 1831 to America to report on the penitentiary system, he wrote *De la Démocratie en Amérique* (1835), which was the first carefully-thought-out book written in Europe on the subject, and made at once a great sensation. The accuracy of the statements, the skill with which the matter had been digested, and the beauty of the style were loudly praised by critics.

The author was described as the continuator of Montesquieu, and the greatest political writer of his time. He became a member of the Academy of Moral Sciences, and in 1841 of the French Academy. The work is a fair and lucid statement from a moderate point of view; but his knowledge was hardly sufficient to bear the whole deductive structure of system which he built on it. In 1835 he was enthusiastically welcomed by the English Whigs, and he married Miss Mottley, an Englishwoman. He shortly afterwards, by a family arrangement, entered into possession of Tocqueville. In 1839 he was elected to the Chamber of Deputies by an overwhelming majority. As a speaker he did not succeed, but he exercised great influence. Immediately after the revolution of 1848 he was the most formidable opponent of the Socialists and extreme Republicans, and as strenuously opposed Louis Napoleon. He became, however, in 1849 vice-president of the Assembly, and from June to October was minister of Foreign Affairs. After the *coup d'état* he returned to Tocqueville, where he devoted himself to agricultural pursuits. He there wrote *L'ancien Régime et la Révolution* (1856), a work now regarded as wanting in width and depth of knowledge, and too favourable to the Revolution. He had also written a work on the reign of Louis XV. (1846-50). He died at Cannes, 16th April 1859. Tocqueville's *Euvres et Correspondance Inédites* were published in 2 vols. (1860; trans. 1861), by his friend G. de Beaumont, with a biographical notice. His *Euvres Complètes* appeared in 9 vols. in 1860-65. See his *Souvenirs* (trans. 1896); a monograph by Jaques (Vienna, 1876); his *Correspondence with Nassau Senior* (2 vols. 1872); and an *Essai politique* on him by R. P. Marcel (1910).

**Tod, JAMES** (1782-1835), author of *Annals and Antiquities of Rajasthan* (1829-32; new ed. 1920), was born at Islington, obtained an East Indian cadetship, and as an officer of the Bengal infantry collected much topographical information. He organised the intelligence department in operations against the Pindharis (1817), and in 1818-22 was political agent in the western Rajput states. He returned to England in 1823, became librarian to the Royal Asiatic Society, and a lieutenant-colonel. Besides his classical *Annals and Antiquities*, he wrote *Travels in Western India*, published with a memoir in 1839.

**Todas.** See NEILGHERRY.

**Todd, DAVID PECK**, American astronomer, born at Lake Ridge, New York, 19th March 1855, studied at Amherst College, Mass., where he became professor of Astronomy in 1881. He worked on the *United States Nautical Almanac*, led many eclipse and other expeditions, designed several observatories, and wrote *A New Astronomy* (1897) and *Stars and Telescopes* (1899, founded on Lynn's *Celestial Motions*).—His wife, MABEL LOOMIS, wrote books of astronomy and travels, and edited the poems and letters of her friend Emily Dickinson.

**Toddy**, the name given in the East Indies to the fermented juice of various palms (Caryota, Cocos, Phoenix, Borassus, &c.; see PALM) from which Arrack (q.v.) is distilled. It is applied in Britain to a mixture of whisky, sugar, and hot water, which forms a popular drink in Scotland.

**Todea**, a genus of leptosporangiate ferns, of the family Osmundaceæ, inhabitants of the southern hemisphere. The *sori* are not, as in Osmunda, borne upon special pinnae, but upon the backs of the ordinary pinnae. *Todea africana* is among those ferns that exhibit apogamy, or the dropping out of the sexual process from the life-cycle, the prothallus producing a new fern-plant by budding. Ferns of this genus, called crape-ferns, are cultivated in greenhouses.

**Todhunter, ISAAC** (1820-84), mathematician, was born at Rye, studied at University College, London, served some time as a tutor, and so was enabled to enter St John's College, Cambridge, where in 1848 he graduated senior wrangler and Smith's prizeman. Elected to a fellowship in his college, he became eventually its principal mathematical lecturer, and ere long his handbooks of Algebra, Geometry, Conic Sections, Trigonometry, Mensuration, and Mechanics made his name known, if not always honoured, in every schoolroom in England. For more advanced students his indefatigable energy and rare faculty of exposition provided also manuals on the Differential and the Integral Calculus, Analytical Statics, Plane Co-ordinate Geometry, and Analytical Geometry.

**Todi**, a city of Umbria, Italy, 25 miles S. of Perugia by rail. It is situated on a hill high above the confluence of the Naja with the Tiber. It was the ancient Tudur, and has three successive lines of wall, Etruscan, Roman, and mediæval. There are also various Roman ruins; the pavement of the piazza rests upon the vaults of a large cistern, while it is surrounded by massive mediæval palaces; and there is a fine substruction wall with niches, perhaps belonging to the forum. The mediæval aspect of the town is striking, and the cathedral has a fine 14th-century façade. Still finer is the Renaissance church of Sta Maria della Consolazione, perhaps after the designs of Bramante (though not executed by him), begun in 1508 and finished in 1607. Fra Jacopone da Todi, reputed author of the *Stabat Mater*, was born here. Pop. of commune (1921) 18,245.

**Todi, JACOPONE DA**, poet and mystic, believed to have been born about 1228 at Todi, in the duchy of Spoleto, from an advocate to have turned Franciscan about 1268, to have been imprisoned for satirising Boniface VIII., and to have died in 1296 or 1306. Next to nothing, however, is known with certainty about his life, and many of the poems once thought his are now attributed to others. See the 'spiritual biography' of him by Evelyn Underhill (1919).

**Todleben, EDUARD IVANOVITCH**, Russian general, was born of German descent at Mitau in Courland, 20th May 1818. After studying at Riga and St Petersburg he distinguished himself as a lieutenant of engineers in the Caucasus, and was with the engineer corps when the Russian army entered the Danubian Principalities in 1853. His genius as a military engineer was discovered before the Russian army crossed the Pruth, on its retreat from the Principalities; and when the French and English undertook the siege of Sebastopol, Colonel Todleben was sent to assist in its defence. He arrived in the middle of April, and the fortifications were soon placed under his direction. The prodigious activity displayed by the Russians in making good the damage sustained by the heavy fire of the enemy filled the allies with astonishment. Everywhere massive ramparts of earthworks, mounted with formidable batteries, rose up as if by magic at each threatened point within the line of defence. During the latter part of the siege he was wounded in the leg. For services in the siege he was created a general, decorated, and made director of the engineer department in the war office. In 1865 he visited England, and was cordially received. He held no very important post till disasters began to befall the Russian army during the Turkish war. Todleben was remembered, and was called to undertake the siege of Plevna (q.v.), which, after a brilliant defence, he took. He was subsequently made commander-in-chief in Bulgaria, and at the time of his death, 1st July 1884, was governor of

Odessa. He wrote an admirable account of the defence of Sebastopol (French ed. 1864). There are *Lives* by Brialmont (Brussels, 1884) and Krahmer (Berlin, 1888). See Kinglake's and Hamley's histories of the Crimean War.

**Todmorden**, a municipal borough of the West Riding of Yorkshire, on the border of Lancashire, prettily situated among hills on the Calder, 9 miles N. by E. of Rochdale, 18½ NNE. of Manchester, and 13 W. of Halifax. The classical town-hall, the gift of the Fielden family, was erected in 1875, and in Fielden Square is a bronze statue by Foley of John Fielden, M.P. (1784-1849), the founder here of a large firm of cotton manufacturers; he was largely responsible for the passing of the 'Ten Hours' Act, 1847. The old county boundary of Lancashire and Yorkshire passes through the town. The public library, which belongs to the corporation, contains a remarkable collection of books on tobacco. Textile goods, especially drills, are the chief production of the town. Pop. (1921) 23,888.

**Toes.** See FOOT.

**Tofana.** See POISON.

**Tofieldia**, a north-temperate genus of Liliaceæ, with a three-lobed calyx-like involucre (calyculus), and sword-shaped equitant leaves. The Scottish asphodel (*T. palustris*), found in wet places on mountains in Britain, resembles a very small plant of *Narthecium*, with greenish flowers.

**Toga** (Lat., from the root of *tēgo*, 'I cover'), the principal outer garment of the Romans, was a thick woollen cloth, originally worn over a loin-cloth or apron. When the tunic was adopted the toga became more bulky and was worn in a looser manner. It was, probably of Etruscan origin, and yet it came to be considered the distinctive badge of the Roman citizen, whence the Roman people are called *togati* or *gens togata*. Cisalpine Gaul, which had adopted the Roman garb, was distinguished as *Gallia togata* from *Gallia braccata* or *Gallia Narbonensis*, which retained the Gallic trousers. Scholars are divided as to its shape, some making it elliptical with pointed ends, while others declare that the most usual form was a crescent, the back of which was an elliptical curve with a circular segment of cloth sewn on to its concave side. The toga of ordinary life was white in colour. The *toga prætexta* had a broad purple border, and was worn by children and by the curule magistrates and censors. When the young Roman was declared to be legally of age he assumed the ordinary toga, on this account called the *toga virilis*. Persons in mourning (*sordidati*) and persons under impeachment wore the *toga pulla*, a garment of a dark colour; while those who were seeking office were wont to dress themselves out in garments which had been made artificially bright by the help of chalk—hence their name of *candidati*.

**Togo**, COUNT HEIHACHIRO, Japanese admiral, born at Kagoshima in 1847, studied at Greenwich, served against China (1894), and as commander-in-chief of the Japanese navy completely defeated Russia in the war of 1904-5.

**Togo**, or TOGOLAND, in 1884-1919 a German protectorate on the Slave Coast, east of the British Gold Coast, west of Dahomey, between 0° 30' W. and 1° 41' E. long., the boundary towards the interior being an artificial line. The area is estimated at 33,000 sq. m., and the pop. at 1,000,000. Togoland had been prosperous since it was annexed by Germany, no contribution from the imperial government being required, and its trade had grown satisfactorily. It was overrun by British and French in the beginning of the Great War. About one-third (in the west) was assigned to Britain, the remainder, with the whole coast, to

France, as mandatory powers. Togo, the largest native town (pop. 5000), is on Lake Togo; Lome is the administrative capital and port.

**Tohoku University** has its seat at Sendai (q.v.).

**Toise**, an old French linear measure containing 6 French feet (6·4 English feet).

**Toisech**, an ancient Gaelic chief of lower rank than a *normaer*.

**Toison d'or.** See GOLDEN FLEECE.

**Tokat**, a town of north-eastern Anatolia, 70 miles inland from the Black Sea; pop. 30,000.

**Tokay**, a small Hungarian town on the Theiss, 130 miles NE. of Budapest, is known for its famous wine, grown on the Hegyalja Mountains. Great care is bestowed on the proper assortment of the grapes (which are never gathered till fully ripe), and also on the preparation of the wine—of which some thirty-four sorts are reckoned; but all of these may be grouped into the two classes of sweet and dry. The wine is brownish yellow while new, changing to a greenish hue as it grows older. The average annual produce of the Tokay vineyards is over 2,000,000 gallons. Tokay wine enjoys an immense reputation. The *Ausbruch* is one of the finest kinds, but is surpassed by the *Essence*, regarded by many as the noblest of all wines, made from the juice that exudes from the grapes by the pressure of their own weight. Genuine Tokay is obtainable by wine-merchants only in small quantity (this is especially the case with the more valuable sort, the sweet or imperial Tokay), and is largely mixed with inferior wines to increase the amount. Large quantities of 'imitation' Tokay are made by French and German chemists, and sent to all parts of Europe, not excepting Hungary itself.

**Tokelan**, or UNION ISLANDS, a British group of small South Pacific islands, north of Samoa, detached in 1926 from the Gilbert and Ellice Islands Colony and placed under New Zealand's jurisdiction; area, 7 sq. m.; pop. 1000.

**Token.** For token money, see MONEY. In Scotland it was usual both in the Established Church and in seceding churches for the minister and elders to furnish communicants with tokens or small vouchers of brass or pewter, serving as passes permitting them to take their places at the communion table, whereupon the tokens were returned to the officiating elders. This system of metal tokens has now been generally superseded by cards.

**Tokharish**, a name given, perhaps somewhat incautiously, to an extinct Indo-European language in which, in the 20th century, an early Buddhist literature has been discovered in Eastern Turkestan and Kansu. This literature (perhaps of the 8th or 9th century A.D.) consists of translations of Indian religious and medical books. Examples of monastic book-keeping also occur. In treatment of palatal sounds the language falls with the 'centum' group (Greek, Italic, Germanic, Keltic), and it resembles Italic and Keltic in forming the passive with *r*. The Tokhari of history conquered Bactria and came into collision with the Parthians in the 2d century B.C.

**Tököly.** See TEKELI.

**Toktamish**, chief of the eastern Kirghiz and of the Golden Horde. See MONGOLS.

**Tokugawa**, a family that ruled Japan as Shōguns from 1600 to 1868. See JAPAN.

**Tokushima**, chief town of Shikoku, Japan, at the N.E. end of the island; pop. 75,000.

**Tōkyō**, or TŌKEI ('Eastern Capital'), the chief city of the Japanese empire, is situated on the Bay of Tōkyō on the east side of Hondo (the main

island). Until 1868, when the emperor removed his court thither from Kyōto, it was known as Yedo ('Estuary Gate'). Originally the site of a small castle, it was chosen by Tokugawa Iyeyasu in 1590 as the seat of his power, and 80,000 of his warriors settled there. The *daimyos* (territorial lords) were also compelled to spend six months of the year in Yedo. By reason of its position at the mouth of the rivers which drain Musashi, the largest of the plains of Japan, it is well fitted to be a national centre. From it Japan was reduced to unity under the Tokugawa *Shōguns*, and the emperors, in resuming direct power on the fall of the Shōgunate in 1868, sought to carry on the traditions of centralisation by establishing the restoration government in Yedo. The city gradually enlarged seaward, as it took possession of the growing delta of the river Sumida, on whose banks it is situated. The immense enclosures (*yashiki*) formerly inhabited by the nobles and their retainers gradually disappeared, and handsome modern buildings in brick for the use of the various government departments took their place. The palace (1889) is a fine structure in Japanese style, with a picturesque double ring of high walls and broad moats. Tōkyō is subject to earthquakes, but nothing has equalled the appalling catastrophe of 1st September 1923, when an earthquake was followed by a fire lasting two days. Want of food and water caused further suffering among the inhabitants, about 60,000 of whom were killed, while about two-thirds of the town (including almost all the government offices, the banks, business offices, railway stations, &c.) was destroyed. The breaking of gas-pipes was largely responsible for the fire, which swept away the small wooden houses. Reconstruction, shared by the government and the municipality, began immediately. Several large parks with tree protection (to act as refuges in time of crisis) were planned, canals and bridges laid out, and streets widened. Owners of land had to give up one-tenth of their holdings without compensation. The central city area has roads extending to the suburbs like spokes of a wheel, and other roads encircle it in a series of concentric circles. Buildings in the business part must be fireproof and made of ferro-concrete, and drains, &c., must be earthquake-proof as far as possible. Electric tramways run throughout (also to Yokohama), while the town is well provided with hospitals, theatres, &c., and is an important railway centre. The imperial university (the splendid library of which perished in 1923) has over 5000 students, and there is a large number of colleges and higher educational institutions, as well as an observatory, zoological garden, art gallery, and learned societies, &c. The harbour is inadequate (Yokohama serving as the real port), but great extensions have been variously projected. The climate of Tōkyō is moist and unhealthy in summer, but is generally fine and healthy from September to the beginning of June. The winter nights are cold, and the keen winds of spring sweep the dust violently through the streets. There used to be a foreign concession at Tsukiji, on the south bank of the Sumida; but since the abolition of extra-territoriality, foreigners have been free to live anywhere in the city. Tōkyō resembles Paris in the overshadowing importance of its place in the national life; it is alive with new schemes and undertakings, and almost every phase of modern industrial civilisation is to be found within its area of 30 sq. m. Pop. (1872) 779,361; (1891) 1,155,290; (1908) 2,186,079; (1925) 1,995,567. See JAPAN, YOKOHAMA.

**Toland, JOHN**, deistical writer, was born of Catholic parents near the village of Redcastle, County Londonderry, 30th November 1370. He entered the university of Glasgow in 1687, but

removed to Edinburgh, where he abandoned the Roman Catholic faith and took his M.A. in 1690. At Leyden, where he spent two years, he studied theology under Spanheim. He resided for some time at Oxford, and in the Bodleian collected the materials of more than one of his later publications. In *Christianity not Mysterious* (1696) he expressly claimed to accept all the essentials of Christianity, but maintained that the value of religion could not lie in any unintelligible element, and that no part of the truth could be contrary to reason. He chose his title with evident reference to Locke's *Reasonableness of Christianity* (1695), and professed to have at heart the defence of revelation against deists and atheists. But the tendency of the work was obvious; it created a great sensation in the theological world, and led to several replies (by Payne and Stillingfleet amongst others). Prosecuted in Middlesex, Toland returned to Ireland, where his book was burned publicly by the common hangman, and Toland fled to London. In *Amyntor* (1699) and other works he fairly raised the question as to the comparative evidence for the canonical and apocryphal scriptures, with professed candour but unmistakably mischievous intent. A pamphlet entitled *Anglia Libera*, on the succession of the House of Brunswick, led to his being received with favour by the Princess Sophia when he accompanied the ambassador at the court of Hanover; and from 1707 to 1710 he lived in various Continental towns. His after-life was that of a literary adventurer, and forms one of the most painful chapters in D'Israeli's *Calamities of Authors*. In *Nazarenus* (1720) he insisted, somewhat on the lines developed by Semler and the Tübingen school, that there were two distinctly opposed parties in the early Christian church—one Judaistic (which he identified with the Ebionites) and one Pauline or liberal. His *Pantheisticon* was an offensive parody of the Anglican liturgy. He resided from the year 1718 at Putney, where he died, March 11, 1722.

Besides the works named, and various defences, apologies, and pamphlets, he wrote a *Life of Milton* (1698); an *Account of Prussia and Hanover* (1705); *Adelsdemon* (1709); *Origines Judaicae* (1709). See the books cited under the heading DEISM in this work; and for Toland's partial anticipation of Semler and Baur, see an article in the *Theological Review*, 1877. There is a life by Des Maizeaux prefixed to two vols. of Toland's posthumous works (1747, including a *History of the Druids*), and a monograph by Berthold, *John Toland und der Monismus der Gegenwart* (Heidelb. 1876).

**Toledo**, a famous city of Spain, capital of a province, and long the capital of the whole country, stands on the north bank of the Tagus, by which it is encompassed on three sides, 40 miles SSW. of Madrid by rail. It is situated on a number of hills, 2400 feet above sea-level; and the climate, excessively hot in summer, is bitterly cold in winter. The Tagus, surrounding the city on the east, south, and west, and flowing between high and rocky banks, leaves only one approach on the land side, which is defended by an inner and an outer wall, the former built by the Gothic king Wamba in the 7th century, the latter by Alfonso VI. in 1109, and both remarkable for the number and beauty of their towers and gates. Seen from a distance the city has a most imposing appearance; within it is gloomy, silent, inert, and its narrow streets are irregular, ill-paved, and steep. In the middle of the city rises the lofty, massive cathedral, surrounded by numerous churches and convents, mostly deserted. The cathedral, built in 1227-1493, on the site of a former mosque (consecrated to Christian uses in 1086, but pulled down to make way for the new church), is a large oblong edifice with semicircular apse, and belongs to the

simplest, noblest style of Spanish-Gothic, with a few touches of the florid Gothic, classical, and Saracenic styles. The interior is more impressive than the exterior, which is blocked by other buildings on all sides save one. It was ransacked and plundered in 1621 and 1808, but it still contains some admirable stained glass, and the choir is a perfect museum of sculpture. The cathedral is 404 feet long and 204 feet wide, and has five naves; the tower is 329 feet high. Connected with the cathedral are an extraordinary number of chapels, of great interest, alike from their architectural beauty, their decorations, and their historical associations. The great square or Zocodover, thoroughly Moorish in its architectural character, is a fashionable promenade, and was long the site on which heretics were burned and bull-fights took place. Moorish architecture is conspicuous in some churches, and in two gateways. The Alcázar or old palace, the fortress commanded by the Cid, rebuilt as a palace in the time of Charles V. and subsequently, occupied the highest part of the city, but was burned down in 1887. The buildings of the town include a theological seminary, one or two old palaces, hospitals, what was once a great monastery, town-hall, &c. There are manufactures of church ornaments and vestments in gold, silver, and silk, and confections. The best Spanish is said to be spoken here. Toledan sword-blades, famous since old Roman times, are still made, but outside the city. The painter El Greco settled in Toledo, and many splendid examples of his work are to be found here. Pop. (1920) 25,251.

Toledo, the *Toletum* of the Romans, is of very early origin. It was the capital of the Goths during their dominion; in 714 it fell into the possession of the Moors, who retained it till 1085, when it was permanently annexed to the crown of Castile as capital. In the days of its highest prosperity it is said to have contained 200,000 inhabitants. It was the headquarters of the Inquisition. The university, founded in 1493, is long since extinct. The whole place has now a dilapidated and broken-down appearance. For the area and pop. of the province, see SPAIN.

**Toledo**, capital of Lucas county, Ohio, on the Maumee River, 8 miles from the western extremity of Lake Erie (to which a channel 17 feet deep has been dredged), and 92 by rail W. of Cleveland. It has a fine harbour, is on the Miami and Erie Canal, and is connected with all parts of the country by thirteen railways. Besides an immense union depôt, it has grain elevators holding 5,000,000 bushels, and a great trade is done in flour and grain, as well as lumber, live-stock, hides, wool, iron, cotton, and tobacco. There are great automobile works, manufactures of glass, coffee, &c., and all branches of iron industry, including bridge-works. Toledo was settled in 1832, and incorporated in 1836. Pop. (1880) 50,137; (1890) 81,434; (1910) 168,497; (1920) 243,164.

**Toledoth Jeshu** (Heb., 'the generations of Jesus'), an apocryphal work in Hebrew purporting to be a history of Jesus; really a mediæval series of clumsy, fragmentary, ribald fictions and burlesques. There are two recensions, of one of which Wagenseil published a Latin translation in 1681. This one may probably contain an ancient element; the other, which Huldreich translated into Latin in 1705, is not older than the 14th or 15th century.

See Baring-Gould, *The Lost and Hostile Gospels* (1874); *Notes and Queries*, 6th series, vol. xi. (1885) p. 212.

**Tolentino** (the ancient *Tolentinum*), an episcopal city of Central Italy, on the left bank of the Chienti, 10 miles SW. of Macerata. It was a fortified town of great natural strength; it has an interesting cathedral, dedicated to St Nicolas, the

patron saint of the town (d. 1305), containing various works of art, and there are a number of mediæval houses. By the treaty of Tolentino (1797) Pope Pius VI. ceded Avignon to France, as well as the papal dominions in the Romagna (this cession was of course only temporary), and the finest treasures of the public museums and galleries of Rome, the great majority of which (though not all) were returned in 1815. Pop. of commune (1921) 13,065.

**Toleration** is the liberty conceded, especially where a particular form of religion is established by law, to those of other religious beliefs to publicly teach and defend their theological and ecclesiastical opinions, and to worship whom and how they please, or not at all. But no permission is thereby given to violate the rights of others, or to infringe laws designed for the protection of decency, morality, and good order, or for the security of the governing power. In Britain there are still in force certain statutes imposing penalties on opinions and practices, once regarded as criminal because of their offensiveness to God, such as Blasphemy (q.v.); but these laws are seldom executed now, the opinion having become prevalent that, except when the religious feelings of the public are so wantonly outraged as to make the perpetrator a nuisance, theological error is best opposed by refuting it, and that when those accused of Heresy (q.v.) are men of piety and earnest conviction any degree of severity short of extirpation tends rather to diffuse than to suppress their tenets. The right of private judgment in matters of faith and worship is now more generally recognised in practice than it used to be, though even yet many resent the exercise by their neighbours who differ from them of the freedom which they claim for themselves. In a church claiming infallibility, and believing that salvation is unattainable beyond her pale, it is not only consistent, but to her more earnest members must seem a duty, to prevent by force the spread of what is accounted a fatal heresy; and, in fact, toleration has never been either professed or practised by the Church of Rome. The Reformers, as a whole, while claiming freedom for themselves, by no means accepted the principle of tolerating what they regarded as pernicious doctrines: a notable case to the contrary is Calvin's treatment of Servetus (q.v.). The peace of Westphalia (1648), which closed the fearful Thirty Years' War, secured a religious and civil freedom in Germany for Catholics, Lutherans, and Calvinists, but for no others. Even the English Puritans, though long oppressed themselves, were so blind to the right of others to differ from them that in their own brief day of power they eagerly repudiated, by word and deed, as a monstrous and impious error, the principle of a universal toleration. In the Westminster Assembly of Divines (1643-46) the Presbyterian members fought successfully against the proposal of the Independents that all sects should alike be tolerated. 'We hope,' wrote Baillie to his Presbyterian friends in Scotland, 'that God will assist us to demonstrate the wickedness of such a toleration.' George Gillespie's view was similar. We accordingly find in the 23d chapter of the *Westminster Confession* an assertion of the duty of the magistrate to promote the true religion, and to restrain and punish heterodoxy—a principle which, soon after the Restoration, was found to work very inconveniently for the Presbyterians themselves, the magistrate being then one who differed from them as to what the true religion was. The Independents, on the other hand, had learned the lesson of toleration in Holland—that nursery of liberty in modern Europe—whither they had fled from oppression in the reign of James I. It is, however, a mistake to suppose that they were the first to

understand and practise the principles of religious freedom, for in the 16th century Zwingli and some of the Hungarian reformers disclaimed, by word and action alike, the notion that any man is entitled to assume, in his dealings with others, that his own interpretations of Scripture are true, and those of other men, if different, false and culpable.

The English sectaries who founded the American colonies, fleeing from religious intolerance, brought with them no larger toleration for others. In most New England states dissent was punished as heresy, though Roger Williams insisted that 'to punish a man for any matter of his conscience is persecution.' In Pennsylvania no man could hold office who did not acknowledge the deity of Christ; and in Maryland Quakers were fined and variously punished from 1659 onwards. To the keen discussions in Holland and England during the century which followed the Restoration; to the moderation or indifference which characterised the Protestant churches a hundred years ago; to the ever-increasing number and power of dissenters; to the enormous impulse given to the notion of personal rights by the French Revolution; and to that wider mental culture which enables men to see that diversity of mental gifts and acquirements naturally leads to diversity of opinion, it is that we must ascribe the tolerant spirit now generally diffused, especially in England and the United States. Not only is the right of free thought and discussion now generally recognised, but its necessity to the well-being of mankind is asserted by eminent thinkers. And in most civilised countries, though churches may be limited in their privileges, private freedom is accorded to all religious belief: Russia is of great Christian nations the most private freedom is accorded to all religious belief.

See Jeremy Taylor's *Liberty of Prophesying*; Milton's *Areopagitica*, his *Treatise of Civil Power in Ecclesiastical Causes*, and his treatise *Of True Religion, Heresy, Schism, Toleration*, &c.; John Owen's *Indulgence and Toleration Considered*; Barclay's *Apology for the Quakers*; Locke's *Letters concerning Toleration*; Paley's *Moral Philosophy*; Sydney Smith's *Letter to the Electors on the Catholic Question*; Martineau's *Rationale of Religious Enquiry*; Guizot's *History of Civilisation in Europe*; Buckle's *History of Civilisation*; Mill *On Liberty*; Lecky, *Rise of Rationalism and History of European Morals*; Bancroft, *History of the United States*; Bouché-Leclercq, *L'Intolérance Religieuse et Politique* (1912); Ruffini, *Religious Liberty* (trans. 1913); the church histories; and in this work the articles CATHOLIC EMANCIPATION, JEWS, PERSECUTION, works cited at FRIENDS, &c.; also SYDNEY (ALGERNON).

The ACT OF TOLERATION was an act passed after the English Revolution of 1689, with the hearty support of William III. It repealed the persecuting acts of Charles II.'s reign against conventicles, &c., and practically gave religious toleration to Protestant dissenters and Quakers, but expressly excluded Roman Catholics or anti-Trinitarians.

**Toll**, an old English word used for tax or tribute ('to whom tol tol'; Wyclif's Bible, Rom. xiii. 7), especially for long (like the German *Zoll*) applied to customs duties, but ultimately almost wholly restricted to money paid for the maintenance of roads by persons using them, and collected from travellers by collectors at toll-gates or toll-bars. Road-tolls were granted by Edward III., and the turnpike soon spread itself over all England, superseding 'statute-labour' in Scotland in 1750. The Rebecca Riots (q.v.) of 1843 were but one instance of the unpopularity of the impost; but in 1871 there were in most parts of the country toll-houses every six or eight miles, and about 5000 persons employed as toll-collectors (not including their families). A board affixed to the toll-house in-

dicated the varying rates of dues enacted for an ass, a score of sheep, a riding horse, a cart, a one-horse gig, a carriage drawn by two horses, &c. Ireland first threw off this form of the burden, an act of 1857 abolishing the last in the island. In England twenty-seven toll-bars near London were abolished, and eighty-one on the north side of London in 1864, sixty-one on the south side in 1865. Others followed (in Scotland, in 1883, under the Roads and Bridges Act, 1878), but it was not till 1889 that the system in Great Britain was finally superseded (except on private roads) by that now in force, for which see ROADS. Bridge-tolls were all abolished in London in 1878-79, but they still survive in some places, and pier-tolls are common.

**Tollens**, HENDRIK (1780-1856), a Dutch poet, author of the national hymn.

**Toller**, ERNST, German dramatist and poet, was born of Jewish parents at Samotschin in 1893, and has associated himself prominently with Socialism. In 1919 he was imprisoned for his share in the Soviet outbreaks in Munich. His works include the plays *Die Wandlung*, *Masse Mensch*, *Die Maschinenstürmer*; and volumes of poems, *Gedichte der Gefangenen* and *Das Schwalbenbuch*; pitched in a distinctly high key, they reflect strongly his political ideas.

**Tolosa**, a town in the northern Spanish province of Guipúzcoa, 15 miles S. of San Sebastián by rail, makes cloth caps; pop. 11,000.—*Tolosa* is also the ancient name of Toulouse.

**Tolstoi**, or TOLSTOY, a noble Russian family, several of whose members have become eminent in diplomacy, war, and literature. Count Peter (1645-1729) was long a trusted agent of Peter the Great; Count Peter Alexandrovitch (1761-1844), one of Suvorof's generals, was under Nicholas I. head of a government department; Count Alexei Constantinovitch (1818-75) was one of the foremost of modern Russian dramatists, a lyrical poet and novelist (his historical novel, *Prince Serebrenni*, was translated into English in 1874); Count Dmitry Andreievitch (1823-89), reactionary minister of Education, was a champion of Russian orthodoxy and the Russifier of the Poles, whose *Romanism in Russia* was translated in 1874. But far better known outside of Russia is

COUNT LEO NIKOLAEVITCH, poet, novelist, social reformer, and religious mystic, born 28th August (o.s.) 1828, at Yásnaya Políána in the government of Tula. He was educated privately at Moscow, and on the family estate till 1843-46, when he studied at Kazan University; in 1851 he joined the army of the Caucasus on the Terek, was attached to the staff of Prince Gortschakoff in Turkey in the first stage of the Crimean war, and was at the storming of Sebastopol by the allies in 1855. He now retired from the army, and, already famous as a poet and novelist, spent a short time in the most brilliant literary and social circles of St Petersburg. He then travelled in Germany and Italy; in 1862 he married, and settled on his estates, devoting himself largely to educational work amongst the peasantry.

It was during his residence in the Caucasus that he wrote *Childhood*, *Boyhood*, and *Youth*, *Memoirs of Prince Nekhluđoff*, and *The Cossacks*. After the Crimean war he wrote three sketches of Sebastopol; during his foreign sojourn, *The Snow Storm*, and the *Two Hussars*; next came *Family Happiness*, *The Three Deaths*, and *Polikushka*. The first of his two great works, *War and Peace* (1865-68), gives a marvelously vivid picture of the Napoleonic campaigns against Russia and the national defence; like many Russian novels, it is devoid of a regular novelistic plot, and is a kind of chronicle of two families and their friends, showing how their fates

and characters were moulded by the events of that terrible time. The other great work, *Anna Karenina* (1875-78), is a melancholy tale of an ill-fated marriage, in which the inability to recognise the prosaic responsibilities of life leads to the suicide of the unhappy wife. It is, as Arnold said, less a work of art than a piece of life; but what it loses in art it gains in reality. 'There is an abundant and admirable exhibition of knowledge of human nature, penetrating insight, fearless sincerity, wit, sarcasm, eloquence, style.'

Soon after this he intimated to the consternation of his friends that he had finally resolved to renounce the career of poet and artist to devote himself to studying the pressing problems of life, remedying its grievances, and becoming the 'friend of the unfriended poor.' From that time he did not cease to write, nor even to write novels, but all his work was written with directly didactic aim. *Ivan Ilyitch*, *What People Live by*, *Where Love is there God is also*, *Two Pilgrims*, *The Dominion of Darkness*, *The Christianity of Christ*, *What I Believe*, and *Life*—all insist on a mode of thought and ideal of life in which revolutionary discontent and religious confidence, Puritanism and Quietism, hyper-Christian self-devotion and an almost Buddhist resignation, deep insight and morbid asceticism are strangely combined and commended by the author's literary power, transparent sincerity, and self-denying tenderness for all the weary, heavy-laden, and oppressed. True religion (not dogmatic orthodoxy) is for him the most valuable element in life, and, though rare in the cultivated, is common if not ineradicable in the working poor, in the people. His conception of Christ's Christianity is summed up in six canons: Do not war; do not judge; do not commit fornication; do not swear; do not give way to anger; do not oppose with force the evil-doer—this last carried to the point of not interfering by force to prevent a murder. The *Kreutzer Sonata* (1890) finds the trail of the serpent—carnal passion and baseness—not merely in most existing social conditions, but in art as now practised, and even in what for others are the sanctities of family life. Turgenev and Tolstoi, with many points of sympathy, never could agree, and had more than once a bitter quarrel; but on his deathbed Turgenev sent a loving message to 'Leo Nikolaievitch' beseeching him to return to literature. Tolstoi would have wholly dispossessed himself of his property to live as a peasant; but his wife refused to see her children exposed to hardship, and Tolstoi made over his estates to her and them. He lived as poorly as a peasant, laboured at mowing or sawing wood for any neighbour who asked him, and in his wife's house lived as a guest. In *What is Art?* (1898) he taught that only that art is good which moves the masses, and to good ends; what is written for the select can only be bad art. In *The Kingdom of God is Within You* (1893), *Master and Man* (1894), *Patriotism and Christianity* (1896), and *Resurrection* (1900) his departure from orthodoxy became increasingly manifest, the Holy Synod excommunicated him, and he persistently refused to return to the fold—he denounced the worship of Jesus as blasphemy and the sacraments as gross sorcery. In 1910 he suddenly left home, designing to end his days in ascetic seclusion, and, exposed to inclement weather, fell ill after travelling some distance by rail. Removed to the stationmaster's house at Astapovo, he died there on the 20th November. The Holy Synod inhibited all religious celebrations for the excommunicated heretic.

Many English and French translations of Tolstoi's works have been published. The standard Life of him in English is that by Mr Aylmer Maude (2 vols. 1909-10), who has made many translations with introductions, and

written variously on his works. See Lives by Birukov (trans. 1911), Romain Rolland (trans. 1911), Knowlson (in Eng. 1904), Staub (in Ger. 1908); various works by Lourié, including *Vie de Tolstoi* (1907); Crauford, *Religion and Ethics of Tolstoi* (1912); Tolstoi's *Diaries* (trans. 1917); the reminiscences of his son Ilya (trans. 1914), and of Gorki (trans. 1920), and *Family Views of Tolstoi* (trans. 1926); Goldenweizer, *Talks with Tolstoi*; Kropotkin's *Ideals and Realities in Russian Literature* (1905); and the relevant works cited at TURGENEV.

**Toltecs.** See MEXICO.

**Tolu.** See BALSAM.

**Toluol**, or TOLUENE, is a Methyl Benzene which dissolves sulphur, iodine, and many resins. It is obtained from the dry distillation of tolu or other resin, by the action of potash on benzylic alcohol, by heating toluic acid with lime, and as a coal-tar product. From it Saccharin (q.v.) may be obtained.

**Tomahawk**, a light war-hatchet of the North American Indians. The early ones were made of stone or of deer-horn put through a handle of wood, or fastened to the handle by sinews or cords of skin; European traders supplied hatchets of steel. The blunt side of the head was sometimes made hollow, for a tobacco-pipe.

**Tomato**, or LOVE-APPLE (*Solanum Lycopersicum*, or according to some, *Lycopersicum esculentum*), a plant of the family Solanaceæ. In the warmer countries of Europe, the United States, and other countries in which the summer is warm and prolonged, it has long been cultivated for the excellent qualities of the fruit as an article of diet. Although belonging to a family of plants usually regarded with suspicion on account of the powerfully poisonous properties of many of the species comprised in it, it is now recognised as one of the most important and valuable vegetables grown for human food. Though it was introduced into Britain

Large Early Red Tomato.  
a, its fruit; b, fruit of common tomato.

as early as 1596, the consumption of its fruit there lagged as compared with some other European countries and America, but it has increased immensely since 1880. The annual supply produced in Britain is quite inadequate to meet the demand, which yearly increased as the agreeable qualities of the fruit became more widely known; consequently enormous quantities of it are imported, packed dry and in tins, the latter being chiefly used in making soups and sauces. The imported fruit, having to be packed in an imperfectly ripe state in order to reach its destination in safety, is inferior to that grown in Britain in colour, flavour, and texture; the latter, therefore, commands the highest price in the market. On this account the culture of the tomato has

developed into a distinct horticultural industry, like grape-growing and mushroom-growing. Very extensive establishments in glass have been erected at Worthing in Sussex and at other places in England and in Scotland exclusively for its culture, which proves a remunerative enterprise. The plant is annual in duration, and too tender to be grown successfully in the open air in Britain, unless it is reared in heat and grown in pots to the flowering stage under glass before the beginning of June, the earliest period at which it may be safely turned out of doors. Even then it must be planted against a wall with a warm exposure and well sheltered. The seeds are sown in February and March in a temperature of 55° to 65°. An open friable soil is essential, and the use of potash as a manure is hardly less so. Like its near relative the potato, the tomato is subject to attacks of *Phytophthora* (the potato-disease fungus), and the fruit is liable to a disease also of fungus origin, which causes considerable loss to inexperienced growers, but rarely attacks the plants of those who understand their treatment under glass. The wilt disease caused by the fungus *Fusarium Lycopersici* is very dangerous. If the soil is infected, rotation of crops should be tried. Varieties immune to wilt have been bred.

The fruit is cooked in a great variety of ways: broiled or fried by itself, or with meat or other accompaniments; made into soups and sauces; sliced raw, it is an excellent ingredient in salads, and eaten with vinegar and pepper and salt uncooked it is perhaps as wholesome and refreshing as in any other way. Its use in any way as food is considered beneficial in affections of the liver, indigestion, and diarrhoea. The word tomato is derived from the Spanish American name *tamate*, and the English name Love-apple has arisen from its supposed aphrodisiac properties.

**Tomb** (Gr. *tymbos*), a monument erected over a grave, in order to mark the resting-place, and preserve the memory, of the deceased. In early ages, and among eastern nations, it sometimes became the practice to place the remains of the dead in excavated sepulchres, whose interior was often decorated with painting or otherwise. Where the usage was to burn the dead their bones and ashes were placed in urns in these receptacles. Some of the most remarkable rock-tombs were those of Egypt. The rock-tombs of Persia and Lycia have imposing architectural façades. See also CATACOMBS, ETRURIA, PETRA.

In the Homeric poems heaps or cairns of stones are placed as honorary memorials above the graves of departed heroes. The tumulus of rude ages (see BARROW, CAIRN) is found over the greater part of northern Europe. Some see in the rectangular Egyptian mastaba with its chambers the origin of the rude megalithic tombs of a great part of the world. The Pyramids (q.v.) were the sepulchres of the Egyptian monarchs from the 4th to the 12th dynasty. The tombs of Greece, and still more those of the Greek colonies in Asia Minor, were sometimes pillars, or upright stone tablets, sometimes small buildings in the form of temples; the most celebrated was the Mausoleum (q.v.). The Roman tombs were not unfrequently important architectural structures, varying in form, but oftenest consisting of a circular tower resting on a square basement; familiar examples being the tomb of Cæcilia Metella (see ROME, p. 766), and the yet larger and more solid tomb of Hadrian, on the banks of the Tiber, best known as the castle of S. Angelo, which is about 220 feet in height, and of immense solidity. The tombs were generally erected outside the towns, and along the principal roads leading into the country, as in the Via Appia at Rome, and the Street of Tombs

at Pompeii. A form of excavated tomb, without external architecture, called Columbarium (q.v.), was also in use in Rome, whose walls were pierced with cells to receive cinerary urns. The prevalent circular tomb became in the latter period of the Roman empire polygonal. In many parts of Italy, and in such Spanish-American towns as Lima and Quito, the cemeteries contain rows of niches rising above one another in terraces, honeycomb-like, and each holding a coffin, which rests there so long as the heirs pay the rent.

In the earlier centuries of Christianity the burial of the dead in churches was prohibited. The first step which led to its adoption was the custom of erecting churches over the graves of martyrs; then followed the permission to kings and emperors to be buried in the church porch. The most important tombs of the middle ages are generally within churches or cloisters. The earlier examples consist of a simple stone coffin, or sarcophagus, often with a low gabled lid and a sculptured cross. An altar-tomb, or tomb in the form of a table, followed; and in the 13th century a species of tomb was introduced, consisting of a sarcophagus, on which rests a recumbent figure of the deceased, the whole being surmounted by a canopy, often of exquisite symmetry and richness (see illustration at CANOPY). The tombs of the Scaligers at Verona, with their beautiful wrought-iron railing, are famous. In the renaissance period of art the tombs became more and more complex. The sarcophagus was disguised, or made the least important part of the monument; the representation of the deceased was confined to a medallion likeness, and the most prominent part of the tomb was composed of sculptured upholstery, and groups of symbolical and eventually mythological figures. In some of the 16th-century examples, as Michaelangelo's tombs of Giuliano and Lorenzo de' Medici, at Florence, the inappropriateness of the design is partly redeemed by the beauty of the figures; but in the succeeding centuries the vicious taste of these monuments rapidly increased, till it culminated in some of the hideous tombs that disfigure Westminster Abbey and St Paul's. The latter half of the 19th century witnessed a reaction, however, and much beautiful sculptured work has been produced since (see SCULPTURE). See also the articles BURIAL, CEMETERY.

**Tombac**, a name given to an alloy of copper and zinc like Prince's Metal (q.v.), or to an alloy of copper and arsenic.

**Tombigbee**. See ALABAMA.

**Tomi**. See OVID.

**Tompkins**, DANIEL D. (1774–1825), was vice-president of the United States from 1817 to 1824, but is most noteworthy for his energetic organisation of the militia of New York State—of which he was governor from 1807 to 1817—during the war with Great Britain.

**Tomsk**, a town of western Siberia, on the Tom, a tributary of the Obi, 2309 miles E. of St Petersburg. On or near the trade-route, and connected by a branch-line (54 miles) with Irkutsk and the Siberian railway, it has long been the seat of an important transit trade. Leather and carriages are manufactured; and a university was established in 1888 (see SIBERIA). Great part of the town was burned in 1890. Pop. 90,000.

**Tom-tit**. See TIT.

**Ton**, the same word as Tun (q.v.), denotes a weight of 20 hundredweight. In Britain the hundredweight contains 112 lb., so that the ton contains 2240 lb. In the United States the hundredweight is sometimes reckoned at 100 lb., and the ton (the 'short' ton) at 2000 lb. The metric

ton is 1000 kilograms or 2204·6 lb. avoirdupois. Ton is also a measure of capacity, varying with the substance measured—timber, wheat, gravel, lime, coke, &c. For the ton used in measuring ships, see TONNAGE.

**Tonalite**, an igneous rock, having a granitic structure, and composed essentially of plagioclase, biotite, and quartz. Hence it is simply a quartz-mica-diorite.

**Tonawanda, North Tonawanda**, two adjacent cities of New York, on the Niagara River and Erie Canal, 8 miles N. of Buffalo by rail, with great ironworks and other manufactories, with power from Niagara Falls, and extensive docks. Pop. (1920) Tonawanda, 10,068; North Tonawanda, 15,482.

**Tonbridge**, formerly TUNBRIDGE, a market-town of Kent, 29½ miles SE. of London, stands on the Medway, which here divides into six streams, one of them called the Tun. A castle, originally Norman, but largely rebuilt in 1280-1300, and held successively by Fitz-Gilberts, De Clares, Audleys, and Staffords, retains a fine Early Decorated gatehouse. The parish church, also Decorated in style, was almost rebuilt in 1878; and the grammar-school, founded in 1553 by Lord Mayor Sir Andrew Judd, occupies handsome buildings of 1865. It was remodelled in 1880. The manufacture of toys, boxes, and other articles in 'Tunbridge ware' (a kind of wood mosaic in veneer) is a specialty. The county cricket ground is the nursery for Kent cricket. A sports ground of 50 acres and a beautiful river walk belong to the town. Pop. 16,000.

**Tone**, in Music. See INTERVAL. For the Gregorian Tones, see PLAIN-SONG.

**Tone**, THEOBALD WOLFE, Irish patriot, was born the son of a coach-maker in Dublin, 20th June 1763. He had his education at Trinity College, Dublin, entered the Middle Temple, and was called to the bar early in 1789. But he soon plunged into political intrigues, acted some time as secretary of the Catholic Committee, and had a large share in the organisation of the United Irishmen. His active mind was impatient of constitutional methods, and from an early period of his career he dreamt of foreign invasion as the remedy. Naturally he found it necessary to take refuge, first in America, next in France. He laboured incessantly to induce the Republican government to take up the scheme of an invasion of Ireland, and held a command in the unlucky expedition under Hoche. In 1798 he again embarked in a small French squadron, which after a fierce fight was captured. Tone was taken to Dublin, tried, and condemned to be hanged as a traitor. He cut his throat in prison, 19th November 1798. His autobiography, edited by his son, an officer in Napoleon's army, and afterwards in the United States service, appeared at Washington in 1826. It is an interesting revelation of a mind of remarkable activity, and a character ruined by inordinate self-esteem and reckless unscrupulousness.

See his *Autobiography* (new ed. 1920); his *Letters* (ed. B. Hobson, 1920); the Life in Dr Madden's *United Irishmen* (3d series, vol. i. 1846); and, as an antidote, two papers by the Duke of Argyll in the *Nineteenth Century* for May and June 1890.

**Tonga**. See FRIENDLY ISLANDS.—Tonga Bay is a small inlet on the east coast of Africa, bounded on the N. by Cape Delgado.—Tongaland is a district on the east coast of Natal, north of Zululand.

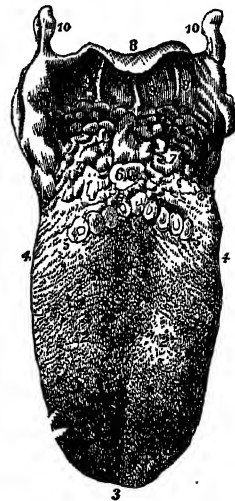

**Tongariro**. See NEW ZEALAND.

**Tongking**, TONQUIN, or TONKIN, since 1884 a French protectorate, is the north-east portion of the Indo-Chinese peninsula, bordering on China; area, 40,000 sq. m.; pop. 7,400,000 (90 per cent.

Annamese; the rest hill-tribes—Thai, Muong, Meo, &c.). Tongking is under more direct French administration than Annam (q.v.), of which it used to be part. The north and west are mountainous, with peaks of 9000 and 10,000 feet. The Red River (Song-cai or Hong-kiang), with its tributaries the Black and the Clear River, traverses Tongking, forming a vast delta, also entered by the Thai-binh. This delta is crossed by many canals and great dykes, whose tops serve as roads. Constant silting and floods (caused by monsoons and reckless destruction of forests by high-land tribes) endanger navigation and cultivation. Rice is the chief crop. Minor products are maize, sugar, tea, coffee, fruits, cotton, silk, ramie, oil, tobacco. Tongking is rich in minerals, hitherto little exploited. Coal is worked at Hongay, near Haiphong; lignite near Ninh Binh; other minerals are tin, zinc, lead, iron, copper. Saw-milling, weaving, cement and soap making, carving and curio-making, and fishing are among the principal industries—largely in Chinese hands. The capital, Hanoi (q.v.), is connected by rail with the chief port, Haiphong, with Vinh in Annam, with Dong-dang on the Kwang-si border, and with Laokay and Yunnan-fu *via* the Red River Valley. For historical and other matters, see ANNAM; also Cunningham's *The French in Tonkin and South China* (1902).

**Tongres**, a very ancient episcopal city of Belgium, in the province of Limburg, 12 miles NW. of Liège. The church of Notre Dame was built in 1240, but its cloister dates from the 10th century. There is a mineral spring in the vicinity, mentioned by Pliny. Pop. 10,000.

**Tongue**, a symmetrical, muscular organ, extending from the hyoid bone upwards and forwards to the lips in front, and occupying the buccal cavity. The superior surface, borders, and anterior third of the inferior surface are free; elsewhere it is attached to adjacent parts by the investing mucous membrane and subjacent structures.

Upper Surface of Tongue:

1, mesial line; 2, 2, lateral parts; 3, tip; 4, 4, sides or edges; 5, 5, V-shaped mass of circumvallate papillae; 6, foramen cœcum; 7, mucous glands; 8, epiglottis; 9, 9, fræna epiglottidis; 10, 10, greater horns of hyoid bone. (From Semmering.)

At certain points this membrane forms distinct folds, containing fibrous or muscular tissue, which act to a certain extent as ligaments to the tongue. The most considerable of these folds is termed the *frænum* (or bridle) of the tongue, and connects its anterior free extremity with the lower jaw. It acts as a strong ligament, and limits the backward movement of the tip of the tongue. In very rare cases this ligament extends abnormally to the tip, so as to interfere with speech and mastication, and the child is said to be 'tongue-tied'; recourse must be then had to division of the frænum, popularly known as 'cutting the tongue.' Other folds of mucous membrane pass from the base of the tongue to the epiglottis; while from the sides of the base, passing to the soft palate, are seen two folds on either side, the 'pillars of the fauces' (see PALATE). The superior surface of the tongue is divided

into two symmetrical lateral parts by a median longitudinal furrow, commencing at the tip, and extending back about two-thirds of the tongue's length. The various kinds of papillæ on their surface are described in the article TASTE. At the back of the surface, just behind the circumvallate papillæ, are large mucous glands, extending into long and capacious canals, and helping to secrete the fluid that moistens the tongue. On the inferior surface the longitudinal furrow, which extends from the tip to the frænum, is deeper than on the upper surface; on each side of it veins are seen running forwards; and immediately beneath the tip is a cluster of mucous glands, known as the glands of Nuck (their discoverer in 1690). The posterior extremity, or base, is flattened and extended laterally before it is inserted into the hyoid bone (known also as the lingual or tongue bone), which, with certain ligaments, must be regarded as the basis or framework of the tongue. The muscles of the tongue are usually divided into two groups—viz. the extrinsic muscles, which attach the tongue to certain fixed points external to it, and move it on them; and the intrinsic muscles, which pass from one part of the tongue to another, constitute its chief bulk, and move it on itself. These intrinsic muscular fibres run vertically, transversely, and longitudinally, and are so interlaced as mutually to support one another, and to act with the greatest advantage. By the action of the various muscles, the upper surface of the tongue may be made concave or convex, or may be pressed against the roof of the mouth; the tip may be protruded straight out or laterally, upwards and downwards, and into any recess. The organ is freely supplied with blood, mainly by the lingual artery, which is given off by the external carotid. With regard to the nerves, the glosso-pharyngeal and certain branches of the third division of the fifth nerve are concerned in the special sense of taste; other branches of the fifth nerve are concerned in ordinary sensation, while the hypoglossal nerve on each side is the motor nerve of the tongue.

The tongue in mammals does not differ very materially from that of man; but in general there is a close coincidence both in size and form between this organ and the lower jaw. In the rodents the tongue has a wedge-like shape. In the giraffe and the ant-eater the tongue is much prolonged, being an important prehensile organ in the former, while in the latter it is driven into ant-hills, and the victims are secured by its viscid secretion. In the feline races the conical papillæ are converted into recurved spines of great size and strength, which the animal uses in scraping bones and in combing its fur. Outside of the mammalia taste-buds are seen on the tongues of some reptiles and even among frogs and fishes, but in the latter they are not confined to the mouth. The functions of the tongue are gustation, prehension (in man and monkeys this function is supplied by the hand), mastication, insalivation, deglutition, and speech; to which may be added spitting and whistling, and insect-catching in animals like frog and chamæleon.

The Gasteropoda are provided with a very singular apparatus known as the tongue (though, of course, there is no homology), and consisting generally of a thin membrane, long and narrow, and rolled, except at its anterior extremity, into a tube; this membrane is covered on its upper surface with transverse rows of minute teeth, or more commonly with plates having tooth-like siliceous projections. The function of this organ is trituration of food. In insects a certain oral appendage is described as a *lingua*.

In its medical relations the tongue is of great importance as an index to the condition of the system, and particularly of the digestive organs;

its appearance, whether firm or flabby, moist or dry, clean, furred, or unduly red and bare, is a valuable guide both as to the diagnosis and treatment of disease.

Amongst the diseases of the tongue may be mentioned *Inflammation* or *Glossitis*. The most marked characteristics of this affection are great swelling, tenderness, and difficulty in speaking and swallowing. It rarely occurs as an idiopathic or spontaneous affection, but often used to accompany severe salivation. It must be treated by purgatives and low diet, and by gargling, as in ordinary salivation (see SALIVA). Incisions are sometimes useful, both to relieve tension, and by the depletion that ensues. Abscess in the tongue is also occasionally met with.

*Hypertrophy*, or persistent enlargement of the tongue, sometimes seems to result from an imperfectly cured inflammation, but is probably in most cases congenital, although perhaps not noticed for a year or two. It sometimes attains an enormous size, but can generally be relieved by operation, at least in its earlier stages. A good deal of attention has been given during recent years to a condition called *leucoplakia*, consisting in whitish spots or patches on the surface of the tongue, very chronic in their course, often traceable to some irritation, particularly smoking, and especially important because they not infrequently become the seat of cancer. One of the most common forms of disease of the tongue is *ulceration*, which may arise (1) from the irritation of a decayed tooth with a sharp jagged edge; or (2) from constitutional syphilis; or (3) from a disordered condition of the digestive organs. In the first case the tooth or its edge must be removed; in the second iodide of potassium with sarsaparilla should be tried; and in the third the complaint generally yields to regulation of the diet and of the digestive organs. *Cancer* is by far the most common tumour met with in the tongue, and is nearly always of the epithelial variety. It is frequently connected with some cause of irritation—e.g. from a broken tooth, or from excessive smoking—and is very much more common in men than in women. It is in general a rapidly fatal form of cancer; and operations for its removal, always serious, are less often followed by immunity than in some other organs. See Butlin, *Diseases of the Tongue* (1885).

**Tonic, in Music.** See KEY.

**Tonics** are medicines which, in cases of want of *tone* in the system, are employed to restore its strength and vigour. Tonics, to a certain degree, are stimulants; but while the latter produce a rapid but transitory excitement, the former slowly induce a certain degree of excitement, and the effect is permanent. Most tonics, in which category we must place the shower-bath, cold sea-bathing, open-air exercise, friction, &c., as well as drugs, act primarily through the nervous system, and secondarily produce their effects upon the system at large. It is of course of the greatest importance to ascertain to what defect in the system the loss of tone is due; whether to poorness of blood, to weakness of the heart, to defective digestion or excretion, or to enfeeblement of the nervous system generally. Otherwise the measures employed, while suitable in one of these conditions, may be very harmful if used in another. Amongst the chief medicines of this class are the dilute hydrochloric, nitric, nitro-hydrochloric, and phosphoric acids, various preparations of iron and arsenic, the various kinds of cinchona bark, with their alkaloids and their salts, cusparia, calumba, cascarilla, chiretta, gentian, quassia, and taraxacum, and generally most vegetable bitters. Although nux vomica and its alkaloid strychnine are placed

by writers on *Materia Medica* amongst the 'special stimulants,' when given in very small doses they have a well-marked tonic action; and there is probably no tonic medicine of more general utility than the *Syrup of Phosphates of Iron, Quinine, and Strychnine* (Easton's Syrup), a non-official but widely-used preparation, of which every drachm (the ordinary dose) contains  $\frac{1}{2}$  of a grain of strychnine.

**Tonic Sol-fa.** See SOL-FA SYSTEM.

**Tonka Bean,** the seed of *Dipteryx odorata*, a large tree of the family Leguminosæ, sub-family Papilionaceæ, a native of Guiana, having pinnate leaves and axillary racemes of purplish flowers. The fruit is an oblong, dry, fibrous pod, containing a single seed, which has a strong, agreeable odour, owing to the Coumarin (q.v.) which it contains, and which is sometimes found crystallised between the cotyledons. Tonka beans are used for flavouring snuff, and are put amongst clothes to preserve them from insects, and to communicate an agreeable odour. They are also, by a natural confusion, often called Tonquin Beans.

**Tonkin.** See TONGKING.

**Tonle-Sap** ('Great Lake'). See CAMBODIA.

**Tonnage,** of ships, is a measure of cubical capacity, and of weight. The term may have reference to 'register,' 'deadweight,' 'displacement,' 'freight,' or other tonnage. From very early times some method must have been employed to determine the relative capacity or carrying power of different vessels, and the term 'tonnage' can be traced back for at least 500 years. In Britain the first Act of Parliament dealing with the subject was passed in 1422. Further laws were introduced in 1648, 1694, and in 1720, but the application of these was limited to particular classes of ships, or those employed in particular trades.

The first legal system of measurement having general application to all classes of merchant-ships was introduced in 1773, and is known as 'Builders' Old Measurement.' Long before its legal enforcement, however, it had become the established practice of British shipbuilders, although not applied in an exactly uniform manner. The rule was to multiply the length (minus three-fifths of the breadth) by the breadth, the product by half the breadth, and divide by 94, the quotient expressing the tonnage. During the long period prior to the 19th century, when naval architecture made little progress, and types of ships and methods of construction were almost stereotyped, this system seems to have answered its original purpose—i.e., roughly expressing the 'dead-weight' carrying power of ships. But with the growth of shipping, and the legal assessment of dues according to the tonnage computed by this system, various methods of evasion were resorted to, the effects of which were most hurtful to true progress in ship architecture. The rule only concerned itself with length and breadth, and took no account of actual form or of depth, but assumed the depth to be equal to half the breadth. Builders had therefore simply to increase the depth, leaving the length and breadth unchanged, or make the form 'fuller,' thus adding to the carrying power without in any way altering the legal and taxable tonnage. Ships were in consequence built of such excessive depth as, in many cases, to render them unsafe and unseaworthy. The inadequacy and perniciousness of this system of measurement were only slowly recognised, and it remained in force until 1836, when a 'New Measurement' law was substituted. This law required certain measurements to be taken to determine the internal capacity of a ship, but the object was easily evaded.

The new measurement gave place in 1854 to

'register' tonnage, the system which, with minor modifications, is still in force as the legal measurement upon which dock, harbour, light, and other dues are assessed. It determines, in an accurate manner, the entire internal capacity in cubic feet of a ship. At suitably placed and equidistant stations throughout the length of the ship, measurements are taken of the vertical transverse areas, and these areas are used, in conjunction with the length, to obtain the volume below the tonnage-deck. If a vessel's hull is continued above the tonnage-deck, the volume of the space is separately measured; and all closed-in spaces above the upper-deck, such as poop, fore-castle, deck-houses, &c., intended for accommodation or stowage, are also calculated. The sum of all these volumes in cubic feet, divided by 100, gives the 'gross register' tonnage. A 'register' ton, therefore, is simply 100 cubic feet of space, and has only a very indirect relation to a 'dead-weight' ton of 20 cwt. avoirdupois. 'Net register' tonnage—the tonnage inscribed in the register of British Shipping—is the figure remaining after certain deductions are made from the 'gross.' It is intended to represent the space available in a ship for remunerative service, such as the stowage of cargo or the accommodation of passengers. In sailing-vessels the deductions are very small, representing chiefly the spaces for the crew. In steamers and motor-ships the case is very different, for not only the crew-spaces, but those occupied by the engines, boilers, bunkers, water-ballast, &c., are deducted. The question of deductions has all along presented many difficulties and anomalies, and the original law had to be amended to obviate these. On the whole, however, the principle on which the present system of tonnage measurement is based has served the purpose, and during the years it has been in force comparatively few changes have had to be made. It has been adopted by the principal maritime nations and by various international commissions. Alternative systems of measurement, such as 'dead-weight' tonnage, and 'displacement' tonnage, have been advocated from time to time when inequalities have been found to press specially hard, but none have found entire favour.

'Displacement' tonnage is by general consent regarded as the fairest measure for the tonnage of warships, since they are designed to carry certain maximum weights and to float at certain load-lines which are fixed with reference to the character of service. It has for many years been the official tonnage for the warships of most nations, and since 1872 the tonnage of British warships has been the displacement.

'Freight' tonnage, a system of measurement sometimes employed by merchants and shipowners, in connection with stowage (although it has no legal authority), is simply a measure of cubical capacity. A freight ton, or 'unit of measurement cargo,' simply means 40 cubic feet of space available for cargo, and is therefore two-fifths of a 'register' ton. It is a purely arbitrary measure, based on the assumption that 40 cubic feet are required to stow a ton weight.

In connection with yachts, the rule most generally adopted is known as the 'Thames Rule,' and is simply a slight modification from the B.O.M. tonnage.

**Tonnage and Poundage.** See TUNNAGE AND POUNDAGE.

**Tonquin.** See TONGKING.

**Tönsberg,** one of the oldest of Norwegian cities and seaports, 71 miles SW. of Oslo by rail, exports whale-oil, margarine, and pitch; its shipping includes many whalers. Pop. (1920) 12,568.

**Tonsils.** See PALATE.—Tonsillitis (or *Tonsillitis*) is inflammation of the tonsils, a form of sore throat varying much in intensity; see THROAT.

**Tonson,** a family of London booksellers in the first half of the 18th century. Its founder, Jacob Tonson, the son of a barber-surgeon, was born in 1656, apprenticed in 1670, and commenced business early in 1678 with a capital of £100. Before 1679 he published some plays of Otway and Tate, and as early as 1681 he had secured the patronage of Dryden. In 1700 he published Dryden's *Fables*, and soon after bought a country-house near the village of Barnes, where as secretary he entertained for many years the members of the famous Kit-Cat Club (q.v.). Tonson was also the first to open Shakespeare to the reading public by producing Rowe's octavo edition in 1709. After 1706 he published some of Pope's works. Tonson had his brother in partnership, and afterwards his nephew, and on his death at Ledbury, April 2, 1736, was succeeded by his grand-nephew, Jacob Tonson the third, who died in 1767. See Charles Knight's *Shadows of the Old Booksellers* (1865).

**Tonsure** (Lat. *tonsura*), a religious observance of the Roman Catholic and Oriental churches, which consists in shaving or cutting part of the hair of the head as a sign of the dedication of the person to the special service of God, and commonly to the public ministry of religion. By some writers it is represented as of apostolic origin (cf. Acts, xxi. 24); but that it did not prevail in the early ages is sufficiently plain. It would appear that the usage first arose in reference to the monastic rather than the clerical life. Paulinus of Nola, in the end of the 4th or beginning of the 5th century, alludes to it as then in use among the western monks; and it speedily passed from them to the clergy, the crown-like figure being regarded partly as a symbol of our Lord's crown of thorns, partly as an emblem of the 'Royal Priesthood' of the Christian dispensation. The form of the tonsure was different in different churches, and the varieties of it are of some historical interest. That of the Roman Church, called 'the tonsure of Peter,' consisted in shaving the crown as well as the back of the head, so that there remained a circular ring or 'crown' of hair. This was the form in use in Italy, Gaul, and Spain. In the 'Scottish (or Irish) tonsure,' which was in use in early Britain, in Ireland, and in those parts of Germany in which the Irish missionaries had preached, the entire front of the head was shaved, leaving the front bare as far back as the line from ear to ear. This tonsure was called 'the tonsure of James,' and by its enemies that of 'Simon the Magician.' The Greeks and other Orientals shaved the entire head. The supposed derivation of the Irish form of tonsure from the apostolic times led to its being held both in Ireland and in Britain, as well as other churches of Irish foundation, to be of the most vital importance. It was in use in the parts of England converted by Scottish missionaries, and was the subject of a violent controversy decided at Whitby in 664 in favour of the Roman usage (which triumphed also in regard to Easter and other peculiarities of the Celtic Church). The tonsure of some monastic orders and friars still leaves but a circle of hair: but the tonsure of secular clergy is quite small. The right to tonsure is with bishops, mitred abbots, cardinal priests, and certain priests with special privilege. Originally the tonsure was merely a part of the ceremonial of initiation in orders, and was only performed in the act of administering the higher order; but about the 7th century it came to be used as a distinct and independent ceremonial; tonsure is not an 'order,' but only a 'preparation for orders.'

**Tontine**, a term derived from the name of Lorenzo Tonti, a Neapolitan, who settled in Paris in Cardinal Mazarin's time, and proposed in 1653 to raise a fund of twenty-five million livres for the relief of the national exchequer by means of a financial association, of which the great prize should ultimately accrue to the longest liver. There were to be shares of 300 livres. The subscribers were to be divided into ten classes according to age; and for each class a fixed sum was annually to be divided equally amongst the members of the class. In this way, while each member should get fair interest from the first on his capital, the profit falling to survivors would increase as years went on, and the last survivor would receive the whole of the interest due to the class he belonged to. Mazarin and Tonti were both Italians, and regarded in Paris with suspicion, and, in spite of the cardinal's support, the scheme fell through. Tonti for a time received a pension, and was an active promoter of companies; but was ultimately committed to the Bastille, whence he for some years corresponded with his friends. There he seems to have died. But in 1689-92 Louis XIV., sorely in need of money, reverted to the plan of the Italian adventurer, and raised a sum of fourteen million livres by a tontine of forty years' duration. The sole survivor was in 1726 drawing an annuity of 73,500 livres on his original share of 300 livres. The tontine is a lottery of annuities—or compound of lottery and annuity—and was frequently had recourse to in France in the 18th century, with government sanction. Generally, in an association on what is called the tontine principle, a payment is made by each member of the association, and with the capital so formed an annuity, payable at the same rate until all the lives forming the association are extinct, is bought from some company or individual. This annuity is divided among the members according to age and premium paid by each; and on the decease of any member the surplus thence arising is divided among the survivors, and on the death of the last member of the association the total annuity reverts to the source from which it has hitherto emanated. There are various kinds of tontines; and the designation of tontine may, with propriety, be applied to any financial scheme by which it is proposed that gain shall accrue to survivorship.

In Britain tontines have been less popular than in France, but both in England and Ireland these were often established. Three Irish tontines in 1773-77 had 3500 members. The last public one in England was in 1789. In Great Britain they were chiefly set on foot not for purposes of public finance, but to enable a number of small capitalists to build hotels and the like, requiring sums beyond what any one of them singly could raise. Such a tontine was founded at Peebles in 1807; 144 members subscribed £25 each, and risked his share not on his own life, but on any life he chose to name—usually a healthy young child. The persons so named had diminished from 144 to 53 by 1864, and to 11 in 1880; in 1887 the shareholders, reduced by death to two, sold their shares for £2130. In 1871 it was proposed to organise a tontine to take over the Alexandra Park and Palace, but the scheme came to nothing. The United States has had its tontines also: the New York Tontine Association, founded in 1790, was wound up in the years 1870-78. See articles in *All the Year Round* (February 1873) and *Chambers's Journal* (March 1880).

We occasionally hear of Tontine Clubs where the original members have the advantage that the last 100 survivors of their number become proprietors of the Club. The system is a feature of many American insurance societies (see INSURANCE).

**Tooke, JOHN HORNE**, was born 25th June 1736, in Newport Street, Westminster, the third son of John Horne, a well-to-do poulterer. He was educated chiefly at Westminster and Eton (where a schoolfellow's pen-knife destroyed the sight of one eye), and then at St John's College, Cambridge. Taking his B.A. in 1758, he entered at the Middle Temple, and for a time was an usher at Blackheath, but in 1760, to please his father, accepted the living of New Brentford. He had neither liking nor reverence for the clerical profession, and dropped it during two travelling tutorships (1763-65); at Paris he met John Wilkes, and conceived the strongest admiration for him. When in 1768 Wilkes stood for Middlesex 'Parson Horne' pledged his credit for his expenses, and vowed that 'in a cause so just and holy he could dye his black coat red;' but ere long they fell out, and in 1771 had a rasping epistolary controversy. Horne, however, who in 1770 had composed the famous (unspoken) speech of Lord Mayor Beckford to the king, still continued to meddle in politics, and even encountered, not without success, the formidable 'Junius.' In 1773 he resigned his living, and resumed the study of law. About this time his spirited opposition to an enclosure bill procured him the favour (*plus* £8000) of the rich Mr Tooke of Purley in Surrey; and to this were due both his assumption in 1782 of the surname Tooke and the sub-title of his *Epea Pteroeonta, or the Diversions of Purley* (2 parts, 1786-1805), that witty medley of etymology, grammar, metaphysics, and politics, which he commenced during an imprisonment in the King's Bench for promoting a subscription for the Americans 'barbarously murdered at Lexington by the king's soldiers in 1775.' In 1779 he found himself debarred from the bar by his orders; in 1790, and again in 1797, stood unsuccessfully for Westminster; in 1794 was tried for high-treason, but acquitted; and in 1801 obtained a seat for the rotten borough of Old Sarum, only, however, to be excluded by a special act from the next parliament (see **CLERGY**). He died at Wimbledon, his home for the last twenty years, on 18th March 1812, bequeathing his property to his natural children.

See the Lives by A. Stephens (2 vols. 1813), and Miss Yarborough (1927); and Thorold Rogers, *Historical Glances* (2d series, 1870).

**Toole, JOHN LAWRENCE**, the most popular low-comedian of his day, was born in London on 12th March 1832. Originally intended for city life, he soon gave up the desk and became an actor. He first played at Ipswich, then served an apprenticeship in the provinces, making a great reputation for himself in Edinburgh, Glasgow, and Dublin. He made his first appearance in London at the St James's Theatre in 1854, and played afterwards at the Lyceum with Charles Dillon, at the Adelphi under the management of Benjamin Webster, and at the ill-fated Queen's Theatre in Long Acre. In 1874-75 he played in the United States, and in 1890 in Australia. In 1879 he became lessee of the Folly Theatre, which he enlarged, changing the name to 'Toole's Theatre.' See his *Reminiscences*, chronicled by Joseph Hatton (1888). He retired in 1896, and died 30th July 1906.

**Tooley Street**, a street in Southwark, at the foot of London Bridge, derives its name from a corruption of St Olave, a church here, and is famous through Canning's story of its three tailors who began their petition to parliament with 'We, the people of England.'

**Toombudra** (correctly, **TUNGBABHADRA**), an important tributary of the Kistna or Krishna,

rises in the south-west of Mysore, and after a north-east course of 400 miles joins the Kistna 16 miles below Karnul.

**Toothache.** See **TEETH**, **DENTISTRY**.

**Tooth-ornament**, a form of sculptured enrichment much used in the Early English style.

**Tooth Powder.** See **TEETH**.

**Toothwort**, a name for the orobanchaceous *Lathraea squamaria*, one of the Insectivorous Plants (q.v.), parasitic on hazel and other tree roots; as well as for the cruciferous *Cardamine bulbifera*, also known as 'coral-wort' and 'tooth-violet.'

**Toowoomba**, a town of Queensland, in an agricultural and wine-growing district of the Darling Downs, 70 miles W. of Brisbane; pop. with suburbs, 25,000.

**Topaz**, a mineral, ranked by mineralogists amongst Gems (q.v.), the finer varieties of which are much valued both for their lustre and the beauty of their colours. In chemical composition it is a fluoriferous silicate of aluminium, usually with a little oxide of iron. It is found generally in acid igneous rocks, and in many parts of the world—Russia, Siberia, Saxony, Australia, the United States, Cornwall, Aberdeenshire, the Mourne Mountains in Ireland—but those most prized by jewellers are generally from Brazil. Topaz may be colourless, light blue or green, rose-pink, orange, or straw-yellow, in great variety of shades. Its crystals are rhombic prisms, generally terminated by four-sided pyramids, but often variously bevelled and acuminated. The prisms are finely striated. The specific gravity is about 3.5. Topaz is translucent or almost transparent on the edges, and is harder than quartz. It is rendered very electric by heat or friction, and by this property a topaz may at once be distinguished from a diamond or ruby, for which otherwise, when cut and set, it might readily be mistaken. A coarse variety of topaz called *Pyrophyssalite* occurs near Fahlun in Sweden, which is nearly opaque; when reduced to powder it can be used as emery for grinding and polishing. The so-called 'oriental topaz' is a yellow corundum; the 'false topaz' is a yellow variety of vitreous quartz.

**Tope** (*Galeus canis*), a small species of shark abundant on the southern coasts of Britain, more rare towards the north. Its range extends to

Tope (*Galeus canis*).

Tasmania and California. The name tope is said to be originally Cornish; other local names are *Miller's Dog* and *Penny Dog*. The fish attains a length of about 6 feet; its colouring is dark gray above, white below. Numerous young—a score or more—are born viviparously at a birth. In France

and Italy the tope is sometimes eaten either fresh or after drying; the liver is also used for oil. The tope is extremely troublesome to fishermen, robbing their lines of the fish which are attached to them, and biting off the hooks, or, if it happens to be itself hooked, often winding the line round its body in many coils and with tangled knots.

**Tope** (Pāli *thūpa*; Sansk. *stūpa*, 'a mound'), a Buddhist tumulus for the preservation of relics, of more or less solid masonry, in which the relics were deposited. The oldest topes are spherical; others have polygonal bases; and they were originally crowned with an umbrella-shaped finial, and surrounded by a carved stone railing with elaborately carved gateway. The chief one of a great group at Sanchi near Bhilsa (q.v.), in Central India, is 42 feet high and 106 feet in diameter. In Ceylon they are called *dāgobas*; the term, from Pāli *dhātu-gabbha*, denotes properly the relic-receptacle within the tope, but is regularly used to mean the whole structure; there is an illustration of one in the article CEYLON. Some topes are rock-cut. See also INDIA, p. 108.

**Topee.** See TANTIA TOPEE.

**Topeka**, the capital of Kansas, is on both banks of the Kansas River, 67 miles W. of Kansas City by four great railways. It is well built, with wide, shady streets, and possesses a handsome capitol building and a Congregational college; while close by are the state asylum for the insane and the reform school. Topeka is the seat of an Episcopal bishop. It has flour-mills, large railway-shops, several foundries and packing-houses, &c. Founded in 1854, it became the state capital in 1861. Pop. (1920) 50,022.

**Topelius**, ZACHRIS (1818-98), Swedish-Finnish poet. See SWEDEN (*Literature*).

**Töpffer**, RODOLPHE, artist and novelist, was born the son of a painter at Geneva, January 31, 1799, and himself studied art, but was obliged by the weakness of his eyes to become a teacher. He founded a boarding-school in 1825, and conducted it till his death, was named in 1832 professor of Rhetoric at the Geneva Academy, and died 8th June 1846. His name is widely known from the delightful *Nouvelles Genevoises* (1841), and from the exquisite little masterpiece of sentiment and fancy, *La Bibliothèque de mon Oncle* (1832). Other novels are *Le Presbytère* (1833) and his last and unfinished work, *Rosa et Gertrude* (1846). Töpffer had a genius for humorous caricature, and the drawings in his two series of *Voyages en Zig-zag* (1843-53) are almost better than the text.

See the Lives by Relave (1886), and Blondel and Mirabaud (1887); also Rambert, *Écrivains nationaux Suisses* (vol. i. Geneva, 1874). See Sainte-Beuve, *Portraits Littéraires*, vol. iii., and *Portr. Contemporains*, vol. iii.

**Tophané**, a suburb of Constantinople (q.v.).

**Tophet.** See GEHENNA.

**Topknot**, the popular name of some small fishes of the same genus as the Turbot (q.v.) and brill. A typical representative is *Rhombus punctatus*, a fish about 6 inches in length and 4 in breadth. It occurs on British and other northern European coasts, living among rocks and seaweed, with which the brown colour spotted with black harmonises well.

**Toplady**, AUGUSTUS MONTAGUE, hymn-writer, was born at Farnham in Surrey, November 4, 1740, and had his education at Westminster and Trinity College, Dublin. He had been awakened at fifteen in an Irish barn, but it was three years more before he had 'a full and clear view of the doctrines of grace.' He took orders in 1762, and became vicar of Broad Hembury, Devonshire, in 1768. During the last three years of his life he preached in a

chapel near Leicester Fields in London; and here he died, August 11, 1778. A strenuous defender of Calvinism, he was a bitter controversialist, and is not sparing in terms of abuse, even of Wesley himself. His work, *The Church of England Vindicated from the Charge of Arminianism* (2 vols. 1769), is safely forgotten, as it deserves to be; but his name survives secure of immortality in a hymn like 'Rock of Ages.' As early as 1759 he had published at Dublin *Poems on Sacred Subjects*; his *Psalms and Hymns* (1776) was a collection, with but few of his own. The best edition of his whole verse is that by D. Sedgwick (1860); of his entire works collections were published in six vols. in 1794 and in 1825. See Bishop Ryle's *Christian Leaders* (1869), and a Life by T. Wright (1912).

**Töplitz.** See TEPLITZ.

**Topolias**, or COPAIR. See BÆOTIA.

**Top-shell.** See TROCHIDÆ.

**Toptani**, a powerful Albanian family. See ESSAD, ALBANIA.

**Torbanehill, Torbanite.** See BOGHEAD COAL.

**Torbernite**, a highly radio-active, bright-green mineral found in Cornwall and elsewhere, is a phosphate of copper and uranium, crystallising in tetragonal plates with perfect basal cleavage.

**Torfæus.** See ICELAND (*Literature*).

**Torgau**, a town of Prussia, till 1889 a fortress of the second rank, stands on the left bank of the Elbe, 70 miles SSW. of Berlin by rail. The river is here crossed by an old bridge and a railway bridge. Among the public buildings are the castle, containing a church consecrated by Luther in 1544; a town-church, with pictures by Cranach, and the grave of Luther's wife; and an old town-hall. Here on 3d November 1760 Frederick the Great defeated the Austrians. Pop. (1925) 12,616.

**Torilis.** See CAUCALIS.

**Torino.** See TURIN.

**Tormentil.** See POTENTILLA.

**Tormentum**, an engine for throwing missiles. See BALLISTA, CATAPULT.

**Tormes**, LAZARILLO DE. See MENDOZA, NOVELS.

**Tornado.** See STORMS.

**Torneå** (Finnish *Tornio*), a town in the Finnish government of Uleåborg, at the mouth of the Torneå River, which, rising in the Torneå lake, forms during great part of its course of 250 miles the boundary between Sweden and Finland; pop. 2000. Across the river is the Swedish town of Haparanda, through which the Finnish and Swedish railways are linked.

**Tornillo.** See MEZQUITE.

**Toro**, a town of Spain, on the right bank of the Douro, 20 miles E. of Zamora by rail; pop. 8000.

**Torontál**, a Hungarian county on the Maros and Theiss, with Nagy-Beckerek for capital, was divided in 1919 between Yugoslavia and Rumania, Yugoslavia getting most of the territory, with Veliki Beckerek (Nagy Beeskerek) and Veliki Kikinda (Nagy Kikinda), Rumania a north-eastern slice.

**Toronto**, second in importance among Canadian cities, and capital of the province of Ontario, stands on the northern shore of Lake Ontario, north of the mouth of the Niagara River, and has thus extensive water communication east and west. The development of its 10-mile water-front by the Toronto Harbour Commission has been combined with the reclamation of land for public parks. Its railways, including the transcontinental lines, give great trading facilities. The name is derived

from the Huron word signifying 'place of meeting.' In 1749 the French established a chain of posts or forts through all the west and down the Mississippi Valley, and two forts, one at Kingston, Fort Frontenac, and one at Toronto, called Fort Rouillé. In 1756 this fort, on the west side of the present city, was destroyed to prevent its falling into the hands of the English. In 1793 Governor Simcoe, finding Niagara or Newark too close to the American side—indeed, right under the guns of an American fort—for the seat of government, crossed Lake Ontario and established his headquarters in a tent on a site to the east of the present city. In this tent he passed a whole winter before a government house could be erected for his use. In 1812 Toronto, called York by Governor Simcoe, was captured and burned and looted twice by the American army and navy. In 1834 it was incorporated as a city with its present name Toronto. In 1837 it was the scene of a brief and ineffectual rebellion under Lyon Mackenzie (q.v.). Since that time its history has been purely civic, without other interest than that attaching to prosperous growth. The increase of population has been rapid. In 1793, when Governor Simcoe landed, there were only two Indian families. In 1834 the population was less than 10,000. In 1861 it had increased to 44,821, in 1871 to 59,000, in 1881 to 96,000, in 1911 to 376,538, in 1921 to 521,893.

All the departments of the provincial government are centred in Toronto. It is the residence of the lieutenant-governor, whose official abode is a handsome building. The local legislature meets annually in the magnificent parliament buildings, completed in the early years of the 20th century. The Dominion government has also great establishments in Toronto in the custom-house, post-office, internal revenue offices, and a meteorological observatory. The law-courts are centred in Osgoode Hall, a very stately and roomy building.

The principal ecclesiastical buildings are the cathedral of St James (Anglican), the Metropolitan Methodist Church, and St Michael's Cathedral (Catholic). In educational institutions Toronto is very rich. The university of Toronto, which was burned to the ground in 1890, was a very imposing structure, and, restored on the old plan, is well worthy of its noble site and splendid grounds. Federated with the university are Victoria College (Methodist), Trinity College (Anglican), Wycliff College (Protestant), Knox College (Presbyterian), and St Michael's College (Catholic). There are also the Normal School, several collegiate institutes, endless public schools and separate (Catholic) schools and convents; and there are schools of pharmacy, dentistry, and veterinary science. Toronto has its Public Library (1910) with branches, University Library, and Law Library.

The factories comprise iron-foundries, engineering-shops, railway works, rolling-mills, manufactories of agricultural implements, cabinet-works and carriage-works, tanneries, soap-works, bootmaking establishments, sash and door factories, pork-packing houses, factories of men's clothing and underwear, ladies' clothing, hats, caps, and furs. The city has many advantages for trade and manufactures, including an ample supply of cheap power from Niagara Falls, about 80 miles distant. Banking is largely represented in the city; and there are numerous newspapers and periodicals published there.

Toronto became the adopted home of Sir Daniel Wilson and of Professor Goldwin Smith, and was for a time the residence of Mrs Jameson the art critic.

See the article ONTARIO; also CANADA and works there cited.

**Torpedo**, a genus of cartilaginous fishes of the family Torpedinidae, related to the skates and rays. They are most remarkable for their electric organs,

which lie on each side of the head (see ELECTRIC FISHES, with illustrations). The electric shock is powerful enough to kill small animals, and specimens 2 or 3 feet wide can by a single discharge disable a full-grown man. The genus, which includes about six species, is widely distributed over the Atlantic and Indian Oceans; *T. marmorata* and two others are common in the Mediterranean, and *T. hebetans* reaches the south coasts of Britain.

**Torpedo.** This name is given to *moving* submarine mines, by which ships may be attacked below the water-line, in contradistinction to submarine mines, properly so called, which are moored (see MINES). Their invention is attributed to Robert Fulton (q.v.) in 1805. He also invented a submarine boat. He obtained only small success, and we hear nothing more of torpedoes until the American civil war of 1861-65. Torpedoes are, or have been, of four classes, viz.:

(1) *The 'Spar' Torpedo*, which is a case of explosive on the end of a long pole, some 40 feet long at least—unless its user is content to risk almost certain death if the charge of explosive be at all adequate—which projects over the bow of a boat usually of the steam-launch class. The boat having got close to the ship attacked, the explosive charge is thrust against the ship's side below water and fired electrically or by percussion (see FUSE). There have been a few instances of its successful use in the past, notably in the American civil war and in the Franco-Chinese war of 1884, but there would be small, if any, chance of success against a ship armed with modern quick-firing guns (see CANNON) and equipped with searchlights, assuming reasonably careful watch is kept where such an attack might conceivably be possible, which normally could only be against a ship at anchor.

(2) *The Towing Torpedo*.—This is a submarine mine towed by 'Otter' gear which made it travel at distances up to about 100 yards from, and *along-side*, the towing vessel. Its chance of success in these days would be about the same as that of the Spar.

(3) *The Controlled Locomotive Torpedo*.—This is a torpedo containing its own means of propulsion, but connected with its point of departure by wires. These wires, which are unrolled by suitable means, either convey electrical power to propelling and steering engines in the torpedo, or, as in the Brennan torpedo, which was adopted by the British government in 1882 for harbour defence, were connected with powerful winding engines on shore. The wires in the Brennan were wound on two drums inside the torpedo, and the pulling of these wires off the drums by the winding engines caused the drums to revolve, and so actuated the screw-propellers. Steering was effected by varying the pull on the wires. The torpedo had a speed of 30 knots. Neither of the controlled torpedoes has been adopted for use by warships in any country; and the use of the Brennan type for harbour defence, owing to its necessarily limited range of action, has been abandoned. It shares, besides, most of the limitations of controlled submarine mines (see MINES).

(4) *The Locomotive Torpedo*, carrying its own means of propulsion, which is discharged from a tube just as a projectile is fired from a gun, whether the tube be fixed on a ship or on shore; or may be dropped from an aeroplane. There have been two forms of this type, the Howell and the Whitehead.

*The Howell* deserves mention, as it was nearly adopted by the United States. It depended for its motive power on a heavy flywheel which was set spinning at a very high rate by an engine *external* to the torpedo. The momentum thus

acquired by the flywheel was the only available store of power. The range possible for a torpedo so actuated was necessarily very small, but over that range it steered very straight, as the revolving flywheel was, though not designedly, also a gyroscope, and acted to keep the torpedo on a straight course somewhat in the way described hereafter.

The *Whitehead Torpedo*, now in use by every navy, was adopted by Great Britain nominally in 1884, but actually in 1871, when the right to use the invention was acquired, and manufacture and experiments in England commenced. It was originally suggested in principle by Captain Lupis of the Austrian navy to Mr Robert Whitehead (1823-1905), who was manager of large works at Fiume. Whitehead commenced his experiments in 1864, but it took many years to achieve real success. Even though the principles possible of application may be well known, their actual application requires mechanical ingenuity and scientific knowledge of a high order, and the Whitehead torpedo of to-day is the result of some fifty years of experiment, experience, and alteration. There is no secret now about the principles involved; but as there is no finality in the perfecting of war stores, there will doubtless be further improvements in details which will be kept secret as far as may be by the nation making them. Two of the main improvements which have been made in the torpedo since it became a practical success may be mentioned, as they are comparatively modern. The first is in the steering of the torpedo. Up to about 1896, when Ludwig Obry, an Austrian engineer, suggested control by the Gyroscope (q.v.), a torpedo had its vertical rudders set permanently after trial runs in which it had been found to steer a straight course; but the torpedo had no means of correcting automatically the effect of any casual occurrence tending to deflect it from the course upon which it had been launched. A trifling unforeseen or unforeseeable deviation, especially if it should occur immediately after launching, as is most likely, will produce a large error if the range to the objective be considerable. The rapidly revolving wheel of a gyroscope, which is mounted in gimbals, has the property of maintaining constant the position in space of the plane of its revolution at the moment when revolution is impressed upon it. If, therefore, the direction of motion of the vehicle—in this case the torpedo—in which the gyroscope is mounted be altered from that which it had when the gyroscope started its revolution, the gyroscope will move relatively to the vehicle in order to maintain the plane of its revolution unchanged. This motion in the torpedo is at once communicated by very sensitive gear to a steering engine, and the deviation is corrected. The gyroscope is started spinning, by the release of a powerful spring, at the moment of launching of the torpedo. The second improvement has been in the increase of motive power. Formerly this was furnished by the expansion of air compressed to as much as 3000 lb. on the square inch. Compressed air, when released, cools rapidly as it expands, and so wastes power. The first attempts to correct this were made in 1906 by heating the air prior to expansion. The latest practice is to use the gases produced by the combustion of oil with the compressed air as it expands. The mixture of gas and oil is ignited at the moment of launching.

As to maintaining the torpedo on a level keel and at a constant depth—which may be, as may be desired, anything between 5 and 30 feet—this is, and always has been, effected by horizontal rudders which are controlled by a pendulum which moves relatively to the torpedo should the latter

try to dive or come to the surface, and by hydrostatic valves which respond to alteration in pressure due to depths of water other than that for which they have been set. Both pendulum and valves act on a steering engine which actually moves the rudders.

Up to a comparatively recent time the extreme range of a torpedo was about 800 yards for effective work. It is now at least 2000 yards, and the extreme range at which the torpedo would function if it struck anything is about 20,000 yards. The speed of the torpedo at its inception was only 10 knots. It is now approximately 40 knots at 3000 yards and 30 knots at 8000 yards.

The torpedo is made of steel plate of high class, the steel of which the air vessel is made being subject to a very severe specification. It is made in three sizes, 14, 18, and 21 inches in diameter at the thickest part, and 14, 18, and 21 feet in length respectively. The torpedo (see fig.) is

cigar-shaped. The head (A) contains the explosive, formerly wet Gun-cotton (q.v.), but now trinitrotoluene (see DYNAMITE). The charges are 180, 315, and 520 lb. in the three sizes respectively. The head also carries a net-cutter and contains the 'pistol' (P), which, when the torpedo strikes its objective, is driven back and fires a detonator (see GUN-COTTON) embedded in the explosive. B is the air-chamber containing compressed air. C is the balance chamber containing the depth-control gear. D is the engine room. E is the buoyancy chamber, which also contains the gyroscope. If filled with water it will cause the torpedo to sink. The entry of water is governed by counter-gear, which works off the engine and causes a valve to open after a certain number of revolutions. When recovery of a torpedo with a charge in it is uncertain, it is usual to set the gear so that the torpedo will sink at the end of its run. Otherwise it becomes a dangerous floating mine. F is the tail carrying two screw-propellers, one in front of the other, but revolving in opposite directions to prevent the torpedo from turning round on its longer axis. It carries also the two horizontal and the two vertical rudders.

*Launching Tube or Carriage* from which the torpedo is discharged; this is made of steel plate. It is placed to discharge on the broadside, and is below water in large, and above water in small, ships. It is capable of considerable traverse round a ball and socket-joint at the front, which coincides practically with the ship's side, so that the torpedo can be aimed in the required direction. There are suitable watertight doors enabling the torpedo to be inserted from the rear and then the tube to be flooded prior to discharge. The torpedo on discharge is driven out of the tube by the gases of explosion of a cartridge of Gunpowder (q.v.) or smokeless propellant (see GUN-COTTON). This cartridge is fired electrically. As the torpedo leaves the tube on discharge, a lever, projecting from it, strikes a projection in the tube and is thrown back. This starts and frees for action the various agencies inside the torpedo, rendering it, as it were, a live thing. In order to prevent the torpedo from being deflected by the violent wrench which it would receive on entering the water when discharged from a ship in motion, a shield projects beyond the mouth of the tube, which holds the torpedo in guides against the lateral thrust of the water until the whole of the torpedo is clear of the tube.

*Aeroplane Carriage.*—When carried on, and

discharged from, an aeroplane, the torpedo is slung horizontally by catches capable of simultaneous release. Before discharge the aeroplane flies about 10 feet above the surface of the water and as horizontally as possible. On release the torpedo enters the water with the speed of the aeroplane at the moment of release. Suitable arrangement is made for moving the actuating lever, mentioned above, at the moment of release. Torpedo-attack by aeroplane was employed in the war of 1914-18, and a few ships were sunk or disabled thereby.

*The Director.*—In order to aim the tube prior to discharge, this instrument is provided, on which the estimated speed and course of the enemy-ship, its immediate bearing, and the speed of the torpedo can be plotted. The combination will give a resultant course on which the torpedo must travel if it is to strike the enemy-ship. It is in the estimation of the speed and course of the enemy-ship that much skill is required if success in hitting is to be attained, and the chances of error in estimation are the limiting factors in the practical employment of the torpedo.

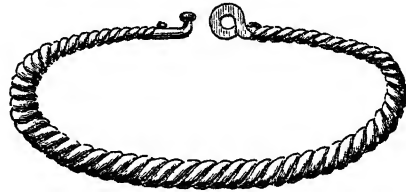

Torpedoes have proved their value in war, sparingly at first, as would be expected, owing to their lack of speed and uncertain steering; but in the war of 1914-18, when perfected and reinforced by the concealed attack of the submarine, their effects may justly be described as tremendous. The loss by Great Britain, attributed to the torpedo, was some six million tons of mercantile shipping and some sixty war vessels of all sizes, including six battleships.

For torpedo-boats, torpedo-catchers, and torpedo-nets, see NAVY; see also SUBMARINE NAVIGATION.

**Torquay**, a watering-place and municipal borough (1892) of South Devon, occupying a cove on the north side of Tor Bay, 23 miles S. of Exeter and 220 WSW. of London. Torre Abbey was founded here for Premonstratensian monks in 1196; and Tor Bay is famous in history for the landing of William of Orange at Brixham (q.v.) in 1688, and during the war with France was often used as a naval rendezvous. But till the beginning of the 19th century Torquay itself was little more than an assemblage of fishermen's huts. Then the advantages of its climate—a peculiarly sheltered position, an equable temperature (mean 44° F. in winter, 55° in summer), and freedom from fogs—caused it to be resorted to by invalids, and it soon acquired a European celebrity, which still is almost unrivalled. The romantic hills and valleys of Torquay and its environs have been overspread with terraces, villas, and gardens, the luxuriance of its foliage being a delightful feature of this 'gem of the English Riviera,' which attracts about a quarter of a million visitors each year. The scenery is as varied as it is beautiful, the geology of the district most interesting; and Kent's Cavern (q.v.) is only a mile distant. The remains of the abbey include some crypts and the 13th century 'Spanish barn' (so called from its having housed some survivors from the Armada); and St Michael's Chapel, on a hill-top, is thought to have been connected with the abbey. St John's Church, by Street, is a striking Early English edifice; and other buildings are the old town-hall (1858), museum (1875), theatre (1880), Princess pier and concert hall (1910), pavilion (1912), new town-hall (1913), and medical and swimming baths (1916). The corporation medical baths comprise one of the best and most modern establishments of the kind in Europe. Torquay is a great yachting station; its chief industries are the working up of Devonshire marbles and the manufacture of pottery ware. Pop. (1851) 7903; (1881) 24,767; (1911) 38,771; (1921) 39,432.

**Torque.** See TORSION.

**Torque** (Lat. *torqueo*, 'I twist'), a species of gold ornament, worn round the neck or arm, which was much in use in ancient times, both among Asiatic and north European nations. It consisted of a spirally-twisted bar of gold, bent

Torque.

round nearly into a circle, with the ends free, and terminating in hooks, or sometimes in serpents. These ornaments seem to have formed an important part of the wealth of those who wore them, and of the plunder obtained by the Roman conquerors from a Celtic or oriental army. Numerous examples have been dug up in Great Britain and Ireland, as well as in France.

**Torquemada**, TOMÁS DE, the first inquisitor-general of Spain, was born at Valladolid in 1420, and died at Ávila, 16th September 1498. He became prior of a Dominican monastery at Segovia, and succeeded in persuading Ferdinand and Isabella to crave from the pope the appointment of the 'Holy Office' of the Inquisition (q.v.). Torquemada was appointed its head, and began in 1483 that infamous work which has left his name a byword for pitiless cruelty. He has given a subject to Longfellow and to Hugo. See *Life* by Rafael Sabatini (1913).

**Torre Annunziata**, a thriving town of Southern Italy, stands at the south base of Mount Vesuvius, 13 miles SE. of Naples by rail. A fishery and a coasting trade are carried on; there are iron-works, macaroni is made, and silkworms are bred. Pop. (1921) 35,270.

**Torre del Greco**, a town at the base of Vesuvius, is only 7 miles from Naples by rail, and has been repeatedly destroyed by eruptions. Fishing is a great source of occupation, and coral is worked. The festival of the four altars (Festa dei Quattro Altari) in June commemorates the abolition of feudalism in 1700. Pop. (1921) 45,641.

**Torrens**, LAKE, sometimes a brackish lake, at others merely a vast salt-marsh, in South Australia, 90 miles N. of Spencer's Gulf; usual length, 120 miles by 40. It is named after Sir R. R. Torrens (1814-84), who between 1841 and 1853 held important offices in the colony, and is remembered for his Land Titles Registration Act. In 1869-74 he sat in the imperial parliament for Cambridge.

**Torre Pellice** (Fr. *La Tour*), a Piedmontese town of 5000 inhabitants, 34 miles SW. of Turin by rail. It is the headquarters of the Waldenses (q.v.), with a fine church, a hospital, an orphanage, and a college, and some manufactures of cotton-cloth and silk.

**Torres Strait** lies between the northernmost part of Australia and New Guinea. The channel is 80 miles in width; and its navigation, though practicable, is rendered dangerous and difficult by innumerable shoals, reefs, and islands. It was discovered in 1606 by Luis Vaez de Torres, a Spanish navigator sent out by the viceroy of Peru, but the record of his discovery was not published till 1764. See map at NEW GUINEA, and the *Reports* (1901 et seq.) of the Cambridge Anthropological Expedition.

**Torres-Vedras**, a town of the Portuguese province of Estremadura, 26 miles N. of Lisbon by rail. It is known from those famous lines of defence within which Wellington defended himself the winter of 1810-11 against Masséna. There were three such lines of fortification; and the area within the lines was about 500 sq m. Hence Wellington issued on that career of slow and hard-won victory which ended in the expulsion of the French from the Peninsula. Pop. 6000.

**Torreya**. See YEW.

**Torricelli**, EVANGELISTA, mathematician and philosopher, was born at Piancaldoli in the Romagna, 15th October 1608. He was brought up by an uncle who resided at Faenza, and who put him under the tuition of the Jesuits. When twenty years old he was sent to Rome, and there devoted himself to mathematical studies. Galileo's theories on force and motion engaged his attention, and led to his writing a *Trattato del Moto* (about 1641), and to his being invited by Galileo (1641) to visit him; on the old philosopher's death, three months afterwards, he was appointed mathematician to the grand-duke, and professor to the Florentine Academy. Here he resided till his death, 25th October 1647. His great discovery was the interpretation of the previously known fact that water will rise in a suction-pump only to the height of about 32 feet—the idea that the column of fluid is sustained by the pressure of the atmosphere on the open surface of fluid (see BAROMETER). The vacuum in the barometer is the Torricellian vacuum; and the barometer is sometimes called the Torricellian tube. Torricelli also effected the quadrature of the cycloid, and made other mathematical discoveries. To him we owe the fundamental principles of Hydro-mechanics (q.v.); and he made and greatly improved both telescopes and microscopes. His *Opere* were edited by Loria and Vassura (Faenza, 1919).

**Torridonian**, a series of red and brown pre-Cambrian sandstones, &c., in horizontal beds, which form pyramidal hills in the north-west Highlands of Scotland, from Cape Wrath to Rum, notably around Loch Torridon.

**Torrigiano**, PIETRO (1470-1522), the Florentine sculptor who, according to Cellini, broke Michelangelo's nose in a quarrel, served as a mercenary soldier, and came to England in 1509 to erect the tomb of Henry VII. and his queen, still in Westminster. He executed other works which were destroyed at the Reformation, and settling in Spain, died in the prisons of the Inquisition.

**Torrington**, GREAT, a borough (1554) of North Devon, on an eminence sloping to the Torridge, 10 miles SSW. of Barnstaple. A castle (1340) has disappeared, though its bowling-green is still in use. The church, accidentally blown up with 200 prisoners, after Hopton's defeat by Fairfax, 16th February 1646, was rebuilt in 1651; Wolsey and John Howe were incumbents. Torrington gave the title of earl to Monk (q.v.) and in 1689 to Admiral Arthur Herbert (1647-1716), of viscount to Admiral George Byng (q.v.). Gloves are manufactured, and the place is noted for its foxhounds, otterhounds, and salmon-fishing. Pop. 3000.

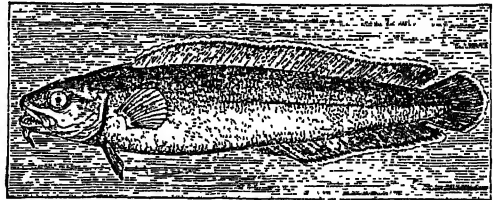

**Torsion** is the kind of strain produced in a bar or wire when one end is kept fixed and the other is rotated about the axis. The axis itself is in no way changed, but every other line originally parallel thereto takes the form of a helix or screw. The torsion is measured by the inclination of the diameter of any section to the diameter originally parallel to it of the section at unit distance. The moment of the forces which produce the torsion is called the torsional stress or *torque*; and the coefficient of

torsion is the ratio of the stress to the strain. The coefficient of torsion depends on the Rigidity (q.v.) of the material and upon the size and form of the bar. For wires and bars of circular section the coefficient of torsion varies as the fourth power of the radius. That is, to produce the same torsion in two wires whose diameters are as 2 to 1, we must apply, in the case of the thicker wire, a torsional stress 16 times greater than that needed for the thinner wire. By the manufacture of excessively thin quartz fibres Professor Boys obtained torsional coefficients of very minute magnitude.

**Torsion-balance** is a form of apparatus in which the torsion of a wire is used for the measurement of various kinds of forces. In this way Coulomb discovered the fundamental laws of electric and magnetic attraction (see ELECTRICITY) and Cavendish measured the density of the Earth (q.v.). By means of his quartz fibres Professor Boys was able to reduce into a very small compass the whole apparatus for making the Cavendish experiment.

**Torsion**, in Surgery, is a method of common application for the purpose of checking arterial hæmorrhage in certain cases. The wounded vessel is drawn out and fixed by a pair of forceps a quarter of an inch from the end; the end of the artery is then twisted round till it will not untwist itself. It is especially useful when there are many small arteries wounded in an operation, as, for example, in the extirpation of a large tumour.

**Torsk**, or, by corruption, TUSK or CUSK (*Bros-mius brosme*), a valuable fish of the cod family (Gadidæ), abundant in the northern parts of the Atlantic. It measures from 18 inches to 3 feet in length. The head is small, with one barbule under the chin; the single dorsal fin is long; the tail is rounded. The head is dusky, the back and sides yellow, passing into white on the belly. The torsk

Torsk (*Brosmius brosme*).

lives in deep water, but spawns very early in the year among the seaweed of rocky coasts. It is caught in the same manner as cod, ling, &c. Firm and tough when fresh, it is esteemed when dried and salted. It is occasionally caught in the Firth of Forth, but belongs to more northern regions, and is very abundant off the Shetland Isles, the Faeroes, on some parts of the coast of Norway, and on the south and west coasts of Iceland. Another species (*B. flavescens*), with two barbules, occurs on the Newfoundland banks.

**Torso** (Ital.), strictly, signifies a trunk—e.g. the trunk of a tree—but is specially applied to a statue of which only the body remains.

**Torstensson**, LENNARD, Count of Orjala, a Swedish general, was born at Terstena on 17th August 1603. He accompanied Gustavus Adolphus to Germany in 1630, distinguished himself in the battles of his great master, and after his death fought under Bernhard of Saxe-Weimar and Banér, and in 1641 he was appointed to the supreme command of the Swedish army in Germany. He invaded Silesia, and, when driven back by the imperialists, turned and crushingly defeated them at Breitenfeld (2d November 1641). The next winter

he hastened north, and in six weeks swept the Danes out of Holstein, and then drove the Austrians, who had thought to assail him in the rear, ignominiously back all the way to Bohemia. In 1645 he advanced to the walls of Vienna. He died at Stockholm on 7th April 1651.

**Tort** (Lat. *tortus*), in the law of England, includes all those wrongs, not arising out of contract, for which a remedy by compensation or damages is given in a court of law. Such are assault, false imprisonment (i.e. arrest or detention without legal justification), unlawful detention or conversion to one's own use of the goods of another, &c. Deceit also is a tort, if a person suffer damage by acting on an untrue statement made with the intention that he should act on it. The general rule of law was that the right of action for a tort died with the person who committed it; but this defect has been cured by statute to a certain extent. If the wrong was done within six months preceding the wrong-doer's death, an action may be brought against his executors within six months after they have assumed office. So if the injured party lived he could always bring an action of damages; but if he died his executors or relatives could not do so until Lord Campbell's Act enabled the wife, husband, parent, or child of such deceased injured party to sue for damages; and in such case the jury may apportion the damages between the widow and children who sue. The right to bring an action for a tort is limited to two, four, or six years respectively, according to the nature of the wrong. In Scotland there is no time limited for bringing the action. The law of the United States is founded on that of England.

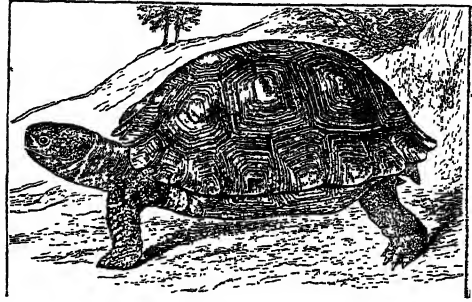

See treatises by Addison (1857; 8th ed. 1906), Clerk and Lindsell (7th ed. 1921), Salmond (5th ed. 1920).

**Tortoise-plant**, a South African name for Elephant's Foot (see HOTTENTOT'S BREAD).

**Tortoises and Turtles** (*Chelonia*) form a well-defined class or sub-class of Reptiles, distinguished especially by the investing shields. Although terrestrial forms are often called tortoises and aquatic forms turtles, the distinction cannot be sustained. The dorsal shield or carapace, within shelter of which the head, limbs, and tail can be more or less retracted, has a complex composition. Externally it is typically covered with epidermic horny scales. The bony part beneath these is made up of (a) the flattened neural spines of the dorsal vertebrae, plus overlying dermal scutes, (b) the flattened and more or less coalescent ribs, plus overlying dermal scutes, and (c) marginal scutes round the periphery. The ventral shield or plastron is typically covered with epidermic scales, and consists of a number of subcutaneous ossifications which probably correspond in part to the 'abdominal ribs' of crocodiles and some other reptiles, and in part to clavicles and interclavicle. The marginal plates link the carapace and the plastron together. There is no breastbone; the limbs are very typical except when turned into paddles; in the course of development the girdles are overarched by the ribs. In the skull the bones are immovably united; there are no teeth, though hints have been detected in some embryos. The brain of the adult Chelonian shows a slight curvature, and, as in all higher vertebrates except snakes, there are twelve cranial nerves, two more than occur in amphibians and fishes. The heart, as in other reptiles except crocodiles, is anatomically three-chambered, but the presence of an incomplete partition in the ventricle makes it work almost as if it had four chambers. The food-canal, ureters, and genital ducts open into a common cloaca, to the wall of which in the males a penis is attached. The large lungs are fixed along the dorsal wall of the thorax.

As the body is boxed in by shields which are often quite rigid, the contraction and expansion of the lungs in respiration must be due partly to their own elasticity, partly to the movements of the viscera with which they are closely connected, and partly to the changes which result when the animal retracts or extends its head and limbs. At the best the respiration is sluggish; and, as this will affect the whole pitch of the animal's life, the sluggishness may be regarded as the price paid for the very strong armature.

Tortoises excel most animals in their tenacity of life. They can live for a long time without food;

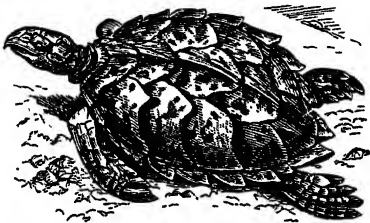

Tortoise (*Testudo elephantopus*).

they are very difficult to kill, and even after the brain has been destroyed life lingers long in the body. It is said that a headless tortoise has been observed to walk 200 yards twenty-four hours after decapitation; and it is well known that the heart removed from the body will, if carefully suspended in a moist chamber, continue capable of beating for two or three days. All Chelonians are oviparous. The eggs have a firm shell, which is in most cases rigidly calcareous. They are usually laid in the sand or mud, and left to be hatched by the warmth of the sun.

Chelonians include two orders, the Athecæ and Thecophora. The Athecæ are represented by one living form, the rare, intertropical, pelagic, Leathery Turtle (*Sphargis* or *Dermatochelys coriacea*), with the dorsal vertebrae and their ribs free from the carapace, which consists of small polygonal plates, covered with leathery skin without horny epidermic scales. It may attain a length of 6 feet and a weight of half a ton. The Thecophora have the dorsal vertebrae and ribs implicated in forming the carapace, and there are horny epidermic scales except in *Carettochelys* and *Trionchoidea*. There are about a dozen families.

The Chelydridæ include the Snapping Turtle (*Chelydra serpentina*) of North and Central America, which gives a ferocious bite, and the vicious Alligator Turtle (*Macrochelys temminckii*) of the Mississippi and Missouri basins. Of the Cinosternidæ, the Mud Turtle or Stinkpot Terrapin (*Cinosternum odoratum*) is a notorious type on account of the disagreeable smell of its groin glands. The Testudinidæ include forms like the Common Greek Tortoise (*Testudo graeca*) and various giant species—e.g. *T. gigantea* of the Seychelles and *T. elephantopus* of the Galápagos Islands, the American Terrapins (*Chrysemys*), the European Pond-Tortoise (*Emys orbicularis*), the edible Terrapin (*Malacochelys terrapin*), much eaten in the eastern United States. The Chelonidæ are turtles in the stricter sense—e.g. the Green or Edible Turtle (*Chelone mydas*), which is often 3 feet long, a vegetarian species feeding chiefly on sea-grass and dulse; the Hawk's-bill Turtle (*Chelone imbricata*), furnishing the 'tortoise-shell' of com-

meree; and the Loggerhead Turtle (*Thalassochelys caretta*), a carnivorous species of little commercial value. The Pelomedusidae are well represented by *Podocnemis expansa*, very common in tropical South America; the Chelydridae by the Mataniata (*Chelys fimbriata*), one of the quaintest of Chelonians, from the rivers of Guiana and north Brazil; the soft-skinned, fresh-water Trionychoidea by *Trionyx ferox*, the commonest soft-shelled turtle of the United States, a voracious carnivorous creature. Apart from the Trionychoidea, the other Thecophora are often divided into two groups, distinguished by the manner in which the head is retracted. In one set—the Cryptodirans, or hidden-necked Chelonians—‘the head is drawn directly within the margin of the shell by the bending of the neck in an S-like manner in a vertical plane.’ In the other—the Pleurodirans, or side-necked Chelonians—‘the neck is bent sideways, so that the head, when retracted, lies on one side of the front aperture of the shell near one of the legs.’

Hawk's-bill Turtle (*Chelone imbricata*).

The tortoises often kept as garden pets in Britain are *Testudo ibera* from Morocco and Asia Minor, *T. graeca* from the northern half of the Balkan Peninsula, Asia Minor, and Mediterranean islands, and occasionally *T. marginata*, which is the only land tortoise in Greece. They are vegetarian, liking lettuce, cabbage, dandelions, and clover; they will learn to take bread soaked in milk or water. They are fond of sunshine, and go to sleep early; they bury themselves in winter in a heap of mould or the like; they pair in early summer; and two to four white hard-shelled eggs are buried in the earth. Gilbert White's *T. ibera* lived for over fifty years in Britain, though this is on an average too cold a country for their comfort. Tortoises are rather irresponsible pets, but they have some memory for persons and a strong sense of locality.

**TORTOISE-SHELL**, the large scales of the carapace or shield of a species of sea-turtle, the *Chelone imbricata* (see above), is so called because formerly the order of animals to which it belongs was little known, and all were confounded under the general name of Tortoises. A remarkable peculiarity in this species is the arrangement of the thirteen plates forming the carapace, which, instead of being joined together by their edges so as to make apparently one piece, are thinned off at their edges, and overlap each other like the tiles of a roof. They vary in size according to the part of the shield they occupy. The larger are sometimes from a foot to 18 inches long by 6 inches broad; the thickness rarely exceeds the eighth of an inch. The beautiful mottled colour and semi-transparent characters of this material are well known. A remarkable quality is possessed by tortoise-shell which very greatly increases its usefulness for the ornamental purposes to which it is generally applied—i.e. the property of being easily softened by a heat equal to that of boiling water, and of retaining any form when cold which has been given to it when heated. Pieces can also be welded together by the pressure of hot irons properly applied. In Britain the chief

use of tortoise-shell is making combs for the hair; but it is also used for inlaying ornamental furniture and various other fancy objects. By the French cabinet-maker Boule (see BUHL) it was used most effectively in combination with brass as a veneer for rich furniture, and all boule or 'buhl' work consists of such a veneering combination. In India, China, and Japan many articles are made of it, showing great skill and taste.

**Tortola.** See VIRGIN ISLANDS.

**Tortona**, a town of Northern Italy, on the Scrivia, a small tributary of the Po, by rail 13 miles E of Alessandria. The ancient Dertona was a Ligurian town, whose position made it important; it was also a strong fortress in the Middle Ages. Pop. of commune (1921) 20,026.

**Tortosa**, an old town of Spain, 42 miles SW. of Tarragona, on an eminence overlooking the Ebro, 20 miles from its mouth, with trade in olives, locust beans, and fruits, and some manufactures; pop. (1920) 33,044.

**Tortugas** (Sp., 'turtles'), DRY, a group of ten islets or keys belonging to Florida, at the entrance of the Gulf of Mexico, 120 miles WSW. of Cape Sable. They are very low, and partly covered with mangrove-bushes; on Garden Key there is a light-house, and also a fort.

**Torture** has been largely used in many countries as a judicial instrument for extracting evidence from unwilling witnesses, or confessions from accused persons, and in the despotisms of the East is still so used; the callousness of torturers and tortured being almost equally remarkable. In ancient Athens slaves were regularly examined by torture. Under the Roman Republic only slaves could be tortured; under the Empire torture, besides being much used in examining slaves, was occasionally inflicted even on freemen, to extract evidence of the crime of *lesa majestas*. Cicero and other enlightened Romans wholly condemned its use. Until the 13th century torture seems to have been unknown to the canon law; about that period the Roman treason-law began to be adapted to heresy, the notions on which the Ordeal (q.v.) was based contributing to promote its use. At a later period torture came to be largely employed by the Inquisition, and it was only in 1816 that it was prohibited by a papal bull. Its use was universal in the witchcraft trials, and accounts for the strange uniformity in confessions.

From the civil law torture became a part of the legal system of most European countries. It was adopted early, and to a large extent, by the Italian municipalities. In Germany elaborate apparatus for its infliction existed, not merely in the dungeons of the feudal castles, but in the vaults beneath the town-halls of Nuremberg and Ratisbon. Horrible tortures were constantly inflicted in the 16th and 17th centuries; the 'second degree' included crushing the thumbs, feet, or head in iron apparatus, and the 'third degree' burning the sides, arms, and finger-nails with fire or red-hot irons and pincers. Torture continued to be practised in many of the prisons of Germany when they were visited by Howard in 1770; but in Prussia it was abolished in 1740-54, and the example of Frederick the Great contributed greatly to its final suppression. In Hanover it was not formally abolished till 1840. The torturing of prisoners was carried to a great height in the Low Countries under Philip II. Savonarola and Galileo are amongst famous men who suffered torture. In France it was part of the judicial system till 1789, and in Scotland it was still in frequent use after the Restoration, and was only abolished in 1708. Torture in its most pitiless form was a characteristic feature of the atrocious Templar trials in

France. Amongst enlightened men who denounced the worthlessness of confessions secured by torture Bayle, Thomasius, Voltaire, and Beccaria deserve mention. In Naples torture was in use in 1860.

The use of torture seems always to have been repugnant to the genius of the law of England: though occasionally used by an exercise of prerogative, it may be doubted whether it was ever recognised as lawful in the ordinary course of the administration of justice. It was employed by royal warrant in the Templar trials (1310), and we are told that till that time it was unknown in England. During the Tudor period the Council assumed the power of directing torture-warrants to the lieutenant of the Tower, and other officers, against state prisoners, and occasionally also against persons accused of serious crimes; and similar warrants were at times issued under the sign-manual. Under James I. and Charles I. torture was less resorted to, and only in state trials. In 1628, in the case of Felton, the assassin of the Duke of Buckingham, the judges declared the examination of the accused by torture, for the purpose of discovering his accomplices, to be illegal. Torture was inflicted in England in 1592, in the case of the Jesuit Southwell (q.v.), in 1640 on Archer, who took part in an attack on Land's palace, and as late as 1646 on witches. In 1806 Sir Thomas Picton (q.v.) was tried for having, as governor of Trinidad, permitted a woman to be tortured under old Spanish laws. Torture is now disused in all countries of Europe, and is universally acknowledged to have been a most unsatisfactory mode of getting at the truth, often leading the innocent, from weakness, to plead guilty.

The instruments of judicial torture have been various. The most celebrated are the Rack, the Boot, and the Thumbscrew. More ingenious instruments were such as the Scavenger's Daughter (rather 'Skeffington's Daughter,' from a lieutenant of the Tower under Henry VIII.), a spiked iron frame, which closed its victim in a deadly embrace. The *Peine Forte et Dure* (q.v.) was a terrible form of torture.

From torture for the sake of extracting evidence must be distinguished cruel punishments and modes of putting to death by lingering tortures—mutilation, breaking on the wheel, burning at the stake, disembowelling, &c. (see EXECUTION). Notable instances of such were the tortures inflicted on the murderers of James I. of Scotland in 1437; on Damians (q.v.), the would-be assassin of Louis XV. in 1757; and on Jean Calas (q.v.) in 1762. See also FLOGGING, PILLORY, STOCKS. Army discipline has sometimes been upheld by 'field punishments' of great severity. Prison discipline was formerly little short of torture, including the use of bilboes and other dreadfully heavy irons; as also was the management of the insane; and the school punishments of comparatively recent times would now be regarded by many as falling under the same head. Powell's *American Siberia* (1892) describes a state of things in the convict-camps of the United States down till 1875 which may fairly be regarded as amounting to cruel torture—including the stringing of convicts up by their thumbs. The marvellous collection of instruments of torture (including the 'Iron Maiden,' resembling the 'scavenger's daughter') once used with hideous effect, and long on show as curiosities in Nuremberg, was bought by Lord Shrewsbury, and exhibited in London in 1891.

See INQUISITION, and works cited; WITCHCRAFT; BOOT, RACK, THUMBSCREW; Jardine, *Torture in the Criminal Law of England* (1837); Lecky, *Rationalism in Europe* (1865); Lea, *Superstition and Force* (Phila. 1866; new ed. 1878).

**Toru Dutt**, a young Christian Hindu girl of extraordinarily precocious genius, was born in Calcutta, 4th March 1856, studied French and English literature with avidity, spent the years 1869-73 in England and France, and at eighteen published a critical essay of strange maturity on Leconte de Lisle, with translations into English verse. She next gave herself to Sanskrit, and translated several portions of the *Vishvupurāna* into English blank verse. In 1876 she published *A Sheaf gleaned in French Fields* (2d ed. Lond., with Memoir by her father, 1880), being English translations of about two hundred French poems. Next year she died, 30th August 1877. A romance which she had written in French, *Le Journal de Mdlle. d'Arvers*, was published at Paris in 1879, with a study by Mdlle. Clarisse Bader. Finally her *Ancient Ballads and Legends of Hindustan* was published at London in 1882, with a Memoir by E. W. Gosse.

**Torula**. See SACCHAROMYCETES.

**Toruń**, the Polish name of Thorn (q.v.).

**Tory** (Irish *Toraidhe*, 'a pursuer'), a name first given to certain bands of outlaws, half robber, half insurgent, who professed the Roman Catholic faith, and harassed the English in Ireland. It is used in this sense in Gayton's *Pleasant Notes upon Don Quixot* (1654), the Irish State Papers (1656), and R. Burney's *Kerdiston Dōron* (1660)—'Wilful peasants . . . degenerate into *torees* and moss-troopers.' About 1679, the time of the Popish Plot, it began to be applied as a term of reproach to the Cavalier or Court party, as supposed abettors of that trumped-up conspiracy. Oliver Heywood's *Diaries* (ed. by J. H. Turner, 1881) refer, under the date 24th October 1681, to 'the Ranters calling themselves Torys . . . an Irish title for outlawed persons,' which shows that the nickname was soon adopted by one of the two great political parties in Great Britain—the adherents, namely, of the ancient constitution of England without change, supporters of regal, ecclesiastical, and aristocratic authority; 'their prejudice,' said Dr Johnson, 'is for Establishment, while that of the Whigs is for Innovation.' As Whig (q.v.) has been largely superseded by Liberal, so, since 1830, has Tory been by Conservative (q.v.), and since 1886 by Unionist. In America the loyalists were called Tories during the Revolutionary war.

See books by Kebbel (1885) and O'Grady (1886), and F. E. Smith's (Lord Birkenhead's) *Toryism illustrated by Extracts from Representative Speeches and Writings* (1904).

**Tory Island**, 2½ miles long, 9 miles off the coast of Donegal, has a lighthouse and signal station.

**Torzhek**, an ancient town of Russia, 310 miles SE. of St Petersburg by rail; pop. 15,000.

**Tosks**, the inhabitants of southern Albania (q.v.).

**Tostig**, a son of Earl Godwin (q.v.), was in 1055 made earl of Northumbria, which he ruled with severity. In 1065 the Northumbrians deposed him, choosing Morcar as earl. King Edward acquiesced. Tostig retired to Flanders, Normandy, and Scotland, and after raiding the Isle of Wight and the south-east coast, joined in Harold Hardrada's invasion, and was killed at Stamford Bridge (1066). See HAROLD II. (England), HAROLD III. (Norway).

**Totanus**. See SANDPIPER.

**Totemism** (from Algonquin, *ototeman*; from a stem, *ote*, which signifies brother-sister kin) is a very wide-spread institution among savage and barbaric peoples. The word as 'totam' is thought to have been first printed by J. Long, an Indian interpreter, in his book of travels (1791), but references to the institution occur in *The Royal*

*Chronicles of the Incas*, by Garcilaso de la Vega—an Inca on the maternal side—and elsewhere. The most apparent feature of totemism is 'an intimate relation supposed to exist between a group of kindred people on the one side and a species of natural or artificial objects on the other, which objects are called the totems of the human group' (J. G. Frazer, *Totemism and Exogamy*, vol. iv, pp. 3-4, 1910). Though there are cases (as in the 'Arunta nation' of Central Australia) in which sets of human beings connected with the same totem are not 'kindred groups,' these cases are exceptions, and can be shown to have diverged from the ordinary type. (This, however, is not the view of Frazer.) There are also numerous instances in which individuals have, or may acquire, a supposed relationship with any object which is not, or very rarely is, hereditary. In some Australian tribes each sex has an animal patron, commonly called 'sex-totem;' and in some cases the kindred groups of people each claim connection with or possession of a smaller or larger number of objects, called 'sub-totems.' Again, mainly in Africa and Polynesia, some *local tribes* (not kindred groups) are attached to an object, usually an animal, called in South Africa the *Siboko*.

We are, however, concerned with the relation between each kindred group and its totem, which is usually, but not always, forbidden to be killed or eaten by the members of the kindreds connected with it and bearing its name, such as bear, duck, cat, or what not. Next, it is the all but invariable rule that such members of such kindred groups of totemic name may not intermarry. Cat may not marry cat, or crow, crow, whether the totem-name be inherited from the father or the mother.

*Totemic Exogamy.*—This custom is called 'totemic exogamy,' or marrying out of the totem. The rule, except where it has conspicuously broken down in the course of evolution, is universal; though it is not found in the aforesaid Arunta nation, where totems are not hereditary, and totem-sets are not akin. Where some persons have acquired animal familiars or protectors, either before birth (the Banks' Islanders, the Arunta) or later, they may marry persons of the same animal, vegetable, or other such name. There are peoples who practise exogamy—i.e. marriage out of a large division of the tribe, or out of a given district—who are not now totemists; and, as in the case of the Arunta, there are totemists whose exogamy is not now governed by the totem, but by the arrangement, mainly found in Australia alone, of 'matrimonial classes,' two, four, or eight subdivisions of each tribe.

*The Study of Totemism.*—The importance of totemism and of exogamy was first perceived by John Ferguson M'Lennan (see his *Primitive Marriage*, 1860, and *Worship of Plants and Animals*, 1869, 1870, republished in his *Studies in Ancient History*, 1896). Thereon followed a good deal of speculation on the origins of totemism and exogamy, by Herbert Spencer (the totems were animal-names or nicknames of human ancestors; the respect felt for them was transferred to the animal species), Lord Avebury (before fathers were recognised the same process occurred in the name of a leader of the human group), Wilken (the animal into which an ancestor's soul transmigrated was that honoured). The totem is the familiar or guardian spirit of an ancestor become hereditary (Dr Boas, C. Hill Tout). All these theories meet the difficulty, at once pointed out by M'Lennan, that the totem name often, and probably at first always, has descended through women. Moreover, as animal-names of individuals are extremely common, it is not apparent why the name of a

single person should thus have been selected and crystallised into a patronymic. (For criticism of these theories, see J. G. Frazer, *Totemism and Exogamy*, pp. 43-50, with the references.) Dr Haddon, looking for the origin of a group-name, suggested that each group might be called by its neighbours after its staple article of food. But ravens, wolves, wallabies, and lions, and so on, can never have been the staple articles of the food of any group. Still, we have here the idea that animal-nicknames were imposed upon groups from without, and were accepted, till each such group came to respect its name-giving animal or plant (Haddon, Report of British Association, Belfast, 1902, pp. 8-11).

A form of this theory had been published by myself in a magazine article, and has since been presented in *The Secret of the Totem* (1905), in which objections are answered. The replies are unnoticed by Frazer in his criticism of Dr Haddon (*Totemism and Exogamy*, vol. iv, p. 51), where my theory is entirely ignored. In 1887 J. G. Frazer first made, in his *Totemism*, a collection of all the evidence then available. This was but a small volume, and the increase of knowledge may be estimated by his four large tomes, *Totemism and Exogamy* (1910), in which his original tract is reprinted. There are additions of information constantly accruing, but Frazer's great work is indispensable to every student of the subject. From his speculative views the present writer differs in most essential points. His map of the totemic world shows that he finds totemism universal in Australia (the most backward region); covering a large area of North America from sea to sea; rare in Central and South America; and represented in ten regions of Africa—East, Central, and South; and in India, Sumatra, Melanesia, Fiji, and New Guinea, with probable traces elsewhere. The traces in Greece—Minoan and Hellenic—among the Celts, ancient Israel, and ancient Egypt are disputable, and are not discussed by Frazer.

*The Origin of Totemism.*—Readers anxious to arrive at results ask, what is the origin of totemism? There have been many theories, as we have seen, and students, as new knowledge accrues, naturally desert old for fresh hypotheses. The same remark applies to the origin of laws restricting marriage—'Exogamy.' In Frazer's present view, exogamy and totemism were originally independent, which is also the view of the present writer. As to totemism, Frazer rests mainly on the customs and beliefs of the natives of central and northern Australia, especially of the Arunta, and on those of the Banks' Islanders (Spencer and Gillen, *Native Tribes of Central Australia*, 1899; *Northern Tribes*, 1904; Dr Rivers, 'Totemism in Polynesia and Melanesia,' *Journal of Anthropological Institute*, xxxix, 1909, pp. 156-180). In these parts of Australia he finds nescience of the part of the male in procreation, while the child is regarded as the incarnation of a primal totemic spirit or germ. In the Arunta nation such spirits, in each case all of one totem, haunt definite spots, and each child's totem is that of the spirits of the place where the mother first became aware of its vitality. In the other northern and central tribes the child is a spirit either of its father's or mother's totem, and is hereditary and exogamous. Among the Arunta it is neither hereditary nor exogamous. Persons of the same totem, among the Arunta, have common magical rites, but are not a kindred group, and they sometimes, but rarely, intermarry. The Banksian islanders are a much more advanced people than any Australians, and are perfectly aware that conception is the result of the unions of the sexes. But if a woman finds in her loincloth an animal or vegetable, *that* has the closest

*rapport* with her child, who, in some way, is affected by the *spiritual* animal or vegetable. There are no kindred totem groups in this case, and a man and woman with the same animal or plant connection may intermarry as much as if they had acquired the connection with their familiars in later life.

Reasoning from these facts, Sir James Frazer thinks that the origin of totemism was 'conceptional.' Pregnant women first discovered their condition when they first felt the life of their burden, and argued that any object which impressed their fancy at the moment—bird, beast, fruit, flower, water, or what not—had then in some way entered into them. The child was that thing, and that thing was its totem (*Totemism and Exogamy*, vol. iv. pp. 57-71).

Thus totemism is a primitive theory of conception, and the intimate *rapport* of man and his totem is explained. Totems became hereditary, on the theory, when the male cohabitant of the woman, or, more frequently, the woman herself, desired that the children should be of his or of her totem—a desire never felt by the Arunta nation or by the Banks' Islanders! The objections to this theory are many. We give two. (1) That woman is nowhere found determining by her 'sick fancies' the totem of her child. Among the Arunta the totem is determined by a regular rule, part of the amazing spiritual or animistic philosophy of the people. That philosophy explains how man comes to have a spirit, a soul which, at the beginning, tenanted an animated bulk, later differentiated into this or that plant or animal, and which is constantly reincarnated. The same explanation also accounts for the fact that man is totemistic. Each person has the spirit of the animal or other totem object which was in the beginning. This theory—too ingenious and complex to be primitive—has, by its neat psychology, superseded the physiological theory of conception familiar to Australian tribes of the lowest and least complex social organisation (that of the Arunta is the most complex). (2) The Arunta have certainly passed, in no very remote age, out of normal, hereditary, exogamous totemism. This is clear, for only a small minority of each totem occurs in one main exogamous division; the majority is in the other; so that, unlike all other peoples with such divisions, a man may find a woman of his totem out of his exogamous division, and so may marry her. This is made possible (Spencer and Gillen, *Native Tribes of Central Australia*, p. 123) by the Arunta method of obtaining totems. The totem has got out of its original and 'right' into another, the 'wrong,' division. The natives recognise the 'wrongness' of this, which entails civil liabilities on the owner of the totem. Had the Arunta originally obtained totems in their present accidental way, the process would necessarily have distributed the totems almost equally between both main exogamous divisions. But this is not the case. 'The great majority' of each totem-set is in one or in the other of the main divisions; is still in the 'right' division. The present Arunta system is therefore a late result of the animistic philosophy. The Arunta recognise the right and wrong in the matter. The 'right' is the original division. These facts are not commented on by Sir J. G. Frazer. In the opinion of the present writer they indicate that, not so long ago, the Arunta totems, like those of all other Australian tribes, were so arranged that each totem-kin was confined to one or other main exogamous division. The Arunta philosophy of spirits and reincarnations has caused the change, which is still obviously incomplete.

*The Origin of Exogamy.*—We have spoken of 'exogamous divisions.' Those in Australia present

three degrees of complexity (see note III.). In the first, the tribe is divided into two main exogamous intermarrying divisions or phratries, such as *Mukwara* (Eagle-hawk) and *Kilpara* (Crow). In each is a number, greater or less, of totem-kins. As all must marry out of their phratries, none can marry into his or her totem. No one is of that totem in the phratry not his own. In the next case the divisions are four; in the third they are eight (as among the Arunta). The first rule prevents marriages of brothers and sisters, and of mother with son or father with daughter—as the descent is reckoned in the female or male line. The two others exclude relations not so close. But not only persons of actual blood-kin but 'classificatory' kin—that is, persons of the same grade and status as the actual kinsfolk in each case—are excluded from intermarriage.

In Sir J. G. Frazer's opinion and in that of Messrs Spencer and Gillen, these divisions were devised first when, in an age destitute of restrictions on unions, an objection (for some reason which is matter of conjecture) arose to unions of brother and sister and of mother and son. The first or phratry division excluded these from marriage; but why did it also exclude numbers of people who were not thus akin by blood, but were merely 'classificatory' kin in status? Sir J. G. Frazer gives various apparently incompatible solutions of this problem. One is (*Totemism and Exogamy*, vol. i. p. 288) that the original reformers did not recognise consanguinity: 'they recognised the classificatory system of relationship, and the classificatory system only. . . .' Yet we are also told that they only meant to bar the unions of the nearest consanguineous relations (Frazer, vol. iv. p. 112), having 'a strong aversion to consanguineous unions, particularly to the cohabitation of brothers with sisters, mothers with sons.' And yet 'they recognised . . . the classificatory system of relationship only' (vol. i. p. 288). This statement ('too absolute') is later thus altered out of existence: 'I assume that the founders of exogamy recognised the simplest social and consanguineous relationships—man with woman, mother with children, brothers with sisters—and that they extended these simple relationships into the classificatory relationships by arranging all the men and women of the community into one or other of two exogamous intermarrying classes' (vol. iv. p. 272). The second theory contradicts the first, and leaves us asking, why, if men decided only to bar brothers and sisters and mothers and sons from wedlock, did they create by legislation swarms of non-consanguineous classificatory kinsfolk, and forbid them to intermarry? This question receives no satisfactory answer. A conjecture at a superstition about the generally blighting effect of close consanguine marriages does not account for an objection to marriages of persons not consanguine.

It therefore appears that there may be some other explanation of the cause of the primary division into two phratries, though the later divisions appear to be legislative measures following the same lines, and following them into a fatal *impasse*.

*Another Theory of the Origin of Totemism and Exogamy.*—The theories which we have been discussing postulate that man originally lived in sexual promiscuity, unions of near kin being prevalent, and license the rule rather than the exception. On the other hand, Darwin held that man was originally solitary, like the gorilla, keeping his women to himself, and expelling—like horses, stags, and other animals—his sons at puberty; or he lived in small communities, but was excessively jealous in keeping his women to himself. In neither case could promiscuity and extreme license occur and require reformation. Starting from Darwin's

view, the late J. J. Atkinson worked out an elaborate system, according to which the jealousy of the sire, prohibiting all intrigues within his fire-circle or camp, and expelling the young males, was the 'primary law,' the beginning of exogamy. The expulsion was mitigated, and sons allowed to remain in the group, on condition of abstaining from the women within it. Such amours and the consequent jealousies and slayings would break up the little community (see Atkinson's *Primitive Law*, published in Lang's *Social Origins*, 1902).

The rule, marriage out of the local group, would persist in Mr Atkinson's system. To this I added that if the local groups were known to each other by animal and other such sobriquets and accepted the names, the rule of exogamy would become, no marriage within the cat, duck, dog, or any group bearing such a name, while the name-giving animals became totems. To the reply that groups would not accept nicknames, I answered by giving many examples of their acceptance of collective nicknames, both in civilised and savage society—derisive nicknames having now actually superseded the old totem-names of Siouan clans in America. I also showed that totemic names of village groups—mice, cuckoos, potato-grubs, herons, and so on—are common in the folklore of modern Europe. Given such exogamous animal-named groups, wives would have to be won in war from alien groups, and if the children of the brides of the spear retained the names of their mothers' groups, the communities would begin to recognise kinship among themselves and desire to obtain wives by peaceful arrangement. Among several very primitive tribes in south-central and south-eastern Australia each totem-kin in phratry A may only marry into one totem-kin in phratry B. This may suggest that originally a pair of totem-kins made alliance and *communitium*; that others followed the example; and that all finally federated, one set of intermarrying kins forming one phratry, and the kins which were their mates forming the other. Finally, as at present (except among the tribes where one-totem-to-one-totem marriage prevails), a man of any totem-kin in phratry A might marry a woman of any totem-kin in phratry B. These processes end in an amalgamation; the divisions—A and B—were not imposed on a tribe previously promiscuous. The non-consanguineous persons excluded by the phratry rule of exogamy from intermarriage did not suffer, as in Sir J. G. Frazer's theory, from a new and needless restriction. They had already been restricted from marrying into their own totem-kins, and though they were excluded from all the women in their own phratry, they had compensation in peacefully obtained wives from all the totem-kins in the phratry not their own. This is the outline of my theory, a modification of that presented in *The Secret of the Totem* (1905). Of course, in all theories the conception of man's primal state—promiscuous or not promiscuous—is matter of conjecture. All turns on the view which we take of that point; but Darwin is a good guide to follow.

On either theory man fell into an initial error. Whether he divided or amalgamated he necessarily cut off many non-consanguineous persons in classificatory relationship from intermarriage. When, in Australia, he came to think that his original aversion had been to closely consanguineous unions and aimed at barring cousins, he divided the tribe, in some cases into four, in others into eight, exogamous classes, always reducing the numbers of the eligible. When the class-names were inherited in the male line, the classes, like Highland clans, came to dwell locally apart. Men had to travel far for the few permitted brides, and among the Kurnai of Gippsland and the Narran-ya of Yorke Peninsula the rules became so irksome that they broke down, and

were succeeded by rules of prohibited degree not unlike our own (A. W. Howitt, *Native Tribes of South-eastern Australia*; 1904). Sir J. G. Frazer's valuable book must be consulted for the many varieties of totemism in communities more advanced than those of Australia. In some tribes of north-west America it survives almost on the earliest Australian model; in others, under the influences of wealth, rank, and settled habitation, it is becoming a singularly complex form of heraldry, with blazons and quarterings. In some North American tribes the phratries were dropped, and persons may marry into any totem-kin not their own. In Melanesia there are phratries, sometimes anonymous, with no totems; in other tribes traces of totemism survive. In some totemic parts of Africa the totem restriction is rapidly breaking down. The religious regard for the totem, or what has been the totem, is most in view sometimes (as in Samoa) where the social functions of the totem are dead or dying; while there is a decline of the rule of respect for the totem in regions where its social aspect is most conspicuous—for example, in the Euahlayi tribe of New South Wales.

*Myths of the Origin of Totemism.*—Light on totemism has been sought in the myths of totemists. But these are in all cases mere savage explanatory myths, and science has invented no hypothesis, including our own, which has not a parallel among the guesses of men themselves totemic. No historical student could expect anything better, but anthropologists have been more sanguine, and they have sought for history where history cannot be found.

NOTES TO THE FOREGOING ARTICLE.—Since the preceding article was written, by the publication of his researches in Melanesia (*History of Melanesian Society*, 1914), Dr Rivers has thrown an entirely new light on the three subjects dealt with by Mr Lang: (1) the dual organisation of society; (2) totemism; and (3) kinship terms or terms of relationship. See KIN.

I. (a) Melanesian evidence makes it probable that the dual organisation, or division of a tribe into two phratries or moieties, is due to the coalescence of two distinct peoples; the dual organisation is also found in Australia, North America, and parts of Africa; there is some ground for supposing that, at any rate in Australia and parts of North America, two peoples coalesced—as in Melanesia—and that the names of the moieties or their attributes indicate the physical characteristics of these peoples.

It is an essential part of Dr Rivers's theory that the immigrants who coalesced with the aborigines to form the dual organisation were comparatively few in number, and, having few women with them, were compelled to intimacy with the natives (especially if there were an objection to the intermarriage of near relatives). How far these conditions would apply in continental areas is uncertain; in the absence of detailed information, it is useless to theorise on the origin of the dual organisation in such regions.

(b) In Melanesia the dual peoples are matrilineal—i.e. the child belongs to the same phratry, moiety, or social group as the mother. This kind of descent is a common feature of totemism, as Mr Lang indicates; but Dr Rivers (ii. 568) gives reasons for supposing that matrilineal descent is not necessarily primitive; it may be due to the coalescence of two patrilineal peoples, reckoning descent through the father. This change in the system may have originated in a condition of sexual communism (see MARRIAGE) which grew up as a result partly of the clash of cultures, partly of the monopoly of women by the old men. Here, again, it is impossible to generalise as to the history of society in other areas without more exact knowledge.

II. (a) Mr Lang has alluded to the fact that Dr Wilken, basing his conclusions on evidence from Indonesia, traced the origin of totemism to primitive views of the lot of the human soul after death. Dr Rivers, basing himself on Melanesian facts, comes to the same conclusion; and the agreement of these two authorities is of importance, because Indonesia was deeply influenced by the same people that Dr Rivers supposes to have given rise to totemism in Melanesia.

(b) We find in Melanesia three kinds of totems—birds, aquatic animals, and plants; and these kinds are in some cases so associated that a single clan has one or more of each kind; these 'linked totems' appear to be due to successive settlements of the people to whom totemism is due; the three kinds of totemism perhaps correspond to three varieties of funeral rites—cremation seems to be associated with land totemism, and throwing into rivers with aquatic totems.

(c) Totemism was not introduced as a ready-made system; all that the immigrants brought was the belief, or at any rate practices capable of leading to the belief, that the souls of the dead migrated into certain animals, and the rule that a man transmitted to his children the association with a definite species of animals or plants. These immigrants, mingling with the dual people (see *ante*), were absorbed into them or absorbed them, according to their relative numbers, forming for the most part matrilineal peoples, though peoples who reckon descent through the father are found where the immigrants and their descendants ceased intermarriage with the aborigines after the first generation.

(d) Dr Rivers supposes that totemism, as a developed system, resulted from the interaction of a body of immigrants and the aborigines whom they found in Melanesia. Here, again, further research is required before we can assert that this theory can be applied to account for totemism all the world over. If Dr Rivers's theory is correct, totemism is a relatively late development in Melanesia; if we suppose that similar conditions lay at the root of totemism in America and Africa, we can hardly attribute this to the interaction of the same peoples. But inasmuch as the essential feature of totemism is the association of an animal species with an exogamous clan, it is by no means axiomatic that the association everywhere arose in the same way. It appears to be established that in Fiji two wholly independent forms of totemism exist side by side.

(e) The association of exogamy with totemism seems to be due in Melanesia to one of two causes: (1) the influence of the matrilineal dual organisation; (2) the existence of a rule against intermarriage within the clan formed by descendants of a given male ancestor. The first of these operated in existing matrilineal areas, the second in patrilineal areas. To explain the matrilineal descent of the totem in other regions of the world on Dr Rivers's theory, we must suppose (a) that the dual or some other matrilineal organisation everywhere preceded totemism; or, alternatively (b), that sexual communism, or some similar cause, brought about a change from an original patrilineal to a matrilineal system. Otherwise we must believe (c) that a woman handed down a belief that a given species was intimately associated with her descendants in the female line; or else (d) that such a belief was inherited from the mother's brother.

III. Mr Lang asserts in his article that in Australia there are three systems of marriage regulation, varying in complexity. It has been pointed out (Thomas, *Kinship and Marriage*, p. 93) that this assumption is erroneous, whether there are two, four, or eight exogamous sections in a tribe,

the restrictions on marriage are the same; rules are laid down as to the relationship in which spouses must stand.

IV. Generally speaking, in the literature of totemism two distinct ideas are confused: (1) the magico-religious society, and (2) the social (kinship) group. Until one or other definition is adopted, or the two ideas are shown to be in practice indissolubly connected, the term totemism is better avoided; the phenomena should be described in unambiguous language, and, if need be, native terms used in each area may be adopted as a substitute for the word totemism.

**Totila** (d. 552), king of the Ostrogoths. See *GOTHS*, *BELISARIUS*, *NARSES*.

**Totleben**. See *TODLEBEN*.

**Totnes**, a municipal borough and market-town of Devonshire, pleasantly situated on the slope of a steep hill on the right bank of the Dart, 29 miles SSW. of Exeter and 24 ENE. of Plymouth. The Dart is navigable to this point for vessels of 200 tons, and Brut the Trojan is fabled to have landed here; the 'Brutus Stone', on which he first set foot, may be seen in the main street. At least, Totnes is a place of great antiquity, and retains two gateways, remains of the walls, a quaint guildhall, a good many antique houses, and an interesting Perpendicular church (1432; restored by Scott, 1874), with a noble red sandstone tower and a fine stone screen. The Norman castle of Judhael de Totnes is represented by the circular shell-keep that crowns the hill-top. There is a grammar-school (1568); and on the 'Plains', near the river, stands a granite obelisk to the Australian explorer Wills, who was a native, as also was the Hebraist Kennicott. Incorporated by King John, Totnes returned two members till 1867. Pop. 4000.

**Totonicapam**, a town of Guatemala, on the plateau, 12 miles ENE. of Quezaltenango, was in 1838-40 capital of a small republic of the same name; pop. 4000.

**Tottel**, RICHARD, publisher, issued mostly law-books from his shop, at the Hand and Star within Temple Bar, from 1553 to his death in 1594. He is best known, however, as the publisher of the first and most important of the anthologies of his time, *Songs and Sonnets*, commonly called *Tottel's Miscellany*, which appeared in 1557, and passed through many editions. To this collection we are mainly indebted for the preservation of the lyrics of Wyatt, Surrey, and other practitioners of the new art of poetry.

**Tottenham**, an urban district and parliamentary borough (two divisions) of Middlesex, a northern suburb of London, contains a cross (c. 1600) and the site of the castle of the Bruces; pop. 147,000.

**Tottington**, a cotton-spinning urban district of Lancashire, 4 miles NE. of Bolton; pop. 7000.

**Touareg**, TUAREG, or TAWARIK, a name (not used by themselves) for a nomadic people inhabiting central and western Sahara, between the Moors in the west and the Tibu in the east. The Arabs speak of them as *Sanhaja-an Litham* ('the people of the veil'), from the *litham*, a sort of turban, dark blue among the nobles, white among the common people or serfs, of which the end is worn constantly over the face possibly as a protection against sand. Disguise on raids has been suggested as the origin of the custom. The women go unveiled. The warriors bear leather shields, muskets, long lances, and swords, and wear a stone ring on the arm to give momentum to their blows. The Touareg are of southern European ('Mediterranean') type, Berber in language. Christian till the coming of the Arabs, they are

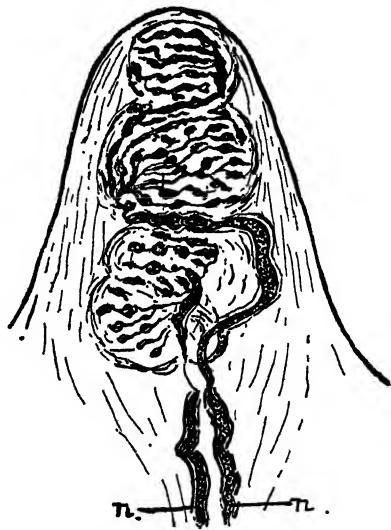

now Mahommedan, but take their religion lightly. The position of women is higher than among the Arabs. One tribe, the Aouraghen (Afrigha), is thought by some to have given its name to the continent. See BERBERS, SAHARA; F. Rennell Rodd, *People of the Veil* (1926).

**Touat**, TUAT, or TWAT, a Berber name for a group of oases in the south-west of Algeria. The name is used somewhat vaguely. It is applied especially to those east of the Wadi Saura, in the neighbourhood of the twenty-seventh parallel of north latitude. Tidikelt and Gurara are commonly included. Touat proper lies between these. Dates and grain are produced. There is a great salt lake in Gurara. The people are Arabs, Berbers, and negroes, with many of mixed race. The region was Moroccan till 1900-1, when it was conquered by the French.

**Toucans** (*Rhamphastidae*), a family of Zygodactyle Picarian birds, numbering more than fifty species, and inhabiting tropical America. They were formerly placed near the Hornbills (*Bucconidae*), which offer several points of analogical resemblance to them, and are often improperly called toucans in the East (perhaps from the similarity of the names: Tupi *tucana*, a 'toucan', Malay *tukang*, a 'hornbill,' literally 'a workman,' from its noisiness); but their nearest allies are now known to be the Barbets (*Capitonidae*), one of which, *Tetragonops rhamphastinus*, strongly resembles a toucan in its coloration, &c. The toucans are divided into five genera: *Rhamphastos*, containing the typical species, has the bill most greatly developed, and the plumage mostly black, varied with white, scarlet, and orange; *Andigena*, containing the Hill Toucans, inhabiting the high forests of the Andes, and with a generally bluish-gray plumage; *Pteroglossus*, with smaller, long-tailed species, clothed in green, scarlet, and yellow plumage, and called Araçaris; *Selenidera* includes the Toucanets, which are very similar; the species of the last genus, *Aulacorhamphus*, are of a bright-green colour. The legs of the toucan are strong, rather short, and with large scales; the toes are arranged in pairs, the first and fourth being turned backward. The form of the body is short and thick; the tail is rounded or even, varying in length in the different species from half the length to almost the whole length of the body, and is capable of being turned up over the body in a remarkable manner, which it always is when the bird is at roost. The neck is short and thick; the enormous bill is at the base of the full width and depth of the head, and is in some species more than half the length of the body. It is arched towards the tip, irregularly toothed along the margins of the mandibles, and extremely cellular and light, yet strong in structure. The tongue is very long, narrow, and singularly feathered on each side, the processes which give it this feathered appearance possibly adding to its sensibility as an organ of taste. When a toucan takes food between the points of the mandibles, the tongue is immediately applied to it, as if to test or enjoy it, and afterwards it is tossed into the throat by a sudden throwing back of the head. Toucans may almost be described as omnivorous; they eat fruits with avidity, but they also seize and devour small birds. Their powerful bill enables them to kill a small bird by a single squeeze. They make a curious clattering noise with their great mandibles, and also emit at times a harsh cry, sometimes resembling the word *tucano*, whence perhaps their name. They live chiefly in the depths of the South American forests, in small flocks, and lay two white eggs in the holes of trees. They are easily tamed, and bear cold climates well. In

captivity they readily eat rice, bread, potatoes, eggs, and many other kinds of food. They are remarkable amongst birds for regurgitation of food, which is subjected to a secondary mastication, analogous to rumination. The colours of the bill are, in most of the species, very brilliant during life, but disappear from stuffed specimens in museums. The largest species, as *Rhamphastos toco*, are about two feet in length; the *R. ariel* is the commonest species. See Gould's *Monograph* (2d ed. Lond. 1854).

**Touch**, or the sense of contact or pressure, like sensations of pain, heat, and cold, from which it has to be distinguished, is elementary, and cannot be split up into simpler components. It enables us to appreciate the slightest mechanical contact of external objects on the surface of our body independent of their temperature. Sensations of simple contact and pressure sensations are both due to deformation of the cutaneous surface, and therefore represent different degrees of a single quality of sensation. It is best elicited in a pure form by contact with a fine brush or wisp of cotton-wool, the mere movement of one of the skin hairs being sufficient to give the characteristic sensation. The deformation of the skin surface necessary may be of the slightest character and almost imperceptible. Examination by the binocular microscope shows that the surface of the skin is not rigid as might be supposed, but is mobile, and behaves to a light touch like an extremely thin membrane floating upon a fluid. The impulses so generated pass to the central nervous system by the sensory nerves. Nerve impulses are not readily produced by direct mechanical stimulation of nerve fibres;

Meissner's Corpuscle in a papilla from the skin of the hand. Highly magnified. Note the terminal varicose ramifications of the nerve fibres.

1, 1, Two nerve fibres passing to the corpuscle.

under ordinary conditions they are produced by the activity of receptor organs situated at the periphery of these nerves in the skin. In man the peripheral fibrils pass to the epithelial cells of the skin, and terminate among or even in the cells of the deeper layers. In many cases these nerve fibrils ramify and form a plexus in the superficial layer of the skin. We know nothing of the nature of the process by which the actual excitation takes place. Deformation of the skin surface probably does not excite the nerve fibrils directly; it is

more likely that the epithelial cells themselves act as receptor organs, and, when excited by contact, transmit to the nerve fibrils a stimulus which originates a nerve impulse in them. The sheaths of the skin hairs are surrounded by nerve-rings which are capable of excitation by mechanical agents a thousand times weaker than those necessary for the direct excitation of the nerves. In regions where there are no hairs elaborate terminations to the peripheral fibrils are found, known as Meissner's corpuscles. Their structure is complex and very variable; the axis cylinder of the fibril usually forms a spiral coil with a number of irregular convolutions and varicose enlargements. They are found specially in the hands and feet. Their superficial position in the skin corresponds to the sharp demarcation of tactile points. Appreciation of touch is lost in cutaneous scars.

A careful examination of the skin shows that it consists of a mosaic of tiny spots, each reacting to one type of stimulus only, and known as 'touch spots,' 'pain spots,' 'heat spots,' and 'cold spots.' It is probable each is served by a separate type of end-organ. The sensitiveness of the skin to touch varies in different parts of the body, the most sensitive parts being the tip of the tongue, the red parts of the lips, and the ends of the fingers. See SENSATION.—Touch as a means of perception is dealt with at PSYCHOLOGY; touching for the king's evil, at SCROFULA.

**Touch-me-not**, a name given to two plants with explosive fruits, *Impatiens noli-me-tangere* (see BALSAM), and the squirting cucumber (*Ecbalium elaterium*), which furnishes the drug *Elaetrium* (q.v.).

**Touch-paper.** See NITRE.

**Touch-stone**, a hard black stone, occasionally used in assaying. The original kind was a peculiar bituminous quartz or flinty slate obtained from Lydia in Asia Minor, and hence known as Lydian Stone; but black basalt may be employed. The process is explained at ASSAYING.

**Touch-wood** is the wood of willows and some other trees softened by decay; *Amadou* (q.v.) is also so called. It is used as tinder, from the readiness with which a spark ignites it.

**Touggourt**, or TUGGURT, a town on an oasis of the Sahara, in the Southern Territories of Algeria, about 120 miles S. of Biskra, with which it is connected by railway. There is some trade in dates. Pop. 2000. The territory of Touggourt (including Biskra) has 213,000 inhabitants.

**Toul**, a fortified town in the French department of Meurthe-et-Moselle, on the Moselle, 20 miles W. of Nancy by rail. It has a former cathedral (965-1496), whose west front, with towers 245 feet high, is reckoned one of the finest in France, an 18th-century hôtel-de-ville, and manufactures of lace, hats, &c. The *Tullum Leucorum* of the Romans, Toul maintained a semi-independence till 1545; on 23d September 1870 surrendered to the Germans after an eight hours' bombardment; but held out in 1914. Since 1871 it has been strongly fortified with a cordon of forts. Pop. 12,000.

**Toulon**, a seaport and naval arsenal of France, in the department of Var, stands on the shore of the Mediterranean, 42 miles ESE. of Marseille and 564 SSE. of Paris. It lies at the head of a deep double bay, and rises towards the north in the form of an amphitheatre. The port is divided into two parts, the old and the new—the former, on the east, appropriated to merchant shipping, and the latter, on the west, surrounded by the dockyard, slips, arsenal, cannon-foundry, &c. Belonging to the arsenal, which is perhaps the finest in France, are the sailyard, armoury, museum, &c.

The fortifications were greatly extended after the conquest of Algeria (1830), Toulon becoming the chief port of communication with Africa; and important works of defence have been added since 1880. Toulon exports bauxite, and imports wine and coal. A cathedral, founded in 1096, the hôtel-de-ville, and a large theatre are the chief buildings. The climate is dry and bracing; but the older portions of the town are still unsanitary. Pop. (1872) 69,808; (1911) 104,582; (1921) 106,331; (1926) 115,120. The Greek *Telonion* and Roman *Telo Martius*, Toulon suffered much from the Saracens, and first rose into importance as a naval stronghold towards the close of the 16th century. The English were defeated off Toulon by the united fleets of France and Spain, 11th February 1744; and in 1793 it was occupied for four months by the English (under Hood) and the Spaniards, who, however, were forced to evacuate the place after being fiercely attacked by the Republicans—a memorable siege as the first great achievement of Napoleon (q.v.).

**Toulouse**, an important city in the south of France, the capital anciently of Languedoc, and now of the department of Haute-Garonne, 160 miles SE. of Bordeaux and 466 S. by W. of Paris. It is situated in a broad and pleasant plain, on the right bank of the river Garonne, with the Canal du Midi sweeping round its eastern and northern sides. The Garonne is crossed here by a beautiful bridge (1543-1626), nearly 300 yards long, which connects Toulouse with the suburb of St Cyprien. Built of red brick, '*la ville rose*,' with the exception of the southern faubourg, is not particularly handsome (though the broad quays have rather an imposing appearance), nor has it many fine public buildings. One may note, however, the cathedral, containing the tombs of the Counts of Toulouse; the Capitole, or town-hall (1769); the Romanesque church of St Sernin (11th to 15th century), with relics of six apostles and many other saints; and the Musée, with its cloisters and its interesting collection of antiquities, forming an almost uninterrupted chain in the history of art from the Gallo-Roman to the Renaissance period. The lofty tower of Notre Dame de la Daurade, a 16th-century church, fell in 1926. Toulouse is the seat of an archbishop, has a university, an academy of 'floral games' (*Académie des Jeux Floraux*), claiming to date from a troubadour's contest in 1323, academies of arts, sciences, antiquities, &c., schools of law, medicine, and artillery, an observatory, botanic garden, and public library. Toulouse manufactures woollens, silks, leather, cannon, steam-engines, tobacco, brandy, &c., and carries on a great trade with Spain. Its liver and truffle pies are celebrated throughout the south of France. Pop. (1872) 114,025; (1911) 149,576; (1921) 175,434; (1926) 180,771.

*Tolosa* was in Caesar's time a city within the limits of the Roman *provincia*, and had been originally the capital of the Volcae Tectosages, a Gallic tribe noted for its wealth and consequence. Under the empire its importance continued. Ansonius describes it as surrounded by a brick wall of great circuit, and so populous that it had founded four colonies. In 412 A.D. the Visigoths made it the capital of their kingdom (see GOTHs); and after the time of Charlemagne it was under the sway of counts, who made themselves independent about 920, but in 1271 the 'county of Toulouse' was reunited to the crown of France by Philippe le Hardi. Its literary celebrity reaches as far back as the Roman empire. Ansonius speaks of the *toga docta* of 'Palladian' Tolosa, and the favourite deities of the city were Jupiter, Minerva, and Apollo. At a neighbouring village a multitude of cinerary urns, statuettes,

Phœnician, Celtiberian, Gallic, Greek, and Roman medals, fragments of buildings, and an entire paved street have been discovered. Early in the middle ages, under the Counts of Toulouse, it became a seat of Provençal poetry, and it suffered terribly in Simon de Montfort's pitiless papal crusade against the Albigenses (q.v.). The parliament of Toulouse had a great reputation, but unhappily it is likely to be best remembered by one of its most iniquitous decisions, that delivered in the case of the Calas (q.v.) family. In the battle of Toulouse (10th April 1814) the French under Soult were defeated by Wellington. Cujacius was born, and Fermat died, at Toulouse. The floods of 1855 and 1875 were specially disastrous.

**Toulouse-Lautrec-Monfa**, HENRI DE, French caricaturist and grotesque poster artist, was born in 1864 at Albi, son of the Comte de Toulouse-Lautrec. Physically weak and sensitive about his deformity—he had broken both legs—he lived in solitude, drank in excess, became insane, and died in 1901.

**Toungoo**, a town of Burma, on the Sittang River, 170 miles NE. of Rangoon by rail, and capital of a district of Tenasserim; pop. (1921) 19,332.

**Touquet**, LE, a French golfing and bathing resort, in the department of Pas-de-Calais, near Étaples (q.v.).

**Touraco**. See PLANTAIN-EATERS.

**Touraine**, one of the old provinces of France, of which the capital was Tours (q.v.), and which coincided with the department of Indre-et-Loire and a part of Vienne. See books on Touraine by Robida (1892) and Anne Macdonell (1906).

**Tourane**, or TURAN, a port of Annam, 50 miles SE. of Hué. There are coal-mines near.

**Tourcoing**, a town of France, department of Nord, on the Belgian frontier, 8 miles NE. of Lille, has manufactures of cloth, soap, beet-sugar, and machinery. It was in German hands in 1914–18. Pop. (1881) 50,268; (1901) 61,058; (1911) 82,644; (1921) 78,600.

**Tourgouneff**. See TURGENEV.

**Tourmaline**, a mineral which has a very complex and somewhat variable chemical composition. The chief constituents are silica and alumina in nearly equal proportions, and forming about three-fourths of the whole. The remainder consists of boric acid, ferrous oxide, manganous oxide, magnesia, lime, soda, potash, and lithia, which are not all present, however, in any specimen. Tourmaline has a hardness of 7 to 7.5, and is thus harder than quartz, but not so hard as topaz. Its specific gravity is 2.94 to 3.3. It crystallises in rhombohedral forms, which are usually hemihedral, the prisms being often triangular or six-sided, and variously acuminated. The mineral has a vitreous lustre, and varies from transparent to opaque. The most common colours are black, brownish black, and bluish black; blue, green, and red varieties also occur; but white or colourless kinds are rare. Red tourmaline is known as *rubellite*; pale blue or bluish black as *indicolite*; Berlin-blue and transparent as *Brazilian sapphire* (in jewellery); green and transparent as *Brazilian emerald*, *chrysolite*, or *peridot of Brazil*; honey-yellow as *peridot of Ceylon*; colourless as *achroite*; black as *schorl*. Tourmaline occurs frequently in drusy cavities in granite, and also as an accessory mineral in granite, gneiss, and many crystalline schists, as also in certain granular dolomites and crystalline limestones associated with schists and plutonic rocks. Not infrequently it occurs along with various precious stones in the sands and alluvia derived from the disintegration of plutonic rocks and crys-

talline schists, as in Ceylon, Siberia, and Brazil. Various kinds are found in the Shan districts of Burma. The finest tourmalines are much valued by jewellers, but are comparatively rare. The black variety, *schorl*, is common in many of the granites and schists of Britain.

**Tournament**, a military sport of the middle ages, in which combatants engaged one another with the object of exhibiting their courage, prowess, and skill in the use of arms. Spectacles of this kind seem first to have become common in France, whence the usage spread to Germany and England, and afterwards to the south of Europe. A tournament was usually held on the invitation of some prince, who sent a king-of-arms or herald through his own dominions and to foreign courts. The intending combatants hung up their armorial shields on the trees, tents, and pavilions round the arena for inspection, to show that they were worthy candidates for the honour of contending in the lists in respect of noble birth, military prowess, and unspotted character. The combat took place on horseback, or at least was always begun on horseback, though the combatants who had been dismounted frequently continued it on foot. The usual arms were blunted lances or swords; but the ordinary arms of warfare, called arms *à outrance*, were sometimes used by cavaliers who were ambitious of special distinction. Tournaments were the subject of minute regulations, which in some degree diminished their danger. The prize was bestowed by the lady of the tournament on the knight to whom it had been adjudged, he reverently approaching her, and saluting her and her two attendants. The period when tournaments were most in vogue comprised the 12th, 13th, and 14th centuries; and the place where the most celebrated English tournaments were held was the tilt-yard near St James's, Smithfield, London. The church at first discountenanced tournaments, some of its decrees prohibiting persons from engaging in them under pain of excommunication, and denying Christian burial to a combatant who lost his life in one. The church seems, however, to have looked with more favour on these combats after the middle of the 13th century. During the 15th and 16th centuries tournaments continued to be held; and no better conception of a tournament can be gained than from the account of the combat at Stirling in 1448 between the knight-errant Jacques de Lalain and the Master of Douglas (Hume Brown's *Early Travellers in Scotland*, 1891). But by 1500 the alteration in the social life and warfare of Europe had changed their character, and they are rather to be regarded as state pageants than as real combats. The death of Henry II. of France, in 1559, consequent on a lance piercing his eye at a tournament, led to their general abandonment, both in France and elsewhere, and there have been few attempts to revive them even as mere spectacles. The progress of firearms helped also to put them out of fashion; but tournaments still took place in the reign of James I., and at the Hague in 1633 the Prince of Orange held a 'passage of arms,' in which Prince Rupert 'carried away the palme.' A magnificent entertainment consisting of a representation or imitation of the old tournament was given at Eglinton Castle in August 1839, by the thirteenth Earl of Eglinton: Lady Seymour was the Queen of Beauty, and many of the visitors enacted the part of ancient knights; among them Prince Louis Bonaparte, afterwards Napoleon III. —According to Ducange, the difference between a tournament and a joust is that the latter is a single combat, while in the former a troop of combatants encounter each other on either side. But this distinction has not been always observed.

**Tournay** (Flemish *Doornik*), a town in the Belgian province of Hainault, on the Scheldt, near the French frontier, 35 miles WSW. of Brussels. Its splendid Romanesque cathedral, 400 feet long, has five towers and pictures by Jordaens, Rubens, and Gallait; and there are also the churches of St Quentin and St Brice (with the grave of King Childeric), the belfry (1190), and a bronze statue (1863) of the Princess d'Epinoÿ, who in 1581 valiantly defended Tournay against Parma. Although one of the oldest towns in Belgium, it has quite a modern appearance, with fine suburbs and beautiful broad streets. The chief manufactures are hosiery, linen, Brussels carpets, and porcelain; but there are few large workshops, most of the fabrics being executed by the people in their own houses. Pop. (1880) 32,566; (1920) 36,410. Tournay, the ancient *Tornacum* or *Turris Nerviorum*, was in the 5th and the beginning of the 6th century the seat of the Merovingian kings, subsequently belonged to France, but in 1526 was included in the Spanish Netherlands. During May 1794 it was the scene of several hotly contested fights between the French and Austro-English armies, the most important of which was that of the 19th May, in which Pichegru beat the Duke of York. Fontenoy (q.v.) is 5 miles SE.

**Tournefort**, JOSEPH PITTON DE (1656-1708), botanist, was born at Aix, travelled in Greece and elsewhere, and died professor in the Collège de France. His botanical system maintained its ground till the time of Linnaeus, who to a great extent built upon his foundation, and his principal works were *Institutiones Rei Herbariæ* (1700) and *Éléments de Botanique* (1694).

**Tourneur**, CYRIL, a dramatist, who flourished at the close of the reign of Elizabeth and the beginning of that of James I., but of whose history absolutely nothing is known beyond the fact (*Acad.* May 9, 1891) that he had seen service in the Low Countries, and died in Ireland, leaving his widow destitute, February 28, 1626. In 1600 he published his *Transformed Metamorphosis* (discovered in 1872), a satirical poem, obscure in expression, and inarred, moreover, by pedantic affectations of style; in 1609 he issued a *Funeral Poem* on Sir Francis Vere, in 1613 an *Elegy* on Prince Henry. But his fame rests alone on two plays, the *Revenger's Tragedy*, licensed and printed in 1607, and the *Atheist's Tragedy*, printed in 1611, but undoubtedly written the earlier of the two. The plot of the latter is poor, though the versification is free and flowing; but when we turn to the *Revenger's Tragedy* we are at once arrested by its tragic intensity, the condensed power of passion, the fiery strength of phrase, the cynical and bitter mockery. The plot is an entangled web of lust and blood in which the dramatist moves with a mastery of the elements of tragic passion that brings him abreast of Webster, the closest of the followers of Shakespeare in one—but that not the greatest—of his moods. Tourneur's power has not escaped the unerring insight of Lamb and Hazlitt. Fleay (*Biographical Chronicle of the English Drama, 1559-1642*) thought the *Revenger's Tragedy* the work of the author of the *White Devil*.

The only complete edition is that of J. Churton Collins (2 vols. 1878), with a good critical introduction; the two plays are printed, together with Webster's *White Devil* and *Duchess of Malfi*, in the 'Mermaid' series, with an introduction by J. A. Symonds (1888).

**Tourniquet**, an instrument for compressing the main artery of the thigh or arm, either for the purpose of preventing too great a loss of blood in amputation, or to check dangerous hæmorrhage from accidental wounds, or to stop the circulation through an aneurysm. For the last purpose special

forms of tourniquet are required, which do not compress the whole limb. The tourniquet is of various types. The original form consisted of (1) a pad to compress the artery; (2) a strong band which is buckled round the limb; and (3) a bridge-like contrivance over which the band passes, with a screw whose action raises the bridge and consequently tightens the band. The best kind of pad is a small firm roller bandage, about an inch thick; it must be placed lengthways over the main artery so as to compress it against the bone, and must be secured in its place by a turn of bandage, over which the band of the tourniquet must be applied. This band must first be tightly buckled, and the pressure must be then quickly increased to the necessary extent (viz. till the circulation through the limb is completely arrested) by the action of the screw, which should always be opposite the buckle of the band.

Common Tourniquet.

The credit of the invention of this most useful instrument is usually ascribed to the French surgeon Morel, who, in 1674, used a stick passed beneath a bandage, and turned round so as to twist it up to the requisite degree of tightness, as a means of preventing the undue loss of arterial blood in amputations of the limbs—a rough but by no means ineffectual form of tourniquet, which may often be usefully extemporised in cases of emergency at the present time (see BANDAGES). Mr Young of Plymouth, in 1679, described a similar apparatus. The improved screw tourniquet described above was invented by Petit in 1718. Many surgeons now use in preference a strong elastic band, wound two or three times round the limb—a method first introduced by Esmarch; or a rubber tube of which the ends are caught in a notched block of wood.

**Tours**, capital of the department of Indre-et-Loire, as it formerly was of the province of Touraine, stands in the fertile valley of the Loire just above the influx of the Cher, and is 147 miles SW. of Paris by rail. It is a regularly built and handsome town, nearly divided in half by the Rue Nationale. Conspicuous amongst its buildings is the noble cathedral, in various styles of Gothic from the 13th to the 15th century, the two towers (partly modified Renaissance) being 205 feet high. The glass is very fine. Other buildings are the church of St Julien, the towers and other remains of the famous abbey church of St Martin (long a place of pilgrimage, but destroyed at the Revolution), the archbishop's palace, palais de justice, museum, public library, &c. Near the town are the remains of the monastery of Marmoutier, and of the castle of Plessis lez Tours, the favourite residence of Louis XI. (see *Quentin Durward*). There are some well-preserved ancient houses, including that of the executioner Tristan l'Hermite. Near Tours are many of the fine old châteaux for which Touraine is famous. There are fine statues of Descartes and Rabelais. Tours has a brisk

trade, manufactures woollens and silk, does much printing, &c., and is famous for its plums and similar confections. Pop. (1872) 43,368; (1901) 58,409; (1921) 75,096. The Roman *Caesariodunum*, Tours was both earlier and later capital of the Turones (whence the modern name). Near it Charles Martel (q.v.) won the great victory that saved northern Europe from the Saracens. Meetings of the States-general and councils repeatedly took place here. The great silk manufactures of Tours, established in the 15th century, were destroyed by the Revocation of the Edict of Nantes (1685), which drove into exile nearly half of the most industrious inhabitants of the place. During the Franco-German war Tours was the seat of government from the time the Germans closed round Paris till (21st September) they in like manner closed round and then occupied Tours. St Martin and Gregory of Tours have separate articles.

**Tourville**, ANNE HILARION DE COTENTIN, COUNT DE, was born at the chateau Tourville, near Coutances, 24th November 1642. Entering the French navy, he became, though of delicate health, almost immediately conspicuous for bravery and enterprise; and his early services in wars against the Turks and Algerines established his reputation. In 1677 he fought against the combined fleets of Spain and Holland. In the war which broke out after the English revolution of 1688, between France on the one part and England and Holland on the other, Tourville was put at the head of the French navy. In June 1690 he entered the English Channel with a powerful fleet, and inflicted a disastrous and ignominious defeat on the united English and Dutch armament near Beachy Head. Tourville ranged the Channel unopposed; and on 22d July his fleet cast anchor in Torbay. In 1692, Louis XIV. having resolved to invade England on behalf of James II., an immense fleet was assembled at Brest under Tourville in order to protect the descent. On the 16th May of this year the French fleet was descried from the cliffs of Portland, and on the following morning the English and Dutch force stood out to give battle. From the morning of the 19th to the afternoon of the 24th raged one of the greatest naval battles of modern times, that of Cape La Hogue (see TACTICS, NAVAL). It ended in the complete defeat of the French, sixteen of their men-of-war being utterly destroyed. In spite of this disaster Tourville was graciously received at Versailles, as having maintained the honour of his country, and was made a Marshal of France. Sailing from Brest harbour in the spring of this year, he attacked an English merchant fleet under inadequate convoy, and succeeded in inflicting a damage on English traders estimated at some millions sterling. Sir George Rooke, who commanded the convoy, had some difficulty in saving his own squadron from destruction. This was the last exploit of the great French admiral; he died at Paris, 28th May 1701.

The *Mémoires* published in his name (1758) were not genuine. See Macaulay's *History*; and Delarbre, *Tourville et la Marine de son Temps* (1889).

**Toussaint l'Ouverture** (a surname added for his bravery in once making a *breach* in the ranks of the enemy), one of the liberators of Hayti, was born a slave in 1743, joined the negro insurgents in 1791, and at length in 1795, for his services against the Spaniards, was made by the French Convention general of brigade, in 1797 general of division, and a little later chief of the army of San Domingo. Soon after he cleared the British and Spaniards entirely out of the island, quickly restored order and prosperity, and about 1800 began to aim at independence of France.

Bonaparte having, after the peace of Amiens, proclaimed the re-establishment of slavery in San Domingo, Toussaint declined to obey, whereupon General Le Clerc was sent with a strong fleet to compel him. The liberator soon submitted, but was treacherously arrested, sent to France, and flung into a damp, dark dungeon at Fort de Joux, near Besançon, where he sank after ten months, 27th April 1803. See his own *Mémoires* (1853), and Lives, also in French, by Saint-Rémy (1850), Gagnon-Lacoste (1877), and Schœlcher (1889).

**Tout**, THOMAS FREDERICK, historian, was born at London in 1855, was educated at Balliol, Oxford, and became professor of history at St David's College, Lampeter (1881-90), and at Manchester (1890-1925). His works include *Edward I.* (1893), *Edward II.* (1914), *Administrative History of Medieval England* (2 vols. 1920), *France and England* (1923), and several text-books.

**Tovey**, DONALD FRANCIS, musician, was born at Eton in 1875. For a time he studied under Parratt, Higgs, and Parry; he obtained the first Nettleship Scholarship at Balliol, Oxford, made his début with Joachim in 1894, in 1914 was appointed professor of music at Edinburgh, and in 1917 organised there the Reid Orchestra. Tovey has made concert tours as pianist in America and on the Continent, and has achieved a great reputation as an intellectual musician, a savant, and a writer of musical analyses. His compositions, which include an opera, a symphony, a piano concerto, and much chamber music, are scholarly.

**Tow**, the coarse or broken part of flax or hemp separated by heckling. See LINEN.

**Tower**. See CAMPANILE, SPIRE, and the articles on the various styles of architecture; also PISA, &c.

**Tower Hamlets**, originally certain parishes, hamlets, and liberties without the jurisdiction of the city of London, and once within that of the lieutenant of the Tower; later a 'parliamentary borough' or division of London, lying to the east of the City and Finsbury. Till 1885 it sent two members to parliament; from that time till 1918 the divisions of Whitechapel, St George's-in-the-East, Limehouse, Mile-End, Stepney, Bow and Bromley, and Poplar each returned one member. These were then grouped anew as the boroughs of Stepney (three divisions) and Poplar (two divisions).

**Tower of London**. See LONDON, p. 737.

**Townley Plays**. See MYSTERIES AND MIRACLE PLAYS; WAKEFIELD.

**Town-council**, the governing body of a municipality. See BOROUGH; also ALDERMAN, BAILIE, CITY, MAYOR, PROVOST.

**Town-planning**. See HOUSING AND TOWN-PLANNING, SATELLITE TOWNS.

**Townshend**, CHARLES, VISCOUNT TOWNSHEND, statesman, was born in 1674, of a very old family, at Raynham in Norfolk. His father, Horatio, had been a prominent Presbyterian, but, having been one of the most forward in restoring the monarchy, was by Charles II. made Baron in 1661, and Viscount in 1682. He died in 1687, when Charles was only eleven years old. He, when of age to take his seat in the Upper House, entered public life as a Tory, but soon afterwards became a disciple of Lord Somers, and cordially co-operated with the Whigs. He was named by the Godolphin administration one of the commissioners for arranging the Union with Scotland; was joint-plenipotentiary with Marlborough at the Hague; and negotiated with the States-general the Barrier Treaty, which pledged the States-general to the Hanoverian succession,

and England to procure the Spanish Low Countries for the United Provinces, as a barrier against France. Dismissed from his places in 1712, on the formation of the Harley ministry, Townshend maintained a close correspondence with the court of Hanover, and obtained the entire confidence of George I., who, while still at the Hague, on his way to his new kingdom, made him Secretary of State. With Stanhope he formed a ministry entirely Whig, in which Walpole, his brother-in-law, soon became Chancellor of the Exchequer. The principal act of the government was the passing of the Septennial Bill (1716); that same year saw Townshend's dismissal. After the bursting of the South Sea Bubble, and the deaths of Sunderland and Stanhope, Townshend (1721) again became Secretary of State. But he was no longer the acknowledged leader of the Whigs. The superior talent of Walpole, his financial abilities, and his influence in the House of Commons caused a change in the relative position of the two ministers, and converted those who had been so long friends and colleagues into rivals and enemies. After Townshend had somewhat precipitately made the treaty of Hanover between England, France, and Prussia, an open and unseemly quarrel broke out between them. Walpole said he thought the firm should be Walpole & Townshend, not Townshend & Walpole; so it was, and Townshend retired into private life in 1730. He introduced the turnip into Norfolk from Germany, greatly improved the rotation of crops, steadily refused to reappear in public life, and died 21st June 1738. See works on Walpole, and Stanhope's *History*.

**Townshend**, CHARLES, wit, orator, and statesman, was second son of the third Viscount Townshend, and grandson of the foregoing. He was born 29th August 1725, and entered the House of Commons in 1747 as a supporter of the Pelham (Whig) administration. His first great speech was against the Marriage Bill in 1753. Upon the dissolution of the Whig government the Earl of Bute gained him by the offer of the post of Secretary at War; but on Bute's resignation in 1763 he was appointed First Lord of Trade and the Plantations—the versatility of his political career obtaining for him the appellation of 'the Weathercock.' In the Chatham ministry of 1766 he accepted the post of Chancellor of the Exchequer and leader of the House of Commons. When Lord Chatham in a distempered state of mind abdicated the post of first minister, Townshend manifested the greatest vanity, ambition, and arrogance. Finding the notion of an American revenue agreeable to the court, and not unpalatable to the House of Commons, he proposed and carried those measures of taxation of commodities in America that led to the separation of the American colonies. Townshend's wife was created a peeress, and he was about to be entrusted with the formation of a ministry when he was carried off by a putrid fever, 4th September 1767. The difference between his contemporary reputation and his fame is very striking. He was ranked as an orator with Pitt. Burke called him 'the delight and ornament of the House of Commons.' Macaulay speaks of him as 'the most brilliant and versatile of mankind,' who had 'belonged to every party and cared for none.' Earl Russell describes him as 'a man utterly without principle, whose brilliant talents only made more prominent his want of truth, honour, and consistency.' See his *Life* by P. Fitzgerald (1866).

**Townshend**, SIR CHARLES VERE FERRERS (1861-1924), major-general, after service in the marines in the Egyptian campaign of 1885, joined the Indian army, and sustained a forty-six days'

siege in Chitral fort (1892). Another spell in Egypt followed. In 1915, in command of the 6th Division in Mesopotamia, he took Kut, and was besieged there after falling back from Ctesiphon. After five months he surrendered (1916). He was released from Prinkipo to negotiate for peace in 1918. Unemployed and aggrieved, he entered parliament for the Wicken as an independent in 1920, but joined the Conservative party in 1922. Besides *My Campaign in Mesopotamia* (1920) he wrote the *Military Life* of his ancestor—George, first Marquess Townshend (1724-1807), field-marshal, who at the capture of Quebec took command after Wolfe fell, and was Lord-Lieutenant of Ireland 1767-72—a brother of Charles Townshend (see above).

**Township**, or **VILL**, the oldest proprietary and political unit of the Germanic races, an organised self-acting group of families exercising ownership over a definite area, the mark. The oldest English manors are contemporaneous with townships: the parish, a later division than the township, and originally purely ecclesiastical, is assumed to be equivalent to the township if there is no evidence to the contrary. In fact many parishes, especially in the north of England, consist actually of but one township; but generally they comprise more than one, and are subdivided into townships, hamlets, 'tithings,' 'boroughs,' or the like, none of which subdivisions, unlike the parish itself, has ever had a church or a constable of its own. For administrative purposes the township is subordinate to the Parish (q.v.).—In the United States the word is variously used (1) of a subdivision of a county; (2) the corporation composed of the inhabitants of such area; or sometimes (3) of municipal corporations only less fully organised and with fewer powers than a city.

**Townsville**, a port of Queensland on Cleveland Bay, in lat. 19° 10' S., has foundries and breweries. Pop. (1921) 21,348.

**Towton**, a township in the West Riding of Yorkshire, where was fought, near Tadcaster (q.v.), one of the chief battles in the Wars of the Roses (q.v.).

**Toxicology**, the science of poisons, embraces the physical and chemical history of all known poisonous substances, the methods of testing for them, their action on the living body, and the *post-mortem* results they occasion; see POISON.—For *toxins* or bacterial poisons, see ANTITOXIN, and articles there noted.

**Toynbee**, ARNOLD, the second son of Joseph Toynbee, a famous aural surgeon, was born in London, 23d August 1852. At Oxford he became a prominent figure amongst an attached circle of students, studied political economy, and read in a miscellaneous fashion. 'Most men,' he said, 'seem to lose their religious beliefs in passing through the university; I made mine.' He came under Ruskin's influence, did some practical work in road repairing, read his Bible diligently, and the *Imitation*. Endowed with the gift of fluent speech, he began to address audiences of working-men; and believing that the poor could only be adequately helped by those who had lived amongst them and felt their needs, he took up residence in Commercial Road, Whitechapel, in 1875, and associated himself with the religious work carried on there by the Rev. S. A. Barnett. His health gave way under his unwearying labours, and the noise, dullness, and dreariness of his surroundings, but from the inspiration of his example and teaching during this period sprang the idea of Toynbee Hall. He died in 1883, owing to overstrain following on two lectures directed against Henry George's *Progress and Poverty*. A course of lectures delivered at Oxford between 1881-82 on the economic history of England, along

with other popular addresses, was published in 1884 under the title of *The Industrial Revolution*, with Memoir by Jowett. Toynbee was frank and unreserved, of transparent sincerity, had a keen sympathy with the life of the labouring classes, and was a close student of history. The residence house known as Toynbee Hall was organised in Toynbee in January 1885, under the direction of the Rev. S. A. Barnett. It partakes somewhat of the nature of both a college and a club, the idea being to connect the memorial of Toynbee with the study of 'political economy in its social aspects, to which he devoted the scholar half of himself, and with his work among the artisan population of our great cities, to which he gave the other, the missionary half.' This is carried out by members of the universities of Oxford and Cambridge who strive 'to provide education and the means of recreation and enjoyment for the people, to inquire into the condition of the poor, and to consider and advance plans calculated to promote their welfare.' During the first four years there were fifty-four residents.

**Toys.** The most primitive toy of most abiding interest for children is the Doll (q.v.), already dealt with. But toys are of infinite variety, and the making of them forms a very important industrial occupation. Large numbers are made in London, Birmingham, and other places in Britain; but by far the greater number in Germany. Wax and china dolls are made in Sonneberg and elsewhere in southern Thuringia, very elaborate ones in Paris; wooden toys such as Noah's arks in the Erzgebirge; mechanical toys in Paris and Nürnberg; toy tea-sets in the Thuringian Forest. Squibs, crackers, &c., are somewhat dangerous toys (see PYROTECHNY), and there are many other ingenious applications of chemistry which combine amusement, instruction and risk—e.g. the so-called Pharaoh's Serpents (see THIOCYANATES), &c. A valuable use of what may be called toys is made in the Kindergarden (q.v.).

**Tozeur**, a town and oasis of Tunisia, on the Shatt el Jerid, 200 miles SW. of Susa, with which it connects by two railways. It is famous for dates.

**Tracadie**, a fishing-town on the east coast of the Canadian province of New Brunswick, 35 miles E. of Bathurst, with a hospital for lepers.

**Tracery**, the beautiful forms in stone with which the arches of Gothic windows are filled or traced for the support of the glass. These forms vary with every variety of Gothic architecture, from the simple early forms to the Decorated (q.v.) and Flamboyant (q.v.). See WINDOW, PERPENDICULAR, CHAPTER-HOUSE, &c.

**Trachea**, or WINDPIPE, that part of the air-passages which lies between the Larynx (q.v.) and the bronchi (see RESPIRATION). It is very rarely affected by disease of independent origin, though often secondarily by extension of laryngitis from above, or of bronchitis from below.

*Foreign bodies* occasionally pass through the larynx into the trachea. In cases of this kind the patient who has had some foreign substance in his mouth which is supposed to have been swallowed is seized with a convulsive cough, threatening suffocation, but subsiding after a time. The symptoms that then ensue vary with the weight and figure of the substance, and according as it is fixed or movable. A large and very irregular body may be impacted in the trachea, and may thus more or less obstruct the respiration on both sides of the chest; and this obstruction will probably soon be increased by the inflammatory products that are excited. A small heavy object will usually pass

through the trachea into one of the bronchi (usually the right), or one of its branches, obstructing respiration to a less extent. While a foreign body remains in the air-passages there is always more or less risk of suffocation, though a piece of bone has been coughed up after sixty years in that situation. The attempt to remove it, however, has also risks; but such an operation is greatly facilitated by the use of the bronchoscope, an electrically-lighted tube by means of which the operator looks directly down the windpipe. If attempts at removal are unsuccessful the foreign substance may become encapsuled and quiescent; but it more often sets up organic lung disease (pneumonia, gangrene, &c.).

**TRACHEOTOMY.**—The air-passages may be opened in several different situations—viz. through the thyroid cartilage (*thyrotomy*; only used for removal of growths, &c.); through the crico-thyroid membrane (see LARYNX; *Laryngotomy*); through the cricoid cartilage and the upper rings of the trachea (*Laryngo-tracheotomy*; very rarely used); and through the trachea, either above or below the isthmus of the thyroid gland (*Tracheotomy* proper, *high* or *low*, according to the part chosen). Laryngotomy is more quickly and easily performed, especially in adult males, and is less dangerous; tracheotomy is a more difficult, tedious, and dangerous operation, but in some cases (as, for example, where there is any necessity for introducing the forceps) must be selected. It is unnecessary to enter into details regarding the modes of performing these operations. When the operation is completed a large curved double tube to breathe through is inserted in the aperture, and the outer tube is secured round the neck with a tape. The inner tube should fit quite loosely into the outer, so that if it becomes obstructed it may have a chance of being ejected by the patient's cough, and that it may be readily removed and cleaned. The tube may be removed in a few days, or may have to be worn permanently. Tracheotomy may be required for cut throat, laryngitis and other laryngeal disease, croup, diphtheria, tumours or epithelial growths in the larynx, foreign bodies below the glottis, or external tumours (bronchocele, abscesses, &c.).

**Trachyte**, a crystalline igneous rock, generally grayish in colour, sometimes brown, yellow, green, or red. It is usually a fine-grained or compact rock, more or less markedly porphyritic. The essential constituents of trachyte are sanidine (felspar), of which the rock is chiefly composed, and one or more of the ferro-magnesian bisilicates—biotite, augite, and hornblende; various other minerals may be present. The rock has often a rough or harsh feeling (Gr. *trachys*, 'rough'), due to the abundant presence of minute vapour or gas pores, or to angular cavities. Trachyte occurs both in the form of lava-flows and as intrusive sheets, dykes, and masses. It is the fine-grained equivalent of the coarsely-crystalline syenites. See IGNEOUS ROCKS.

**Tractarianism** is named from the ninety *Tracts for the Times*, published at Oxford in 1833–41. The principal writers were Pusey (q.v.), Newman (q.v.), Keble (q.v.), Hurrell Froude, and Isaac Williams. See also ENGLAND (CHURCH OF).

**Traction-engines** are usually steam locomotives dragging trailer wagons behind them on ordinary roads; but the term may be here extended so as to include the steam-carriages for conveying passengers—attempted as early as the end of the 18th century.

*Steam-carriages.*—It was to the conveyance of passengers by steam that all the plans of early inventors were devoted, but at the present day

interest in them is entirely historical. The main idea in all cases was to fit an engine and boiler to an ordinary carriage or coach. The boiler, usually carried at the back, was of some form possessing strength with little weight, and capable of rapidly raising steam; the engine also, either at the back or under the coach, usually worked a cranked axle, and the main axle carrying the two driving-wheels was driven from this by chain gearing; most of them ran on four wheels, though some had a fifth wheel as a steerer. Cugnot, a Frenchman, made a steam-carriage in 1769; it ran at  $2\frac{1}{4}$  miles per hour, and carried four persons; a capsized in a street in Paris led to the imprisonment of the inventor, and put a stop to further trials. Murdock in 1782, Watt in 1784, Symington in 1786, and others made models, but the first one which actually ran in England was made by Trevithick and Vivian in 1803. This attained a speed of 8 or 9 miles per hour in the streets of London; but want of encouragement and difficulties produced by bad roads compelled Trevithick to turn his inventive faculties into other fields of work. Improvements in the main roads led to a great revival of interest about 1830, and during the years 1827-34 numerous more or less successful steam-carriages were built; one made by Sir Goldsworthy Gurney ran for three months in 1831 with passengers between Cheltenham and Gloucester, while Hancock's steam-omnibuses (carrying 14 to 16 passengers) ran pretty constantly during the years 1833-36 in London, and attained often a speed of 10 or 12 miles per hour; some of his coaches ran long journeys, such as from London to Brighton; he was in fact the most successful of all these inventors. Scott-Russell also constructed and ran in 1834 six steam-coaches between Glasgow and Paisley. However, the great opposition placed in their way by road trustees, and the gradual spread of railways, led to the abandonment of all these schemes. In 1891 Serpollet patented an ingenious and successful steam-carriage with a flattened coil boiler; superheated steam was used, and the engine was very economical. The electrically driven or petrol-engine motor-cars have led to the entire abandonment of steam-carriages for passenger traffic (see MOTOR-CARS).

*Traction-engines for heavy loads.*—The main difficulty with which builders of these engines have to cope has been the driving-wheels, the tires of which must be able to resist the great wear and tear and violent shocks caused by passing over bad roads or uneven ground, and must at the same time possess considerable adhesive powers, since the resistance to motion even on good macadamised roads is more than eight times as great as it is on rails. Boydel, who made the first successful engine in 1856, used a series of flat segments of rails, so jointed round the circumference of the driver that the engine ran, as it were, on an endless tramway; it was an extraordinarily noisy, clattering, unmechanical contrivance, still it gave great adhesion, and enabled his engines to drag heavy loads over exceptionally soft ground. A little later Bray brought out a wheel with rigid tires, fitted with short strong spikes projecting from the rim (these could be withdrawn when not wanted); this, again, had considerable adhesion, but was very destructive to the roads. R. W. Thomson of Edinburgh, in his so-called 'road-steamers,' adopted flexible india-rubber tires; the driving-wheels were light wrought-iron drums about 15 inches wide, with a flange at the sides; round the drum was stretched an india-rubber band 5 inches thick and 12 inches wide, protected on the outside with a flexible sheath of thin steel plates. This tire had the great advantage that it formed a perfect spring for the engine, and, flattening under the pressure, it gave a broad

tread, and so increased enormously the adhesion; on paved roads with a gradient it had much better hauling power than any engine with rigid tires. The objection to the use of such tires is their heavy cost (those of the 'Ravee,' a road-steamer for service in India, cost £241), and the expense of renewals; they were, however, very successful, being employed in Glasgow and other towns hauling heavy castings, boilers, &c., from the workshops to the wharves. All these types and many others are now practically obsolete. The modern engine usually has rigid wheels, the hind or driving-wheels are made of steel tee hoops built up with steel spokes radiating from cast-steel bosses, diagonal steel cross strips being riveted to the outside of the tee hoops; the leading wheels, smaller in diameter, are also made of strong section steel tee rings. The traction-engines now in use run on four wheels, the hind pair being drivers, the front pair steerers; the boiler is of the locomotive or some similar type, working usually at steam pressures varying from about 130 lb. to as much as 200 lb., according as the steam-engine is of the simple or compound type; the engine and attached parts are carried on the top of the boiler, cylinder at forward end, crank-shaft at firebox end. The cylinder valves are usually slide-valves, but in the most recent types piston valves have been adopted both for simple and compound engines. Motion goes from the crank-shaft to the driving-axle through steel spur-wheel reducing gear carried by other shafts. The transmission gear is usually arranged on the four-shaft principle; the gear-wheels are cast-steel with machine-cut teeth when of less than two-inch pitch, the gearing is designed to give road speeds of 2 and 4 miles per hour. A differential compensating bevel gear is usually fitted, one driving-wheel being then loose on its axle; this enables the engine to turn corners without straining the axles. Springs are also now usually fitted, though their use somewhat complicates the method of supporting the gearing between the crank-shaft and driving-wheel axle; these, however, greatly reduce the shocks in passing over bad roads. Most of the engines now made have a winding-drum, which enables steep gradients to be overcome; the engine itself proceeds to the top of the incline, then a steel rope attached to the wagon carrying the load is gradually wound up on the drum, thus hauling up the load. To obtain increased power, the engines sometimes have two cylinders, and are also made compound; a stock of coal is carried in a bunker behind the foot-plate, and water in a tank under it. One of the most serious difficulties in the working of these traction-engines is the problem of securing pure water for feeding the boiler, as it is frequently necessary to depend upon supplies drawn from wayside ponds and streams. With water of an indifferent quality there is the risk that the crown plate of the firebox may become badly scaled, with resultant serious loss in heat transmission from the fire to the water, and local overheating of the crown plate and consequent danger of accident. This trouble has been overcome in the most recent types by the use of corrugated firebox tops, such as those used by Messrs Marshall, Sons & Co., of Gainsborough, in their traction-engines and road-roller boilers. These engines are now most extensively used, and are much cheaper than horse traction; this may be shown by the following information in regard to the hauling powers of two classes of traction-engines. A single cylinder type, using steam-pressure of 150 lb. classed as 5 nominal h.p., weighing when in full working order  $9\frac{1}{2}$  tons, can haul 15 tons in trailers on average macadamised roads on level or moderate gradients at 4 miles per hour, and up a gradient of 1 in 12 $\frac{1}{2}$  at 2 miles per hour. A compound

cylinder type, using steam-pressure of 180 lb., classed as 8 nominal h.p., weighing 13 tons when in full working order, can haul under the above conditions a load of 23 tons. Steam-ploughing by direct traction can be carried out by using engines of very similar design, but fitted with travelling wheels of exceptionally large diameter and width of face. With the use, if necessary, of multi-furrow ploughs (up in some cases to 10 or 11 furrows) direct traction-ploughing, except in swampy or hilly ground, is probably more economical in first cost of plant and in working costs than the cable systems for hauling the ploughs.

*Agricultural locomotives* are essentially portable engines, fitted with various methods of self-propulsion—in some cases by pitch-chains, more usually by spur-gearing. They are much lighter in make, though otherwise very similar to traction-engines; they are employed mainly in drawing loaded wagons, thrashing-machines, &c., from farm to farm; by disconnecting the propelling gear and blocking the wheels, they can be used as stationary engines to drive by belting off the flywheel, with which they are always fitted, thrashing-machines, fans, and other farm plant. Fowler's steam-ploughs are locomotive; they are able both to pay out and wind up the steel rope moving the plough to and fro, and also to shift themselves along the field. Traction-engines are now made by all the chief firms of agricultural implement-makers; to the late Mr T. Aveling of Rochester, much of the present success of steam road-traction is due. In making macadamised roads, the rolling of the broken metal is now done by heavy steam-propelled rollers very similar in all respects in design to traction-engines.

**Tract Society.** In the 17th century several traces are found of associations for printing and promoting the sale of religious works, but none of them seems to have existed long. The 'Society for Promoting Christian Knowledge,' founded in 1701, had for one of its objects 'the dispersion, both at home and abroad, of Bibles and tracts of religion.' In 1750 was formed 'The Society for Promoting Religious Knowledge among the Poor,' not, like the former, confined to the Church of England, but embracing Christians of all denominations. The Religious Tract Society (1799) originated with the Rev. George Burder (q.v.). Its beginnings were humble, but it soon expanded. The Society's operations have extended over all quarters of the world, and it has issued books and tracts in some 300 languages and dialects. Its business is conducted by a committee of whom half are members of the Church of England and half Nonconformists. It also carries on important missionary work at home and abroad by grants of money and books. The Tract and Colportage Society of Scotland was instituted in 1793.

**Trade, BOARD OF,** a department of government more correctly designed 'The Lords of the Committee of Her Majesty's Privy-council appointed for the Consideration of all Matters relating to Trade and Foreign Plantations.' In 1660 Charles II. created two separate councils for Trade and for Foreign Plantations, which in 1672 were consolidated into one. The Board of Trade and Plantations, after being abolished in 1675, and reappointed in 1695, was again abolished in 1782. In 1786 the presently existing department was established by Order in Council, being a permanent committee of Privy-council for the consideration of all matters relating to Trade and the Colonies. The board consists of a president, together with the Lord Chancellor, the Archbishop of Canterbury, the First Lord of the Treasury, the principal Secretaries of State, the Chancellor of the

Exchequer, the Speaker of the House of Commons, and others. But of the latter *ex officio* members none take part in the work of the board which is managed by the president and his staff; the staff includes the permanent and parliamentary secretaries, four assistant secretaries, and a chief of the statistical department. Since 1864 the presidency has usually been held by a cabinet minister. Before 1867 there was a vice-president who was a member of the administration, though without a seat in the cabinet.

The functions of the Board of Trade are partly of a ministerial, partly of a judicial kind, and have of late years been greatly enlarged by a variety of statutes. The board is charged with the general superintendence of all matters relating to the mercantile marine. It requires and considers reports made to its inspectors and other officers, and orders returns of various kinds regarding trade and navigation. It is empowered to make regulations regarding the examination and qualifications of applicants for the position of master or mate of passenger-ships. Under the Merchant Shipping Act, 1854, it grants licences to persons to engage or supply seamen or apprentices for merchant-ships, decides on claims for wages, and investigates charges of misconduct and incompetency. It also appoints officers to inquire into and report on the condition of steam-vessels.

The supervision of railways and railway companies, both as to their original formation and their working, constitutes an important part of the duties of the Board of Trade. Railways were first subjected to government control by an act of 1840 which conferred power on the Board of Trade to appoint inspectors of railways, to approve or disallow bylaws, to require returns of traffic, and to decide disputes between connecting lines. Further powers have been added by subsequent acts. In 1846 the increase of these duties, arising from the rapid extension of railways, led to the transfer of this department of the Board of Trade to a separate board created exclusively for the management of railway business; but in 1851 this latter board was abolished, and its powers were retransferred to the Board of Trade. Notices of applications for railway acts with plans are required to be deposited with the board before any bill can be introduced into parliament; and before any railway can be opened for traffic the permission of the board must be obtained on the report of an inspector. On the occurrence of an accident notice must be given to the board, which sends an inspector to inquire into the circumstances, and on his report the board is empowered to take what steps are judged necessary for the security of the public.

Many matters relating to the interests of trade which come before other departments are referred to the Board of Trade for information or advice. Thus there are frequent communications with the Foreign Office regarding the negotiation and working of commercial treaties, and with the Treasury regarding alterations in the customs. The Board of Trade is also concerned with trade disputes through the Industrial Councils established in 1911, trade boards and unemployment exchanges.

A statistical department of the board was established in 1832, whose province is to collect and publish tables containing classified information regarding the revenues, population, commerce, wealth, and moral and economical condition of the United Kingdom and its dependencies, to prepare a selection from the statistics of foreign countries, and a monthly account of trade and navigation. All applications made to the King in Council by companies or private persons for charters of incorporation are referred to the Board of Trade; and among the functions committed to it by statute are the

registration of joint-stock companies and copyright designs, and the supervision of proceedings under the Bankruptcy Act, 1883. The board is empowered by several local and personal acts to control the proceedings of the commissioners for regulating the employment of coal-whippers and the discharge of coal-laden vessels in the port of London. In 1853 the Department of Science and Art, which owed its origin to suggestions made in the Second Report of the Commissioners for the Exhibition of 1851, and was at first a department of the Committee of the Privy-council on Education, was placed under the control of the Board of Trade; but in February 1856 it was retransferred by an Order in Council to the Education Department. Since 1886 the department issues monthly the valuable *Board of Trade Journal*, containing extracts from consular reports, customs regulations and changes of tariff, a report on the state of the skilled labour market, and much information of value to the mercantile community.

**Trade Boards.** See TRADE UNIONS (*Conciliation*).

**Trade Corporations.** See CORPORATION, COMPANY, GUILDS, LIVERY.

**Trade Disputes.** See MASTER AND SERVANT, TRADE UNIONS (*Legal Position*).

**Trade-marks.** A trade-mark is the name or mark under which any one trades. It is a mode of connecting certain goods in the mind of the public with a particular manufacturer or seller; and its function is to give to a purchaser a satisfactory assurance of the make and quality of the article he is buying. A trade-mark is the property of the person legally adopting it, and he has a right—antecedent to and independent of the various trade-mark acts—to prevent any one else from using it to his prejudice.

Water-marks on paper, dating from the 14th century, are among the oldest trade-marks. Trade-marks appear to have become a prominent feature in the industrial life of England in the early part of the 18th century. The law relating to them has pursued the following course of development. (1) At first no *right of property* in a trade-mark was recognised, and only the *actual, fraudulent, and injurious* use by one person of the mark of another was restrained and punished. This rule, which originally prevailed both at common law and in equity, was inspired by the old judicial dislike of patent privileges and the failure to see the essential difference between a patent and a trade-mark. (2) In 1838, however, in the case of *Millington v. Fox* (3 My. and Cr. 338) Lord Chancellor Cottenham granted a perpetual injunction against the defendant, although no intentional fraud was established. Since that time the Court of Chancery has uniformly interfered to prevent the infringement of trade-marks on the principle of protecting property alone, and it has not been necessary for the plaintiff to prove that the defendant invaded his rights intentionally. (3) The Courts of Common Law did not imitate the wise liberality of the Court of Chancery, and down to 1873 proof of fraud on the part of an infringer was of the essence of a common-law action for damages. The Judicature Act of 1873 provided, however, that in any conflict between the rules of law and of equity the latter should thenceforth prevail; and if actions of infringement were still tried in the King's Bench Division, there can be little doubt that the equitable rule would be applied, and proof of fraud dispensed with. (4) But under the Judicature Acts and the Rules of the Supreme Court, trade-mark cases are brought in the Chancery division, so that the former variance between the Courts of Common

Law and the Court of Chancery has now only a historic interest and importance. The owner of a trade-mark that is being infringed usually applies for an *interlocutory* injunction to restrain the immediate infringement, and at the same time brings an action in which he claims (a) a *perpetual* injunction, and (b) an account of the profits made by the infringer, or damages in lieu thereof. The fraudulent imitator of a trade-mark may be indicted for false pretences, but not for forgery. See, however, *Merchandise Marks (infra)*.

*The Registration of Trade-marks.*—At common law a trade-mark could be acquired only by actual user; it must have been 'so applied in the market as to indicate to purchasers that the goods to which it was attached were the manufacture of a particular firm.' By the Trade-marks Registration Act, 1875, a Register of Trade-marks was established at the Office of the Commissioner of Patents (now the Patent Office), and it was provided that the registration of a trade-mark should thenceforth be equivalent to public user. This provision was in substance repeated in the Trade-marks Act, 1883, and is reproduced in the Trade-marks Act, 1905, by which, together with certain provisions of the Patents Act, 1907, the Patents and Designs Act, 1914, and the Trade-marks Act, 1919, the registration of trade-marks is now regulated. The registration of a person as proprietor of a trade-mark is *prima facie*, and after seven years is conclusive, evidence of his right to the exclusive use of the said mark (subject to the provisions of the act); and no person can institute proceedings for infringement unless the mark alleged to be infringed has been registered, or, in the case of marks in use prior to the act of 1875, has been declared by the certificate of the Comptroller-general to be non-registrable. A registrable trade-mark must contain at least one of the following essential particulars: (a) a name of a company, individual, or firm represented in a special or particular manner; or (b) the signature of the applicant for registration, or his predecessor in business; or (c) an invented word or words; or (d) a word or words having no reference to the character or quality of the goods, and not being a geographical name; or (e) any other distinctive mark. There may be added to any one or more of these 'essential particulars' any letters, words, or figures, or combination thereof. Any disclaimer necessary for the protection of other traders or of the public may be required. Any special and distinctive word or words, letter, figure, or combination thereof used *separately* and as a trade-mark prior to the act of 1875 is still registrable. A trade-mark when registered may be assigned and transmitted, but only in connection with the goodwill of the business concerned in the particular goods or classes of goods for which it has been registered, and is determinable with that goodwill. The provisions for the rectification of the Register noticed in the article PATENTS apply, *mutatis mutandis*, to trade-marks. Where a registered word trade-mark is the only name of an article or substance manufactured under a patent, the right to the exclusive use of such trade-mark ceases on the termination of the patent. The 'International Convention for the Protection of Industrial Property'—the history of which is given in the same article—also extends to trade-marks. The convention has been applied to various colonies and other countries under British jurisdiction and in the chief European states. Under that convention an applicant for registration of a trade-mark in any one of the contracting states may obtain protection in any of the other contracting states by application there within four months from the date of the first application. The subsequent application is ante-dated to the date of the first, and is consequently not

defeated, as otherwise it might have been, by prior user in the protected interval. The rights conferred on a person who has applied for protection of a trade-mark in a foreign state extend to his legal representatives and assignees (Patents and Designs Act, 1914). In Britain in 1923 there were 12,479 applications for registration of trade-marks, and 4837 were registered. In the United States the numbers were 16,817 and 14,845.

**Merchandise Marks.**—Under the Merchandise Marks Acts, 1887-94, which apply to England, Scotland, and Ireland, every person that (a) forges, (b) falsely applies to goods, (c) makes, disposes of, or has in his possession any instrument for forging any trade-mark, or (d) applies any false trade description to goods, is liable, on conviction on indictment, to a maximum period of two years' imprisonment, and on summary conviction to a maximum term of four months' imprisonment with hard labour, or a fine of £20, for the first offence, and in the case of a second or subsequent offence to a term not exceeding six months with hard labour, or a fine of £50. Any person aggrieved by the decision of a court of summary jurisdiction may appeal to quarter sessions. It is a competent defence to a prosecution under the act that the defendant took all reasonable precautions against committing the offence, and gave, on demand by, or on behalf of, the prosecutor, all the information in his power, or otherwise acted innocently. The limitation for proceedings under this act is the expiration of the three years next after the commission, or the one year next after the discovery, of the alleged offence, whichever shall first happen. A conviction under this act does not relieve the defendant from liability to *civil* proceedings. By the Merchandise Marks Act, 1911, important powers are conferred on the Commissioners of Customs of requiring from the importer of goods bearing a fraudulent mark information as to the name and address of the person by whom the goods were consigned to the United Kingdom, and production of documents relating to the goods.

See works by Sebastian and Kerly.

**Trade Protection Societies** are associations composed of merchants, tradesmen, and others, which have been formed for the promotion of trade and for protecting the individual members from losses in their business transactions; one of the earliest being the 'London Association of Guardians for the Protection of Trade,' established in 1776. In 1871 the Board of Trade granted a license for incorporation to one under the Companies Acts, 1862-67. The operations of these societies used to be confined chiefly to the compilation of registers of bankruptcies, insolvencies, and private settlements with creditors. Each member informed the secretary of the name, occupation, and address of the customers who became insolvent, with the amount of dividend their estate yielded; and latterly, whether the insolvency was due to recklessness and extravagance, or was innocent misfortune. Special attention was directed to the exposure of swindlers and persons who had been guilty of fraud or embezzlement. The information accumulated in the registers, though always accessible to such members as made inquiry at the offices of the society, was kept strictly private from all others. But the extraordinary development of commercial enterprise which took place in the early part of the 19th century added a new stimulus to the trade protection movement. The registers which the societies now printed and circulated among their members contained transcriptions from the following public records—viz. the records of the bankruptcy courts, registers of assignments and trust-deeds, bonds or warrants of attorney, bills of

sale, judges' orders, protested bills, and decrees in absence. The societies also undertook to recover past-due bills and accounts for their members, to investigate the circumstances connected with bankruptcies and insolvencies, collect dividends, and perform the general agency business of their members—the whole being done under the direction of a committee appointed for this purpose. Committees were also appointed to scrutinise all measures affecting trade and commerce which might be introduced into parliament, and to promote legislation favourable to the commercial interest. The sphere of action of trade protection societies thus rapidly widened. The older societies established offices and branches throughout the country; new societies sprang up in the large provincial cities, which in their turn opened agencies and branches in other towns and villages; and the various societies being in communication, the machinery of the whole is available for the purposes of each. In 1852 the various societies formed themselves into an association.

**Tradescantia**, a genus of American perennial herbs (Spiderworts) of the family Commelinaceae, differing much in habit. Some belong to the United States, and some are tropical. The flowers are loosely or densely panicked, and resemble umbels. *T. virginiana* is often cultivated in gardens. A form of this species, *T. discolor*, has leaves dark-green above, violet below. The genus was named after John Tradescant, traveller and gardener to Charles I., erroneously said to be of Dutch descent, who died in 1637. It was his son and successor, John Tradescant (1608-82), also a traveller, who left his *Museum Tradescantianum* to Elias Ashmole (q.v.).

**Trade Unions** are combinations of wage-earners maintained for the purpose of protecting the workman in the conflict between the rival interests of labour and capital, and are defined legally in the Trade Union Act of 1876 as 'any combination, whether temporary or permanent, for regulating the relations between workmen and masters, or between workmen and workmen, or between masters and masters, or for imposing restrictive conditions on the conduct of any trade or business.' Their justification is that the individual workman, acting separately, can never have the power necessary to compel unwilling employers to grant concessions, and that only when the workmen combine and act together through representatives can they protect and benefit themselves. Arising historically as a product of capitalism, these protective associations have found their characteristic weapon in the strike and the mass resistance to the lock-out of the masters; in the course of their development, however, a new point of view has emerged, and the trade union has become the organ of industrial democracy.

**Early History.**—Strictly speaking, the history of trade unionism cannot begin prior to the industrial conditions which created the conflict of which it is a part. These conditions are marked principally by a separation between the employed and employing classes. So long as the journeyman could hope reasonably to become an employer in due time, so long as the employing section was regarded generally as but a group of the whole mass of labouring people, this separation was not complete, and modern trade unionism could not arise. The separation did not come suddenly, and so trade unionism has an interesting introductory history in the evolution of the craft guilds, which, however, in no instance emerged into trade unions. There is some disagreement as to the exact function of the craft guilds and their relation to the

industry of their time (cf. Ashley, *Introduction to Economic History and Theory*; Cunningham, *History of Industry and Commerce*; Brentano, *Guilds and Trade Unions*), but their nearest approach to the modern trade union was the attempt to protect the small employer from being crushed out by the large capitalist. The craft gild was essentially an organisation to protect one type of capitalist producer against another; the trade union is essentially an organisation to protect the hired workman against his hirer. The difference is fundamental.

The early history of trade unionism is concerned with a three-fold process: (1) The evolution of industry, so that group after group of trades comes to offer opportunities for labour organisation; (2) the federating of separate unions in the same group of trades; (3) the adoption of new policies to meet new industrial circumstances. This last includes the emergence of trade unions as a new political power in the state, and has, notably since the beginning of the century, reacted potently on (2), stimulating the formation of amalgamations, and tending to obliterate the old craft lines of demarcation in the interest of a new sense of solidarity among the workers as workers.

(1) The origin of trade unions may be assigned, if not to gilds, to the social habits of the workman. 'People of the same trade seldom meet together,' says Adam Smith in his *Wealth of Nations*, 'even for merriment and diversion, but the conversation ends in a conspiracy against the public or in some contrivance to raise prices.' Thus, we find that the earliest combinations were formed in trades like tailoring and shoemaking, which allowed considerable intercourse amongst the workmen; and the movement towards association developed rapidly with the growth of the factory system. The movement, Mr and Mrs Webb state in their *History of Trades Unionism*, begins in the 18th century, and is marked by petitions and counter-petitions of employers and employees to the House of Commons, and by an increase in the number and stringency of laws against combinations until the Act of 1799 made illegal all combinations for an advancement of wages, a decrease of work, or interference with the management of business. It has also to be noted in passing that the mediæval spirit of Christian charity, especially as regards the dead and the wandering, determined that, from the first, the older societies should give friendly benefits. The Glasgow coopers, with a record going back to 1752, well illustrate the activities of such societies, and it was a frequent complaint that, in the event of disputes with employers, these compassionate funds were spent for fighting purposes. As a purer example of a union formed to meet economic change, that of the tailors may be selected. The growing tendency in the 17th century to wear fine clothes led to a differentiation in skill in cutting and designing from the capacity to sew. It also tended to differentiate the shop-keeper-middleman from the workman. Capital was required for the shops, and skill in designing and cutting-out came to be in a position to employ to its own advantage the mere sewer. Hence we find that in 1720 over 7000 journeymen tailors in the city of London combined to raise wages and reduce their working day by an hour, and to defend themselves against any prosecution which might follow (Galton, *The Tailoring Trade*). Frame-work knitters and compositors were active for similar purposes.

The other cause of combination—the rise of a capitalist class owning the means of production—is illustrated in the unions amongst the woollen workers in the west of England, whose doings were brought before parliament in 1717. This is specially

interesting because, as Mr Webb points out, whilst in the west country, where the manufacturers were rich and owned the machinery of production, there were unions at an early date, in Yorkshire, where the industry was domestic, no unions were formed till that system died out towards the end of the 18th century. Similar changes had befallen the hosiery, the cotton, the cutlery trades, each of which shows signs of labour combinations before the factory system proper became the rule. When this system became prevalent towards the end of the 18th century, every trade began to have its unions. Some, like unskilled labouring in all its branches, did not respond, owing to their poverty and the casual nature of their work, till much later; and not till the dock strike of 1889 did the class of dock-workers, gas-labourers, and the like form and maintain a combination.

Even when the economic and industrial conditions have been favourable, the spread of trade unionism has depended very considerably on tides of public feeling, and these tides have been accompanied, as a rule, by legislative changes. Laws limiting the economic power of the workman to improve his condition by forcing up the price of his labour power on the market appeared early on our statute-books, the typical and best known instance being the Statute of Labourers, passed in 1350-51. The petitions to which reference has been made, addressed to parliament by employers throughout the 17th century, led to the passing of the Combination Act of 1799. The theory had been that parliament acting through the justices protected the workman, and statutes had been passed and were enforced fixing wages, the number of apprentices, the amount of machinery to be used, and similar things. But both theory and practice were breaking down; and when the workmen began to protect themselves by combinations, parliament resented it, and the interest of employers then controlled the legislature. Consequently, during the whole of the 18th century, acts were being passed prohibiting combinations in specified trades. The Act of 1799 was general, and was hustled through parliament. There had also been growing up through the century a code of master and servant, and conspiracy laws. Although these acts failed to stamp out combinations they led to many prosecutions—as many as 1100 per annum on the average, according to Mr Howell (*Labour Legislation, &c.*)—and by the end of the first decade of the 19th century a somewhat conflicting agitation for legislative revision was on foot. Employers desired the repeal of some of the acts, and workmen the repeal of others. In 1824 a select committee of the House of Commons was appointed to inquire into the operation of the Combination Laws, with the result that in that year they were repealed. A great increase in trade union activity was the immediate response. People became alarmed, and a further inquiry was immediately undertaken. It was shown that the unions had increased greatly. Prices were rising, and men had the greatest incentive to combine. The law was again altered in 1825 to the disadvantage of the workmen, but the right of combination was recognised. Amongst the unions founded in this period, and still surviving, are the Consolidated Bookbinders (1792), the Friendly Society of Ironfounders (1809), General Union of Carpenters and Joiners (1827), with names changed after absorbing or amalgamating with other societies.

(2) A new period dates from about 1833. When the Combination Laws were altered the idea of national unions began to be discussed. Many trade clubs and local societies were in existence, and proposals were made for their union. In 1829

the trade clubs of the cotton-spinners became branches of a national society. Indeed the idea of one society for all trades was then mooted, and several attempts were made to carry it out (1830-4). But the time for that had not then come. For the next forty years the characteristic of trade union evolution was this federating of local bodies into national amalgamations. Through periods of much unsettlement and strife, of stagnation and activity, the great national unions, pioneered by those of the cotton and building trades, grew, tossed about every now and then upon political and utopian waters, as in the heyday of the Owenite and Chartist agitations, but always increasing in membership and solidarity. Amongst the societies which date from this time are the Amalgamated Society of Engineers (1851)—now the Amalgamated Engineering Union—the amalgamation which typifies the whole period; the Operative Bricklayers' Society (1848); the Yorkshire Miners' Association (1858); and the conflicts which marked the triumph of the workmen include the historical lock-out in the engineering trade of 1852, the Preston cotton strike of 1853, the strike and lock-out in the London building trade of 1859-60.

The period began with a revolutionary spirit, Owenism, and ended with the vision of the unions narrowed to conflicts with the employers upon specific points. The increase of political liberty, and the enjoyment on the part of the workmen of some measure of economic improvement, had an influence on trade union policy. The support of middle class and professional men led the unions to appeal to the law courts and parliament, and definitely to adopt the strike as a method of redressing specific grievances. This change took place about the middle of the period (1840-50). In these years also the beginning of the trade union 'civil service' of specialised secretaries and administrators is to be found.

The Amalgamated Society of Engineers set aside in its rules the secrecy with which unions were wont to conduct their business. But the old spirit of secret conspiracy engendered by unwise legislation died hard, and it produced as a final legacy what are known as the 'Sheffield outrages.' Another inquiry into the combinations of workmen was demanded. The unions were not adverse, for not only were they certain that the 'outrages' would be found to have no essential connection with trade unionism, but they believed they could prove to the commission that labour combinations ought to be granted wider legal freedom. A Royal Commission on Trade Unions was appointed (1867), and its report issued two years later was a virtual exoneration of the unions. The extension of the franchise, which took place in 1868, enormously strengthened the power of trade unionists, and the Trade Union Act of 1871 followed. Trade unions were legally recognised, workmen were allowed to combine to withhold labour, peaceful picketing was admitted, and the law courts were not to interfere in the internal government of unions. Trade unions were thus put on a legal footing all by themselves.

(3) Hitherto the organised trades had been almost exclusively skilled trades. From time to time attempts had been made to organise the labourers, but such unions had been ephemeral. The activities of Socialist speakers in the east end of London from 1882 onwards created the conditions under which the famous dock strike of 1889 was a success, and unions of unskilled labour followed. A change in trade union policy, known as 'the New Unionism,' then came as a consequence. In the first place the labourers' unions did not attempt to copy friendly societies. They asked

for very small contributions from their members, and they spent their money in organisation and in fighting. But that was only an indication of a more fundamental change. The 'new unionism' came near to the unionism inspired by Owen and the Chartists. It sought industrial change through parliamentary action. Superficially, this was no new departure, for, in ways appropriate to the opportunity which the times presented, labour combinations have always been ready to turn to parliament for assistance, and the 'old unionists' had not only carried on an active propaganda in the lobbies of the House of Commons (Howell, *Labour Legislation, Labour Movements, and Labour Leaders*), but had run candidates, through the Labour Representation Association, for parliament, first of all at a bye-election in 1869, when George Odger was their champion, and at the General Election of 1872, when Mr Alexander Macdonald and Mr Burt were elected. The difference between the two schools was, however, that whilst the old pursued parliamentary action only to redress certain legal injustices, like the Master and Servant Act, the new regarded parliament as an instrument by which capitalism was to be curbed in its industrial activities and finally supplanted altogether. Politics was to be the ally of trade unionism in the conflict which trade unionism was waging.

Since 1868 the trade unions had met in annual congress, and had an executive body since 1869, known until 1920 as the Parliamentary Committee, and thereafter as the General Council. Year after year the active spirits in the movement brought up at these annual conferences the question of political action. At first the Parliamentary Committee resisted the new trend; but at last, at the congress which met at Plymouth in 1899, the whole movement declared for it on the ground that economic and industrial evolution, as evidenced, for instance, in the concentration of capital and the over-representation of the employing classes in parliament, made it no longer possible for trade unions to fight successfully on the old lines, i.e. by the strike alone.

*Modern Trade Unionism: 1899.*—1899 is a crucial date in trade union history. The decision to co-operate with the Socialist bodies in forming an independent political party for Labour, meant not only the victory of the new unionism over the old, but the emergence of trade unionism itself in its modern and characteristically British form. It has gone through various moods since then under the influence of changing circumstances and experiences, e.g. the growth of more effective combination among employers, the discovery and application of new sources of economic power, and above all, the Great War with its legacies of interrupted flow in international exchange, disturbed markets, wage cutting, on the one hand, and the development of financial power and industrial combination on the other. It has not worked out either a final form for itself or a completed philosophy. But the direction of its outlook was given by the Plymouth Congress in 1899, and its subsequent history is in essence the history of the infiltration of the implications of that decision right through the body of the membership. The control of human freedom by industrial power, which the industrial revolution really meant, was soon felt by the workers, who found themselves, their status, and conditions completely subject to that power. Their first effort at resistance—overlooking sporadic disorders—was to organise themselves into unions which, accepting the system, asked for higher wages, shorter hours, steadier employment, pensions, &c., within it, but by the end of last century, they had begun to extend and deepen their vision and see their

task in a wider relation than had hitherto been possible. Labour began to survey the whole battlefield, the far objective, and not only the limited point of immediate attack. It then realised that the industrial organisations of the workers engaged in defensive operations against capitalism were but an incident in the long-drawn-out conflict between the human spirit striving for freedom and material circumstances imprisoning that spirit. It was fighting a battle wider than that of workshop grievances. So, when trade unionism in 1899 swung itself into politics, it announced not only a change in tactics, but in mind. It ceased to be merely a defence force, it became an active agency in reconstructing society; at the same time it continued to carry on its wonted industrial work.

*History since 1899.*—The victory of the new unionism in 1899 was consolidated by a series of amalgamations that went on continuously during the next twenty years and are still going on. In 1888, the Miners' Federation of Great Britain had been founded, but it was not until ten years later, when the Durham and Northumberland miners joined it, that the federation could speak for the whole body of workers in the coal industry. In 1910 the Transport Workers' Federation was formed, to be extended some ten years later. In 1913 the National Union of Railwaymen launched an 'all grades' programme, based on the idea that all classes of workmen engaged in an industry like railways should be in one union and not in separate unions of their respective crafts. The outstanding feature in the trade union world of to-day is the unions that represent this 'all grades' policy and stand for the claims and aspiration of workers as such, against the craft spirit of the older unions. The idea of national sympathetic union action grew, and French revolutionary syndicalism and its American counterpart, the Industrial Workers of the World, influenced the movement. This culminated in 1926 in the general sympathetic strike undertaken to help the miners (*infra*).

The foundation in 1899 of the General Federation of Trade Unions was intended to give expression to this new idea of mutual support and protection. The federation, which was an insurance agency with a common fund, was to provide resources for unions engaged in disputes, and help financially weak unions to fight their battles. The federation has since dwindled in importance, and can now claim but 600,000 members.

The years that followed were agitated and unsettled, and unemployment was a constant irritant. In 1910, 1911, and 1912 a series of great strikes took place, of which the outstanding ones were the railway struggle of 1911 and the mining dispute of 1912, which ended in the settlement of a national minimum wage by legislation. This led to some conflict of opinion between revolutionary industrial action, 'direct action,' and constitutional political and trade union action, the Socialist influence being strongly in favour of traditional trade unionism combined with parliamentary activities. The whole trade union world was still in a condition of unrest when the war broke out. An industrial truce was, thereupon, at once proclaimed, and the unions surrendered certain privileges in view of the national needs. Upon peace there was much unsettlement. The government during the war had pledged itself to restore trade union conditions after the conclusion of peace, and there were difficulties in doing this. Extravagant promises of great change could not be kept. Many hoped, however, that after the war a new era of peaceful reconstruction was to begin, and hopes for industrial conciliation were based upon the 'Whitley' Councils (1917), on which representatives of employers and workers sat.

The first big task that had to be faced was the decontrol of services that had practically to be nationalised for war purposes. Decontrol of the railways was followed by the great railway strike of 1919, ending in the establishment of a national sliding-scale system in 1921; the sudden decision to decontrol the mines, following on the refusal of the government to carry out the finding of the Royal Commission (Sankey) they had set up in 1919, led to a protracted and disastrous lockout. The commission did secure a seven hours' day for the miners, but its recommendations as to nationalisation were disregarded. From then till now the history of trade unionism has been the history of the miners. Since 1921 unrest has been constant in the mining industry, where conditions were going from bad to worse. The threat of united trade union action in support of the miners failed in 1921 with the collapse of the triple alliance which had been effected for mutual protection between the railway and transport unions and the miners; but in July 1925 it compelled the government to grant a subsidy to the industry (£23,000,000) and appoint the Samuel Commission. All attempts to settle the dispute failed and work on the coal-fields ceased on the 1st May (1926). A conference of trade union executives decided that day to declare a national strike in support of the miners to begin on the night of the 3rd. This lasted till the 11th, when the General Council produced terms on which it believed a settlement would be made. Upon their rejection by the miners the council called off the national strike, and the miners continued their struggle until the 20th November, when they surrendered. Meantime, the government had passed the Miners' Eight Hours Act, and work was resumed on district settlements, reduced wages, and lengthened hours. The Trade Union Act (1927) followed (*infra*).

*Disputes.*—Statistics issued by the Ministry of Labour show that between 1910 and 1925, including both years, over 280,000,000 working days were lost through industrial disputes.

Year.	No. of Work-people Involved.	No. of Days Lost.
1910.....	514,000.....	9,867,000
1911.....	952,000.....	10,155,000
1912.....	1,462,000.....	40,890,000
1913.....	684,000.....	9,804,000
1914.....	447,000.....	9,378,000
1915.....	448,000.....	2,958,000
1916.....	276,000.....	2,446,000
1917.....	872,000.....	5,647,000
1918.....	1,116,000.....	5,875,000
1919.....	2,591,000.....	84,989,000
1920.....	1,932,000.....	26,568,000
1921.....	1,801,000.....	85,872,000
1922.....	552,000.....	19,850,000
1923.....	405,000.....	10,672,000
1924.....	613,000.....	8,472,000
1925.....	442,000.....	7,906,000

Far the most expensive years, from this point of view of lost time, were thus 1912, and the years of the post-war slump—1919–23; 1912, 1920, and 1921 include great mining stoppages; 1921 being, like 1926, a lock-out. Out of the total of days lost, the post-war slump years account for 170 million, or far more than half.

From time to time the chief points of conflict between capital and labour have changed, and at no time have they been the same in every trade. Trade union programmes have, therefore, varied very greatly. Nearly every union has had to fight for what is called 'recognition,' by which is meant the right of the representatives of the organised workmen to negotiate with the employers in the name of the workmen. This was involved in the famous Preston cotton strike of 1853. Now this long drawn out battle has been won, and recognition is universally granted. The limitation in the number of apprentices—long the subject of statutory

enactment (1566 and 1603)—was the cause of contention from the beginning of labour combinations. When machinery became common the old system of apprenticeship began to decay, and the skilled workman saw his market flooded by men who had not been trained in their calling. The workmen tried to enforce the Statute of Apprentices against their employers, but without success, Lord Ellenborough declaring (1811) that new trades like engineering did not come under it. From 1812 till 1814, when parliament abolished a statutory limitation upon apprentices (a Parliamentary Committee of Inquiry was appointed in 1813), an agitation was carried on by petition, pamphlet, and correspondence by the threatened journeymen, and later on the collective power of trade unionism was used to force employers to impose restrictions upon themselves. During the middle years of the 19th century this was a much discussed matter, such societies as the engineers, the boot and shoe operatives, the compositors, the flint glassmakers (which declared a strike in 1858-59 on the question) being specially agitated by it.

The use of machinery was another sore point with the unions. The workman who finds a machine turning him out on to the street is not pacified by the thought that it is reducing the cost of production and giving an impetus to labour of another kind to his own. Therefore, Luddism appears with what is called the 'Industrial Revolution.' The strike in the boot and shoe trade which dragged on between 1857 and 1859 arose from the introduction of a machine for 'closing' the uppers of boots.

But the common causes of disputes have been on questions of hours and wages. The historical 'nine hours' strike and lock-out in the building trades (1859-62), and in the engineering trades in the north-east coast (1871), bear their purpose on their title, and the disastrous engineers' dispute of 1897 was for an eight hours' day. At the same time, strikes for reductions in hours, if severe, have been few. During the ten years from 1900 to 1909 inclusive, whilst there were 3028 strikes on wages' questions, there were only 169 on questions relating to hours of labour. The advantages of shorter hours have been gained largely as an indirect result of factory legislation affecting women and children, though the Mines Act of 1908 directly dealt with adult men. But the pressure and other influences of trade unionism have been effective in an unobtrusive way in reducing the length of the working day. Strikes for reductions in hours have as a whole been less successful than strikes for increases in wages. The reasons appear to be: (1) That increases in wages are seldom asked for unless the state of the market can evidently bear them; and (2) To shorten working hours is a complicated industrial change not only affecting profits, but also workshop management with results difficult to foresee.

Some years ago the agitation for a legal eight hours' day was very popular, especially amongst the more Socialistic trade unionists. It was largely a product of the 'new unionism' which arose after the dock strike (1889), and a good deal of literature appeared on the subject. This is also a plank of the international labour platform, but for some years little interest has been taken in it, though frequent attempts have been made to revive it. The miners were successful in getting their Eight Hours Bill carried in 1908 after an agitation of twenty years, and in 1919 seven hours became the legal maximum working day, again to be lengthened to eight in 1926. The International Labour Convention, summoned to meet at Washington by the League of Nations in 1919, passed by 83 votes to 2 an international eight hours' agreement, which somewhat

revived the agitation, but none of the great industrial powers, save Belgium, have seen fit to ratify it (1927).

The most fruitful of all the causes of labour disputes have been matters affecting wages—either demands for increases or refusals to accept reductions. This has been a particularly prolific cause of disputes in the cotton and mining trades.

The following summary of the causes of disputes is taken from official sources:

	Wages.	Hours.	Trade Unionism.
1908 .....	249 .....	14 .....	29 .....
1909 .....	256 .....	27 .....	31 .....
1910 .....	302 .....	22 .....	41 .....
1923 .....	353 .....	16 .....	91 .....
1924 .....	436 .....	13 .....	57 .....
1925 .....	306 .....	15 .....	72 .....

An important part of the disputes regarding wages has been the basis of pay—e.g. piecework, time-rates, bonuses; and it has been found that whilst one trade favours one method, another favours another. The commonly-held belief that trade unions are opposed to piecework is nothing but a delusion. The attitude of the unions is determined by the circumstances of each trade, but agreements on a basis of 'piece' or a statement of prices—as, for instance, in the boot and shoe trade—are as common as, if indeed not more common than, agreements on a basis of time—as, for instance, the dockers' 'tanner' an hour. What the unions try to secure is a piece-rate which to the average workman will secure a weekly income upon which he can live; or, as it was expressed in connection with the sliding-scale arrangements by which wages rise and fall with the market-prices of products, 'a scale with a living-minimum, below which it cannot slide.'

Although the history of the trade union movement from 1899 is marked by renewed industrial conflict, these incidents stand out in any chronicle with undeserved prominence against the quieter background of industrial bargaining through which the unions used their power to maintain or improve conditions for their members, and, very slowly, win for the workers a new status. Disputes never have been the whole of trade union history, least of all in its modern phase. It is significant that in 1924, according to the returns of the Registrar-General, registered trade unions spent only £1,151,137 on dispute benefit, against £3,175,709 on unemployment, travelling, and emigration benefit; £818,598 on sick and accident benefit, £306,922 on funeral benefit, and £984,108 on 'other benefits,' including superannuation, &c., i.e. less than a fifth of their expenditure on benefits was on dispute benefit.

Of the disputes and lockouts that took place in 1925 50·7% arose out of wages questions, 2·5% out of questions of hours, 23·3% out of 'employment of particular classes or persons,' i.e. demarcation. In the same year 26% of disputes were settled in favour of workpeople, 31% in favour of employers, and 42·8% were compromised. This latter table, however, requires to be read in connection with the fact that the disputes settled in favour of the workpeople affected 56·9% of the workpeople; those settled against them only 15·5%.

*Conciliation.*—The Conciliation Act of 1896 gave the Board of Trade power, since transferred to the Ministry of Labour, to intervene in any dispute if both parties agreed; since 1908 standing panels of independent persons have been constituted, from which courts of arbitration may be set up. In 1911 an industrial council was established—a joint body, designed to facilitate conciliation. In 1909 the Trade Boards Act set up boards empowered to fix minimum scales of wages in 'sweated' industries. In 1924 a Minimum Wage Act was passed

for agricultural labourers, and local committees were set up to fix it.

The joint industrial councils, devised as the result of the work of the Whitley Committee, presuppose the existence of organisations of workers and employers, on whose basis joint machinery for discussion and the elimination of disputes was to be erected. Such machinery already existed in many of the more highly organised trades—for instance, the engineers have an elaborately devised system by which any matter of dispute which cannot be settled locally is passed on through a series of more comprehensive bodies till it reaches a full national delegate meeting; and similar arrangements for settling issues by mutual discussion exist in the iron and steel, coal-mining, cotton, ship-building trades, &c., while for the railways a special representative national council was set up as part of the 1919 settlement. Industrial councils of the 'Whitley' type were either set up or, as in the case of the boot and shoe and pottery trades, superimposed upon existing arrangements. In 1922 there were 73 such joint industrial councils; by 1925 the number had fallen to 43, covering industries employing over three million persons. In addition to this some one and a half million workers are covered by 35 trade boards. During 1925, 423 disputes were settled by representatives of the parties concerned, 44 by conciliation, and 10 by arbitration.

**Legal Position of Trade Unions.**—The vital significance of political action was brought home to the trade unions by the decision given in the House of Lords (upsetting that given by the Court of Appeal) in the Taff Vale case in 1901. The acts of 1871 and 1876, while denying to trade unions the full privileges of incorporation, had protected them; this decision, however, imposed on every trade union, whether registered or not, complete corporate liability for any injury or damage caused by any person who could be deemed to be acting as the agent of the union, not merely in respect of any criminal offence which he might have committed, but also in respect of any act not contravening the criminal law, which the judges might hold to have been actionable. The Amalgamated Society of Railway Servants had not authorised the Taff Vale strike; nevertheless, damages of over £23,000 were awarded against it. The whole position of the unions was thus challenged. After considerable agitation, during which it was generally admitted that something had to be done, in 1906 the Liberal government passed the Trade Disputes Act, which restored the 1876 position with all its anomalies.

In 1909 a new attack developed. Osborne, a member of the A.S.R.S., took action to restrain his union from spending any of its funds on political objects. In 1909 (the Osborne Judgment) the law courts sustained his claim and gave a new interpretation to the act of 1876. Again agitation followed, and in 1913 another Liberal government passed an act which gave power to a trade union to include in its constitution any lawful purpose whatever, so long as its principal objects were those of a trade union as defined in the 1876 act. Levies for a political fund were to be optional, and that fund was to be kept separate from other monies. Since 1913 this act, with the Trade Disputes Act of 1906 as interpretive of the act of 1876, has defined the legal status of trade unions. The manner in which trade unions make their political levies, and the difficulty of applying the law of peaceful picketing had become a matter of party controversy by 1925, and the general strike in support of the miners in 1926 forced it to the forefront. On the assumption that the general strike had as an object the overthrow of the government, an Act was passed in 1927 making strikes and lock-outs illegal if not confined to trade dis-

putes, or if they have political objects, preventing unions penalising members who do not take part in illegal strikes, limiting picketing and changing the position of the parliamentary levy, so that instead of those unionists who do not wish to subscribe being granted exemption, those who do wish to subscribe must do so by signing a form to that effect. The new Act also prevents unions of civil servants being associated with other trade unions or political parties, and no local or public authority may make membership of a trade union a condition of employment.

**Membership.**—The movement of trade union membership since 1892 is shown in the annexed table. Of the total for 1924 of 5½ millions, nearly

#### NUMBER AND TOTAL MEMBERSHIP OF TRADE UNIONS IN GREAT BRITAIN AND NORTHERN IRELAND, 1892-1924.

[Compiled from Returns collected by the Chief Registrar of Friendly Societies, the Registrar of Friendly Societies for Northern Ireland, and the Ministry of Labour. The figures include the total membership of all Unions with head offices in Great Britain or Northern Ireland.]

Year.	Number at end of Year.	Membership at end of Year		
		Males *	Females *	Total
1892.....	1233	Not available		1,576,020

1924†.....	1155†	4,719,823†	811,320†	5,531,143†

\* The subdivision of the total membership into male and female is not exact, as estimates have been made for some trade unions which are unable to state precisely the numbers of males and females comprised within their membership.

† The figures given for 1924 are provisional.

**Note.**—The statistics relate to all organisations of employees—including those of salaried and professional workers, as well as those of manual wage-earners—which are known to include among their functions that of negotiating with employers with the object of regulating the conditions of employment of their members. The figures of membership include members in the Irish Free State and other overseas branches numbering approximately 61,000 in 1924.

one million were accounted for by mining, 678,000 by metal-work, 609,000 by textiles, 334,000 by building, 425,000 by transport other than railways or shipping, 506,000 by railways, 511,000 by general labour. Out of the 5½ millions, again, 4,719,000 were males; the only big group of female workers in trade unions being the textile, which accounted for 334,863 out of a total of 811,320. During the decade immediately preceding the war, trade union membership rather more than doubled. Individual years show upward and downward fluctuations, but, broadly, the total rose from two millions in 1904 to over four millions in 1913. During and

immediately after the war the increase was still more rapid, the membership more than doubling between 1914 and 1920—the 'peak' year—when the total reached 8½ millions. Since then there has been a considerable decline. A large proportion of war-time employees (especially women) drifted out of industry, which they only entered for war purposes; protracted unemployment and falling wages have compelled many others to fall out of membership. The disputes of 1926 were immediately followed by a further reduction in membership.

Comparable figures showing the development of effective association among employers are not available. It is matter of common knowledge that such combination has gone on very rapidly in recent years, and notably since the war. The Annual Abstract of Labour Statistics for 1926 shows that the number of employers' associations 'concerned with labour matters' rose from 1487 in 1914 to 2403 in 1925; but this total by no means comprises all the effective associations of employers organised for industrial bargaining, and takes no account of the progress of industrial amalgamations and trusts.

*Trade Union Structure and Government.*—Since 1890 there has been comparatively little change in the internal structure of the unions, as described in Mr and Mrs Webb's *History of Trade Unionism*, or Mr G. D. H. Cole's *Introduction to Trade Unionism*. The organisation, having grown up in response to the varying circumstances and conditions affecting the various industries, shows a wide range of difference, and reflects those circumstances and conditions, rather than any consciously adopted principle. Even the two main lines of union organisation which may at present be said to be contending for supremacy, craft unionism and industrial unionism, seldom appear in pure form. At the same time the conflict between these two ideas accounts for a certain proportion of disputes—e.g. those raging round questions of demarcation—and for a good deal of friction between unions. Post-war conditions have exposed the members of 'craft' unions, like the engineers, to exceptional hardships, and encouraged the growth, at their expense, of more or less unskilled and of 'mixed' unions, sometimes on an industrial basis, more often not. These same conditions have caused a merging of small unions of female membership in the related unions of men. Thus the Federation of Women Workers, founded by Miss Mary Macarthur, was in 1921 incorporated as an autonomous 'district' in the National Union of Municipal and General Workers.

The government of the unions is democratic whether one has in mind a small union, consisting of a single local branch, or of a great and complex federation. The election of secretaries in nearly every case, as of executives, is by a ballot vote of the members. In the cotton trade, owing to the high technical duties to be performed, some of the secretaries are chosen by examination; the Iron and Steel Trades Confederation affords a unique example of the selection of secretaries by the executive. Moreover, the rules of the societies provide for the reference of every question of importance to the general body of members. Only in a few cases, as, for example, that of the National Union of Railwaymen, has the executive the power to declare a strike; the normal procedure is for a ballot vote to be taken. So limited is the power of the executive of the Miners' Federation that it is merely an administrative body, the real executive being the National Conference. There is considerable variety of method within the general system—control of funds by branches, district autonomy, appeals from executive decisions, complicated plans

for the reference of disputes from one area of discussion to another—but these points are clearly laid down in the rules in every case, and the rules themselves can only be altered by processes which sometimes involve a referendum and always necessitate delegate meetings. Some of the unions have annual delegate conferences; others meetings at stated intervals. Except on great national issues, such as the calling or settling of a strike, ballot votes are generally small, corresponding to the small proportion of members who take a detailed interest in the work of the unions.

The government of the unions is autonomous. No progress has recently been made with the ambitious plans which have been under discussion since the failure of the 'triple alliance' in 1921, for concentrating control in the hands of the General Council of the Trade Union Congress. This was done as an emergency measure during the national strike (1926), but the miners broke away (*supra*).

The General Council has a headquarters staff of its own; but while co-ordinating, it does not in any sense control the individual unions beyond exercising the right to refuse affiliation to unions that break its rules.

*Finance.*—The income of the trade unions is drawn from the subscriptions of their members. These subscriptions vary widely in amount from union to union, and are determined by whether the wages of the members are high or low, steady or unsteady, and whether the union is solely a fighting organisation or a friendly society as well. Thus, in the general labour unions, where the members are normally in receipt of low wages, the contribution is usually 3d. or 4d. a week, the rates for women being sometimes lower still. Contributions, again, are low in unions like those of the postmen and railwaymen, where employment is steady, and carries certain insurances with it; and in the mining unions which pay few friendly benefits. The skilled craft unionist, on the other hand, pays 1s. a week, or more, which includes several insurances. In many cases levies for specific purposes (political and other) are additional to the normal contribution. In trade union administration friendly benefit funds have never been kept separate from general funds, and have been available for urgent calls for money. The expenditure of unions must be studied with these facts in view, some unions levying themselves to meet administrative expenses alone, others including friendly society benefits in their dues.

The following figures show the income of expenditure of one hundred of the most important trade unions:

INCOME.				
	Members' Subscriptions.	Government Grants for Unemployment		Total.
	£	£		£
1921 .....	10,386,000	7,822,000		19,850,000
1922 .....	8,069,000	5,040,000		13,842,000
1923 .....	7,345,000	2,427,000		10,814,000
1924 .....	7,551,000	1,913,000		10,025,000

EXPENDITURE.				
	Unemployment Benefit.	Dispute Pay.	Friendly Benefit.	Management and other Expenses.
	£	£	£	£
1921....	14,925,000	3,180,000	1,911,000	3,830,000
1922....	7,701,000	1,409,000	1,852,000	3,221,000
1923....	3,506,000	675,000	1,736,000	2,787,000
1924....	2,927,000	1,149,000	1,896,000	2,823,000
				Total.
				£
				24,541,000
				14,819,000
				9,404,000
				9,400,000

It should be noted that management is a very miscellaneous heading, and includes all unclassified payments, but excludes those made from the Parliamentary Fund.

*International Trade Unionism.*—Both on its industrial and on its political side organised labour in Great Britain is in close contact with organised labour throughout the world. The war broke the international organisations of labour, but not its

international spirit, and so soon as the armistice made it possible the old affiliations were revived.

On the industrial side contact is maintained partly through the International Federation of Trade Unions, with headquarters at Amsterdam, which is itself a federation of national federations; partly through international federations of the unions in many of the great industries, such as mining, building, clothing, textiles, postal workers.

Generally speaking, continental trade unions did not achieve an effective organisation until after more or less solid Socialist parties had been formed in the various countries. By 1901, however, at a conference held at Copenhagen, it was possible to form an international trade union secretariat which held biennial conferences, and in 1913 was transformed into the International Federation of Trade Unions, generally known as the I.F.T.U. In 1919 the I.F.T.U., which had ceased to function during the war, was reconstructed, with an executive including representatives of the national federated trade unions of all the great countries, save Russia (which set up an opposition 'Red' Trade Union International of its own, on Communist lines, joined by some of the dissident national sections) and the United States, where the American Federation of Labour still holds aloof.

The work of the I.F.T.U. is mainly propagandist, directed to such issues as the eight hours' day, international control of raw materials, working-class education, disarmament, and the prevention of war. It also organises industrial and financial support to national unions engaged in struggles in which international interests are involved—e.g. the recent mining dispute, when it considered (and rejected) an embargo on the transport of coal into England and collected relief funds. Its activities in no way trench on the autonomy of the separate national movements. In 1925 it comprised national federations covering a trade union membership of over 15 millions, out of a total estimated world trade union membership of 36 millions in that year.

Of the national federations constituting the I.F.T.U. the most important numerically is the German, representing in 1925 over 5 million trade unionists as against 4 million for our Trade Union Congress. This 5 million comprised 4½ millions organised in the German Confederation of Trade Unions (*Allgemeiner Deutscher Gewerkschaftsbund*) and some half a million in the 'Christian' unions, which are nominally non-party. Trade unionism in Germany dates from 1868, the year in which our own Trade Union Congress first met; the earliest unions there were founded by followers of Lassalle, and came into a national confederation in 1890. The Christian unions were founded in opposition to the social democratic unions, and only came into being in 1894.

Trade unionism in Austria has suffered markedly from Nationalist divisions in the past, and still suffers from division between Socialists and Catholics; there, as in Germany, the Socialist unions comprise the overwhelming majority of organised workers; their membership affiliated with the I.F.T.U. totalled in 1925 over 800,000.

In France the trade union movement, like the political, has been kept weak by syndicalism and communism; the *Confédération Générale du Travail* has never recovered its pre-war strength. It is affiliated to the I.F.T.U. on a basis of only three-quarters of a million members. Trade unionism in France has never emerged from a utopian revolutionary spirit.

The other more important constituent bodies of the I.F.T.U. are the trade union federations of Belgium (578,000 members), Denmark (230,000); Holland (180,000), Poland (300,000), Sweden

(360,000), Canada (106,000). In Italy trade unionism as we know it has been stamped out for the present under the Fascist régime.

To give any detailed account of the development of trade unionism, either on the continent of Europe, in the British colonies and dominions, or in the United States, is obviously impossible within the confines of this article. In Australia trade unionism is powerfully developed, originally on purely British lines, latterly with developments of its own, as the result of specific Australian legislation on arbitration, wages boards, &c. At the end of 1924 the trade union membership there was 730,000, or 55 % of the male workers in the country. In South Africa there is a growing trade union movement, of a craft type, among whites; in India the development of trade unions is going on, despite extreme difficulties. In Canada the trade union movement is closely associated with that of the United States, although the Canadian unions are affiliated to the I.F.T.U. and the American Federation of Labour is not. With 2,800,000 members in 1925, the American Federation of Labour still holds aloof from political action, though it takes a subordinate part at presidential elections. It does not include some of the most powerful and progressive unions in the States, notably the Railroad Brotherhoods and the Amalgamated Clothing Workers. It has to contend with the 'open shop' policy of many big industries and the fact that over a million workers are organised in 'company' unions. Other bodies, such as the Knights of Labour and the Industrial Workers of the World, have now shrunk to small dimensions.

**Trade-winds.** See WINDS.

**Tradition.** See ROMAN CATHOLIC CHURCH, NEWMAN.

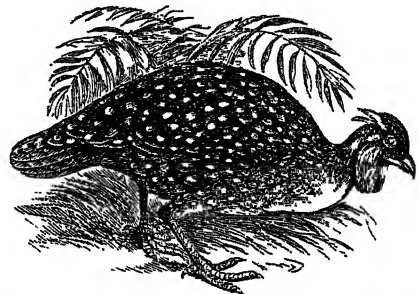

**Traducianism.** See PRE-EXISTENCE.

**Trafalgar'**, CAPE, a low promontory on the south coast of Spain, about 29 miles west-north-west of Tarifa (q.v.), on the Straits of Gibraltar. It is memorable for the great naval victory obtained (21st October 1805) by the British fleet under Nelson over the combined fleets of France and Spain under the French admiral Villeneuve and two Spanish admirals. See NELSON; Sir J. K. Laughton's *Story of Trafalgar* (1890), and Corbett's *Campaign of Trafalgar* (1910).

**Tragacanth** (Gr. 'goat-thorn'), a name given to several low spiny shrubs of the genus *Astragalus* (*A. gummifer*, *A. microcephalus*, &c.), found in western Asia, and to the mucilaginous substance or gum derived from them—for which see GUM.

**Tragedy.** See DRAMA, THEATRE.

**Tragopan** (*Cerionis*), a genus of birds in the Pheasant family, represented by five species in

Tragopan, or Horned Pheasant (*Cerionis satyra*).

India and China. They are birds of very beautiful plumage, of the most brilliant reds, browns, buffs, and lustrous blacks. The males show, especially

when courting, an erectile fleshy horn above each eye, and a loose wattle, capable of being inflated, like an apron on the throat. The best-known species are the Indian Crimson Tragopan (*C. satyra*) and the Black-headed Tragopan (*C. melanocephala*), inhabiting the forests on high ranges. In courtship the male 'shows off' his beauty in an elaborate way before his desired mate. The other species are *C. blythii* from Upper Assam, *C. caboti* from south-west China, and *C. temminckii* from Central China. The tragopans are capable of acclimatisation, and possibly domestication, in Britain.

**Tragus**, or **BOCK**, **HIERONYMUS** (1498-1554), one of the founders of modern botany, was born in the Odenwald. He studied theology, the humanities, and medicine, became a teacher, then keeper of the duke's garden at Zweibrücken, and in 1532 preacher at Hornbach, where he also practised medicine, and where he died. For a time he had to take refuge, as a Protestant, with Count Philip of Nassau. His *New Kreutterbuch* (1539) gives exact descriptions of plants, not in Latin, as was usual, but in German. For his historical importance, see *Greene, Landmarks of Botanical History* (i., Washington, 1909). See also **BOTANY**.

**Traherne**, **THOMAS**, poet and prose-writer, the son of a Hereford shoemaker (perhaps originally of Welsh descent), was born about 1636 (or a year or so earlier), entered Brasenose College, Oxford, in 1652, and took his degree in divinity. In 1657 he became rector of the Herefordshire village of Credenhill, and from 1667 till his death in 1674, at Teildington, near Hampton Court, Traherne was chaplain to Sir Orlando Bridgman, who was for some time Lord Keeper of the Seals. Traherne's poetry dates more from the earlier part of his life and his prose from his later years. A controversial work, *Roman Forgeries*, appeared in 1673, and a prose work, *Christian Ethics*, in 1675 (neither, however, retaining its interest for the modern reader), but nothing else of his work (except a small pamphlet) was published till the 20th century. Some MSS. were sold out of a county library in 1838, and were nearly published by Dr Grosart as Vaughan's work. Mr Bertram Dobell edited the *Poetical Works* in 1903, and the prose *Centuries of Meditations* (partly autobiographical) in 1908, while Mr H. I. Bell discovered some new material in the *Poems of Felicity* (1910). Traherne's lyrics anticipate those of Blake and Wordsworth in their passionate intensity and spontaneous enthusiasm, but are almost surpassed by the *Centuries of Meditations* for nervous vitality and felicity of expression. A contemporary described Traherne as 'very affable and pleasant in his conversation, ready to do all good offices to his Friends, and Charitable to the Poor almost beyond his ability.' See a study by Gladys E. Willett (1919).

**Trail**, **HENRY DUFF** (1842-1900), D.C.L., educated at Merchant Taylors' and St John's, Oxford, and called to the bar in 1869, was soon absorbed in journalism, wrote books on Sterne, Coleridge, Strafford, William III., Shaftesbury, Sir John Franklin, and others, and edited *Social England* (6 vols.) and *Literature* (for the *Times*). He contributed **STERNE** to this work. *The New Lucian* (1884), of which a new edition appeared just before his death, is a brilliant series of 'Dialogues of the Dead,' and is his most original work. Others were a book on *Central Government*, one on Egypt (originally letters thence to the *Daily Telegraph*), *The New Fiction*, and some plays and verses.

**Training**. See **ATHLETICS**, **GYMNASTICS**, **ROWING**. For train-bands, see **MILITIA**; for training-colleges, see **EDUCATION**.

**Trajan** (**MARCUS ULPIUS TRAJANUS**), Roman

emperor, was born at Italica (near Seville) about 56 A.D., and gaining distinction in the Parthian and German campaigns, was made prætor and consul (91), and adopted (97) by Nerva as his colleague and successor. He became sole ruler in the following year. In 101 Rome for the first time beheld its emperor leading forth his legions when Trajan set out on his first campaign against the Dacians. The struggle was long and fierce; but the Romans at last gained a decisive superiority, and in 105 completely subdued the country, which thenceforth became the Roman province of Dacia. In 113 the emperor left Italy for his great expedition in the East, directed mainly against the Parthians. Landing in Syria he made Armenia and Mesopotamia into Roman provinces, and advanced to Ctesiphon on the Tigris, meeting however with actual defeat at Ctesiphon and Hatra. Meanwhile the Jews rose in Cyprus and Cyrene and made fearful massacres; and other enemies took advantage of the emperor's absence in the far east. Trajan took ship for Italy, already in failing health, and was overtaken by death at Selinus in Cilicia, August 117. Though most of Trajan's reign was spent in the field, the internal administration was carefully and excellently guided; the administration of justice was vigorous and impartial; that of finance was equally admirable; informers (*delatores*) were severely punished, and peculating governors of provinces rigorously prosecuted. The improvement and beautifying of Rome was carried on; the empire was traversed in all directions by new military routes, canals and bridges were constructed, new towns built, the Via Appia was restored, the Pontine Marshes partially drained, the magnificent 'Forum Trajani' erected, and the harbour of Centum Cellæ (*Civita Vecchia*) constructed. His mildness and moderation were proverbial; and though he persecuted the Christians, it was because he regarded the new religion as distinctly subversive of the state. His famous letter to Pliny (q.v.), then legate in Bithynia and Pontus, shows his character in this regard, and his sincere desire for the comfort and happiness of his subjects is reflected in the customary wish formally uttered on the occasion of an emperor's accession—that he might be 'happier than Augustus, better than Trajan' (*Augusto felicior, Trajano melior*). A popular mediæval legend even described him as saved by the prayers of Pope Gregory I. from the pains of hell. Trajan's Column is described at **ROME**, Vol. VIII. p. 763. Trajan's Wall is the name given to an old Roman earthwork in the Dobrudja, running from the Danube above Cernavoda to Kustendji on the Black Sea; it is an earthen wall, 8 to 15 feet high, and was defended against the Russians in 1854.

There are works on Trajan by Francke (2d ed. 1840), Dierauey (1868), and De la Berge (1877). See also Merivale, or other histories of the Roman Empire by Mommsen, Ihne, H. Schiller, Duruy, Greenidge (1905).

**Tralee**, a town of County Kerry, on the Lee, about a mile from where it discharges into Tralee Bay, and 207 miles SW. of Dublin by rail. There is a ship-canal to the sea, but the trade of Tralee as a port has decayed since larger ships took to discharging at Fenit, 5 miles along the bay. Tralee returned a member to parliament till 1885. Pop. (1926) 10,536.

**Tram**. See **SILK**, p. 393.

**Trammel-net**, one of the commonest of the *moored nets* described in the article **FISHERIES**.

**Tramps**. See **VAGRANTS**.

**Tramways** (Old Swed. *tram*, 'log, wooden sledge'). In the article on **Railways** (q.v.) the early application of rails for purposes of locomotion was referred to. From very early times

stone and wood had been used to lessen friction in the traction of heavy weights at quarries and collieries. The first use recorded of iron for this purpose was in 1738, when a 'plate-way' was laid at Whitehaven. Again in 1767 some cast-iron rails were laid in Coalbrookdale, and ten years later a cast-iron 'tramway' was nailed to wooden sleepers in a colliery belonging to the Duke of Norfolk near Sheffield, after the design of John Carr. Fearing a reduction of wages or lessened employment in the future, the labourers employed got up a riot and tore up the road, the inventor having to flee for his life. This 'tramway'—a name said falsely to be derived from one Benjamin Outram belonging to a Derbyshire family—as in other earlier specimens had a flange cast on its outer edge to keep the wheels on the road. It was not until 1789 that the great improvement was made of transferring the flange from the rail to the tire of the wheel, the track then assuming its present form.

In 1801 a tramway 23 miles in length, something of the modern type, was constructed for the Tredegar and Sirhowy ironworks in South Wales, and in the same year a public act was passed for the laying of a line near London from Wandsworth to Croydon. This tramway, which was designed for extension to Reigate, was intended to furnish a more ready means of transport (by horse and mule power) of coal and merchandise from the Thames to the districts south of London. But the undertaking failed to fulfil the hopes of its promoters, and on the discontinuance of its working the greater part of the route was occupied by the Brighton Railway Company.

The rapid development of the locomotive effectually diverted attention in England from the utilisation of rails for the purposes of ordinary street traffic; but as everything that tends to economise labour has for many years past found special favour in the United States, the Americans were not slow to discern the merits which the tramway system offered for the movements of the population. The Fourth Avenue (Harlem) Tramway was chartered in New York in the year 1831, about the time that the Manchester and Liverpool Railway was opened for traffic, but for about twenty years maintained a monopoly of the street railway traffic. A rapid extension of the system then followed, as towns in different parts of the Union increased in size. Philadelphia and Boston established street tramway lines in 1857. All of these were, of course, operated by horses, but steam, cable, and other methods of mechanical traction came into use, though it was not until electric traction was introduced that tramways developed very greatly. Now, every place of any importance has its electric tramways, and many of these lines have been developed to connect neighbouring cities, townships, and villages by means of inter-urban railways, many running on their own right of way and operating practically as railways. So much so, indeed, that, in the United States, these lines carry much of the local railway traffic, and except in the very big cities of America, the standard railways do little in the way of catering therefor, as the tramways and inter-urban railways meet all requirements in this respect. In European countries, too, electric street railways or tramways are general, while there are lines here and there which can be compared with the American inter-urban lines. 'Gas-electric' cars are in use in some places where the traffic does not warrant the erection of overhead conductors and the provision of an electric generating-plant.

The reintroduction of tramways into the United Kingdom in 1858-59 was not a successful venture. An enterprising American (George Francis Train)

obtained permission to lay several short lines in different parts of the country. The one first laid was at Birkenhead; but the London lines were all laid down without special parliamentary authority, and their removal as a nuisance to existing traffic was, after a short trial, decreed by the different vestries concerned. The first successful street tramway system in Britain was established in Liverpool in 1868, followed in London in 1869-71, and afterwards in Glasgow, Edinburgh, and Dublin. These were all worked by horse-traction. The first horse tramway in France was on a line from Paris to Saint Cloud in 1856, and it was called the 'American' railway; the first line in Paris itself was laid in 1875. With the development and success of the tramway system, the attention of inventors and engineers was turned to the devising of some kind of mechanical propulsion. Horse-traction proved too slow and expensive. Many methods were suggested—steam, gas, compressed air, and vapour motors, and others; but, with the exception of steam, which was tried in several places and found unsuitable, nothing resulted from any of them. Later the cable system had an extensive use, and electricity is now the universal system. The cable system is based on a very old method of traction. Various patents have been taken out for the laying of an underground pipe in which a rope or cable should travel, with a grip attachment on the cars capable of picking up or letting go the travelling cable. The first practical adoption of the idea was made in San Francisco by a Mr Halladie in 1873. The road in some parts had very steep gradients, impracticable for a horse-car line, and the success of the new method was at once established. This success led to the introduction of the system into Britain, and lines were laid by American engineers on Highgate Hill in 1884 and afterwards in Edinburgh, where steep gradients exist, and in Birmingham, Bristol, and other places. Although electricity had been used as early as 1835 for the propulsion of cars, it was not till after the invention of the dynamo that it became a practical method. Many experiments were made between 1879 and 1883 to prove the practicability of this system, but the first line opened, on the overhead trolley system, was in Kansas City in 1884. In electric traction, each car is supplied with one or more motors for its propulsion, and the chief difference between the various systems is the method of supplying the electric current. In the overhead trolley system, the current is taken from an overhead wire conductor by means of a trolley wheel carried on a pole extending upward from the roof of the car. The current passes down the trolley conductor to and through the motor, and returns to the central station by means of the rails. The advantages of this system, as compared with the cable, in respect of increased speed and general efficiency, have led to its almost universal use in the United States, not only in new lines, but also in supersession of previously existing cable systems. In Great Britain all large towns and many smaller ones now have their own electric tramway system, and in many cases a great deal of the purely local traffic is conveyed thereby. The solvent operation of the tramways is, however, seriously menaced in many places by motor-omnibus services since introduced, and although this aspect is modified in some towns by the exercise of local oversight over public service transport to prevent unrestricted and unreasonable competition, and in other cases the municipalities themselves operate both tramway and motor-omnibus undertakings, it seems practically certain that there will not be many new tramway routes opened in future. It is still realised, however, that, where the traffic is of great volume, the already-existing electric tramways fully justify themselves,

and it is mainly in respect of projected extensions and routes where traffic is light that electric tramways must now be regarded as less satisfactory and more costly than motor omnibus services. Thus, in London, Birmingham, Manchester, Glasgow, Edinburgh, and other large towns, the tramways carry such loads that their replacement by motor-omnibuses is not regarded seriously. For extension services, including plying within town limits for through traffic, the electric tramway is not now favoured, and here and there light traffic routes are being closed down. Speaking generally, however, all the bigger towns and many smaller ones depend, and will continue to depend, very largely upon electric tramway services. There are now some 242 tramway undertakings in Great Britain, 170 owned by local authorities, and 72 by companies. Over 2600 route miles are in use, 1860 by local authorities, and 750 by companies. Track mileage is about 4400, annual car-miles number about 380,000,000, and the number of passengers conveyed in twelve months is over 4,600,000,000. Some 13,000 vehicles are in use. Nearly all electric tramways take current from overhead wires, but the conduit system is used in central London, and here and there in other places. More recently trackless trolley routes have come into use. The cars take current from overhead wires, but can move freely about the road surface on their routes, as in the case of motor-omnibuses. There are now about 20 such undertakings in service. See **ELECTRIC RAILWAY**, and Dawson, *Electric Railways and Tramways* (1897); also the Parliamentary Returns on Tramways, and G. I. Phillips, *Tramways Act, 1870, with Introduction, &c.* (1890).

**Trance**, a morbid sleep, differs from natural repose in duration; in profound insensibility to external impressions; in following excitement and the exaltation of certain instincts, chiefly the religious and amative, rather than fatigue or exhaustion; and in being the concomitant or symptom of diseases of the nervous system, particularly Hysteria (q.v.). It differs on the other hand from Coma (q.v.) in not being associated with serious organic disease, and in the absence of stertorous breathing, muttering, delirium, &c. See **SLEEP**, **INSANITY**, **CATALEPSY**, **ECSTASY**.

**Tranent**, a police-borough of Haddingtonshire, 10 miles east of Edinburgh. It has a fine school and Colonel Gardiner's grave. Coal has been mined since 1219. Pop. (1851) 2096; (1921) 4763.

**Trani**, a seaport and archiepiscopal city of Southern Italy, 28 miles NW. of Bari, with a very fine 12th-century cathedral with three apses, a crypt, a campanile, and bronze doors made by Barisanus, a native of the place, whose handiwork is also found elsewhere; there are other interesting buildings. It has some trade in country produce, but the harbour is nearly sanded up. Pop. (1921) 34,568.

**Tranquebar** (*Tarangambādī*), a seaport of Madras Presidency, 18 miles N. of Negapatam. A Danish settlement from 1620 to 1807, it passed finally to the English in 1845 for 12½ lakhs of rupees, but the construction of the railway to Negapatam (1861) diverted its trade. The first Protestant mission to India was established here in 1706. Pop. (1921) 11,520.

**Transcasian Railway**, starting from Krasnovodsk on the Caspian, goes through Merv and Bokhara to Samarkand, and since 1895 has been continued to Tashkand and Andijan. It has a branch from Merv to the Afghan frontier, and connects with the main Russian system by a line from Tashkand to Orenburg (1903).

**Transcaucasia**, a federal Soviet republic formed in 1922, consisting of the republics of Armenia, Georgia, and Azerbaijan, and itself a member of the Russian federation. The capital is

Tiflis. Within the several republics various degrees of autonomy have been granted to Nakhitchewan, Nagorni-Karabach ('Mountain Republic'), Abkhasia, Adjaria, and the South Ossetian Territory—the North Ossetian Territory being on the European side of the Caucasus, in the North Caucasian Area of Russia proper.

**Transcendentalism**. The words transcendental and transcendent (*transcendentalis*, *transcendens*) were employed by various Schoolmen, in particular Duns Scotus, to describe the conceptions that, by their universality, rise above or transcend the ten Aristotelian Categories (q.v.). Thus, according to Scotus, *Ens*, or Being, because it is predicable of substance and accident alike, of God as well as of the world, is raised above these by including or comprehending them; it has the same relation to the sum of the categories as the *summum genus* to the various genera within a single category. Further, the predicates assumed by Scotus to belong to *Ens*, or simple existence—the One, the True, the Good—are styled transcendent, because applicable to *Ens* before the descent is made to the ten classes of real existence.

Between the hitherto convertible terms, transcendental and transcendent, Kant himself drew a distinction of considerable importance for the understanding of his system. By the word 'transcendental' he designates the non-experiential, *a priori* elements of thought (see **KANT**)—especially the forms and categories (space and time, causality, &c.) which in his view, though they are not products of experience, are manifested only in experience, and contribute an essential element in all experiential knowledge. The word 'transcendent' Kant reserves for those among the transcendental or *a priori* elements that transcend and lie beyond all experience; they may seem to be given in experience, but they are not really given, and are in so far illegitimate as cognitions (though *belief* in them may be attained in other ways). Such are the 'ideas of the pure reason,' God, an immaterial soul, &c.

For post-Kantian systems which affirmed the identity of subject and object the distinction of transcendental and transcendent ceased to exist, and absolute knowledge was practicable; such systems are said to be or contain *transcendentalism*. 'Transcendental Philosophy' was Schelling's own name for an important part of his system (see **SCHELLING**). Oken and others carried much of this transcendentalism into their *a priori* construction of the nature-philosophy—in which in some cases scientific fact had to yield to speculative deduction. Transcendental has also often been used by 'common-sense' philosophers and the association school for the *a priori* generally. And in vulgar parlance the word applies to what is disapproved of as abstruse, speculative, obscure, fantastic, and as such absurd; it is specially familiar as a criticism of almost any form of idealism. See **IDEA**.

The epithet of Transcendental School has come, however, to be specially associated with a group of American authors and thinkers, who early in the 19th century led and cherished a wide-spread reaction against time-honoured Puritan prejudices, humdrum orthodoxy, old-fashioned metaphysics, and materialistic philistinism and utilitarianism. The movement was identified with idealism, vague pantheism, mysticism, and eclectic orientalism, and had at times a distinct flavour of the pedantic, the paradoxical, and the extravagant. Among the main exciting causes were the influence of Carlyle and the discovery of the new world of German literature. Brook Farm (q.v.) was one outcome of the school. The first meeting of the Transcendental Club took place in 1836 in the house of George Ripley (q.v.); other conspicuous members

of the school were Margaret Fuller and Theodore Parker. Many well-known American authors, such as Hawthorne, have at some time shown affinities that way. But the thinker who most effectively summed up what was best in the movement, gave it the most permanent expression, and secured the widest hearing, was Ralph Waldo Emerson (q.v.). See O. B. Frothingham, *Transcendentalism in New England* (New York, 1876).

**Transept.** See CHURCH.

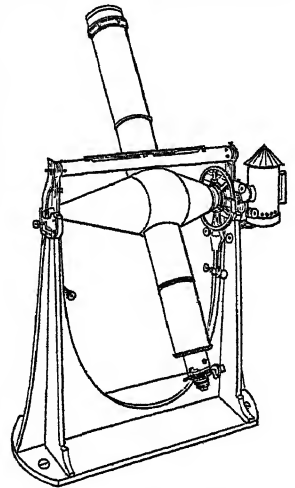

**Transfiguration, FEAST OF THE**, instituted in honour of the Transfiguration of Christ (Matt. xvii. 2), is one of the twelve great feasts which come next after Easter in dignity. In the Anglican Church it is only a Black-letter feast. It is commonly said to have been instituted in the West by Pope Calixtus III. (1455-58), but is mentioned in the 9th century. Both Greeks and Westerns keep it on the 6th of August.

**Transformer.** See ELECTRIC LIGHT.

**Transfusion of Blood** consists in the transference of blood from the veins (or arteries) of a healthy person to one whose blood is so impoverished as to endanger life. The earliest case on record is, so far as we know, that of Pope Innocent VIII., who is said to have been unsuccessfully operated on in April 1492. In 1667 the operation was performed both in France and England, apparently with success; but it again fell into oblivion till 1824, when Dr Blundell, in his *Researches*, proved the feasibility of the process. Since that time it has been regarded as a legitimate operation, and has frequently been successful in apparently hopeless cases; but the difficulties attending it are sufficiently indicated by the number of different procedures and kinds of apparatus devised for its performance. It has been used most frequently and successfully in cases of profuse hæmorrhage after child-birth; but also in many other conditions—e.g. phthisis, puerperal fever, pernicious anaemia, poisoning by agents which destroy the blood-corpuscles or impair their activity. The blood of the lower animals has been shown to be dangerous for this purpose; further, the serum of certain persons clumps or destroys the corpuscles of others when blood is injected. The first requisite, therefore, is to find a healthy person able to spare blood enough for the purpose. Next the blood corpuscles of this person (donor) must be tested with some serum from the patient (recipient), to make sure that they are compatible. The chief difficulty in the performance of the operation is the prevention of coagulation of the blood before it reaches the blood-vessels of the patient. The process was much used in the late European war, and coagulation of the donor's blood was prevented either by smearing all tubes, needles, &c., before use with melted paraffin, or by mixing the blood, as it flowed from the donor's vein, with citrate of soda solution, and transfusing the mixture into the vein of the recipient.

**Transit-instrument**, one of the most important of astronomical instruments, consists of a telescope fixed to a horizontal axis, so as to revolve in the plane of the meridian. It is employed, as its name denotes, in the observation of the meridian transits of the heavenly bodies—i.e. the apparent passage of the heavenly bodies across the observer's meridian, an appearance due to the revolution of the earth (for the transits of Venus, see SUN, Vol. IX. p. 772). The axis, which is the most important part of the instrument, and thus demands the utmost care in its construction, consists of a hollow sphere or cube, at opposite sides of which are tightly fastened the bases of two cones in whose apices the pivots are screwed; the sphere or cube is pierced for the admission of the telescope, which is firmly soldered at right angles to

the axis. One of the pivots is hollowed so that a stream of light can be directed from a lantern, through an aperture in the side, and half-way along the interior of the axis, into the telescope tube, where, being received by an annular mirror set at 45° to the axis and telescope tube, it is directed to the eyepiece, and brilliantly illumines the field of view, while the annular form of the mirror prevents any interference with the passage of rays from the object under observation to the eye. The pivots must be very carefully turned to a perfectly cylindrical form, and fitted into the instrument, so that their axes are accurately in line. One extremity of the axis carries one and sometimes two small graduated circles, each supplied with index, clamping screws, and vernier; these circles are capable of indicating angular measures to within 1' or 2'. The pivots rest on massive blocks of stone or other stable material which is little affected by change of temperature, stability being the great mechanical essential of the instrument. This condition satisfied, there are three adjustments necessary before a transit can be observed: the axis must be horizontal; the line of collimation must be at right angles to the axis of motion; and the latter must be placed so as to point accurately east and west. On the perfection of the first two of these adjustments depends whether the telescope sweeps over a great circle of the sphere, and the third is necessary to ensure that this great circle shall be the meridian of the place of observation. These adjustments can never be made quite perfect, and the usual mode is to investigate the amount of error in each, and allow for it in the apparent result. To note accurately the instant of time by the astronomical clock at which the object

Transit-instrument.

(e.g. a star) is seen to pass the centre of the field of view is the essential part of a transit observation. The most effective method is to register the beats of the clock by an apparatus which at the end of each oscillation of the pendulum marks a dot upon a uniformly moving slip of paper. This is effected by the agency of electricity, and is one of its most valuable contributions to astronomical science. At a certain point in each oscillation of the pendulum it becomes part of a complete galvanic circuit, the contact being immediately broken by its progression in its oscillation; and it is at these points that the galvanic agency causes the dot to be made. The instant of a transit's occurrence is similarly noted by the observer, who, by a tap on a break-circuit key, fastened to the side of the transit-instrument, causes the graver to make an extra dot; and the distance of this dot from the previous seconds one, compared with the distance between two seconds dots, gives the time accurately almost to  $\frac{1}{177}$  of a second. Various ingenious modes of registering have been proposed, all founded on the above principles. It is from the times of transit of the several heavenly bodies thus accurately observed that their right ascensions are determined.

There has been found part of what has been

called a transit-instrument made for Tut-ankh-amen (*Nat.* 1924, p. 756). The transit-instrument strictly so called was invented by Römer about 1690. One was erected in Greenwich Observatory by Halley in 1721; but it was little used till 1742. Troughton's transit-instrument there was erected in 1816.

The transit-circle differs mainly from the older transit-instrument in the addition, on the axis of rotation, of two large graduated circles which are read off by microscopes fixed on an independent coaxial wheel called an alidade, any variation in the position of which may be detected by a large spirit-level attached to it. This instrument is as well suited for giving the declinations as for giving transits or right ascensions.

**Transition** is a term applied to the architectural features of buildings erected at periods intermediate between the fully-developed 'styles' technically so called. Thus in Britain there is a transition between the Norman and First Pointed or Early English, another between the First Pointed and the Decorated or Middle Pointed, and a third between the Middle Pointed or Decorated and the Perpendicular. See ARCHITECTURE.

**Transjordan.** See KERAH.

**Transkeian Territories**, a part of the Cape Province, lying between the great Kei River (the boundary of British Kaffraria) and the borders of Natal. Covering most of the former Kaffraria proper, they are made up of Griqualand East, Tembuland, Transkei proper (comprising the districts of Idutywa, Kentani, Ngamakwe, Tsomo, and Willowvale), and Pondoland. The last was annexed in 1894, but has, for native administration, a general council independent of that of the other Transkeian Territories. See CAPE OF GOOD HOPE.

**Translation**, the art of rendering what is written in one language into its corresponding sense in the words of another. Obviously it should first be faithful—a reproduction of the sense and ideas rather than a paraphrase; contrasted with this prime quality all such ends as preserving the colour, the music, the idiomatic vigour, the distinctive manner of the original are counsels of perfection. To translate perfectly is to interpret to the last detail; and to interpret it is necessary to understand. The feeling is more important than the exact word, and the admonition of Dryden may be commended to the adult translator, if not the schoolboy—not 'to lacquey by the side of his author, but to mount up behind him.' It is difficult enough to express one's own meaning to one's wish; doubly difficult is it so to realise another's as to express it as he would have done had ours been his mother-tongue. A literal translation is better than a loose one, but obviously in the case of idioms and metaphors of special meaning the literal rendering cannot be the right one, for in such mechanical transposition the spirit and perfume will be found to have evaporated in the transfusion. 'Translation from one language into other,' said Don Quixote, 'is like looking at Flemish tapestries on the wrong side; for though the figures are visible, they are full of threads that make them indistinct, and they do not show with the smoothness and brightness of the right side. Yet,' he continues, 'a man may employ himself in ways worse and less profitable to himself,' and we need not cut ourselves off from some of the richest springs of human thought and experience because the drinking vessels available are seldom of exquisite workmanship. A prose translation of a poem like the *Iliad* or the *Aeneid* can be of course only an approximation to the ideal translation—a shadow of the reality, like the music of the sea, heard but in a shell, the colour being lost, the light and shade altered as in a photograph. Yet such translations as those of

the *Odyssey* by Butcher and Lang, the *Iliad* by Leaf, Lang, and Myers, Theocritus by Lang, Sophocles by Jebb, Pindar by Myers, Virgil by Conington or Mackail, the *Inferno* by Dr Carlyle or C. E. Norton, the *Purgatorio* and *Paradiso* by A. J. Butler, are masterpieces of triumph over the difficulties of their kind. Of all books the Bible, or more strictly the New Testament, loses least in translation, the language being itself a product of a degenerate stage of Greek, the ideas to be conveyed relatively direct and simple, the matter being much more heeded than the manner. Fortunately for our literature the English translation was made at a time when the language had reached its period of fullest simplicity and vigour.

To lay down canons of translation will not help much in the matter, for the best translators are those who possess an individuality as well as their originals, such as Edward FitzGerald, whose versions from Calderon and Omar Khayyam, wide of their text as they frequently are, yet succeed to perfection in reviving in a sympathetic English reader the effects produced by the original. Hookham Frere's free versions of Aristophanes are perhaps the best things of their kind that have ever been done. The translation ought to be such that the reader should, if possible, forget that it is a translation at all, and be lulled into the illusion that he is reading an original work. Or again, the translator should retain every peculiarity of the original, so far as he is able, with the greater care the more foreign it may happen to be. Such are some of the more or less perfunctory attempts to lay down definitions of translation, and we need only say in short that this, instead of being the easiest, is one of the most difficult of tasks, only to be essayed by men who are at once masters of both languages and of the subject-matter of the book to be translated. What men thus adequately equipped can make of an ancient author we see when we turn to Jowett's Plato, Munro's Lucretius, Conington's Persius, Long's Marcus Aurelius and Epictetus, Reid's *Academica* and *De Finibus* of Cicero, Church and Brodribb's Tacitus, also the *History* by Albert W. Quill, Rann Kennedy's Demosthenes, Jebb's *Characters* of Theophrastus, Shuckburgh's Polybius, Lewis' Juvenal, Macaulay's Herodotus, Welldon's Aristotle (*Rhetoric* and *Politics*), and the *Ethics* by F. H. Peters, Verrall's *Æschylus* (*Agamemnon* and *Septem contra Thebas*), Dakyns' Xenophon; or, of English translations from modern languages, the *Thousand and One Nights* of Edward Lane, of John Payne, and of Sir K. Burton; the *Don Quixote* of John Ormsby, and of H. E. Watts; Pascal's *Pensées* by Kegan Paul; Van Laun's Molière; Carlyle's *Wilhelm Meister*; and from the old Icelandic, the 'Saga Library' of Morris and Magnússon. Urquhart's Rabelais, Florio's Montaigne (as well as that by Cotton), North's Amyot's Plutarch, Shelton's *Don Quixote*, Painter's *Palace of Pleasure*, Philemon Holland's Livy, Hobbes's Thucydides; as also such metrical translations as Gavin Douglas' *Aeneid*, Harrington's Ariosto, Fairfax's Tasso, belong to a special group in English literature, valued more for their excellent English than for their accuracy. Among modern poetical translations especially notable are Coleridge's *Wallenstein*, Gifford's Juvenal, Cary's Dante, Calverley's Theocritus, Philip Worsley's *Odyssey* and that by William Morris, Plumptre's *Æschylus*, E. D. A. Morshead's trilogy of *Æschylus* (the *Agamemnon* better than Milman or Robert Browning), Lewis Campbell's Sophocles, W. H. Pollock's *Nuits* of Alfred de Musset, Lang's *Ballads and Lyrics of Old France*, Rossetti's group of translations from Italian poets entitled 'Dante and his Circle.' The difficulty of translating is well expressed in the punning Italian proverbial

saying, that the translator is a betrayer (*Traduttore traditore*). Elphinstone's Martial has the merit of being among the worst, and Dryden's versions of part of Juvenal among the best, of their kind. Horace, the despair of translators, has yet been well treated by Conington and Sir T. Martin; Homer forms a library of itself, famous poetical versions being those by Chapman, Pope, Cowper, and Lord Derby; Chapman preserves the strength of the original, but his fanciful quaintness is a grievous impediment. Pope's *Iliad* is a noble poem, but, as Bentley said with fatal truth, 'you must not call it Homer.' It lacks its naturalness, its flowing simplicity, the Homeric ideas having gained a completely un-Homeric colour in the crucible of a characteristically 18th-century intellect.

There are some excellent remarks on translation by Jowett, in the preface to the third edition (1892) of his *Plato*.

**Transmigration.** See REINCARNATION.

**Transmission of Power** means the doing of useful work at a distance from the engine or whatever other source supplies the energy. An ordinary tow-rope evidently fulfills such a function; and in a wide sense all forms of connecting rods, Belts and Belting (q.v.), and similar gearing (see WIRE) do the same. The revolving shaft of a screw-steamer transmits rotatory motion through a considerable distance; but for long-distance transmission ordinary mechanical devices, if they do not altogether fail, lose greatly in efficiency. In a series of shafts geared one to another by beltings there must be considerable loss through slipping. In the Pneumatic Despatch (q.v.) and in Boring (q.v.) compressed air has been successfully applied as a transmitter of power. Electricity, however, is the most promising agent for indefinite transmission of power. Thus a dynamo-electric machine may be worked by a waterfall; its voltage or potential may be transmitted along wires to distant stations, and there generate electric currents capable of driving an electric motor and keeping a whole factory in operation. Such transmission of power for 200 miles or more may be commercially successful. This principle is now being systematically applied throughout Great Britain. See DYNAMO-ELECTRIC MACHINES, ELECTRIC LIGHT, NIAGARA.

**Transmutation of Elements**, especially of other metals into gold, was the aim of Alchemy (q.v.). The study of radio-activity has shown that such changes actually occur. See RADIIUM; also LEAD, p. 564. The production of gold from mercury has been reported, and of mercury from lead.

**Transpadane Republic.** See CISALPINE REPUBLIC.

**Transpiration.** See PHYSIOLOGY (VEGETABLE), LEAF, STOMATA.

**Transplanting**, the act of removing bodily a plant or tree from the place in which it grows, and establishing it in some other place. The operation goes on in gardens and nurseries throughout the year. But for the facility with which the great majority of cultivated plants may be transplanted, gardens would be comparatively profitless and uninteresting, and pleasure-grounds and the landscape be adorned with few but indigenous forms of trees, shrubs, and flowers. In the large trade nurseries transplanting is one of the chief occupations of the workers. Seedling forest trees are reared annually in hundreds of thousands, and either are transplanted in the nursery to adapt them for special purposes, or are transferred from the seed-bed at the age of one or two years direct to moors and hillsides to form woodlands. Ornamental shrubs from all temperate countries are in the same way prepared for distribution. Fruit trees are especially benefited by

the process. By frequent transplantings fruitfulness is accelerated in young fruit trees, and the operation is systematically resorted to in order to maintain fertility in those that are more aged.

The operation is most practicable in the youthful stage of all plants. In those that are aged and have been long established in one place it is attended with danger, chiefly because in the case of large trees and shrubs it is impracticable to preserve uninjured a sufficiency of the fibrous roots to draw nourishment from the soil. Yet very large trees have been successfully transplanted, and sylvan effects have been created in bleak, treeless situations in two or three years by this means, which would have taken half a century to produce in the ordinary course. In moving trees of a size exceeding that which two or three men may easily handle, transplanting machines are required. These may be ponderous four-wheeled carriages in which the tree is swung in chains or on a platform upright as it grew, and may be carried any distance where bridges overhead do not occur in the way. A lighter two-wheeler type has the disadvantage that the tree must be carried in a horizontal position. The transplanting of large trees successfully involves the possession of considerable experience of the work by the person superintending it. He should know the proper time or season for the transplanting of each kind of tree with which he has to deal. Various kinds of trees are not all amenable to the same methods. Greater care is required in every stage of the work with some than with others. The prime object to keep in view in every case is the preservation of the fibrous roots; every one of these destroyed lessens the chances of success. When it is determined to transplant trees which have been growing undisturbed for some years, it is necessary to prepare them one or two years prior to lifting them. A trench is opened in a circle 2, 3, or more feet—according to the age and size of the tree—from the bole all round, and all the roots are cut off beyond the circle. The trench is carried deep enough to reach all the roots, and is then filled up either with the earth excavated or, in cases requiring special care, with soil of a kind more favourable to the formation of fibrous roots. The mutilated roots send out new feeders into the new soil, and if the work has been properly done they will be numerous enough one or two years hence, according to the peculiarities of the subject, to bind the new soil in a compact mass, and thus facilitate the transportation of a considerable ball of earth along with the tree.

Limes, poplars, willows, and such-like quick-growing and free-rooting trees are more easily transplanted when of considerable age than oak, beech, sycamore, and the like. Evergreen trees and shrubs transplant most successfully in spring, when they are beginning to grow. Deciduous subjects on the other hand succeed best when transplanted immediately after the fall of the leaf. Surrounding the roots with light compost and watering, and mulching the area over which the roots extend to lessen evaporation, are ordinary but essential means to success, especially in the case of large and difficult subjects. Securing the tree at once against disturbance by wind after it is planted is of vital importance.—For the transplanting of skin, see SKIN, RHINOPLASTIC OPERATIONS; and of teeth, see DENTISTRY.

**Transportation**, technically as distinguished from Banishment (q.v.), the removal of offenders beyond seas, but loosely used for the removal of convicts to foreign or distant regions by sea or land. The history of English transportation is fully treated at PRISONS. For French and Russian transportation, see GUIANA, NEW CALEDONIA, SIBERIA.

**Transposing**, in Music, is changing a piece of music in performance from the key in which it is written to another key. To play at sight an accompaniment for such an instrument as the pianoforte or organ, transposed from one key to another, requires considerable artistic skill. To the singer transposal presents no difficulties.

**Transubstantiation.** The meaning of the theological term transubstantiation is made apparent in the following canon of the Council of Trent: 'If any one shall say that, in the most holy sacrament of the Eucharist, there remains the substance of bread and wine together with the body and blood of our Lord Jesus Christ; and shall deny that wonderful and singular conversion of the whole substance of the bread into the body, and of the whole substance of the wine into the blood, the species of bread and wine alone remaining—which conversion the Catholic Church most fittingly calls *Transubstantiation*—let him be anathema' (*Conc. Trid. Sess. xiii. Can. 2*). The canon just quoted was intended as a condemnation of the theories of impanation and consubstantiation. According to the theory of impanation, which was advocated chiefly by Oslander, in the sacrament of the Eucharist the bread and wine are hypostatically or personally assumed by the Divine Word. According to the theory of consubstantiation, which was favoured by the large majority of the Lutherans, the substance of the bread and wine remain together with the body and blood of Jesus Christ, but without being hypostatically assumed.

The doctrine of transubstantiation is then an article of Roman Catholic faith. Furthermore, the Council of Trent in the same Session xiii. declares that this doctrine 'has always been the conviction in the church of God.' Protestant divines call in question the truth of this declaration, and assert that the doctrine was unknown before the middle ages. Roman Catholic theologians on the other hand, while admitting that the term transubstantiation is comparatively new, profess their ability to prove by a *catena* of witnesses, commencing with the earliest ages of the church, that the doctrine conveyed by the term has been believed from the first. That the term is comparatively new is unquestionable. Cardinal Franzelin, indeed (*De Eucharistia*, page 177), gives instances of its use by Catholic writers in the 11th and 12th centuries. Nevertheless it was not formally adopted into the doctrinal phraseology of the church before 1215, when it was employed in a profession of faith drawn up by the fourth Lateran Council. After this period we find the term again employed in a 'confession of faith' which was presented for subscription to Michael Palæologus, the Greek emperor, by Pope Clement IV. (1267), and was professed by the emperor in the second Ecumenical Council of Lyons held in 1274 under Pope Gregory X.

That the doctrine conveyed by the term transubstantiation is at least much older than the term all historians must admit. Berengarius of Tours, who had attacked the prevalent teaching on the Eucharist, was required by a council held in Rome under Pope Gregory VII. (1079) to make the following profession of faith: 'I, Berengarius, believe in my heart, and profess with my lips, that the bread and wine which are placed on the altar are substantially changed into the true and proper and life-giving flesh of our Lord Jesus.' And in the largely attended council held at Piacenza (1095), seven years after the death of Berengarius, it was once more declared that 'the bread and wine, when they are consecrated upon the altar, are truly and essentially changed into the body and blood of our Lord.' In a treatise *On the Sacrament of the Body and Blood of Our Lord Jesus Christ*, written by Paschasius Radbertus (831), the author very plainly

stated the doctrine of transubstantiation. Some of the views expressed in this treatise were traversed by Rabanus Maurus, Ratramnus, and other contemporary writers; but the author's teaching on transubstantiation was challenged by no one.

It is admitted, with more or less of unanimity, that from the days of Paschasius Radbertus down to the period of the Reformation the doctrine of transubstantiation was in general acceptance. But when the inquiry turns upon the belief of the early fathers this unanimity disappears. Catholic theologians assert that the expressions employed by the Greek and Latin fathers, when treating of the effect of the Eucharistic consecration on the substance of the bread and the wine, are irreconcilable with any theory but transubstantiation. Leibniz is disposed to grant the truth of this contention. 'The records of pious antiquity,' he writes, 'plainly enough demonstrate that the bread is changed into the body, and the wine into the blood of Christ; the ancients, too, universally acknowledged therein a change of substance, which the Latins have aptly rendered transubstantiation' (*System of Theology*). But in making this concession Leibniz parts company with the great majority of Protestant divines. The latter contend that the change indicated by the language of the fathers is not a change in the substance of the elements, but a change in their use, efficacy, and dignity.

Transubstantiation is a doctrine not only of the Roman Catholic, but also of the Greek Church. In 1643, as a protest against the Calvinist 'Confession of Faith,' which had been drawn up by Cyril Lucaris, and circulated amongst the Christians of the East, and with the view of preventing any further attempts to unite the Reformed and Greek churches, a 'Profession of Orthodox Faith' was formulated by Peter Mogilas, archbishop of Kieff and primate of all Russia, and was subscribed by Parthenius, patriarch of Constantinople, Joannicius, patriarch of Alexandria, Macarius, patriarch of Antioch, Paisius, patriarch of Jerusalem, and the other metropolitans and bishops of the Greek and Russian churches. This profession, which is divided into 'Questions,' treats from question 98 to question 119 of the seven sacraments, explaining the use, nature, sanctity, and efficacy of each. Under question 107 the doctrine of transubstantiation is distinctly enunciated as follows: 'When these words (of consecration) are pronounced, immediately transubstantiation (*ἡ μεταστροφή*) takes place; the bread is transubstantiated into the true body of Christ, and the wine into the true blood, the species alone remaining.' At the Synod of Jerusalem, held (1672) under the presidency of the patriarch Dositheus, this profession was solemnly confirmed as the expression of the faith of the entire Eastern Church.

Transubstantiation differs from all natural changes in this, that natural changes, even though they may be substantial changes, such as, e.g., the conversion of food by the processes of assimilation into the substance of the person nourished, or the conversion of wood into ash by the action of fire, are, at most, transformations. When, e.g., wood is converted into ash, the *form* or *active* principle which made the original substance to be wood gives place to a *form* that makes the substance, which is the term of the change, to be ash. But the *matter* or *passive* principle, which before the change was the subject or recipient of the substantial form of wood, remains after the change as the subject or recipient of the substantial form of ash. And thus in all natural changes, even though they be substantial, there is not an entire but only a partial change of substance. The active principle of the original substance is changed, but the *passive*

principle remains. In transubstantiation, however, both the *matter* and the *form* of the bread and wine are changed, for, according to the Tridentine definition, there is a 'conversion of the whole substance of the bread into the body (of Christ) and of the whole substance of the wine into the blood.' Another respect in which transubstantiation differs from all natural changes is indicated by those other words of the Tridentine definition, 'the *species* of bread and wine remaining.' By *species* is here meant *accidents*. As *accidents* have no existence of their own, but exist with the existence of the substance in which they inhere, it follows that when that substance is destroyed its accidents must in the ordinary course of things cease to be. Thus, e.g., the external manifestations and the active and passive qualities of wood do not exist after wood has been converted into ash. But in transubstantiation the external manifestations, such as shape, colour, flavour, odour, &c., the passive powers of corruption, &c., the active powers of nutrition, &c., and the other forces and characteristics of bread and wine, continue to exist and to operate after the destruction of the substances on which they naturally depend. To hold, as Magan and other Cartesians have done, that these accidents remain as mere phenomena and subjective impressions, void of objective reality, is to hold what is in opposition not only to experience, but also to the common teaching of the Catholic Church, as expressed, e.g., in the 'Catechism of the Council of Trent,' part ii., chap. 4, q. 43. But though the accidents persist after the subject in which they naturally inhere is withdrawn, they do not acquire the mode of being which is proper to substance, for they exist not *per se*, but by the 'extraordinary concursus' of God, and, while not actually existing in substance, they still retain an essential relation to substance as their subject. S. Thomas Aquinas (*Sum. Theol.*: *tertia pars*, q. 77, art. 2), holding with Aristotle that extension is the 'first disposition' of matter, and that all other accidents in consequence are referable to material substance 'through the medium of extension,' is of opinion that the extension of the bread and wine receives from God the power to act as the 'quasi subject' and support of those other qualities of bread and wine which manifestly exist and operate after transubstantiation has been effected.

**Transvaal** (till 1900 the SOUTH AFRICAN REPUBLIC), now an original province of the Union of South Africa, bounded on the N. by Southern Rhodesia, on the E. by Portuguese East Africa and Swaziland, on the SE. by Natal, on the S. by the Orange Free State, and on the W. by Bechuanaland. In 1903 a tract of about 7000 sq. m., consisting of the districts of Utrecht, Vryheid, and part of Wakkerstroom, was transferred to Natal. The area of the province to-day is about 110,450 sq. m.

Previous to 1830 the land was a *terra incognita* so far as European knowledge or influence went, and was inhabited by several Bantu clans, speaking Bantu dialects. These clans were ruled by a branch of the Zulu race under the paramount chief Umziligase. The well-timbered savannahs abounded with big game; the larger rivers were filled with alligators, hippopotami, and fowl; and early hunters such as Harris and Gordon Cumming found here a sportsman's paradise. The fifth decade of the 19th century saw the first concerted intrusion of Europeans on this wild scene. A few Cape Colony farmers, offended by some regulations promulgated by certain crown officials, sacrificed their land and belongings, and, taking with them their families and the most rudimentary necessities of life, struck for the north, preferring the chances of death by wild animals or wild men to the irritating exactions of petty officialdom.

The pastoral wealth of the country was such that during the subsequent years on to 1870 the stream of Boer *voortrekkers* ('pioneers') fitfully continued to enter, fight for, and possess the land. Native wars were of frequent occurrence, and little progress was made in the development of the country. The Boers were essentially pioneers, had none of the trader's instinct, and they did not till the soil to any great extent. The little commerce was in the hands of British firms.

Under Andries Potgieter a rudimentary government was instituted about 1840, and by the Sand River Convention of 1852 the independence of the Boer farmers north of the Vaal River was recognised by the British government. But in 1877, owing to an exhausted public treasury and accumulated debts brought about by chronic native wars, the republic was on the eve of dissolution, and the country about to relapse into barbarism. To avert this catastrophe the British government assumed the care of it, subjugated by imperial forces and Swazi levies certain rebellious natives, and put the finances of the state in order. The promises to the Boers, however, on the subject of self-governing institutions made for the home government at the time the country was annexed were not carried out. Arbitrary officials and military martinets were appointed to rule on behalf of the crown. By reason of their lack of tact, as well as of irritating regulations and the non-fulfilment of political engagements, friction was created between the governing and the governed—the English and the Boers. The spark which caused the explosion that had its final and humiliating episode in Majuba (q.v.) was an ill-timed enforcement of a petty tax. The English officials called out the Queen's troops in ignorance of the fact that the whole state felt sympathetic with a now common cause. Then followed the Transvaal war, the death of General Colley, and the signing of terms of peace, resulting in the conventions of 1880 and 1884 between England and the Transvaal. The first gave the Boers republican rights, but retained British control over boundaries, native affairs, and foreign relations. The 1884 convention gave the state the name of the South African Republic, and restricted British suzerainty to the control of foreign relations. The rapid development of the gold industry greatly increased the financial prosperity, but introduced elements of difficulty into public life. For, as the Boers reserved all political power to themselves, the British and other 'Uitlanders,' to whom the wealth of the country was mainly due, resented not merely their exclusion from political privileges, but the oppressive action of the government in regard to mining regulations, monopolies for the sale of dynamite at exorbitant prices, the unfair incidence of the taxation (the new-comers bearing the great bulk of the burden), and other grievances. The discontent of the Uitlanders, a large majority of the total population, centred principally at Johannesburg, took overt shape in 1895, and led to the disastrous invasion by Dr Jameson in December (see JAMESON). Many acts of petty tyranny further accentuated the discontent, and the shooting of a British subject named Edgar by a Boer policeman finally roused the Uitlanders. A petition signed by 21,000 British subjects was sent to Queen Victoria through the High Commissioner in March 1899, pointing out that their grievances, instead of being remedied as promised, had rather been aggravated since the Jameson Raid; the enforced submission of the High Court to the Raad, and the fact that trial by jury meant trial by Boers, made justice impossible. Negotiations ensued between the Colonial Office and the Boer government, which repudiated British suzerainty and claimed the position of a sovereign international state. A con-

ference between Sir Alfred (later Lord) Milner, the High Commissioner, and President Kruger was held at Bloemfontein (31st May) to consider certain franchise and other proposals, but without effect, the suzerainty being still repudiated and the arbitration suggested by the Transvaal government being rejected by the Home authorities; and relations rapidly got more strained. In September the Orange Free State announced its determination at all hazards to support the Transvaal, which sent large bodies of burghers to the frontier and seized £800,000 of gold from the mines. The British government in reply called out 25,000 of the reserve forces. On 9th October the Transvaal presented a note demanding that all troops on the frontiers be instantly withdrawn, that all reinforcements sent to South Africa since 1st June be removed, that none of the troops then on the high seas be landed in South Africa, and requiring an answer within two days. As it was out of the question for Britain to concede these demands, the Boer ultimatum was virtually a declaration of war, and on the 11th the Boer forces invaded Natal and the burghers of both republics were called out for service. From the state of their preparations, the number and quality of their guns and rifles, and the enormous quantity of ammunition and other stores, it was seen that the republics had been secretly preparing for war for years. On account of the distance from Britain and the difficulties of transport the Boers had considerable successes at first, especially in Natal, where they invested Ladysmith and 9000 men; but as the British forces increased till nearly 250,000 men were in the field under Lord Roberts, the tide of war turned against the Boers. Kimberley (16th February 1900), Ladysmith (28th February), and Mafeking (17th May) were relieved; Cronje was captured with 4000 men at Paardeberg (27th February); Bloemfontein (13th March), Johannesburg (31st May), and Pretoria (5th June) were occupied, and the South African Republic and the Orange Free State were proclaimed British colonies. President Kruger fled to Europe, to seek in vain for European intervention. In December 1900 Lord Roberts returned home, and Lord Kitchener, left in command, counteracted the guerilla raids of the Boers by an extensive series of block-houses. In May 1902 the Boer leaders, after negotiation, accepted the British terms, and peace was signed on 31st May 1902.

The Transvaal and Orange River Colonies were governed by the British crown till resettlement permitted the concession of self-government as in Cape Colony. The Letters Patent for the constitution of responsible government in the Transvaal colony were issued in December 1906, and provided for (1) a governor with a ministry not exceeding six; (2) a legislative council of fifteen members appointed in the first instance by the governor; and (3) a legislative assembly of sixty-nine members elected on a manhood suffrage (whites only). At any time after four years the legislature was empowered to pass an act making the legislative council an elected body. In 1910 the Transvaal united with Cape Colony, Natal, and the Orange Free State to form the Union of South Africa (see SOUTH AFRICA, UNION OF). As a province of the Union the Transvaal is now under an administrator appointed for five years by the governor-general of South Africa in council, an elected Provincial Council of fifty members, and an executive committee consisting of the administrator and four persons elected according to the system of proportional representation by the Provincial Council. The Provincial Council is elected for three years by European manhood suffrage; must have at least one session every year; may be prorogued; but cannot be dissolved before the expiry of its term. Members

are paid. The Provincial Council deals with local matters delegated to it by the Union parliament, the consent of which is required for its acts.

Stock-raising and mining are the chief industries of the Transvaal. It ranks first among the gold-producing countries of the world, the Far East Rand being the main centre of production. Coal is found near the gold-fields, and its production is rapidly increasing. There are also deposits of silver with copper and lead, platinum, iron, cobalt, and other metals and minerals. (See SOUTH AFRICA, Mining). Large numbers of sheep, cattle, and goats are reared. The cultivated crops are mainly maize, tobacco, and fruit, with some cotton. Manufacturing industries are being developed. At the census of 1921 the population was 2,087,636, of whom 543,485 were whites and 1,544,151 coloured people, including Kaffirs and Indian and Chinese coolies. The Boers belong to the several divisions of the Dutch Reformed Church. Much money and attention has been devoted in recent years to educational development, and the province has a good system of primary and secondary schools. The University of Witwatersrand was incorporated in 1922, while Potchefstroom University College and Transvaal University College (Pretoria) are constituent colleges of the University of South Africa. The natural seaports for the Transvaal are Delagoa Bay and Durban; and from them and the Cape ports lines of railway extend to Johannesburg and Pretoria (since 1892-95). Pretoria (white pop. 54,121) is the seat of provincial government, and of the executive of the Union.

Distant, *A Naturalist in the Transvaal* (1892); Hatch and Chalmers, *The Gold-mines of the Rand* (1895); H. Cloete, *History of the Great Boer Trek* (1899); W. D. Mackenzie, *South Africa: Its History, Heroes, and Wars* (1900); G. M. Theal, *History of South Africa* (5 vols. 1908 edition). See also B. Worsfold's book on Lord Milner; and the books quoted at SOUTH AFRICA. The war of 1899-1902 produced a large literature, including the *Official History* (4 vols. 1906-10) and the *Times* history, that by Sir F. H. E. Cunliffe, Fitzpatrick's *Transvaal from Within* (hostile to the Boers), Voigt's *Fifty Years of the Republic in South Africa* (hostile to Britain), Sir Conan Doyle's *Great Boer War*, Kruger's *Memoirs* (1902), De Wet's *Three Years' War* (1903).

**Transylvania**, till 1918-20 the easternmost part of Hungary, now part of Rumania, is mainly a plateau surrounded and crossed by mountain-chains, and drained by tributaries of the Theiss and the Danube. Of the population (about 2,700,000) some 55 per cent. are cattle-breeding Rumanians or Wallachians of the Greek Church. The Hungarians number about 30 per cent., farmers and Roman Catholic or Unitarians (the Szeklers retain many characteristics of the old Magyars). The Germans or Saxons, 9 per cent., live in the south, where they farm and grow fruit and wine; they are mostly Protestant. Other peoples include Jews, Greeks, Armenians, Slavs, and some 50,000 Gypsies. Klausenburg (Cluj, Kolozsvár), Kronstadt (Brassó, Braşo), and Hermannstadt (Sibiu, Nagy-Szeben) are the principal towns. Transylvania is important both for its agriculture and its industry. The forests, 5½ million acres in area, include much valuable oak timber. The arable land is devoted chiefly to forage crops, cereals, grasses, fruits, vines, tobacco, flax, and hemp. Cattle, buffaloes, horses, and sheep are widely bred. Transylvania, which was previously a land of large Magyar landholders, was much affected by the agrarian reforms (see RUMANIA). The industries include flour-milling and brewing and the manufacture of leather, chemicals, woollens, soap, and candles. The

chief minerals are salt (a state monopoly), gold, natural gas, silver, copper, lead, iron, and some coal; there are also abundant mineral springs. Transylvania, the Roman Dacia (q.v.), was successively overrun by Ostrogoths, Gepidae, Petchenegs, and Magyars (11th century). The 13th century brought German colonists to mix with Romano-Dacians and Magyars (Szeklers). From the land being divided into seven administrative divisions it acquired the name of *Siebenbürgen*—the Seven Strong Towns. In the 16th century the voivode of Transylvania, John Zapolya (see HUNGARY), asserted his independence of the emperor; and till the end of the 16th century the princes of Transylvania even regarded the sultan as their suzerain. During the first half of the 19th century the Hungarian elements of the population strove to promote a closer union with Hungary, and at the same time stoutly asserted the ancient rights of which the people of Transylvania (except the Rumanians) had been gradually deprived by the imperial governors. The Rumanians, too, petitioned very earnestly for the same political rights as the Magyars, Szeklers, and Saxons enjoyed. These various conflicting claims resulted in 1848 in a fierce racial war, in which General Bem, acting in conjunction with the Hungarians, for some time successfully withstood the forces of the emperor (the Austrians), the Russians, and the Rumanian levies. After hostilities had ceased in 1849 Transylvania was made a crown-land of the Austrian empire, its ancient rights being restored to it eleven years later. But in 1867–68 the Hungarian party effected the complete union of the country with Hungary, and from that time it was 'Magyarised' apace. Transylvania declared its independence of Hungary 2d December 1918, and on 11th January 1919 was annexed by Rumania. The Paris Conference insisted on the protection of minorities, linguistic and religious, provision for which by treaty was hotly resented by Rumania and disregarded in practice. Transylvania (with the Banat, Crisana, and Maramuresh) is divided into 22 administrative districts under prefects, and sends 112 deputies and 45 senators to Bucharest.

Müller, Haltrich, and Fr. Fronius, *Siebenbürgisch-Deutsche Volksbücher* (3 vols. 1885); N. Iorga, *Histoire des Roumains de Transylvanie et de Hongrie* (Bukarest, 1914); Zsombor de Szász, *Minorities in Roumanian Transylvania* (1927).

**Trap** (Sw. *trappa*, 'a stair'), an old-fashioned word for various crystalline Igneous Rocks (q.v.), mostly basic, often arranged in approximately horizontal beds, separated by layers of some more yielding material, such as tuff, shale, sandstone. Under the influence of denudation the relatively hard crystalline rocks come to stand out like huge steps on hill-faces and mountain-slopes. Most of the trap-rocks are varieties of Basalt (q.v.), but under the same head were included many other modern rock types.

**Trapa**, a genus of plants of the Hydrocaryaceæ, and named from the resemblance of the fruit to a Caltrop (q.v.; Low Lat. *calcitrapa*). The genus comprises only two or three species, all aquatic and natives of central and southern Europe, India, China, Japan, and Africa. The seeds of all abound in starch, and are much used for food. The most familiar is the *T. natans*, or Water Chestnut. *T. bispinosa*, the Singhara Nut, affords a great part of the food of the inhabitants of Kashmir.

**Trapani** (anc. *Drepanum*), a seaport of Sicily, and capital of a province in the north-west of the island, stands on a tongue of land 40 miles W. of

Palermo, but fully thrice (141 m.) that distance by rail. It has a trade in wheat, wine, olives, sumach, salt, tunny fish, sponges, and coral. It has a number of interesting baroque buildings, as well as some older remains. Since 1860 it has been transformed: most of its fortifications have been removed to make room for promenades, gardens, new streets, and monuments; a suburb (the Borgo Annunziata, where, close to the church of that name, is the town museum, founded by Conte Pepoli) 2 miles long has been built; and the place is now noticeably clean, and plentifully supplied (since 1891) with good water brought 60 miles. The musician A. Scarlatti and the astronomer L. Ximenes were born here. The ancient *Drepanum* took its name from the low, sickle-shaped promontory on which it stood. It was probably founded by the Carthaginians, who in 260 B.C. transported here some of the inhabitants of Eryx (q.v.), which rose on the lofty mountain (Monte S. Giuliano) to the north-east of the town; and here they utterly defeated the Romans in a celebrated naval engagement in 249 B.C. Pop. (commune, 1921) 71,174.

**Trapezium**. Euclid defined a trapezium as any quadrilateral except a square, an oblong, a rhombus, and a rhomboid. Later Greek geometers seem to have used the word in the more restricted sense of a quadrilateral with one pair of parallel sides; and the word trapezoid was introduced to describe a quadrilateral which had no two sides parallel. On the Continent the words are so distinguished to this day. By English geometers and writers on mensuration the words got interchanged as regards their significance, so that with us a trapezoid is generally defined as a quadrilateral with two parallel sides. Thus English writers have retained trapezium in the broader sense, and have used trapezoid in the restricted sense of a Euclidean trapezium with two sides parallel. The continental custom is historically and etymologically the better. There is, however, hardly a necessity for both words, since the word quadrilateral is now invariably used by modern geometers for a four-sided figure which is not a parallelogram.

**Trappists**, a religious order, celebrated for its extraordinary austerities, is so called from an abbey of the Cistercian order, founded in the middle of the 12th century, in the narrow valley of La Trappe, near Mortagne, in the Norman department of Orne—called 'the trap' because of its inaccessibility. The discipline of this monastery, in common with many others of the more wealthy monastic bodies, especially of those which were held in *commendam*, had become very much relaxed. In the first half of the 17th century the abbey of La Trappe fell, with other ecclesiastical preferments, to Dominique Armand-Jean le Bouthillier de Rancé (1626–1700), originally an accomplished but worldly courtier, who suddenly underwent a great change and turned his back on the vanities of the world. He undertook a reform of his monastery, and in the end established what was equivalent to a new religious order. It was in 1662 that he commenced his reforms. At first he encountered violent opposition from the brethren; but his firmness overcame it all. He himself entered upon a fresh novitiate in 1663, made anew the solemn profession, and was reinstalled as abbot. From this time may be dated the introduction of the new austerities which characterised the order. The monks were forbidden the use of meat, fish, wine, and eggs. All intercourse with externs was cut off, and the old monastic habit of manual labour was revived. The reform of De Rancé is founded on the principle of perpetual prayer and entire self-abnegation. By the Trappist rule the

monks are obliged to rise at two o'clock A.M. for matins in the church, which last till half-past three; and after an interval occupied in private devotion they go at half-past five to the office of prime, which is followed by a lecture. At seven they engage in their several daily tasks, indoors or out, according to the weather. At half-past nine they return to the choir for the successive offices of terce, sext, and none; at the close of which they dine on vegetables dressed without butter or oil, or on vegetable soup, and a little fruit. Milk and cheese are used save in time of fast; the sick are allowed eggs. The dietary is not the same in all the houses of the order. In some light beer or wine is sparingly allowed. The principal meal is succeeded by manual labour for two hours, after which each monk occupies an hour in private prayer or reading in his own cell until four o'clock, when they again assemble in the choir for vespers. The supper consists of bread and water, and after a short interval of repose is followed by a lecture. At six o'clock they recite compline in choir, and at the end spend half an hour in meditation, retiring to rest at eight o'clock. The bed is a hard straw mattress, with a coarse coverlet; and the Trappist never lays aside his habit, even in case of sickness, unless it should prove extreme. Perpetual silence is prescribed, save in cases of necessity, and at certain stated times; only the abbot and the guest-master are allowed to speak to strangers. But conversation by means of manual and other signs is practised. The minor practices and observances are devised so as to remind the monk at every turn of the shortness of life and the rigour of judgment; and the last scene of life is made signal in its austerity by the dying man being laid during his death-agony upon a few handfuls of straw, that he may, as it were, lay aside upon the very brink of the grave even the last fragment of earthly comfort to which the necessities of nature had till then compelled him to cling.

The reformed order of La Trappe scarcely extended beyond France in the first period of its institution. The inmates of La Trappe shared, at the Revolution, the common fate of all the religious houses of France: they were compelled to quit their monastery; but a considerable number of them found a shelter at Valsainte, in the canton of Fribourg in Switzerland. In the vicissitudes of the revolutionary war they were driven from this house; and a community numbering about 250, together with a large number of nuns who had been established for purposes of education, found refuge at Constance, at Augsburg, at Munich, and even in Russia. Later in the course of the war small communities obtained a certain footing in Italy, Spain, America, England, and, notwithstanding the prohibitory law, even in France, at Mont Genève. After the Restoration they resumed, by purchase (1817), possession of their old home at La Trappe, which continued to be the head monastery of the order. During the course of the next fifty years they formed many establishments in France, the house of La Meilleraye being one of the most famous abbeys. Congregations were also founded in Belgium and Italy, and in 1892 the order was reorganised as the 'Order of Reformed Cistercians,' its headquarters being established at the old abbey of Cîteaux, which came into its possession in 1898. The order now has over seventy houses scattered throughout the world. In England the Cistercian house of St Bernard in Leicestershire is Trappist; so is the convent at Staplehill in Dorset. In Ireland the order has houses at Mount Melleray, near Cappoquin, in Waterford, and at Roscrea in Tipperary. There are also houses in America, Canada, China, Japan, and Africa.

See works quoted at MONACHISM; Gaillardin's *Trappistes; ou l'Ordre de Cîteaux au 19<sup>me</sup> Siècle* (1844); Pfannenschmidt, *Geschichte der Trappisten* (1873); Comte de Charenay, *Cartulaire de l'Abbaye de Notre Dame de La Trappe* (1891); M. Heimbucher, *Orden und Kongregationen*, vol. i. (1907); and for life in a Trappist monastery, Huysman's *En Route* (trans. 1896).

**Traprain**, or DUNPENDER, a phonolite neck in East Lothian, overlooking the Tyne opposite East Linton. It is associated with the story of St Kentigern's mother, St Thenaw (see KENTIGERN). In 1919 it became more famous by the finding of treasure trove, consisting of Roman silver plate (bowls, spoons, plates, &c.), Roman coins and pottery; and of relics of native manufacture, mostly bronze (weapons, tools, harness, &c.), but also including glass, brooches, beads, &c.; there is also evidence of earlier occupations, axes, burial urns, and moulds, dating from the Bronze Age. The site of Traprain was certainly occupied by a native fortified town during the first four centuries A.D., and it is supposed that the silver plate—late Roman in date, and (in part) Christian in design—was looted from some religious house on the Continent and buried here by Teutonic invaders. See A. O. Curle, *Treasure of Traprain* (1923).

**Trasimene Lake**, a shallow Italian lake lying between the towns of Cortona and Perugia. Surrounded on all sides by hills, it is about 14 miles in length by 8 in breadth. It contains three islands and is full of fish. The flat and reedy margins were of late planted with eucalyptus trees. In 1898 a new canal was completed (close to the old one near the south-east corner) to regulate and partially drain the lake, which is memorable for the great victory obtained by Hannibal (q.v.) in 217 B.C. over the Romans on the north bank.

**Tras-os-Montes**. See TRAZ-OS-MONTES.

**Trass**. See TUFF.

**Traun See**. See GMUNDEN.

**Traunstein**, a summer resort of SE. Bavaria on the river Traun, has saline springs; pop. 7000.

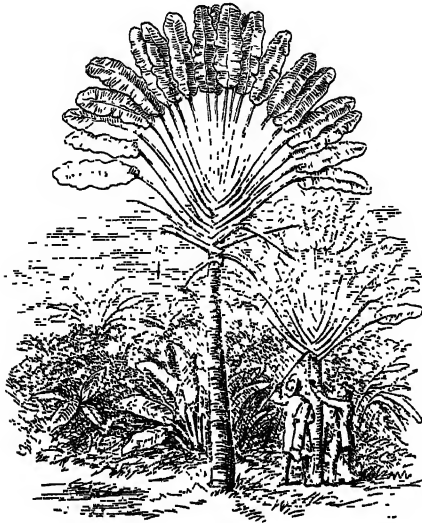

**Trautenau** (Czech, *Trutnov*), a town of Czechoslovakia, 120 miles NE. of Prague, has an ancient church (1283) and important manufactures, especially linen; pop. (1921) 14,584.

**Travancore** (*Tiruvāṅkōḍ*), a state in the extreme south of India, bounded on the N. by Cochin, on the E. by British territory, and on the W. by the Indian Ocean. The state pays a yearly tribute of 8 lakhs of rupees to the British government, and is politically connected with the presidency of Madras. Area, 7625 sq. m.; pop. (1881) 2,401,158; (1921) 4,006,062, two-thirds Hindus. Nairs are over a sixth of the total, Mohammedans about 7 per cent. Christians number 1,172,934, more than half of whom belong to the Syrian churches (see THOMAS, CHRISTIANS OF ST). There are some black Jews. At the southern extremity of the state is Cape Comorin; the Western Ghāts run along the eastern side. The physical appearance of the higher part of the country, which is varied and picturesque, is described at GHĀTS. Westward of the hill-foots is a level belt, 10 miles wide, covered with coconut and areca palms. On the elevations the soil is light and gravelly; in the valleys it is in general a deep black mould. The lagoons or backwaters along the coast, which Travancore shares with Cochin, are explained at COCHIN. The chief produce is copra, coir, tobacco, nut-oil, areca-nut, ginger, pepper, cardamoms, beeswax, coffee, and timber. The rajās are intelligent, have been faithful to the English alliance, cherish education, and govern well. The capital is Trivandrum; other principal places are Aulapolai, Nagercoil, and Quilon. See Mateer, *Native Life in Travancore* (1883).

**Travellers.** See COMMERCIAL TRAVELLERS, CARRIERS, INN.

**Traveller's Joy.** See CLEMATIS.

**Traveller's Tree** (*Ravenala madagascariensis*, or *Urania speciosa*), a remarkable plant of the family Musaceæ, a native of Madagascar, forming a characteristic feature of the scenery of many parts of that island. The stem sends out leaves only on two opposite sides, like a great expanded fan. The lower leaves drop off as the stem grows, and in an old tree the lowest leaves are sometimes 30 feet from the ground. A tree

Traveller's Tree (*Ravenala madagascariensis*).

often has twenty or twenty-four leaves, the stalk of each leaf being 6 or 8 feet long, and the blade 4 or 6 feet more. The blade of the leaf is oblong, bright green, and shining. The fruit is woody, capsular, three-celled, the seeds are arranged in two rows in each cell, and are surrounded by a pulpy blue aril. Forty or fifty fruits grow in a bunch, and three or four bunches may be seen at once on the tree. The leaves are much used for thatch, and for many other purposes, and the leaf-stalks for the partitions, and often even for the walls of houses. It received its popular name, *Arbre des voyageurs*, first from the French on account of the stores of more or less potable water found in the large cup-like sheaths of its leaf-stalks, and obtained by tapping the sheaths at the base. There is a similar tree, *R. guianensis*, in South America.

**Travemünde.** See LÜBECK.

**Traverse City**, the capital of Grand Traverse county, Michigan, U.S.A., 150 miles N. of Grand Rapids, has numerous manufactures connected with lumbering, also flour-mills and a state hospital; pop. 11,000.

**Travertin**, the Italian name for limestone formed by springs holding lime in solution. See CALCAREOUS TUFF.

**Travnik**, a town of Bosnia, once its capital, stands on the Lasva River, 45 miles NW. of Sarajevo by rail. The administrative department of Travnik has a population of 280,000.

**Trawling.** See FISHERIES.

**Traz-os-Montes** ('Beyond the Mountains'), a province forming the north-east corner of Portugal, bordering on Spain and bounded S. by the

Douro, now falls into the two districts of Braganza and Villa Real, with a collective area of 4160 sq. m., and a population of 400,000. It is a coldish plateau, with bare mountain masses, broken through by deep romantic ravines; but the wine district known as the *Alto-Douro* is fertile. Wine is the chief product, but the mountains are also rich in unutilised metallic wealth.

**Treacle**, the dark, viscons, uncrystallisable syrup obtained in refining sugar; also the drainings of crude sugar, properly distinguished from treacle as molasses. See SUGAR, SYRUP. The word *treacle* is a corruption of *theriacal* (from *theriaca*) and originally meant an electuary, or compound syrupy medicine; it was applied to molasses from the similarity of appearance. *Theriaca*, supposed to be an antidote to the poison of venomous animals, is said to have been invented by Andromachus of Crete, physician to the Emperor Nero.

**Treacle Mustard.** See ERYSIMUM.

**Tread-wheel**, an apparatus formerly used in prisons in Britain for enforcing a portion of the sentences of imprisonment with hard labour. Sir W. Cubitt about 1818 devised its construction. The Prison Act, 1865, required that every male adult prisoner over sixteen years of age sentenced to hard labour should during at least three months of his sentence be employed on labour of the first class—crank, capstan, tread-wheel, stone-breaking, or other like kind of bodily labour. The minimum period was by the Prison Act, 1877, reduced to one month.

The tread-wheel consisted of a hollow cylinder of wood on an iron frame, and revolving on an iron axle. The cylinder, usually about 5 to 6 feet in diameter, had on its outer circumference steps about  $7\frac{1}{2}$  inches apart. The weight of the prisoners coming on these steps in succession caused the wheel to revolve. By means of suitable gearing this power was transferred and utilised for grinding corn, pumping water, and other purposes. The speed of the wheel was regulated by some sort of brake applied by means of a 'governor.' Prisoners were kept at this work for 6 hours in each day, divided into two periods of 3 hours each; and during each of these periods they were on the wheel for spells of 15 minutes, and then resting for 5 minutes. In order to prevent intercourse between prisoners, wooden partitions were placed so that each of them worked in a separate compartment.

The crank was sometimes substituted for the tread-wheel as a means of enforcing hard labour. It had the advantage that the prisoner could work it in his cell. The prisoner turned a handle which caused a wheel to revolve, and the resistance to be overcome was derived from a brake fitted on the wheel, or from mill machinery applied to grinding corn, pumping water, turning saws, or other purposes. Hard labour now takes other forms.

**Treason** may be defined in general terms as an attempt to overturn the government established by law. In early times it was regarded entirely as an offence against the monarch in whom that government was personified, and this view is still apparent in the present state of the law. The foundation of the English legislation on the subject is the Statute of Treasons (25 Ed. III. sect. 5), 1352. Previous to that the law was vague. Murder, highway robbery, piracy, even charging the king wrongfully, were sometimes punished as treason. What was termed 'accroaching'—i.e. assuming or trespassing on royal power—also fell under this designation. The Statute of Treasons was passed to declare the law on the subject. It enumerated various acts which constitute the crime. These were compassing the king or queen's death,

or that of the heir; seducing his wife or eldest daughter, or the wife of his heir; levying war against the king, or assisting his enemies; killing the judges whilst in the execution of their duty. A later age found this, as other mediæval acts, alike redundant and defectiva. There has never been any prosecution under some of its provisions, and many varieties of attacks on the state or its ruler did not come within its plain meaning. The judges gave a forced construction to the clauses, and thus widened their application; yet there was much fresh legislation. Under Henry VII. (1494) it was enacted that obedience to the king *de facto* but not *de jure* was not treason. Under Henry VIII. there were nine acts passed creating fresh treasons, but these were all swept away in the first year of his successor. Again, acts on the subject were passed under the Stuarts, and were in turn superseded by laws passed after the Revolution.

The provisions of the Statute of Treasons above mentioned still remain in force. It is to be noted that the offence consists in *imagining* the sovereign's death, and that it is proved by such overt acts as display the intention. As to levying war, this includes an attempt by force 'to compel the sovereign to change his measures or counsels, or to intimidate or overawe both Houses or either House of Parliament,' or an attempt 'by an insurrection of any kind to effect any general public object,' as, for instance, to pull down dissenting meeting-houses generally. Although the speaking of words expressing and imagining the king's death is not of itself an overt act, yet if written or accompanied by words of advice or command they constitute such an act. In treason every accessory is a principal traitor.

An act of 1848 provides a maximum punishment of penal servitude for life for those who shall be guilty of the treason felony of attempting to deprive the sovereign of any of his dominions, or of making war against him. Insulting the sovereign, attempting to seduce soldiers, illegal drilling, and assisting at royal marriages to which the sovereign has not given consent are offences akin to treason. Offences against the state are called *high-treason*. It is distinguished from *petty-treason*—the murder of a husband by his wife, a master by his servant, or an ecclesiastical superior by his inferior. These crimes, once dealt with in many respects like those for the graver offence, are now treated as other murders; and the term *petty-treason* was abolished in 1828. Misprision of treason is knowledge of the principal crime and concealment thereof. It is still punishable with forfeiture of goods as well as imprisonment for life. Sedition (q.v.) is cognate to treason; Coining (q.v.) used to be dealt with as treason. See also *PRÆMURRE*.

The punishment for high-treason has always been death. In its old savage form, first inflicted in 1284 on the Welsh prince David as on Sir William Wallace a few years later, and in force till 1870, the sentence provided that the criminal should be drawn on a hurdle to the place of execution, be hanged but not till he is dead, be cut down and have his entrails torn out and burned before his eyes, and then be beheaded and quartered, his remains to be disposed of as the king should think fit (see *DRAWING AND QUARTERING*). That sentence was last passed (though not carried out) in 1867 on the Fenians Burke and O'Brien. Women were burned alive, though the sentence might be commuted by the king to beheading, as in the case of Lady Alicia Lisle (q.v.). The punishment is now execution by hanging. The Act of 1870 prevented forfeiture of property on conviction for treason.

After the Union (1707) an act was passed making the Scots law of treason the same as the English.

Thus the prosecution is not at the instance of the Lord Advocate but on the presentment of a grand jury, and there is a petty jury of twelve who determine the guilt or innocence of the prisoner. The traitor's property is still forfeited, as the Act of 1870 does not apply to Scotland.

In the United States treason is confined to levying war against the state, or adhering to and giving aid and comfort to its enemies; it implies the assembling of a body of men for the purpose of overturning or resisting the government by force.

**Treasure-trove** (Norman or Old French, *tresor trove*, 'treasure found') is the equivalent of the Latin phrase of the earlier law-books, *thesaurus inventus*, and is used to denote that particular kind of treasure which, when found ownerless, becomes by the law of England the property of the crown. It is defined by Coke as follows: 'Treasure trove is when any gold or silver, in coin, plate, or bullion, that hath been of ancient time hidden, wheresoever it be found, whereof no person can prove any property, it doth belong to the King, or to some lord or other by the King's grant or prescription.' This is the definition adopted by the Museums Committee (1898) and cited by the Attorney-general in the case before the High Court (1903) in which the question to be decided was whether the trustees of the British Museum were in legal possession of a hoard of gold ornaments which had been ploughed up (in 1896) at Limavady in Ireland, and sold to the trustees for £600 by a collector who had acquired them from the finders; or whether the articles in question were treasure-trove, and consequently the property of the crown. The case was decided against the trustees, and the articles were subsequently gifted by the King to the Irish National Museum in Dublin. It is settled law in England that unless the ownerless treasure be of gold or silver, and can be shown to have been hidden, it is not treasure-trove. Evidence of hiding may be inferred from the circumstances of the deposit. The administration of the law of treasure-trove is under the direction of the Treasury, but in England the coroners have statutory jurisdiction, on information of the discovery of treasure, to hold an inquest and obtain a verdict of a jury on the facts of the case, and 'who are the finders, or who may be suspected thereof,' the concealment or illegal retention of treasure-trove being a criminal charge punishable by fine or imprisonment. In the case against Thomas and Willett (1863), who bought from the finder at less than the price of old brass a hoard of gold articles weighing about 11 lb., ploughed up in Sussex, and sold them to a gold-refiner by whom they were melted down, the court imposed on each a fine of £265 (the amount they had received for the gold) and ordered them to be imprisoned till the fine was paid. The finder or possessor of treasure-trove, being bound by law to deliver it up to the authorities, has no legal claim to compensation, although, as the law is now administered, the Treasury gives remuneration as an act of grace on certain conditions. By a circular issued in 1886, with a view to encourage the notification to the authorities of such finds in England, they intimate that they will return to the finders who surrender their discoveries all the articles which are not required for national institutions, together with the antiquarian value of such as may be retained, less 20 per cent. In Ireland the law is the same, but since 1861 the Treasury has had no direct connection with its administration, the whole responsibility having been delegated to the Royal Irish Academy, which receives a parliamentary grant of £100 annually towards the acquisition of treasure-trove for the National Irish Collection of Antiquities in the Dublin Museum of Science and Art. The Academy issues notices

throughout the country that payments for such articles, higher than those which could be obtained from dealers, will be made to finders who notify their finds, and that the treasure-trove regulations protect persons who sell to the Academy against claims by the crown. In Scotland there is no statute law of treasure-trove, but the claims of the crown are based on the common-law maxim, *Quod nullius est, fit Domini Regis*, and include all descriptions of ownerless personal property. The administration is in the hands of the King's and Lord Treasurer's Remembrancer in Exchequer under the direction of the Treasury. The circular (1859) gives notice to 'finders of ancient coins, gold or silver ornaments, or other relics of antiquity in Scotland,' that on their delivery to the authorities, the actual value of the articles, if retained for the crown, will be paid to them; and in cases where they are not surrendered the procurators-fiscal are instructed to take steps for their recovery. The administration of the law is practically limited to cases in which it is desirable in the public interest to secure the preservation of important finds which might otherwise be lost, destroyed, or dispersed. In all civilised countries the questions of property arising in connection with the discovery of hidden treasure have been dealt with by law, the regulations enacted by different states differing considerably in their details, for which see Dr David Murray's *Archæological Survey of the United Kingdom* (1896).

**Treasury**, the central department of the British executive government. After the Norman Conquest a separate board was appointed for revenue matters on the model of the Exchequer of Normandy, and a royal treasurer (usually a churchman) appointed. The office was sometimes held along with that of Justiciar. So great was the political influence of the Lord High Treasurer that James I. in 1612 thought it prudent to put the office into commission—i.e. to entrust it to a board of Lords Commissioners; since the death of Queen Anne no Lord High Treasurer has been appointed; the office has been always in commission. Similar offices existed in Scotland and Ireland. The Treasury Board now consists of four Lords Commissioners and the 'Chancellor of the Exchequer,' an officer originally appointed to check the accounts of the Treasurer (see EXCHEQUER, CABINET). The First Lord (the lord whose name stands first in the commission) is a political officer of the highest rank; he has no departmental duties to perform, and his office is therefore usually assigned to the prime minister. Since 1806 the head of the administration had always presided over the Treasury; but in 1836 Lord Salisbury undertook the department of Foreign Affairs, the leader of the House of Commons acting as First Lord of the Treasury. The junior lords perform such duties as it may be convenient to assign to them; they are usually members of the House of Commons. The Treasury Board is now no more than a name; formal documents run in the name of 'my lords,' but the working head of the department is the Chancellor of the Exchequer, who holds under a distinct patent the office of Under-treasurer. There are two secretaries, both of whom are usually members of parliament; the Financial Secretary is specially responsible for the civil service estimates; the Parliamentary Secretary conducts correspondence relating to appointments, and acts as chief whip of the ministerial party in the House of Commons. The permanent officials of the Treasury enjoy a high reputation for ability, and the traditions of the office are not to be disregarded even by the most enterprising Chancellor of the Exchequer. When the First Lord of the Treasury is himself Chancellor of the Exchequer he receives only half the salary of the latter office.

Since the Restoration it has been the established practice to keep the receipt of revenue separate from the expenditure of public money; but the Treasury exercises a general control. By an arrangement sanctioned by parliament in 1834, all public revenue is paid into the Bank of England to the credit of the Comptroller-general; this officer is in fact the pivot of the whole system; he checks all receipts and payments, and reports independently to the House of Commons. Estimates of expenditure in all the public departments are submitted to and revised by the Chancellor of the Exchequer, who is thus enabled to take a comprehensive survey of the resources and liabilities of the nation. Towards the end of the financial year he opens his budget in committee of the House of Commons, estimates the total expenditure of the coming year, and indicates the ways and means by which the required sum may be raised. Payments on account of the army, navy, civil-service, &c. are made by the Paymaster-general on the authority of the Treasury. Under various statutes the Treasury regulates the salaries of newly-created officers in other departments, and fixes the number of officers employed in new departments. The duties of the Treasury also comprise the examination of the expenses of legal establishments, sheriffs, county courts, and criminal prosecutions. The Solicitor to the Treasury is a permanent official of great importance; his office is now combined with that of King's Proctor. For a full account of the law relating to this subject, see Todd's *Parliamentary Government in England*. See CROWN.

**Treaty**, in Public International Law, is an agreement or contract between two or more separate states. In practice the word treaty is commonly used for the larger political or commercial contracts, the term convention being applied to agreements on matters of minor importance. The range of treaties extends to the whole variety of international relations. No special form is prescribed by international usage as necessary for treaties. The general practice is to embody a treaty in a formal written instrument signed by persons duly authorised on behalf of the contracting parties. When a treaty is entered into through the agency of plenipotentiaries, the authority of the plenipotentiaries is understood as conferring a right to conclude agreements subject to the ultimate decision of the governments whose representatives they are. Hence, in the absence of special agreement to the contrary, a treaty entered into and signed by plenipotentiaries is not binding until it is ratified, either expressly or tacitly, by the treaty-making power of the state. The constitution of each state determines in whom resides the power of making treaties. In monarchies it is usually vested in the sovereign, but the power or competence of the sovereign to make treaties may be subject to constitutional restrictions. In Great Britain the treaty-making power resides in the crown; but it would appear that a treaty which lays a pecuniary burden on the people, or which alters the law of the land, needs parliamentary sanction. In many states the treaty-making body is distinct from the executive. Thus under Art. 2, sec. 2, of the Constitution of the United States, the president can only ratify treaties with the consent of the senate. When by the constitution of a state it is essential to the validity of a treaty concluded by plenipotentiaries that it shall be sanctioned by a body, distinct from the executive and not necessarily having knowledge of the instructions given to the negotiators, the right of that body to refuse to ratify the treaty is well understood and recognised by other states. The senate of the United States has frequently refused to ratify treaties made by the executive, or has amended them as a condition

of ratification. A recent instance is the refusal of the senate to ratify the Treaty of Versailles, 1919, by which peace was made between the principal allied and associated powers and Germany. Article 18 of the Covenant of the League of Nations provides that every treaty or international engagement shall forthwith be registered with the Secretariat, and shall, as soon as possible, be published by it; and that no such treaty or international agreement shall be binding until so registered. The treaties registered are published periodically by the League.

A treaty, like a contract, may be brought to an end by agreement between the contracting parties that it shall no longer bind them. If a time limit for its duration is stipulated, it terminates when the fixed period has elapsed. Where the specific object of a treaty is the performance of some stipulated act to be done once for all, such as the payment of an indemnity or the cession of territory, the binding force of the treaty is extinguished so soon as the act stipulated in it has been performed. On the other hand, a treaty, purporting to regulate for an indefinite period the obligations and relations of the contracting states—e.g. an extradition treaty, an alliance, a commercial treaty—does not lose its obligatory force by the efflux of time. It is, however, recognised that such a treaty may cease to be binding if the conditions which existed at the date of its conclusion, and which formed at that date implied conditions of its obligatory force, are essentially altered. This principle is commonly known as the principle of *Rebus sic stantibus*. The difficulty lies in the application of the principle—in other words, in determining what is an essential change rendering it justifiable to disregard a treaty. The invocation by Germany of this principle as justifying the invasion of Belgium in 1914 in disregard of treaty engagements made plain the difficulty attending the application of the *Rebus sic stantibus* doctrine, and the danger of its being improperly used to hide the violation of a treaty behind the shield of law. An attempt to deal with the problem is made in Article 19 of the Covenant of the League of Nations, 1919, which provides that the Assembly of the League may from time to time advise the reconsideration by members of the League of treaties which have become inapplicable, and the consideration of international conditions whose continuance might endanger the peace of the world.

Treaties which merely settle some matter of dispute between the parties to them do not in any way affect international law. On the other hand, certain classes of treaties are a source of international law. Thus treaties concluded by a considerable number of the leading states in the world for the purpose of making changes in, or adding new provisions to, the existing law—e.g. the Declaration of Paris in 1856, the Hague Convention, the Covenant of the League of Nations—are important, as a source of international law, in proportion to the number of states which sign them or which subsequently adhere to the rules laid down in them. Another class of treaties which may properly be termed 'law-making' are those which are expressly declaratory of international law as understood by the contracting parties—e.g. the Protocol signed at the Conference of London in 1871.

Performance of the stipulations contained in a treaty used frequently to be secured by the taking of hostages. This practice is now in disuse, the Treaty of Aix-la-Chapelle in 1748 'being the last occasion upon which hostages were given, except in military conventions. The occupation of territory has also often been used as a mode of taking

security. Thus by the Treaty of Versailles, 1919, as a guarantee for the execution of the treaty, German territory situated to the west of the Rhine, together with the bridge-heads, was occupied for a period by allied and associated troops. States now, in the ordinary case, are content to rely on their own power, and on the good faith of nations, to secure the observance of treaties entered into with them. One of the objects of the League of Nations is, as set out in the preamble of the Covenant, 'to achieve international peace and security by a scrupulous respect for all treaty obligations.'

As regards the effect of war in annulling or suspending treaties to which the belligerents are parties—there are many treaties whose object and import are such that war will put an end to them. On the other hand there are treaties meant to remain in force in perpetuity, or dealing with the case of war as well as peace, which will survive the outbreak of war. A distinction is also to be taken between treaties to which the belligerents only are parties and treaties to which other powers besides the belligerents are parties. It is a usual practice for the parties to a treaty of peace to make special stipulations in the treaty with respect to the revival of treaties which had been cancelled or suspended by the war. This practice was followed in the treaties of peace entered into at the end of the war of 1914–18.

See Oppenheim, *International Law*, vol. i. secs. 555–568, for a summary of the more important law-making treaties; Sir E. Hertslet, *The Map of Europe by Treaty* (4 vols. London, 1875–91).

**Trebbia** (anc. *Trebia*), a southern tributary of the Po, which rises in the Ligurian Apennines. Here Hannibal (q.v.) decisively defeated the Roman consul Sempronius, 218 B.C., 4 miles W. of Placentia, on the left bank of the river, according to the account of Polybius.

**Trebelli** (1838–92), ZELIA, opera-singer, was born of German parents called Gilbert at Paris, and made her début at Madrid under the name of Trebelli (? Gillebert transposed) in 1859. Subsequent triumphs in Berlin, London, Scandinavia, Russia, and the United States confirmed her reputation as the greatest mezzo-soprano of her day.

**Trebizond** (Old Gr. *Trapezous*; mediæval Lat. *Trebisonda*; Turk. *Tarabzân*) is the capital of a vilayet of the same name in the extreme NE. of Asia Minor. The city is a flourishing seaport on the Black Sea coast, between the sea and the mountains; its importance being due to the fact that it stands on the great overland trade-route between Europe and Persia over the tableland of Armenia, though this trade has been much injured by the Batum-Tiflis railway. It is surrounded by walls of great extent, which have many picturesque forts and enclose numerous gardens as well as the town itself. The harbour is but a roadstead, not protected on the north-east, and vessels cannot come close inshore. The pop. of the town is about 40,000. The city is noted for its silk manufactures, which, however, are fast decaying. The old Greek city is said to date from 756 B.C., and was founded by a colony from Sinope. Conquered from Mithradates by the Romans, it rapidly rose in importance, became a free city, and was made by Trajan the capital of Pontus Capadocius. On the capture of Constantinople by the Crusaders in 1204 one of the imperial Byzantine family, Alexis, established himself at Trebizond, where he had previously exercised the functions of governor, and founded a state known as the *Empire of Trebizond*, which stretched from the Phasis to the Halys, and maintained its independence against the Turks till 1462.—George of Trebizond (1396–1486),

descended of parents from Trebizond, was born in Crete, but settled in Italy in 1420 as a teacher of rhetoric, Greek grammar, and philosophy. Trebizond was the birthplace of Johannes Bessarion (q.v.).

**Treble**, the highest part in harmonised music, which in general contains the melody, and is sung by a Soprano (q.v.) voice. For the treble or G clef, see CLEF.

**Tredegar**, a market-town on the north-west border of Monmouthshire, 12 miles WSW. of Abergavenny and 7 ENE. of Merthyr-Tydfil. Grown from a mere village since 1800, it stands in the midst of a district rich in coal and ironstone; but its iron and steel works are a thing of the past. Pop. 20,000.

**Tredgold**, THOMAS, architect and engineer, was born at Brandon, near Durham, 22d August 1788. While apprenticed to a cabinet-maker, and while working as a carpenter in Scotland, he devoted his leisure time to the study of the principles of architecture and kindred subjects. A civil engineer in later life, he died 28th January 1829. Tredgold's scientific contributions to periodicals and also to the *Encyclopædia Britannica* range over a wide field; but his most valuable works are *The Elementary Principles of Carpentry* (1820) and *The Strength of Cast Iron* (1821).

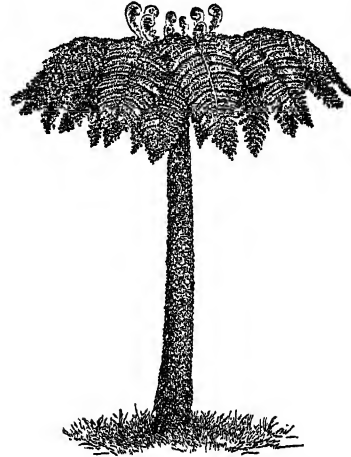

**Tree**, any large woody plant of perennial duration, the natural habit of which is to rise from the ground with a distinct trunk, in contradistinction to Shrub, which is smaller, and may produce several stems more or less directly rising from the root. The terms are, however, somewhat arbitrary in their application. Trees are found in all climates except the coldest, but the number of species, as well as the luxuriance of the forests, is greatest in the tropics. As we advance towards the polar regions, or ascend high mountains, trees disappear before other forms of vegetation. The different characters of trees affect very much the landscape of the countries in which they grow; some countries, and particularly in northern parts of the world, being covered with sombre pine forests, whilst others abound in ash, beech, and similar trees of verdant foliage. Every kind of tree has its peculiar character, not only in its foliage, but in its general form and its mode of branching. An ash is as easily distinguished from an elm by a practised eye in winter when destitute of leaves as in the full foliage of summer. No flowerless plant assumes the character of a tree, except a few ferns known as Tree-ferns. See also ECOLOGY, FORESTRY, GARDENING, TIMBER, TRANSPLANTING, WOOD; and for tree-worship, see PLANTS.

In Law, trees and shrubs are fixtures, and on sale pass with the land to the purchaser. Except in nursery gardens, shrubs are reserved to the landlord. Even a lease of land with woods gives only the right of thinning plantations, cutting copsewood, and of cutting wood for repairing or building houses upon the ground, but not of selling wood. Injuries to trees are punishable at common law as malicious mischief.

**Tree**, SIR HERBERT BEERBOHM, actor, was born 17th December 1853 in London, and definitely established his reputation in 1876 by his representation of the curate in *The Private Secretary*. In 1887 he undertook the management of the Haymarket Theatre, removing ten years later to Her Majesty's Theatre. His splendid versatility, helped by his aptitude for the technique of stage-production, brought him success in many rôles, but he is specially remembered in connection with his revivals of Shakespeare. He was knighted in 1909, and died in London 2d July 1917. A collection of *Memoirs* was edited by his brother, Max Beerbohm, in 1920.

**Tree-creeper**, a common name for *Certhia familiaris*. See CREEPER.

**Tree-fern**, the common name for ferns with arborescent trunks, of which there are many species, all natives of tropical and subtropical countries. Their stems are formed of the consolidated bases of the fronds, surrounding a central column of soft tissue, in which the circulation takes place. In the landscape their columnar trunks, surmounted by graceful crowns of spreading fronds, have a similar

Tree-fern (*Cyathea dealbata*).

effect to the palms. The height to which they attain varies from 2 or 3 feet to 80 feet, according to the species. The Alsophilas and Cyatheas are the giants of the tribe. *A. excelsa*, a native of Norfolk Island, is stated by Captain King to grow to the height of 80 feet. The pith or soft cellular matter in the centre of the stem of *A. excelsa* and *A. medullaris*, the latter a native of New Zealand, is greedily eaten by swine, and when cooked resembles inferior turnips in taste and texture. Numerous species of tree-fern are cultivated in British conservatories.

**Tree-frog** (*Hylidae*), a family of arboreal Amphibians, nearer toads than frogs, including about 150 species, all American and Australian except the Old World *Hyla arborea* and two closely allied forms. Half of the species occur in South

Tree-frog (*Hyla arborea*).

America, evidently their headquarters. Most of the species are in the genus *Hyla*. The last joint of the fingers is claw-shaped and swollen at its base, and carries an adhesive muscular pad. The adhesion, due to the molecular attraction between

pad and branch, is helped by a sticky secretion. The colour of tree-frogs is often green and often changeable; the voice is often loud and enhanced by resonating sacs; the food consists of insects. The tree-frogs show many different ways of dealing with the eggs; e.g. in a mud-nest, in a leaf-nest (Phyllomedusa), in a brood-pouch (Nototrema). The name tree-frog is often extended to arboreal Amphibians with adhesive disks, e.g. Hylodes, which are not, however, referable to the family Hylidae.

**Tree-nettle.** See NETTLE-TREE.

**Trefoil**, a name given to many herbaceous plants with leaves of three leaflets, as Clover (q.v.), Lotus (q.v.), Medick (q.v.), Buckbean (q.v.), &c. The term is used also in Architecture (for a three-lobed aperture in tracery) and in Heraldry.

Trefoil in  
Architecture.

**Tregelles**, SAMUEL PRIDEAUX, New Testament critic, was born of Quaker parentage at Falmouth, 30th January 1813. After some years as a private teacher, he gave himself to the study of the New Testament text, and at twenty-

five formed the plan of a Greek New Testament on the principles which he afterwards carried out. In search of MSS., he spent five months in Rome, where he was allowed to see, but not to collate, the *Codex Vaticanus*. The first part appeared in 1857; the sixth, completing the text, in 1872. The seventh part, containing the *prolegomena*, appeared in 1879, edited by Dr Hort and A. W. Streane. Other works of his were the *Codex Zacynthius* (1861), and *Canon Muratorianus* (1868); an *Account of the Printed Text of the Greek New Testament* (1854), and *Remarks on the Prophetic Visions of Daniel* (1847). Besides these he edited *The Englishman's Greek Concordance*, and *The Englishman's Hebrew Concordance*, and translated Gesenius's *Hebrew Lexicon* (1847). In 1861 and again in 1870 he was stricken by paralysis; yet, aided by a pension from the civil list, he persevered in his labours with a noble fortitude. He died on the 24th of April 1875.

**Treguier**, a small port of 2500 inhabitants in the department of Côtes-du-Nord, Brittany, the birthplace of Renan.

**Treinta y Tres**, an eastern department of Uruguay (q.v.), washed by the Lagoa Mirim. The name was given to commemorate the *thirty and three* patriots who on 19th April 1825, after revolutionary meetings in Buenos Aires, crossed the Plate and proclaimed a revolt against Brazil.

**Treitschke**, HEINRICH VON, a distinguished writer on German politics and history, was born 15th September 1834 at Dresden, the son of an army officer of high rank. After studying at Leipzig and Bonn and lecturing at Leipzig on history and politics, he became a professor at Freiburg (1863). But three years later he threw in his lot with Prussia, and obtained appointments at Kiel, Heidelberg, and eventually Berlin (1874). There Treitschke was a figure of great eminence. He wielded a powerful influence as champion of the Hohenzollern cause and a colonial policy, but was restricted in his activities as a member of the Reichstag by his chronic deafness. He died 28th April 1896. His literary activities were manifold. He edited for a long period the *Preussische Jahrbücher* and, after Sybel, the *Historische Zeitschrift*, but his chief production was his *Deutsche Geschichte im 19. Jahrhundert* (5 vols. 1879-94), which, however, barely covers the first half of the century. There are several collections of his political essays—*Historische und politische Aufsätze, Zehn Jahre*

*deutscher Kampfe, Politik*—and two volumes of patriotic verse. His *History* shows deep and careful scholarship but is markedly biased. There is an English translation of it by E. and C. Paul (1915-18) and of the *Politik* by B. Dugdale and Torben de Bille (2 vols. 1916). See also the English translation of Adolf Hausrath's *Treitschke: His Life and Works* (1914), and H. W. C. Davis, *Political Thought of Treitschke* (1914).

**Trelawny**, EDWARD JOHN, a venturesome Cornishman, whose name is strangely linked with the names of Shelley and Byron, sprang from a famous and ancient family, was born in 1792, and entered the navy at eleven. Harsh treatment, together with a native spirit of insubordination, made him desert, and he is said next to have joined a privateer, and to have lived a life of desperate enterprises in the Indian and Malay Seas. In January 1822 he made the acquaintance of Shelley at Pisa, and it was he who took the chief part in the burning of the poet's body in August on the shore near Via Reggio. Next year he accompanied Byron to Greece, and there remained some time after Byron's death, attached to the fortunes of the chief Odysseus, who came to be more or less in open opposition to the government. Once while Trelawny was sheltering in the cave of Odysseus a treacherous Englishman shattered his jaw with a bullet; but he, with characteristic magnanimity, and though himself expecting death, saved the wretch from the vengeance of his men and sent him away in safety. The wanderer next travelled in North and South America, lived awhile in Italy, and spent his last years in Monmouthshire or Sussex, dying in his home at Sompting near Worthing, 13th August 1881. His body was cremated, and the ashes carried to Rome and laid beside the graves of Shelley and Keats. Trelawny was a man of indomitable courage and generous to a fault, but restless, impatient, and completely impracticable. He had scarcely ever had an illness, to the last wore neither overcoat nor underclothing, took scarce any animal food, and was abstemious throughout his life. Remarkably handsome in youth, in old age his presence was no less striking. He was the old Arctic voyager in Millais's 'North-west Passage.' Trelawny published two books, *The Adventures of a Younger Son* (1830; new ed. 1890), a vivid though ill-constructed story, based on the adventures of his own youth; and *Recollections of the Last Days of Shelley and Byron* (1858), re-issued in 1878 with considerable changes as *Records of Shelley, Byron, and the Author*. The importance of the latter is of course almost altogether relative; it reveals considerable power of insight into character, and betrays, as might have been expected, much greater sympathy for Shelley than for Byron. See his *Letters* (1911).

**Trelawny**, SIR JONATHAN, from Westminster passed in 1663 to Christ Church, Oxford, and became bishop in turn of Bristol (1685), Exeter (1688), and Winchester (1707); he was one of the Seven Bishops (q.v.) tried under James II., and is the hero of R. S. Hawker's well-known ballad, 'And shall Trelawny die?' This was based on a contemporary refrain, the strong feeling aroused among the Cornishmen due rather to Trelawny's being head of an ancient Cornish house than to his being a bishop or even a martyr in a good cause. Trelawny died in 1721.

**Tremadoc Slates.** See CAMBRIAN SYSTEM.

**Trematodes**, a class of parasitic flat-worms, related to Planarians (q.v.) and Tapeworms (q.v.). The body is unsegmented, usually leaf-like, provided with adhesive suckers. Many are ectoparasitic, and most of these have but one host ('monogenetic'), e.g. *Gyrodactylus* on sticklebacks,

Diplozoön on minnows. Common on the gills of tadpoles and in the bladder of the frog is *Polystomum integerrimum*. Many are endoparasitic and require two hosts ('digenetic'), e.g. the Liver-fluke (see FLUKE), which has its young stages in a water-snail, and the adult usually in the sheep. Almost all Trematodes are hermaphrodites; Bilharzia (q.v.) and a few others are bisexual.

**Tremella**, a genus of Fungi, of the division Hymenomycetes, soft and gelatinous, mostly growing on decaying wood. In some places they receive such popular names as Witches' Meat, and an imaginary medicinal value has been ascribed to them.

**Tremolite**, one of the amphibole group of minerals. It is composed of silicate of magnesium and calcium, and has a hardness of 5.5 to 6, and a specific gravity of 2.9 to 3. It occurs usually in long prisms, white or gray, vitreous, and translucent to opaque, but frequently appears as fibrous asbestos-like aggregates with a silky lustre. Tremolite is usually associated with crystalline schistose rocks, often occurring in the granular limestones, and sometimes forming the chief material of the so-called tremolite-schists.

**Trench.** See FORTIFICATION, SIEGE.

**Trench**, FREDERICK HERBERT, poet and dramatist, was born at Avoncore in County Cork, 12th November 1865, and educated at Haileybury College and at Keble College, Oxford. He was widely travelled, and from 1891 to 1908 was examiner with the Board of Education. In 1908 he undertook the control of the Haymarket Theatre, and staged *King Lear*, *The Blue Bird*, &c. His chief poetical works are *Deirdre Wed* (1901), *New Poems*, including 'Apollo and the Seaman' (1907), *Ode from Italy in time of War* (1915), *Poems with Fables in Prose* (1917). His plays include *Napoleon* (1918). He died 11th June 1923. His collected works were edited by H. Williams in 1924. See a work in French by Abel Chevalley (Paris, 1925).

**Trench**, RICHARD CHENEVIX, Archbishop of Dublin, belonged to an Anglo-Irish family of Galway, the Trenches of Woodlawn, and was born at Dublin, 9th September 1807. He passed from Harrow in 1825 to Trinity College, Cambridge, where he graduated in 1829. After a journey to Spain (its object to fight in the cause of liberty) and his ordination he was curate at Hadleigh, incumbent of Curdridge in Hampshire, and then for four years curate to Samuel Wilberforce, afterwards Bishop of Winchester; and during 1835-46 he published six volumes of poetry, which were favourably received, and which were re-issued as *Poems Collected and Arranged anew* (1865); the first of them was *The Story of Justin Martyr*. In 1845 Trench was presented to the rectory of Itchenstoke; in 1847 he became Theological Professor in King's College, London; in 1856 Dean of Westminster; and in 1864 Archbishop of Dublin, an office which he resigned in 1884. He died 29th March 1886, and was buried in the nave of Westminster Abbey. Trench's poetry was marked by sensibility and refinement, but not by genius. His theological writings laid his contemporaries under deep debt of gratitude, more for their tone and spirit than for originality or critical insight. And in the field of philology, while his interest was not in scientific problems for their own sake, he took pains to secure accuracy in his facts, and contrived to fascinate his readers with the 'fossil poetry and fossil history imbedded in language.' His principal works, some of which ran to many editions, are *Notes on the Miracles* (1846), *Notes on the Parables* (1841), *The Lessons in Proverbs* (1853), *Hulsean Lectures*

(1845), *The Sermon on the Mount illustrated from St Augustine* (1844), *Sacred Latin Poetry* (1849), *St Augustine as an Interpreter of Scripture* (1851), *Synonyms of the New Testament* (1854), *English Past and Present* (1855), *An Essay on the Life and Genius of Calderon* (1856), *Deficiencies in our English Dictionaries, Select Glossary of English Words* (1859), *The Study of Words* (1851), a memoir of his mother (1862), *Studies on the Gospels* (1867), and *Lectures on Mediæval Church History* (1877). See his *Letters and Memorials* (2 vols. 1888).

**Trenck.** The cousins Franz and Friedrich, Freiherren (or Barons) von der Trenck, soldiers and adventurers, were descended from an ancient house of East Prussia. The elder, Freiherr Franz, was born at Reggio, in Calabria, on 1st January 1711, where his father was an Austrian general. When he was seventeen he received a commission as a cavalry officer. He fought duels and indulged in such adventures that he had to flee, and went to Russia, where he was made a captain of hussars. Cashiered and imprisoned for insubordination, he returned to settle on his estates in Slavonia. At the outbreak of the Austrian war of succession (1740) he obtained from Maria Theresa permission to raise at his own cost a body of 1000 Pandours (q.v.), who, increased to 5000, formed the advanced guard of the imperial army in Silesia. But Trenck and his Pandours were even more distinguished for outrageous cruelty than for reckless daring; there had been no such monster, says Carlyle, since Attila and Genghiz. On the 7th of September 1742 he attacked Cham, a town in neutral territory, this act being, of course, in defiance of all law and discipline; and he completely annihilated it. After the battle of Sohr, in September 1745, he offered to capture Frederick the Great and bring him a prisoner to the Austrian camp. He failed in the enterprise, with great loss of men, but he secured the king's tent and much valuable booty. Suspicious were, however, entertained that he had allowed the king to escape, or even that he was in communication with the enemy, and he was tried by court-martial. He was imprisoned at Vienna, but made his escape with the assistance of a lady of rank; he was however captured, and condemned to life-long imprisonment in the Spielberg at Briinn, where he poisoned himself, 4th October 1749.

See his Autobiography (1748; new ed. 1807); the Life by Hübner (1788); a monograph, *Freiherr Franz von der Trenck* (3d ed. Celle, 1868); and Carlyle's *Frederick the Great*.

Freiherr Friedrich was born at Königsberg, 16th February 1726, the son of a Prussian major-general, and distinguished himself at the university. At sixteen he became a cornet in the guards; and two years afterwards he attempted some kind of intrigue with the Princess Amalia, and fell into disfavour. The discovery of a correspondence (itself innocent enough) with his Austrian cousin was a pretext for his imprisonment at Glatz, whence in 1747 he escaped to take service in the Austrian army at Vienna. Having returned to Prussian territory on family business, he was clapped in prison by Frederick the Great, and on his attempting to escape from the fortress of Magdeburg was heavily ironed—hands, feet, and waist. He was released on 24th December 1763, and afterwards settled at Aachen, where he married the burgomaster's daughter, and went into business as a wine-merchant. He published his *Memoirs* in 1787. The book was translated into all languages, and Trenck became more famous than his famous cousin; several plays founded on his adventures were brought out on the French stage. In 1774-77 he had travelled in England and France, and the restless

man received again his confiscated Prussian estate. But having gone to Paris during the Revolution, he was imprisoned by Robespierre as a secret political agent, and guillotined near the Barrière du Trône, 25th July 1794.

See Carlyle's *Frederick the Great*; Trenck's Autobiography (full of exaggerations, 1787); the Life by Wahnemann (1837); the monograph, *Freiherr Friedrich von der Trenck* (3d ed. Cella, 1868); and Vcte. du Jeu, *Trenck: un aventurier prussien du XVIII<sup>e</sup> Siècle* (1923). A complete edition of Trenck's collected works, containing his poems, was published in 8 vols. 1786.

**Trendelenburg**, FRIEDRICH ADOLF, philosopher, was born at Eutin, 30th November 1802, and was for nearly forty years professor at Berlin, and a member of the Academy; he also sat as a Conservative in the Prussian Second Chamber. He died 24th January 1872. His principal works are *Elementa Logices Aristotelicæ* (1837; 8th ed. 1878; trans. as *Elements of Logic*, 1881); *Logische Untersuchungen* (1840; 3d ed. 1870); *Historische Beiträge zur Philosophie* (1846-67); and *Naturrecht* (1860). See the Memoirs by Bonitz (1872) and Bratuschek (1873), and a work by Orphal (1891).

**Trengganu**, an unfederated Malay State on the east side of the Malay Peninsula, between Kelantan and Pahang, passed from Siamese to British protection in 1909. It exports dried fish, copra, tin and wolfram ores, areca nuts and rubber. Area, 5000 sq. m.; pop. (1921) 153,092; capital, Kuala Trengganu (12,456).

**Trent**, a river of central England, the third in length, rising on Biddulph Moor on the north-west border of Staffordshire, and flowing south-east through Staffordshire, then north-east through the counties of Derby, Leicester, Nottingham, and Lincoln, till it unites with the Ouse to form the Humber, about 15 miles W. of Hull. It receives on the right the Sow, Tame, Soar, and Devon, and on the left the Blythe, Dove, and Derwent; passes the towns of Burton, Nottingham, Newark, and Gainsborough; and is about 150 miles long. The construction of a series of locks between Newark and Nottingham (1922-26) enables barges of 120 tons to reach Nottingham. The Trent is also connected by canals with many other Midland manufacturing towns.

**Trent** (Ital. *Trento*, Ger. *Trient*, Lat. *Tridentum*), a town of Italy, on the left bank of the Adige, in a beautiful and fertile valley, surrounded by high limestone hills, 57 miles by rail N. of Verona. With its spires and towers, ruined castles and ancient embattled walls, it presents an imposing appearance from a distance. It is surrounded by detached forts. The Piazza Dante has a fine monument to the poet (1896). The Piazza Vittorio Emanuele III. is adorned with a splendid fountain of red marble, surmounted by a colossal statue of Neptune with his trident. The cathedral, begun in the 12th century, is a beautiful specimen of Lombard Romanesque, with a few features suggestive of the contemporary German style. The fine Renaissance church of Santa Maria Maggiore (15th century) was the meeting-place of the famous council during the bishopric of Cristoforo Madruzzo (see below). Among other public buildings are the seminary church (formerly the Jesuits' church), ornamented with the richest foreign marbles; the theatre; the town-hall, formerly the palace of the Counts of Thun; some noble private mansions; and the Castello del Buonconsiglio adjoining the town, a noble specimen of the feudal architecture of North Italy, with fine frescoes recently restored. Trent manufactures silks, wine, pottery, confections, and sugar, and has a brisk transit trade. Pop. (1880) 19,585; (1900) 24,908; (1921) 35,130.

The ancient *Tridentum* or *Tridente* derived its name from the Tridentini, an Alpine tribe, whose capital it was. In 1027 its prince-bishops obtained the temporal rule of the valley of the Adige, and under them Trent rose to great prosperity. Essentially an Italian town it became Austrian in 1803, being incorporated with Tirol (q.v.). After much fighting, however, it returned to Italy from 1810 to 1814, but then became Austrian again, and was only restored to Italy (in the treaty of St Germain, 1919) after the Great War. When hostilities ceased on 4th November 1918 it had been already occupied the day before by Italian troops, which had pushed beyond it as far as Salorno and the hills south-west of Bolzano (Bozen, Botzen). The province has an area of 2539 sq. m. and a population of 406,260, and forms with the province of Bolzano the *regione* of Venezia Tridentina. See TIROL. The district surrounding Trent is known as the *Trentino*.

THE COUNCIL OF TRENT, generally reckoned as the eighteenth oecumenical council of the church, assembled at Trent, and sat with certain interruptions from December 13, 1545, until December 4, 1563. From the first outbreak of the Reformation a council of some sort had been called for by both Catholics and Protestants. Luther and his friends thought of one in which all Christians should be represented and the Scriptures accepted as the sole rule of faith. The emperor and many Catholic princes desired a council mainly for the reformation of abuses in ecclesiastical government and discipline, a reform, as the phrase went, 'in the head and members,' and to obtain certain concessions in doctrine and ritual, in the hope of conciliating Protestants and restoring to Europe religious peace. The pope and the Roman court, on the other hand, recognised in general the need of reform, and made sundry efforts in that direction, but for some time regarded the convocation of a council with undisguised aversion, from a well-grounded fear lest the emperor should dictate the subjects of debate and usurp the functions of the holy see, and partly lest the council itself should, in the spirit of some recent synods, presume to declare itself superior to the pope, and initiate reforms unacceptable to the Roman curia. It was the object of the popes, with or without a council, to more clearly define Catholic doctrine, pronounce the condemnation of the new heresies, strengthen the bonds of ecclesiastical unity, and consolidate the papal power. These conflicting aims and interests supply the key to the intricate negotiations which led first to the long delay in the meeting of the council, and subsequently to its several prorogations and suspensions, covering in all a period of more than forty years. Clement VII., who for ten years had resisted the pressure put upon him by Germany, at length, after an interview with the Emperor Charles V. in 1533, consented to call a council at Mantua or some Italian city. The Protestants now in their turn made difficulties, and insisted upon a freedom of debate and a reopening of closed questions which were incompatible with the traditions and principles of the Roman Church. Meanwhile England was lost to the pope, and Paul III. (December 1534), recognising that a council was inevitable, set himself earnestly to overcome all practical difficulties, indicted the council first at Mantua for May 1536, then at Vicenza, and again, without success, at Trent in 1542, until finally the council actually opened at the latter place, as has been said, December 13, 1545, the twelfth year of the pontificate of Paul, with four archbishops, twenty-two bishops, five generals of orders, and two ambassadors, under the presidency of three papal legates, the cardinals Del Monte (afterwards

Julius III.), Cervini, and the Englishman Reginald Pole.

It was at once apparent that, though considerable freedom of speech was tolerated in the course of debate, the procedure of the council and its final decrees were under the immediate control and direction of the pope. Matters for deliberation could only be proposed by the legates, though this was a source of frequent complaint and contention; and the legates on all questions of difficulty awaited the pope's decision. The pope had desired that matters of doctrine should be dealt with first, while the emperor demanded that the council should begin with practical reforms. It was finally agreed that doctrine and discipline should be treated simultaneously in every session. The decrees were prepared in particular congregations, or select committees, afterwards more fully discussed and voted upon in general congregations, and finally proclaimed in public sessions. The position which the council was to take up with regard to the principles of the Reformation was soon made clear. In the fourth session, held April 8, 1546, sacred tradition, or the unwritten Word of God, was put on a par with Scripture, all the books contained in the Vulgate, including the so-called Apocrypha, were declared to be canonical, and the Vulgate version was pronounced 'authentic.' The important doctrine of Justification, which some of the bishops admitted to be comparatively new and to raise questions which the Schoolmen had not fully treated, was after much discussion laid down (sixth session, January 13, 1547) in terms which involved the emphatic condemnation of the Lutheran teaching, as well as of certain moderate views in that direction which had recently found favour within the Roman Church, and had been advocated by Cardinal Pole, who in the preceding October had resigned his legation on the plea of health. Discussions followed on original sin and the sacraments; but while the new heresies were explicitly condemned, care was taken not to close, without grave reason, any questions which divided the Thomists and Scotists or the orthodox schools of Catholic theology. Many ancient subjects of dispute, as, for example, the Immaculate Conception, were thus designedly left unsettled. One of the most prolonged of the party struggles which agitated the council arose at the earliest stage of its proceedings out of a discussion on the laws regarding episcopal residence. The Spanish bishops, who formed a strong minority, and who were at times supported by the French, were eager to strengthen the authority of bishops, and wished the council to define that episcopal jurisdiction was derived immediately from Christ and not through the pope. The Italians, supported by the legates in the interests of papal centralisation, were opposed to any such definition. It was not till towards the close of the council in 1563 that a decree, so worded as to leave the point in ambiguity, was accepted as satisfactory. Meanwhile the legates, seeing the emperor irritated by the action of the council, and his power much increased by the recent course of political affairs, had become anxious to transfer the council to a spot less open to his influence. An epidemic at Trent afforded a sufficient pretext for removing in March 1547 to Bologna. Certain bishops in the imperial interest remained at Trent, and for a time there was risk of a schism. The fathers at Bologna, however, abstained from publishing any decrees; and the few sessions there held related only to successive prorogations until in September 1547 the council was suspended *sine die*.

In February 1550 Julius III. succeeded to the papacy, and in the following year, May 1551, reopened the eleventh session of the Council at Trent

under the presidency of Cardinal Crescenzio. It now sat for about twelve months, but in April 1552 the military successes of Maurice of Saxony led to another suspension. Meanwhile, in this second period of the council, the fathers had proceeded with the doctrine of the sacraments, and transubstantiation was defined. Certain Protestants now desired to be heard, and a safe conduct was accorded to their deputies, who were received in a general congregation; but their demands were considered impracticable, and the negotiations came to nothing.

Many years now passed, with little thought or opportunity of renewing the council. Meanwhile, the Emperor Charles V. had abdicated. Julius was succeeded by Cardinal Cervini, Marcellus II., and he in turn by the stern reformer Paul IV. (1555-59), who occupied himself mainly with the organisation and extension of the Inquisition. To Pius IV. (1560-66) belongs the credit of renewing the council, and, by his energy and tact, bringing it to a successful conclusion. This third period, in many respects the most important, begins with the seventeenth session, held in May 1562. Disciplinary decrees were passed regarding episcopal duties, the religious orders, the education of the priesthood, and the censorship of books. Clandestine marriages were by a new law made invalid. The odious office of questors of alms was abolished. Doctrinal decrees were issued on the mass, purgatory, the veneration due to saints, and the doctrine of indulgences.

During these last sessions (seventeenth to twenty-fifth) there were present at one time or another, besides ambassadors and theologians, 270 prelates, of whom 187 were Italians, 31 Spaniards, and 26 Frenchmen. The decrees of the entire council were confirmed, January 26, 1564, by Pius IV., who in the same year published the Profession of the Tridentine Faith, a brief summary of doctrines, generally known as the Creed of Pius IV. (see CREED).

Several important works, recommended or initiated by the council, but which the fathers could not effectually carry out, were handed over to the pope for completion. Thus, the revision of the Vulgate, ordered at Trent in 1546, was finally completed under Clement VIII. in 1592. Pius V. founded the Congregation of the Index to carry out the work attempted but left unfinished by the council. The same pope also undertook the revision of the Breviary, and in 1566 published the *Catechism of the Council of Trent* (see CATECHISM).

The first important history of the council was written in a very hostile spirit by a Servite friar of Venice, Paul Sarpi (q.v.), whose book was published in Italian under a feigned name at London in 1619, and afterwards translated into English by Brent in 1640. The Jesuit, Cardinal Pallavicini, who had access to Vatican archives, wrote a refutation of Sarpi in his *Historia del Concilio* (2 vols. fol., Roma, 1656). Le Plat, in his *Monumenta Concilii* (Louvain, 1781), printed a large collection of documents; to which must be added the *Acta Genuina*, printed by Theiner (1874) from the diary of Massarelli, the secretary of the council, and the *Sammlung von Urkunden* of Döllinger (1876). The best general history in English is that of the Rev. T. A. Buckley (Lond. 1852), who has also translated the *Canons and Decrees* (1851) and the *Catechism*; with which should be compared, on the Roman Catholic side, Waterworth's *Canons and Decrees*, &c. (1848). An interesting account of the debates within the council will be found in Mendham's *Memoirs* (1834), which includes the history of the synod under Pius IV. by Paleotto, the protonotary. A collection of the historical sources of the council (diaries, acts, letters, &c.) began to be published in 1901 (Freiburg). See also Ranke's *History of the Popes*; Philippon, *La Contre-Révolution Religieuse au XVI<sup>e</sup> Siècle* (1884); and Dejob, *De l'Influence du Concile de Trente sur la Littérature*, &c. (1884). And see ROMAN CATHOLIC CHURCH, TRANSUBSTANTIATION.

**Trent Affair.** In October 1861 Captain Charles Wilkes, U.S.N., intercepted at sea the British mail-steamer *Trent*, bound from Havana to St Thomas, and took off two Confederate commissioners accredited to France, senators Mason and Slidell, who were among her passengers. They were taken to Boston, and imprisoned in Fort Warren, but were released on 1st January 1862, on the demand of the British government, and suffered to proceed to Europe. The affair created intense excitement at the time, but Secretary Seward accepted Britain's demand as an adoption of the American doctrine which denied the 'right of search,' and on that ground replied that the prisoners would be 'cheerfully liberated.'

**Trente-et-un, Trente-et-quarante.** See ROUGE ET NOIR.

**Trentino, Trento.** See TRENT.

**Trenton**, the capital of New Jersey, is on the Delaware River, at the head of tide-water and of steam-navigation, 57 miles by rail from New York and 34 from Philadelphia. It is a handsome city, divided into Trenton and South Trenton by Assanpink Creek, with wide, straight streets, in the residence portions delightfully shaded. The public buildings include a commodious state-house, federal buildings, a county court-house, city hall, and state lunatic asylum, arsenal, penitentiary, reform school, and normal school, and there are several homes and hospitals. The Delaware, which is crossed by two fine bridges, is largely utilised for water-power. The industry chiefly identified with Trenton is the production of crockery and pottery, of which it is the principal centre in the United States; but there are other manufactures of scarcely less importance, including iron, steel, and zinc, rubber goods, fire-bricks, &c. On 26th December 1776 Washington here surprised 1500 Hessians, and captured nearly 1000, after crossing the Delaware during the night, amid blocks of floating ice and in the face of a fierce snow-storm. Pop. (1880) 29,910; (1920) 119,289.

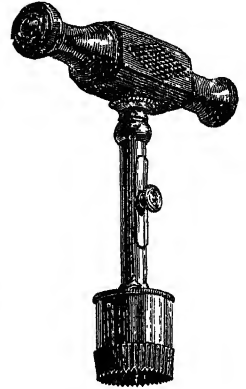

**Trenton Falls**, a village of New York, on West Canada Creek, 17 miles by rail NW. of Utica, celebrated for its beautiful cascades (five, within a deep, narrow limestone ravine), with an aggregate fall of nearly 400 feet in 2 miles.

**Trepan.** See TREPHINE.

**Trepang**, the Malay name for species of *Holothuria*, principally *H. edulis* and *H. nigra*, much esteemed in China as a food delicacy. It passes also under the name of 'bêche de mer,' or sea-slug. The ordinary kind resembles a prickly cucumber; but they vary in colour when dried, being black, white, or red. There are no less than thirty-three different varieties enumerated by Chinese traders. It is gutted, boiled, split open, and smoke-dried. The average size is about 8 inches long, but some are found 2 feet in length. In the commercial form it is very hard and rigid, but when boiled down into a kind of gelatinous soup it is much esteemed. The fishing is carried on extensively on the northern coast of Australia, in India, Fiji, Tahiti, Macassar, Sumatra, and New Caledonia. Although there are so many varieties, only about five kinds have any great commercial value—viz. brown, large and small black, red, and white: these rank in importance in the order given. It is only in China (where it is valued as an aphrodisiac) that this marine food-substance is appreciated; some is shipped annually from India to Hong-kong, and a little also from Japan.

**Trephine.** The instrument in its original form was like a carpenter's brace, and was called a *trepam*, from Gr. *τρυπάω*, allied to Lat. *tereō*, 'I bore.' The operation of trephining consists in the

perforation of a bone, usually the skull, by means of a trephine, which is a small cylindrical or circular saw, with a centre-pin on which it works. It is practised on the skull in cases of fracture, chiefly when symptoms of compression or irritation of the brain are produced by depressed portions of bone, or by hæmorrhage beneath the skull; as a necessary preliminary to all operations on the brain—e.g. the evacuation of abscesses; for the removal of the focus of irritation in certain cases of epilepsy, &c., particularly where the disease has followed injury to the head; and even in rare cases for the removal of tumours. Trephining was known and practised in prehistoric times; many skulls of the Stone Age that had been thus practised on are to be found in archæological museums. Comparatively recently it was used almost as a routine treatment in severe head injuries; but it is now restricted to a very small proportion of such cases. The advance of knowledge of localisation of function in the brain, and the introduction of antiseptic methods in surgery have, however, extended its scope in other directions. It has more recently been applied to the treatment of tumours of the brain as well as other diseases of the head, and in certain forms of idiocy and insanity.

Trephine.

**Trespass**, in Law, is a physical interference with the person or property of another. However innocent the act, if it be voluntary, a legal wrong is done. Thus, if pursued by a wild beast you deliberately take refuge in another man's house, you commit a trespass; but if you rush there in mere blind fear, you do not. Again, if you drive in so careless a manner as to hurt any one, though unintentionally, this is a trespass. If animals or, indeed, any chattels are on a man's land doing damage, they may be seized and impounded till compensation be made. This remedy is called distress *damage feasant*. It is similar to distress at common law—e.g. there is no power of sale. If a dog worry cattle or sheep, the owner is liable since 1863. Formerly it was necessary to prove *scienter*—i.e. knowledge by the master of the animal's vicious disposition. *Scienter* must still be proved in other cases, and generally when animals, not savage by nature, do hurt—a legal doctrine quaintly parodied in the vulgar saying, that the dog is entitled to his first bite. Even in complete absence of real injury an action for trespass will lie, for, says Lord Denman, those rights are an extension of that protection which the law throws round the person. A verdict of a farthing damages is, however, the frequent and appropriate compensation for injury without damage (*injuria sine damno*).

As will be seen, there are various kinds of trespass: (1) trespass to goods, which consists in damaging them physically, as *asportation*—i.e. carrying them away; (2) trespass to the person, which is either battery, assault, or false imprisonment. Battery is an active attack on any one. Assault (q.v.) is an attempted battery; both are criminal offences as well as civil wrongs. False imprisonment is usually classed among the latter. It consists in depriving a man of his liberty without lawful excuse. Compelling any one to submit by the exhibition of superior force, though no

actual violence be used, is a wrong of this nature. If a constable intervene, the question is, did he do so of his own initiative, or at the prompting of a third party? In the second case only, even if the arrest be illegal, can the third party be held liable for the false imprisonment. Trespass to the person may be justified on the ground that a man was acting in self-defence, that it was necessary to stop a breach of the peace, to apprehend a felon, or to assist police-officers in the execution of their duty, and that the person arrested was dangerous to himself and others. Various acts give power to arrest those found committing certain specified misdemeanours.

As regards trespass to land, since a plaintiff must succeed by the strength of his own, not by the weakness of his adversary's case, bare possession is a good title as against a wrong-doer; so the occupier may turn out an intruder, using, upon his refusal to depart peaceably, as much force as is necessary. If the possessor be forcibly turned out, he may forcibly re-enter, even though outer doors be broken open to effect the purpose. But this must be done immediately, otherwise the owner, though entitled to possession, will, if he use violence, render himself criminally liable under the statutes of Forcible Entry. In making a distrain for rent, or in levying an execution, but not in executing criminal legal process, it is a trespass to break open the outer door. Although the general rule is that any entry on another's land is a trespass, yet in certain cases of necessity an entry is excused—e.g. to abate a nuisance, or to prevent the spread of fire. A customary right of recreation or right of way will excuse what would otherwise be a trespass. Cut glass or spikes on a wall are allowable as a defence against intruders; but not man-traps or spring-guns (except inside a dwelling-house), at least since 1827. Even before that a trespasser could recover for damages so done to him, unless he had notice of the existence of the engines in question. The mere act of trespassing on another's land is not a criminal offence, but by statute it is when in pursuit of game, on railways, on places where explosives are stored or animals afflicted with contagious disease are confined. Besides the remedies for trespass—viz. forcible expulsion and an action for damages—an injunction may be granted, even for a bare trespass, since the Judicature Act of 1873. The law of the United States is based on the English law.

The term trespass, in Scots law, is borrowed from that of England. It is restricted to trespass to land. The law on the subject is generally the same as in the rest of the United Kingdom. The Trespass Act, 1865, provides a summary form of punishment for those who camp upon open land, or lodge in premises or enclosures without leave. Against mere trespassers an interdict may be obtained. See RIGHT OF WAY, POACHING, GAME-LAWS.

**Trevelyan**, SIR CHARLES, was born on 2d April 1807, the fourth son of the Archdeacon of Taunton, and was educated at the Charterhouse and Haileybury College. He entered the East India Company's service, and became assistant-secretary to the Treasury (1840-59), governor of Madras (1859-60, being recalled for his protest against new taxes proposed), and Indian finance minister (1862-65). He was created a K.C.B. in 1848, and a baronet in 1874; published several works on educational and philanthropic subjects; and died on 19th June 1886.—His son, the Right Hon. Sir GEORGE OTTO TREVELYAN, by his first wife, Hannah, Lord Macaulay's sister, was born at Rothley Temple, Leicestershire, on 20th July 1838. He passed from Harrow to Trinity College, Cambridge, and graduated as second classic (1861). In

1865 he was returned for Tynemouth in the Liberal interest, in 1868 for the Border Burghs, and he became a Lord of the Admiralty (1868-70), parliamentary secretary to the Board of Admiralty (1880-82), Chief-secretary for Ireland (1882-84) as Lord Frederick Cavendish's successor, and a member of the Privy-council, chancellor of the duchy of Lancaster, with a seat in the Cabinet (1884-85), and Secretary for Scotland (1886). Defeated in the Borders at the general election (1886) as a Unionist, in August 1887 he regained admission to parliament for Bridgeton (Glasgow) as a Gladstonian, was re-elected in 1892, was Secretary for Scotland (1892-95), and was re-elected in 1895, but retired from public life in February 1897. He wrote *Horace at the University of Athens* (1861) and *The Ladies in Parliament* (1869), two brilliant Aristophanic skits; *Letters of a Competition Wallah* (1864); *Cawnpore* (1865); the admirable *Life and Letters of Lord Macaulay* (1876-1908); the *Early History of Charles James Fox* (1880); and *The American Revolution* (1899-1914).—Sir George's eldest son, CHARLES PHILIPS TREVELYAN, born in London 28th October 1870, and educated at Harrow and Trinity College, Cambridge, sat as a Liberal for Eiland 1899-1918. He became Parliamentary Secretary to the Board of Education in 1908, but resigned in 1914, disapproving of the government's war policy. He re-entered parliament in 1922 as Labour member for Central Newcastle, and was president of the Board of Education in Mr MacDonald's government.—GEORGE MACAULAY TREVELYAN, another son of Sir George, born 16th February 1876, was also educated at Harrow and Trinity College, Cambridge. Besides a series of notable books on Garibaldi he has written *A History of England* (1926) and other works on British history.

**Trèves.** See TRIER.

**Trevet.** See TRIVET.

**Treviranus**, GOTTFRIED REINHOLD (1776-1837), and his brother, LUDOLF CHRISTIAN (1779-1864), are eminent in the history of biology. See EVOLUTION, and BIOLOGY.

**Trevisa**, JOHN (c. 1326-1402), a Cornishman, fellow of Exeter and Queen's Colleges, Oxford, vicar of Berkeley, and canon of Westbury (most likely Westbury-on-Trym near Bristol), Englished Bartholomæus Anglicus, Higden, and other authors—probably also the Bible. See a monograph by H. J. Wilkins (1915), and A. J. Perry's introduction to the *Dialogus inter Militem et Clericum*, &c. (E.E.T.S. 1925).

**Treviso** (the ancient *Tarvisium*), the capital of an Italian province, on the Sile, 17 miles N. of Venice by rail. It has a cathedral dating from 1141, restored and enlarged in the 15th century, with pictures by Titian and Pordenone; the Gothic church of San Nicolò (1310-52); and a public library (100,000 vols.). Other churches contain art treasures, and the picturesque battlemented Palazzo dei Treinto in the main square is noticeable. The 15th century town-walls are still preserved. Treviso has various manufactures, and is the centre of a fertile district. Pop. of commune (1921) 49,737.

**Trevithick**, RICHARD (1771-1833), one of the pioneers of railway travelling. See RAILWAYS, and the Life by Francis Trevithick (1872).

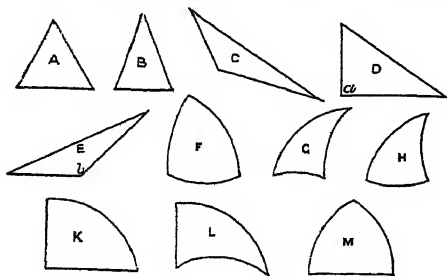

**Trevor**, SIR JOHN, born in 1633, in the parliament which met on 19th May 1685 was elected Speaker of the House of Commons. 'Trevor,' says Macaulay, 'had been bred half a pettifogger and half a gambler, had brought to political life sentiments and principles worthy of both his callings, had

become a parasite of Jeffreys, and could on occasion imitate not unsuccessfully the vituperative style of his patron. The minion of Jeffreys was, as might have been expected, preferred by James, was proposed by Middleton, and was chosen without opposition. In the same year he was made Master of the Rolls. He contrived to maintain his political and judicial position after the revolution of 1688, and was re-elected Speaker in 1690, on an understanding with the government that he was to take the management of the bribery department. As first commissioner of the Court of Chancery, his integrity was greatly suspected; and though he was deficient neither in learning nor in parts, his greed and venality at length became notorious. In 1695 a committee of the House of Commons reported that in the preceding session Sir John Trevor had received 1000 guineas from the city of London for expediting a local bill. When it was moved in the House that the Speaker had been guilty of a high crime and misdemeanour, he had himself to put the question, and to declare that the 'Ayes' had it. A few days afterwards he was formally expelled. He still, however, retained the Mastership of the Rolls, 'to the great encouragement' says North, 'of prudent bribery for ever after.' He died 20th May 1717.

**Trial.** See CRIMINAL LAW, JURY. For Trial by Combat, see BATTLE (WAGER OF).

**Trialism.** See AUSTRIA-HUNGARY, p. 610.

**Triangle** (*tres*, 'three,' *angulus*, 'a corner'), the most simple of closed geometrical figures, is a figure having three angles, and consequently three sides. It is, indeed, generally defined by geometers as a figure of three sides, and its property of being three-angled is put in the subordinate position of a necessary consequence. In plane geometry a triangle is bounded by three straight lines; and triangles are classed according to the relative length of their sides into *equilateral* (A), or equal-sided; *isosceles* (B), or having two sides equal; and *scalene* (C), or unequal-sided. Considered with reference to the size of its angles, a triangle is *right-angled* (D) when one of its angles (*a*) is a right angle ( $90^\circ$ ), *obtuse-angled* (E) when it has one angle (*b*) greater than a right angle,

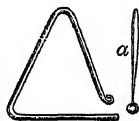

Triangles.

and *acute-angled* (A or B) when it has no angle so great as a right angle. The triangle being the fundamental figure of plane geometry, through which the properties of all other figures have been arrived at, the investigation of its properties has always been held to be of primary importance. The simpler of these properties have of course long been known; but in modern times a whole system of geometry has grown up known as the geometry of the triangle, in which an endless number of remarkable properties are discussed. To the modern geometer the triangle connotes not merely the closed figure bounded by the sides, but the outside regions of space marked off by the sides

produced to infinity. Of special importance also are those lines drawn through the angles which bisect these angles, or bisect or are perpendicular to the opposite sides. Then there are many interesting theorems connected with the inscribed, circumscribed, and escribed circles (see Casey's *Sequel to the First Six Books of Euclid*). The area of a triangle is half of that of a parallelogram which has the same base and altitude, and is thus equal to half the product of the base into the altitude. In the geometry of the sphere a triangle is a figure bounded by three arcs of circles (as F, G, H, K, L, and M). For triangulation, see ORDINANCE SURVEY, SURVEYING, TRIGONOMETRY; for triangular numbers, see FIGURATE NUMBERS.

**Triangle**, a musical instrument of percussion, formed of a steel rod bent in triangle-form, open at one angle, as shown in the figure. It is suspended by means of a string attached to the upper angle, and struck with a steel beater (*a* in figure). Many composers use it in their works as an adjunct to the drums, and it has a place in all military bands.

**Triangulation.** See ORDINANCE SURVEY.

**Trianon.** See VERSAILLES. The treaty of Trianon, signed 4th June 1920, made peace between Hungary and the 'Allied and Associated Powers.' Hungary ceded to Czechoslovakia a great stretch of territory in the north, including all Slovak and Ruthenian county; to Rumania Máramaros (Maramuresh), Crisana, Transylvania, and part of the Banat—all the Rumanian and German speaking regions of the east, with a Székler population as well; to the Serb-Croat-Slovene state a stretch of territory along the river Mur, Croatia-Slavonia, and parts of the Banat, Bács-Bodrog, and Baranya—mainly South Slav in population. Fiume was given up, its fate to be decided later. Burgenland went to Austria, but much of it was soon afterwards regained. For limitations placed upon Hungary's armed forces, see HUNGARY. On the whole, Hungary was treated much as Germany had been, with more ruthless reduction of territory. See also DANUBE.

**Triassic System.** This forms the basement group of the Mesozoic or Secondary strata, and was formerly associated with the Permian System under the name of the New Red Sandstone. The term *trias* has reference to the threefold grouping of the system in Germany, where the strata are more fully developed than in Britain. In our area the system rests unconformably upon the upturned and denuded edges of the Permian and older Palæozoic strata. It is well developed in the central plains of England, whence a long belt extends north from Nottingham to the valley of the Tees, while another band stretches down the Severn valley into Devonshire. Small areas likewise occur in Dumfriesshire and near Elgin, and also in the north of Ireland. The system, however, assumes more importance in central Europe, where it occurs at the surface over a wide tract between the Thüringerwald in the east and the Vosges Mountains in the west, and between Basel in the south and Hanover in the north. North of that region it continues underneath overlying formations, but appears again and again at the surface where these latter are wanting. Trias is also met with in Heligoland and the south of Sweden. In all the regions now noted the strata appear to have been deposited in inland seas, and the following table gives the general succession of strata:

RHÆTIC	Dark shales, red, green, and gray marls, thin gray limestones, sandstones, and bone-beds (Penarth Beds); and in Germany occasional thin coal-seams.
UPPER TRIAS OR KEUPER.	Red, green, and gray marls and shales, and thin sandstones, with rock-salt and gypsum (Penarth Beds); red sandstones, marls, and clays, with thin coal-seams (Germany).
MIDDLE TRIAS OR MUSCHELKALK.	Limestones and dolomites, with associated beds of rock-salt, gypsum, and anhydrite. Not represented in England.
LOWER TRIAS OR BUNTER.	Mottled red and green sandstones, marls, and conglomerates; with (in Germany) occasional beds of dolomite, rock-salt, and gypsum.

In the Alpine regions the Trias differs much from that of England and Germany. It attains a thickness of many thousand feet, and forms ranges of mountains. The lower division consists chiefly of fossiliferous limestones, the middle of shales, marls, limestones, and dolomites, while the Rhætic is built up mainly of limestones and dolomites. Thus in north-western and central Europe we have one well-defined type consisting of strata which have accumulated for the most part in inland seas, while in the Alpine regions the character of the beds betokens more open water. In France isolated areas of Trias occur, some of which approximate in appearance to those of England, while others resemble those of Germany. In Spain and Portugal both the German and Alpine types are represented.

In North America the Trias is well developed, as in Nova Scotia, Prince Edward Island, the Connecticut valley; the west side of the Hudson River, and south-west through Pennsylvania into Virginia; North Carolina. Strata believed to be of the same age cover wide areas in the western territories, extending from the eastern borders of the Rocky Mountains into Alaska, British Columbia, and California. Brick-red sandstones and marls are a prominent feature in all those areas. Like the similar rocks of Europe they contain few fossils, but animal tracks and footprints are of frequent occurrence. On the whole the American strata above referred to resemble the English type of the Trias. But on the Pacific slope, in Northern California and Mexico, the strata yield a plentiful marine fauna, and resemble the type of the Alpine Trias. Rocks of Triassic age have been recognised in Spitzbergen, in the Himalayas, and again in South Africa, in New Zealand, and New South Wales, where the strata contain clay iron-stone and thin seams of coal.

*Life of the Period.*—The predominant plants were cycads (*Pterophyllum*, *Zamites*, &c.), horse-tails (*Equiseta*), ferns, and conifers, especially the cypress-like *Voltzia*. In the red beds of the Trias few fossils occur, our knowledge of the life of the period (more especially the invertebrate life) being derived from the Rhætic, the Muschelkalk, and the marine strata of the Alpine Trias. Foraminifera, sponges, star-corals, and echinoderms were tolerably numerous. One of the most beautiful fossils is the lily encrinite (*Enerinus liliiformis*) of the Muschelkalk. Amongst Lamellibranchs *Myophoria*, *Avicula*, *Pecten*, *Cardium* were common forms. A number of Palæozoic genera of Gastropods (*Loxonema*, *Murchisonia*, &c.) appear, commingled with newer forms. The same is the case with the Cephalopods, such old genera as *Orthoceras*, *Cyrtoceras*, and *Goniatites* occurring along with *Ceratites* and other members of the great tribe of Ammonites. This remarkable association of Palæozoic and Mesozoic genera is most notable in the Alpine Trias. In the same strata occur the earliest traces of dibranchiate cephalopods, represented by the internal bone or shell (*Belemnites*). The Triassic fishes are ganoids and placoids—the latter represented by spines and palate teeth (*Cera-*

*odus*). Labyrinthodonts abounded, and are known chiefly through their footprints, which are often plentiful in the red beds of the Trias. Some of these creatures attained a large size—the skull of one (*Mastodonsaurus*) measuring over 3 feet in length by 2 feet in breadth. Lizard-like reptiles (*Telerpeton*, *Hyperodapedon*) were numerous, while crocodiles (*Stagonolepis*) made their first appearance. The same is the case with the extinct group of Dinosaurs—terrestrial reptiles, some of which could walk on their hind-feet, which were often only three-toed—their front feet being four-toed. The footprints of these Dinosaurs are very numerous in some sandstones, and the three-toed impressions were at first supposed to be those of birds. They vary in size, the largest being nearly 2 feet long. Swimming reptiles (*Nothosaurus*) have also been recorded from the Trias. Another remarkable group of reptiles were represented by *Dicynodon*, which had a horny beak and carried two large tusk-like teeth in the upper jaw. The Trias is further remarkable for having yielded the earliest relics of mammalia. They seem to have been small marsupials (*Microlestes*, *Dromatherium*), with some affinities to the little Banded Ant-eater of Australia.

*Physical Conditions.*—The British Triassic strata afford evidence of having, for the most part, been deposited in a great inland sea or salt lake, from the waters of which sodium chloride (rock-salt), gypsum, and other chemically-formed materials were precipitated. This inland sea covered a large part of England, and extended north into southern Scotland and across what is now the area of the Irish Sea into the north-east of Ireland. It is possible also that the same sea stretched into northern France. Another but smaller lake is indicated by the red sandstones of Elgin. The lands surrounding these lakes were clothed with cypress-like evergreens, and their shores were haunted by labyrinthodonts and various reptiles. The briny waters were unfavourable to life, and we have consequently few traces of any aquatic fauna, which seems to have consisted chiefly of small phyllopods (*Estheria*) and fishes. Eventually the lacustrine areas became largely silted up, and then subsidence of the land took place, so that the sea occupied some of the shallow depressions. In these marine tracts the Rhætic beds were deposited.

On the Continent during a large part of the Triassic period an inland sea extended westwards from the Thüringerwald across the Vosges country into France, and stretched northwards from the confines of Switzerland over what are now the low grounds of Holland and North Germany. In this ancient sea the Harz Mountains formed an island. In the earlier stages of the period the conditions resembled those that obtained in Britain, but the thick Muschelkalk with its numerous marine forms seems to indicate an influx of water from the open sea. Afterwards, however, this connection was closed, and the subsequent accumulations point to increasing salinity, during which chemical formations (gypsum, rock-salt, &c.) took place, while the marine fauna disappeared. Towards the close of the period, after the great inland lake had been largely silted up, a partial influx of the sea introduced a fauna comparable to that of the English Rhætic. It seems highly probable that the lands surrounding the inland lakes of central and north-western Europe were more or less dry and sandy regions, like the great wastes of central Asia. Many of the sandstones in the Bunter series of England are made up of grains so completely worn and rounded that they exactly recall the appearance presented by the wind-blown sands of desert regions. Some geologists therefore infer that in

the earlier stages of the Triassic period large tracts of Britain were sandy deserts before the inland sea attained its greatest development.

The Alpine Trias, which is mostly marine, shows that, while continental and lacustrine conditions obtained in central and north-western Europe, an open sea existed towards the south—a Mediterranean of much greater extent than the present. From the fact that Triassic rocks with characteristic fossils occur within the Arctic regions, it may be inferred that the climate of the period was generally genial or warm.

**Tribe**, an aggregate of stocks—a stock being an aggregate of persons considered to be kindred—or an aggregate of families, forming a community usually under the government of a chief. The chief is possessed of despotic power over the members of the tribe, which is one of the earliest forms of the community among all the races of men. The discussion of the origin of tribes will be found in the article **FAMILY**; see also **MARRIAGE**, **CLAN**, and the articles on peoples, such as the American Indians, whose organisation is tribal (cf. **IROQUOIS**).

**Tribonian** (Tribonianus), a very eminent Roman jurist of the 6th century, of Macedonian parentage, but born in Paphlagonia. He held under the Emperor Justinian the offices of quaestor, master of the imperial household, and consul. But he is famous chiefly through his labours in connection with the Code (q.v.) of Justinian (q.v.) and the Pandects. Tribonianus died in 545.

**Tribulus**, a genus of xerophilous herbs of the family Zygophyllaceæ, inhabiting south Europe, Asia, Africa, and America. The fruit is distributed by means of sharp, stiff spikes, which catch in the fur of animals, or in their feet, after the manner of the Roman *tribulus*, for which see **CALTROP**.

**Tribune**. See **ROME** (*The Republic*).

**Triceps**. See **ARM**.

**Triceratops**, a Cretaceous dinosaur of North America, with a great skull bearing three horns, and a bony frill on the neck.

**Trichiasis**. See **EYE**.

**Trichilia**, a tropical genus of trees of the family Meliaceæ; several African species yield oil-nuts used in soap-making.

**Trichina** (*Trichinella spiralis*), a minute parasitic Nematode, occurring especially in rat, pig, wild-boar, and man, the adults in the small intestine, the larval stages encysted in muscle.

Trichina lying coiled up in muscle (magnified).

The female is three to four millimetres in length, the male a little less than half that. If a pig devour a dead rat with larval Trichinae in its muscles, these are set free in the intestine; they feed, grow, moult, pair, and multiply. The males die after copulation; the females bore in or through the wall and liberate young ones viviparously, in the lymph spaces in particular. Each female produces about 1500 larvæ, 60 to 80 at a time. The larvæ migrate, often in large numbers, for the most part passively in the blood-stream;

they penetrate through the capillaries into the intramuscular connective tissue, and thence into the muscle-fibres, where they coil in a spiral and encyst, causing degeneration. They may remain alive for many years, but will not develop further unless the muscle be eaten by an appropriate second host. If man should eat trichinosed pig's flesh in which the

Trichinae have not been killed by curing and cooking, he will be the scene of what has been described for the pig. See Braun's *Animal Parasites of Man* (1916).

**Trichinopoli**, the capital of a district (4319 sq. m.) in Madras Presidency, on the right bank of the Kaveri, 56 miles from the sea. At least seventeen villages and hamlets are included in the municipal limits. The fort, which includes the old town, is dominated by a mass of gneiss 273 feet above the level of the street. There are two temples upon it. The walls of the fort, which are now demolished, had a circuit of two miles, and this area is inhabited by a dense population. The moat has been laid out as a boulevard, and the Nawab's palace, which was restored in 1873, has been utilised for courts and offices. Beyond the walls is St John's Church, where Bishop Heber was buried in 1826. The troops are stationed 1½ mile south of the fort. There are a market (1868), military and municipal hospitals, and an observatory. Cheroots are made in large quantity, chiefly from excellent tobacco grown at Dindigal. Manufactures of hardware and jewellery, especially gold chains, are extensively carried on. It is the residence of a Roman Catholic bishop, with a first-grade Catholic college affiliated with Madras University; and the Lutherans, Wesleyans, and the Society for the Propagation of the Gospel have missions, and the last mentioned a first-grade college. Pop. (1921) 120,422.

**Trichinosis**, or **TRICHINIASIS**, a disease caused by the parasite *Trichina* (q.v.).

**Trichiurus**. See **HAIR-TAIL**.

**Trichodectes**. See **SHEEP-LOUSE**.

**Trichodesmium**, a genus of algae belonging to the blue-green seaweeds (Cyanophyceæ), but red in colour. Vast floating masses occur in tropical seas; and it is supposed that the Red Sea takes its name from the great banks of *T. erythraeum* that appear in it from time to time.

**Trichoptera**. See **CADDIS-FLY**.

**Trichromatic Theory** of Thomas Young (q.v.). See **COLOUR PERCEPTION**; and for applications, **ILLUSTRATION**, **PHOTOGRAPHY**.

**Tricolor**. See **FLAG**.

**Tricoupis**, **CHARILAOS** (1832-96), Greek statesman, born at Nauplia, a son of Spyridon Tricoupis, was foreign minister (1866), and several times prime minister between 1875 and 1895. He aimed at strengthening Greece as a military and naval power, and developing communications.

**Tricoupis**, **SPYRIDION**, a modern Greek statesman and writer, was born at Missolonghi, 20th April 1788. He served as private secretary to Lord Guilford in the Ionian Isles, but took his place amongst the patriots on the outbreak of the war of independence. From 1821, except during the presidency of Capo d'Istria, he was continually employed in administrative and diplomatic business, was thrice sent to London as envoy-extraordinary, was minister of foreign affairs and of public instruction (1843), vice-president of the senate (1844-49), and envoy-extraordinary to Paris (1850). He died February 24, 1873. His speeches were collected at Paris (1836). Notable also are his poem on the Klephts (1821) and his *History of the Greek Revolution* (1853-57).

**Tricuspid**. See **HEART**.

**Tricycle**. See **CYCLING**.

**Tridacna**. See **CLAM**.

**Trident**, a three-pronged fork used by fishermen, is employed as the attribute of Poseidon (Neptune), and is frequent on coins of such Greek states as had Poseidon for patron deity. The con-

ventional figure of Britannia bears a trident as the symbol of sovereignty over the sea.

**Tridentum.** See TRENT.

**Tridymite**, a mineral composed of silica, which occurs in various acid igneous rocks in the form of thin transparent six-sided plates, several of which are usually grouped together. It is very brittle, has a hardness of 7, and specific gravity of 2.25 to 2.33. The mineral occurs in cavities in the more acid igneous rocks, as in those of the Siebengebirge, Mont Dore, Euganean Hills, Ireland, Iceland, Mexico, &c. It is also met with scattered through the ground-mass of volcanic rocks, as at Kosmütz in Silesia, Kaschau, Hüttenberg in Carinthia, &c.

**Triennial Acts.** See PARLIAMENT.

**Trient.** See TRENT.

**Trier** (Fr. *Trèves*), a city of Rheinland, lies on the right bank of the Moselle, in a valley between low vine-covered hills, 69 miles by rail SW. of Coblenz. The river is crossed here by an eight-arch bridge, 623 feet long, whose Roman piers date from 25 B.C. 'A quiet old-fashioned town, Trèves,' Freeman says, 'has a body of Roman remains far more numerous and varied, if not individually more striking, than any other place north of the Alps can show.' These include the 'Porta Nigra,' 118 feet long, and 95 high, one probably of the five gates by which Trier was entered in Constantine's time; the so-called Roman baths (more probably part of an imperial palace); and a basilica built of Roman brick by Constantine for a court of justice, but demolished in great measure to make room for an electoral palace in 1614. This, however, was removed, and the basilica fitted up for a Protestant church in 1856. Beyond the walls are the ruins of an amphitheatre that could seat 30,000 spectators; and 6 miles off is the 'Igelsäule' or 'Heidenturm,' a monumental column, 71 feet high, sculptured with bas-reliefs of the 2d century. The cathedral of SS. Peter and Helena is an interesting structure of various antiquity, but chiefly in the early German Romanesque style of the 11th century. The most famous of its relics is the seamless or 'Holy Coat,' which consists of 'connected fragmentary particles of material.' Said to have been brought to Trier by the Empress Helena, it is first referred to in 1106 by an anonymous monk, and was not a source of revenue till 1512. It was visited by nearly two million pilgrims in 1891, the first time of exhibition since 1844. A 'Holy Coat' is also shown at Argenteuil and in nineteen other places. Connected with the cathedral by a cloister is the beautiful Liebfrauenkirche (1243); and there is an extensive library containing many MSS., among them the 'Codex Aureus' of the Gospels, presented to the abbey of St Maximin by Charlemagne's sister Ada. A university, founded in 1472, was suppressed in 1798. The industries comprise manufactures of woollens, cottons, and linens, besides a brisk trade in corn, timber, and Moselle wine. Pop. (1871) 21,442; (1891) 36,162; (1910) 49,112; (1919) 53,248; (1925) 57,341.

Trier, which claims to be 1300 years older than Rome, derives its name from the *Treviri*, a Gallic or, more probably, a Belgic people, who in Cæsar's time inhabited a large district between the Meuse and the Rhine. Their capital, *Augusta Trevirorum*, seems to have become a Roman colony in the reign of Augustus, and ultimately was the headquarters of the Roman commanders on the Rhine, and a frequent residence of the emperors, especially Constantine. Sacked by Attila in 451, it passed to the Franks in 463, to Lorraine in 843, to Germany in 870, and back to Lorraine in 895,

and was finally united to Germany by the Emperor Henry I. The Archbishop of Trier was, as chancellor of Burgundy, one of the Electors of the Empire, a right which originated in the 12th or 13th century, and which continued till the French Revolution. The last elector removed to Coblenz in 1786; and Trier was the capital of the French department of Sarre from 1794 till 1814, since which time it has belonged to Prussia.

**Trieste**, a town of Italy (till 1918 the most important seaport of Austria-Hungary), stands at the head of the Gulf of Trieste, an arm of the Gulf of Venice. In 1849 it was constituted an imperial free city, and attached and belonging to it was a territory 36 sq. m. in extent. The city of Trieste, in which the population of the district is almost wholly massed, consists of the old town, the new town, and two suburbs. The old town, built on the slope of a steep hill crowned by a castle (1470-1680), is distinguished by its narrow streets and black walls. It contains the cathedral of S. Giusto, a Byzantine edifice built between the 5th and 14th centuries, into the walls of which stones bearing Roman inscriptions and carving have been built, and the tower of which is said to rest on the foundation of a temple of Jupiter, Juno, and Minerva. Here are also the Museo Lapidario, and the so-called Arco di Riccardo, perhaps part of a Roman aqueduct. The new town, with broad streets built in regular parallelograms and handsome houses, occupies the plain that fronts the sea. Between these two divisions runs the *Corso*, the chief thoroughfare. The *Tergesteo* (1842), in the new town, is a splendid modern edifice, containing an exchange and reading-rooms. Close by are the museums. Trieste, which from 1719 till 1st July 1891 was a free port, has a very fine harbour (1868-83, with later additions). It is the most important on the Adriatic. The Lloyd Triestino navigation company, formerly the Austrian Lloyd, makes its headquarters here. The manufactures are very extensive, including shipbuilding, rope-making, and the manufacture of soap, rosoglio, white-lead, leather, &c. Trieste is also the headquarters of important insurance offices. Pop. (1810) 29,908; (1880) 144,844; (1890) 158,344; (1900) 134,143, or, with suburban villages and garrison, 178,680; (1921) 238,655.

Trieste, the ancient *Tergeste*, was of importance under the Romans, and first receives historical mention in 52 B.C., when it was overrun and plundered by neighbouring tribes. After the fall of the Roman Empire it suffered greatly from barbarian invasions. After many political changes, in 1382 it passed into the hands of Austria, and its prosperity is chiefly owing to the Emperor Charles VI., to whom its constitution as a free port was due, and to Maria Theresa. During the World War continued efforts were made to advance on Trieste, but the Italian armies were never able to pierce the strong defensive positions of the Carso. After the final victory on the Piave, Trieste was occupied from the sea on 3d November 1918, and definitely became Italian under the treaty of St Germain, though it had always been a centre of Italian patriotism under Austrian rule. A 'light-house of victory' (1927) commemorates its acquisition by Italy. A university was founded in 1924. Charles Lever and Sir Richard Burton were consuls here. Trieste is now the capital of the province of the same name: area, 474 sq. m.; pop. 325,940.

**Trifolium.** See CLOVER.

**Triforium**, the arcade over the arches of a church between the nave and side aisles. It is usually a dark gallery, being the wall-space against which the lean-to roof of the aisles rests. See GOTHIC ARCHITECTURE.

**Triglyph.** See ENTABLATURE.

**Trigonocarpon.** See CARPOLITES.

**Trigonometry**, originally the branch of geometry which had to do with the measurement of plane triangles. This gradually resolved itself into the investigation of the relations between the angles of the triangle, for the simple reason that all triangles having the same sets of angles are similar, so that if, in addition, one side is given the other two at once follow. It is easy to show from the Sixth Book of Euclid that, if we fix the values of the angles of a triangle, the ratio of the sides containing any one of these angles is the same whatever be the size of the triangle. This ratio is a definite function of the angles; and it is with the properties of such ratios that trigonometry has now to deal. The fundamental ratios are obtained from a right-angled triangle, of which one angle is the angle under consideration. It will suffice to show what these ratios are and how they have received their names. Let POM be the angle considered, PM being drawn perpendicular to OM. With centre O describe the two circles PA and MQ. The appropriate measure of the angle at O is the ratio of the subtended arc to the radius

—i.e. either  $\widehat{AP}/OP$  or  $\widehat{MQ}/OM$  (see CIRCLE). This measure we shall adopt throughout, and shall represent it by the symbol  $\theta$ . If QN is drawn perpendicular to OM, then the ratio of any pair of sides of the triangle OQN is equal to the ratio of the corresponding sides of triangle OPM. All the possible ratios which can be formed are the so-called trigonometrical or circular functions of the angle  $\theta$ . Thus the ratio  $PM/OP$  or  $QN/OQ$  is the *sine* of  $\theta$ . It is evidently half the chord of the angle  $2\theta$ ; and its value is numerically less

than  $\theta$ , because PM being less than the chord PA is less than the arc PA. Again, the ratio  $PM/OM$  is the *tangent* of  $\theta$ . MP is, in fact, the geometrical tangent drawn from the one extremity of the arc MQ

till it meets the radius through the other extremity. For a similar reason the ratio  $OP/OM$  or  $OQ/ON$  is called the *secant* of the angle  $\theta$ . In the same way the ratios  $OM/OP$ ,  $OM/PM$ ,  $OP/PM$  are respectively the *sine*, *tangent*, and *secant* of the angle OPM, which is the complement of the angle POM. Hence these ratios, regarded as functions of  $\theta$ , are called the *cosine*, *cotangent*, and *cosecant* of  $\theta$ . For any given angle there are, then, six trigonometrical functions. It is obvious that these functions are mutually dependent. Indeed, if any one is given the other five can at once be calculated. For instance, the well-known relation  $OM^2 + MP^2 = OP^2$  gives at once by dividing by  $OP^2$

$$(\sin. \theta)^2 + (\cos. \theta)^2 = 1,$$

or, as it is usually written,

$$\sin.^2 \theta + \cos.^2 \theta = 1.$$

Then, again, the *cosecant* is the reciprocal of the *sine*, and the *secant* of the *cosine*. The *tangent* is the ratio of the *sine* to the *cosine*; and the *cotangent* is the reciprocal of the *tangent*. The sine and cosine are never greater than unity, and the secant and cosecant are never less than unity. The tangent is less or greater than unity according as the

angle POM is less or greater than half a right angle.

Suppose OP to rotate counter-clockwise. Then as the angle AOP increases from zero to a right angle the sine evidently grows from zero to unity; while at the same time the cosine diminishes from unity to zero. Continuing the increase so that AOP becomes an obtuse angle, we find that the sine begins to diminish, and that the cosine begins to increase numerically but towards the left of O. In other words, the cosine becomes negative, and continues so until OP has completed three right angles. In the same way, as AOP passes through the value of two right angles and becomes re-entrant, the sine becomes negative, being thenceforward measured downwards until OP has made one complete revolution. After one complete revolution both sine and cosine, and also secant and cosecant, begin to go through exactly the same cycle of changes in magnitude and sign as at first. They are therefore periodic functions (see PERIOD), and their period is  $2\pi$  or four right angles. The tangent and cotangent, however, go through their cycle of changes in half this period or two right angles. All possible numerical values of the functions are obtained in the first quadrant. It is therefore sufficient in constructing tables of the trigonometrical functions to tabulate for angles from  $0^\circ$  to  $90^\circ$  inclusive. For example, the angle  $130^\circ$  ( $90^\circ + 40^\circ$ ) has the same sine as the angle of  $50^\circ$  ( $90^\circ - 40^\circ$ ); and its cosine differs only by being negative. Of greater practical importance than the tables of the functions themselves are the tables of their logarithms. These are generally tabulated for every degree and minute of angle from  $0^\circ$  to  $90^\circ$ ; and proportional parts are added by which is readily calculated the number corresponding to an angle involving seconds of arc.

The calculation of the functions and their logarithms is a sufficiently laborious task. It is generally effected by means of Series (q.v.), although the values for certain particular angles can be found by the simplest of arithmetical operations. Thus, the cosine of  $60^\circ$  is evidently  $\frac{1}{2}$ ; sine  $60^\circ$  is therefore  $\frac{1}{2}\sqrt{3}$ ; tangent  $60^\circ$  is  $\sqrt{3}$ ; and so on. What might be called the fundamental series for the sine and cosine in terms of the arc are:

$$\begin{aligned} \sin. \theta &= \theta - \frac{\theta^3}{1.2.3} + \frac{\theta^5}{1.2.3.4.5} - \frac{\theta^7}{1.2.3.4.5.6.7} + \dots \\ \cos. \theta &= 1 - \frac{\theta^2}{1.2} + \frac{\theta^4}{1.2.3.4} - \frac{\theta^6}{1.2.3.4.5.6} + \dots \end{aligned}$$

If we make all the signs in these two series positive we get two other functions of  $\theta$ , which are called the hyperbolic sine and cosine of  $\theta$ , and are written *sinh.  $\theta$*  and *cosh.  $\theta$*  respectively. Related to these functions there are the hyperbolic tangent, cotangent, secant, and cosecant; and they are connected by relations similar to, though not quite identical with, the ordinary circular functions. We may see, by adding the series with signs all positive, that the sum of the hyperbolic sine and cosine is the exponential of  $\theta$ . Demouivre's theorem gives the corresponding equation for the circular sine and cosine (see DEMOIVRE, and QUATERNIONS). The reason for the names circular and hyperbolic may be partially indicated thus: The relation  $\cos.^2 \theta + \sin.^2 \theta = 1$  may be put in the form  $x^2 + y^2 = a^2$ , which is the equation of a circle of radius  $a$ , referred to rectangular axes (see GEOMETRY). The equation of the rectangular Hyperbola (q.v.) is  $x^2 - y^2 = a^2$ , to which there corresponds the relation  $\cosh.^2 \theta - \sinh.^2 \theta = 1$ . The hyperbolic sines and cosines are really exponential functions, and are not periodic. They are of constant occurrence both in the higher analysis and in mathematical physics. To facilitate their use in calculation, tables have recently been constructed.

Besides the series given above, there are many others, some of which are particularly serviceable for calculating the values of the functions or the values of their logarithms. There are also the converse series, by which an angle is found in terms of one of its circular functions. One of the simplest, and at the same time most historically famous, of these is Gregory's series, which expresses an angle in ascending powers of its tangent. It is as follows :

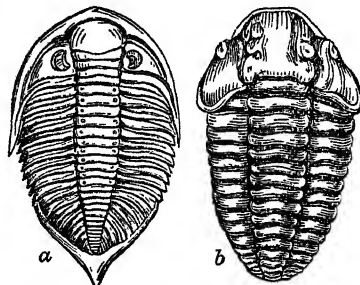

$$\theta = \tan. \theta - \frac{1}{3} \tan.^3 \theta + \frac{1}{5} \tan.^5 \theta - \frac{1}{7} \tan.^7 \theta + \dots$$

Of great importance are the addition formulæ which express any required function of the sum or difference of two given angles in terms of the trigonometrical functions of these angles. They are readily established for the circular functions by application of the elementary theorems of orthogonal projection. Similar formulæ hold for the hyperbolic functions. As plane trigonometry has to do chiefly with the solution of plane triangles, so spherical trigonometry is devoted to the discussion of spherical triangles. In navigation, geodesy, and astronomy the formulæ of spherical trigonometry are in constant use. The ordinary text-books on trigonometry do little more than present the subject in its practical bearings. An introductory study of the general theorems in analysis which have sprung out of the development of trigonometry will be found in Chrystal's *Algebra* (part ii.). It is impossible to make any progress in the higher mathematics without a thorough knowledge of the properties of the trigonometrical functions.

**Trikhala**, or TRIKKALA, a town of Greece (since 1881), in Thessaly, 40 miles W. of Larissa, on the slope of a hill, manufactures cotton and woollen stuffs, and has a large transit trade. The neighbouring plains, which are watered by the Salambria (anc. *Peneus*), are rich in fruits. Pop. (1920) 24,005. Trikhala, the *Trikka* of Homer, was celebrated for its temple of Asklepios.

**Trilobita**, an order of fossil arthropods entirely confined to the Palæozoic rocks. They make their first appearance in the Cambrian, attain a great development in the Silurian, occur sparingly in the Devonian and the Carboniferous, and disappear finally in the Permian system. The dorsal surface of the body was covered with a calcareous shell or crust, which is usually trilobed longitudinally. The body consisted of (1) a head bearing a pair of eyes, a pair of antennæ, and several mouth-parts, and (2) a trunk of numerous segments free anteriorly and united posteriorly in a 'pygidium,' all except the last (telson) bearing biramous appendages. The eyes were invariably sessile and compound, consisting of an aggregation of facets, covered by a thin cornea. The lenses are frequently well preserved, and in some species can readily be seen with the naked eye. Although usually faceted, yet in certain forms the eyes are smooth; while a few species had no organs of sight. The number of facets varies considerably. Thus, while in some types there are not more than fourteen facets, in others there are as many as 15,000 in each eye. The thoracic segments, which vary in number in the different types, were capable of more or less movement, and this to such an extent in some species as to allow of the animal rolling itself up like a hedgehog. Specimens showing the under surface are very rare, but the few which have been found show that the margin of the dorsal crust was turned under in the form of a more or less narrow 'doubleure.' In the centre of this doubleure in the cephalic region is attached the lip-plate or 'hypostome,' with which, as shown in one specimen, buccal organs (maxillary palpi) seem to have been

associated. Other specimens have shown that all the segments of the thorax and tail carried jointed limbs, and that branchial filaments were also present. More recently Dr Walcott, by making thin sections of rolled-up specimens of trilobites, has greatly increased our knowledge of their under surface. He shows (in the case of *Calymene*) that the mouth, behind the lip-plate, was bounded by four pairs of jointed appendages, the basal joints of which acted as jaws; while the thoracic and pygidial segments each carried a pair of slender jointed legs. To the thoracic segments were likewise attached spiral gills, one row on each side; and probably branchial appendages were also attached to the bases of the thoracic legs. The sexes are believed to be indicated by variations in the breadth of the cephalic shield, and in the length of the cephalic and pygidial spines. The members of the order varied greatly in size, some species being scarcely larger than a pin's head, while others, like *Asaphus gigas*, attained a length of 18 inches, and even sometimes of 2 feet. The eggs of trilobites appear to have been deposited in clusters, but very little is known as to the larval condition of these curious animals. It is possible, as some think, that the young in many species may have been naked, but the dorsal crusts of minute larval forms have been met with, and it is not improbable that many so-called species may be only larval or transition forms of others. Trilobites appear to have swarmed on the muddy bottoms of Cambrian and Silurian seas, although they lived also in regions where

*a*, *Phacops caudatus*; *b*, *Calymene blumenbachii*.

only pure limestone was being accumulated. It is now believed that many of the peculiar markings seen upon the surfaces of Cambrian and Silurian strata, some of which have been described as fossil plants, are really the tracks and trails of trilobites and probably other crustaceans. Some doubt exists as to the systematic position of Trilobita, but they are plausibly regarded as entomostracous crustaceans distantly related to the phyllopods. Some authorities regard them as more nearly allied to the Xiphosura (king-crabs).

**Trilogy**, the name given by the Greeks to a group of three tragedies, either connected by a common subject, or each representing a distinct story. A satyric drama was customarily added as a termination, whence the whole was sometimes termed a *tetralogy*. We possess only one perfect specimen of the classic trilogy—the *Oresteia* of Æschylus (q.v.), which embraces the *Agamemnon*, the *Choephori*, and the *Eumenides*. Schiller's *Wallenstein* is a trilogy, and so are Swinburne's *Chastelard*, *Bothwell*, and *Mary Stuart*.

**Trim**, the county town of Meath, on the Boyne, 30 miles NW. of Dublin by rail, with imposing ruins of a 12th-century castle, the Yellow Steeple (125 feet) on the site of an ancient abbey founded by St Patrick, and a column to Wellington, who had his first schooling here. Close by are the ruins of Newtown Abbey and the Priory of St John the Baptist, and 5 miles down the

river are the noble ruins of Bective Abbey. Pop. (1926) 1325.

**Trimethylamine**,  $N(CH_3)_3$ , incorrectly called propylamine, is an organic base resembling ammonia in some of its properties, and having a strong herring-brine odour. It is obtained principally by distilling herring-brine with lime. It is also prepared from residues from beet-sugar manufacture. It has been employed with success, in doses of 10 to 15 drops, in the treatment of acute rheumatism.

**Trimmer**, MRS SARAH, was born at Ipswich on 6th January 1741. Her father was Joshua Kirby, a man of intelligence and piety, who in 1755 removed to London, and became tutor to the Prince of Wales, afterwards George III., in the science of perspective. Here his daughter met Dr Johnson, with whom she speedily became a favourite. In 1759 her father was appointed Clerk of the Works at Kew Palace; and here she became acquainted with Mr Trimmer (1738-92), who married her in 1762, and to whom she bore twelve children. It was not till 1780 that she came before the world, by the publication of her *Easy Introduction to the Knowledge of Nature*—the first of nearly thirty volumes for the young, which, though now forgotten, except *The History of the Robins*, were excellently adapted for their purpose. She died suddenly, 15th December 1810. See her *Life and Writings* (1814).

**Trimoda Necessitas**. See TRINODA NECESSITAS.

**Trimorphism**. See DIMORPHISM.

**Trimūrti** (from the Sanskrit *tri*, 'three,' and *mūrti*, 'form') is the name of the Hindu triad, or the gods *Brahmā* (masculine), *Vishnu*, and *Śiva*, when thought of as an inseparable unity, though three in form. When represented, the Trimūrti is one body with three heads—in the middle that of *Brahmā*, at its right that of *Vishnu*, and at its left that of *Śiva*. The symbol of the Trimūrti is the mystical syllable *Om* (q.v.). The conception is neither very ancient nor popular, nor has it exerted any influence of importance on Indian thought.

**Trinacria**. See SICILY.

**Trincomalee**, a former naval station and magnificent harbour on the north-east coast of Ceylon, 110 miles NE. of Kandy. The town is built on a bold peninsula, which divides the inner and outward harbours. Here the Malabar invaders of Ceylon built the 'Temple of a Thousand Columns,' to which pilgrims flocked from all parts of India. This celebrated shrine was demolished in 1622 by the Portuguese, who fortified the heights with the materials derived from its destruction. It was next held by the Dutch, and subsequently by them and the French alternately, until the capture of Ceylon by the British in 1795. The modern town is in no way remarkable, and, with the exception of the official buildings (barracks, residences of civil, military, and naval authorities), makes a poor appearance, though there is a fine esplanade. The Bay of Trincomalee is landlocked, and presents a scene of tranquil beauty; the harbour is renowned for its extent and security; unlike every other in the Indian seas, it is accessible to every description of craft in every variation of weather, but unluckily it lies out of the course of trade, Colombo having in this respect a great advantage over it. There was an admiralty dockyard, and the fortifications were strengthened shortly before their abandonment (1905). Pop. (1921) 9442.

**Tring**, an urban district of Hertfordshire, on a spur of the Chilterns, 2 miles W. of Tring station, and 31 NW. of London. Situated near the Ick-

nield Way and the Grand Junction Canal, it has a good church, and some manufactures. Tring Park, built by Wren, is the seat of Lord Rothschild. The second baron established here an important natural history museum. Pop. (1921) 4352.

**Tringganu**. See TRENGGANU.

**Trinidad** is the most southerly of the British West India Islands, being only 7 miles from the coast of Venezuela, the Gulf of Paria (an extremely safe anchorage) lying between. It is about 50 miles long, varying in breadth from 30 to 35 miles, and the area amounts to 1755 sq. m. Three ridges of mountains run east and west, one fringing the north coast and reaching an elevation of 3000 feet. There is a pitch lake near the village of La Brea, about 3 miles in circumference, and 138 feet above the sea; pitch and petroleum fill the hollow, on which a little water floats. Fine mineral oil is obtained from borings, and commercially worked. The soil is very rich and productive. The climate is hot and moist, but not unhealthy; the mean maximum is 87.7°, and the mean minimum 70° F.; and the rainfall is about 74 inches. The chief town, Port of Spain, is one of the finest towns in the West Indies (pop. 65,000). There is another town called San Fernando, with two or three pretty villages. The most important products are cocoa, asphalt, petroleum and petrol spirit, sugar, rum, molasses, coffee, coconuts, tobacco, bitters, and fruit (exported since 1839). The trade is chiefly with Britain and the United States. Oil-bunkering has become important. Pop. (1871) 109,638; (1881) 155,128; (1911) 333,552 (including 20,762 in Tobago); (1921) 365,913, mainly negroes (speaking a French patois), with many East Indian coolies. There are over 120 miles of railway in the island, which with Tobago forms a crown colony, ruled by a governor, an executive council, and a legislative council of twenty-five members (seven elected). The West Indian College of Tropical Agriculture was opened in 1922 at St Augustine, about 7 miles E. of Port of Spain. Trinidad was discovered by Columbus in 1498, but no permanent establishment was founded there until 1532 by the Spaniards. It suffered at the hands of the English (Sir Walter Raleigh in 1595), the Dutch (1640), and the French (1677 and 1690). In 1797 it first fell into the hands of the British, who were confirmed in possession of it in 1802. See WEST INDIES.

**Trinidad**, a small island in the Atlantic, in 20° 30' S. lat., and 700 miles E. of the coast of Brazil, to which it belongs. It has been reported to contain pirates' buried treasure. See Knight's *Cruise of the Alerte* (1890).

**Trinidad**, capital of Las Animas county, Colorado, on the Purgatory River, 210 miles by rail S. by E. of Denver, with mills and a trade in wool. Coal is found close by. Pop. 11,000.

**Trinitarians**, a religious order founded at Rome in 1198 to redeem Christian captives from the infidels (see SLAVERY). Their rule was a modification of St Augustine's. They bore a red-and-blue cross on the right breast of their white serge garments. They were bound to devote one-third of their total revenues to the work of redeeming the captives; in the 17th century they claimed to have redeemed from the beginning upwards of 30,000. At the Reformation there were eleven houses in England, five in Scotland, and one in Ireland. The remaining houses of the order in Spain were suppressed in the reign of Isabella II.

**Trinitro-compounds**, **Trinitrotoluene**. See DYNAMITE AND OTHER HIGH EXPLOSIVES.

**Trinitrophenol**. See PICRIC ACID.

**Trinity**, THE DOCTRINE OF THE, is the highest and most mysterious doctrine of most forms of the Christian religion. It declares that there are three Persons in the Godhead, or divine nature—the Father, the Son, and the Holy Ghost, and that these three are one true, eternal God, the same in substance, equal in power and glory—although distinguished by their personal properties. An uncompromising statement of the doctrine is given in the so-called Athanasian Creed, which asserts that ‘the Catholic faith is this: That we worship one God as Trinity, and Trinity in Unity—neither confounding the persons nor dividing the substance—for there is one person of the Father, another of the Son, and another of the Holy Ghost. But the Godhead of the Father, and of the Son, and of the Holy Ghost is all one; the glory equal; the majesty co-eternal.’

It is admitted that the doctrine is not found in its fully-developed form in the Scriptures; but it is believed to be clearly revealed in its elements in the New Testament, and also to be indicated in many of the statements and revelations of the Old Testament. The form of expression in speaking of God in the Old Testament Scriptures—the plural *Elohim*, coupled with a singular verb; the apparent distinction recognised in the revelations to the Patriarchs and Moses between Jehovah and ‘the Angel of Jehovah;’ the mode in which ‘the Spirit’ and ‘Word’ of God, and ‘Wisdom’ (Proverbs viii.) are spoken of; and the gradual unfolding of the doctrine of a ‘Messiah,’ have all been regarded as indications from the earliest times of the truth of a plurality of persons in the Godhead. In the New Testament Scriptures the doctrine is represented as clearly taught in the Trinitarian formula of baptism, the general character of the claims and prerogatives of Jesus Christ, especially the ascription to Him of the designation ‘the Son of God,’ and in the functions attributed to the Holy Spirit. The evidence is held conclusive of the equal divine nature and yet distinct personality of the Son and the Spirit along with God the Father. It is generally conceded, however, that the Christians of the 2d and even of the 3d century were far from having a clearly understood and recognised doctrine on this high subject. They were content for the most part to use scriptural expressions in speaking of the Father, and the Son, and the Spirit, without defining articulately their relation to one another. It was not till the progress of opposing heresies sought, on the one hand, to degrade the divine dignity of Christ, or, on the other, to confound the personality of Christ with God the Father, that the church was led to define in its Creeds, Nicene (325 A.D.) and others, the relation of the Son to the Father; the Christological controversies which led to the ultimate definition are discussed at CHRIST. The Constantinopolitan Creed (381) affirmed also the deity of the Holy Spirit; but this church doctrine of a Trinity of Persons was not fully completed till the addition of the *Filioque* clause in the Western Church of the 6th century, which led to the separation of the Greek Church from the Latin (see GREEK CHURCH, CHURCH HISTORY, CREEDS). The Western or Latin Church had less genius for such speculations, and, in so far as it meddled with them, imparted to them a coarser and more contradictory aspect—witness the so-called Athanasian Creed (q.v.). Strenuous assertion of the doctrine of the Trinity occasionally led to what was denounced as tritheism, or doctrine of three gods (so Philoponus in the 6th century). Roscellin was charged with tritheism by Anselm. Scotus Erigena taught a Neoplatonic heretical view; the mystic Richard of St Victor emphasised his view of Trinity as founded on love more than any mediæval teacher.

The Reformers clung to the doctrine as already formulated. Jakob Boehme developed a strangely mystical doctrine. Socinus and modern Unitarians are the most outspoken in their rejection of the doctrine of the Trinity, which has always been specially obnoxious to Deists and advanced Rationalists, and is little insisted on by Broad Church thinkers. Some speculative theologians and philosophers have refined away the Trinity into aspects of God’s action rather than *hypostases* or persons as formerly understood. Clarke and the semi-Arians of the 18th century were not trinitarian in the full sense.

Tripartite divisions have had a special charm for philosophers from Plato to Hegel; to some of these the term Trinity has been applied. The Trimūrti (q.v.) is called the Hindu Trinity. Trinities of father, mother, and child (as Osiris, Isis, Horus) are not uncommon.

See the articles ARIUS, ATHANASIUS, SOCINUS, SPIRIT (HOLY), UNITARIANS; books named at DOGMA and THEOLOGY; Dörner’s great work; Illingworth, *Doctrine of the Trinity* (1907); and Rendel Harris, *Origin of the Doctrine of the Trinity* (1919).

**Trinity**, a river of Texas, formed by the union of two forks near Dallas, runs 500 miles SSE. to Galveston Bay.

**Trinity College.** See DUBLIN, OXFORD, CAMBRIDGE.

**Trinity House.** The London Trinity House, commonly called the Corporation of Trinity House of Deptford Strond, is responsible for the management of the public general lighthouses, light vessels, buoys, and beacons in England and Wales, with a supervisory authority over local lights and buoys, and a partial control over the public lighting systems of Scotland and Northern Ireland.

In 1514 the corporation, which had already existed as an Association of Mariners for some hundred years, was granted a Charter of Incorporation by King Henry VIII., and its privileges were confirmed and extended by subsequent charters granted by Edward VI., Mary, Elizabeth, Charles II., and James II. The charter granted by King James II. in 1685 is that under which the corporation is now governed, subject to slight modifications under supplemental charters granted by Queen Victoria and King George V.

The Corporation of Trinity House built its first lighthouse at Caister, Norfolk, in 1600, and after this date, as lighthouses increased in number, many of them were built by private individuals under the authority of Royal Patent or Act of Parliament, but by an act passed in 1836 all private rights in public lighthouses were compulsorily acquired by the Trinity House, London. By an Act of Parliament passed in 1853, all light dues formerly collected direct by the Trinity House (as well as by the Scottish and Irish Lighthouse Boards) were ordered to be paid into the Mercantile Marine Fund, from which all disbursements for lighthouses were paid after approval by the Board of Trade. Since 1898 light dues have been paid into a separate fund called The General Lighthouse Fund, controlled by the Board of Trade.

The Removal of Wrecks Act, 1877, and subsequent legislation laid upon the Trinity House the additional duty, in waters adjacent to the coasts of England and Wales where no local harbour or conservancy authority exists, of removing wrecks dangerous to navigation. Trinity House is also the principal pilotage authority for England and Wales, and it licenses the pilots for the London, Isle of Wight, Plymouth, and many lesser pilotage districts, and administers the service in accordance with the Pilotage Act, 1913.

As at present constituted, the Corporation of

Trinity House of Deptford Strond comprises a Master, ten 'active' Elder Brethren, one of whom is Deputy Master, about eleven 'honorary' Elder Brethren, a variable number of retired, 'active' Elder Brethren, and an unlimited number of Younger Brethren, the great majority of whom are naval officers or master mariners.

The Master and 'honorary' Elder Brethren are usually Princes of the Blood Royal or distinguished statesmen. The 'active' Elder Brethren are elected by the Court of Elder Brethren from such of the Younger Brethren as are possessed of the necessary qualifications—i.e. in the case of a naval officer to have served afloat actually in command of one or more of His Majesty's ships for at least two years after having attained the rank of commander; and in the case of the Mercantile Marine, to have commanded on foreign voyages for at least three years. The Deputy Master and 'active' Elder Brethren constitute the board which discharges the public and corporate duties of Trinity House.

In addition to the duties indicated above, Trinity House administers extensive charitable funds and maintains a number of almshouses for the benefit of distressed mariners and their dependants. It also possesses certain non-charitable funds, which are applied to the maintenance of its house on Tower Hill, and for purposes of entertainment, for which, of course, the light dues as public funds are not available.

Two of the 'active' Elder Brethren sit with the Judge in the Admiralty Division of the High Court of Justice at the hearing of all cases of collision and in most suits involving salvage claims, their function being to afford expert nautical assistance to the court.

Other Trinity houses at Hull (q.v., instituted 1369), Newcastle upon Tyne (q.v., incorporated 1492), Leith (instituted 1380), Dundee, like in history and originally with similar functions, now exist (except that of Dundee, altogether defunct) only in their charitable capacity.

**Trinity Sunday**, the Sunday immediately following Whitsunday, so called as being set aside for the special honour of the Blessed Trinity. The festival was not generally observed before the 12th century, though kept in Liège two centuries earlier; only in 1334 was it established by Pope John XXII. as a common festival of the whole Western Church; but the mass and office for the day are older.

**Trinoda Necessitas**, three species of contributions to which in Anglo-Saxon times all the lands of England were subject—viz. *brycg-bōt*, for keeping the bridges and highways in repair; *burh-bōt*, for keeping the fortresses in repair; and *fyrd*, for maintaining the military and naval force. Trinōda ('three-knotted') is a modern error for Trimōda ('of three kinds').

**Trinovantes**, an ancient British tribe, dwelt in Essex, and were Cæsar's allies. In the form Troy Novant (taken to mean New Troy) the name was given to London in the Brut legend.

**Trio**, in Music, a composition for three voices or for three instruments; also a subsidiary movement, generally in a different key, which follows the main portion of a minuet, scherzo, march, &c., and leads back to it—probably so called from having been formerly written for three instruments.

**Triolet**, a mediæval French verse form in which the first, fourth, and seventh lines are alike, the third and fifth rhyming with them, and the second and eighth alike, the sixth rhyming with them. It has been practised in English by Robert Bridges and Austin Dobson.

**Trional**, a well-known hypnotic (see NARCOTICS), is technically a diethyl-sulphone-methyl-ethyl-methane.

**Tripe de Roche**, a name given to lichens of the genera *Gyrophora* and *Umbilicaria*, nutritious but bitter and purgative, used as food by hunters and arctic explorers when better was not to be had.

**Triple Alliances.** (1) A treaty concluded in 1668 at The Hague between England, Holland, and Sweden, having for its object the protection of the Spanish Netherlands and the checking of the conquests of Louis XIV. (2) An alliance concluded in 1717 between Britain, France, and Holland against Spain. (3) Between Britain, Russia, and Austria in 1795. (4) Between Germany, Austria-Hungary, and Italy, formed and confirmed between 1883 and 1887; ended 1915 by the secession of Italy, which thereupon declared war upon the others. This superseded the 'alliance of the three emperors' (*Dreikaiserbund*) between Germany, Austria, and Russia in 1872-84.—The Triple Entente (1907) was an alliance (at first less complete) between Britain, France, and Russia; the Little Entente, one between Czechoslovakia, Yugoslavia, and Rumania (1921).—For an industrial Triple Alliance see TRADE UNIONS, p. 195.

**Tripoli** (Arabic *Tarābulus*; Ital. *Libia Italiana*), an Italian territory, till 1911-12 Turkish, was the easternmost of the Barbary States of North Africa. It is bounded on the W. by Tunis, on the S. (very vaguely) by the Libyan Desert (Fezzan being included), on the E. by Egypt, and on the N. by the Mediterranean Sea. In 1919-20 the boundary from Ghadames (Rhades), by Ghat (Rhat), to east of Tummo (all of these being already in Tripoli) was smoothed out in Italy's favour by arrangement with France; and Britain agreed that Jaghhub (Jarabub) and the oases of Kufara (the Senusi headquarters) should be included also in Libia Italiana. To this Egypt assented in 1925, in exchange for a slight rectification of the frontier at Sollum. The area is roughly estimated at 500,000 sq. m.; the population, which is very mixed—Libyan Berbers, Arabs, negroes, some Europeans (chiefly Italians, and Maltese) and Jews—was returned in 1921 as 550,000 (20,000 Europeans) for Tripolitania; 235,000 (10,000 Europeans) for Cyrenaica. Tripoli is divided into the administrative districts of Tripolitania (capital, Tripoli) and Cirenaica (capital, Benghazi), the ancient Cyrenaica (q.v.; and see BARCA), and is less mountainous than the rest of Barbary, for the Atlas range terminates here in a couple of chains running parallel to the coast and never exceeding 4000 feet in height. The sponge-fishery is valuable. There are no rivers, and rain seldom falls during the long hot summers, but the heavy dew supports vegetation in favoured spots. The climate is extremely uncertain. The coast region (about 1100 miles in length) is very fertile about Tripoli and Mesurata, where all sorts of sub-tropical fruits, grain, wine, cotton, madder, &c. are produced; but further east, along the shores of the Gulf of Sidra, reigns sandy desolation. There are tunny and sponge-fisheries. Esparto grass is an important crop. The interior yields senna, dates, and galls, and the carob and lotus are indigenous. Sheep and cattle are reared in great numbers, and there is a hardy breed of small but excellent horses, besides strong and beautiful mules. The commerce of the country consists in exporting, principally to Italy, Malta, and the Levant, the products of the country and of the interior of Africa (gold-dust, ivory, natron, and ostrich feathers), which are brought hither in caravans across the desert. The imports declined with the abolition of the slave-trade. Nevertheless, Tripoli is still a mart of the caravan trade with the interior. Each of the two provinces has a governor and parliament, Italians and natives having equal rights.

From the Phoenicians Tripoli passed into the hands of the rulers of Cyrenaica (Barca), from whom it was wrested by the Carthaginians. It next belonged to the Romans, who included it within the province of Africa, and gave it the name of *Regio Syrtica*. About the beginning of the 3d century A.D. it became known as the *Regio Tripolitana* (on account of its three principal cities, Cea, Sabrata, and Leptis, which were leagued together), and was probably raised to the rank of a separate province by Septimius Severus, who was a native of Leptis. Like the rest of North Africa, it was conquered by the Arabs early in the 8th century (see BARBARY), and the feeble Christianity of the natives was supplanted by a vigorous and fanatical Mohammedanism. In 1510 it was taken by Don Pedro Navarro for Spain, and in 1523 it was assigned to the Knights of St John, who had lately been expelled by the Ottoman Turks from their stronghold in the Island of Rhodes. The Knights kept it with some trouble till 1551, when they were compelled to surrender to the Turkish admiral Sinan (see Lane-Poole, *Barbary Corsairs*), and Tripoli henceforward joined in the general piracy which made the Barbary States the terror of maritime Christendom. In 1714 the ruling pasha, Ahmad Karamanli, assumed the title of bey, and asserted a sort of semi-independence of the sultan, and this order of things continued under the rule of his descendants, accompanied by the most brazen piracy and blackmailing, until 1835, when the Porte took advantage of an intestinal struggle in Tripoli to reassert its authority. A new Turkish pasha, with viceregal powers, was appointed, and the state was made a vilayet of the Ottoman empire. Several anti-Turkish rebellions (notably in 1842 and 1844) were suppressed. The religious movement set on foot by the prophet Senusi in the middle of the 19th century is one of the most remarkable features in the recent history of Tripoli. The first Senusi died in 1860, and was succeeded by his son (1847-1902), called the Mahdi, who commanded the devotion of a large following in northern Africa, much as did the better-known Mahdi in the Sudan (see SENUSSI). Italy's ambitions in North Africa led her into war with Turkey in 1911. Tripoli was invaded, and annexed. The treaty of Ouchy (1912) left it practically an Italian possession. The Italian hold upon it was slight until after the treaty of Lausanne (1923). See FEZZAN.

**Tripoli**, probably the Cea of antiquity, called in Arabic *Tarābulus*, or *Tarābulus Gharb* ('Tripoli of the West'), is the capital of the foregoing province, and lies on the edge of the desert, on a point of rocky land projecting into the Mediterranean and forming a bay. It is a typical Moorish city, irregularly built, surrounded by high bastioned walls, and celebrated for its beautiful gardens. There are many mosques, besides several large churches. The harbour, water-supply, and sanitation have been improved during Italian administration. Pop. about 65,000. Though the majority of the inhabitants are Moslems, nearly all the trade is in the hands of Jews and Christians.

**Tripoli** (*Tarābulus*, or *Atrābulus*), a port of the French mandatory state of Lebanon, 40 miles NNE. of Beirut, is watered by a small stream, the Kadisha. In and around the town are many remains of antiquity and traces of Saracenic architecture. Originally an important maritime city of Phœnicia, the ancient *Tripolis* was besieged and taken by the Crusaders in 1104, and retaken by the Mameluke Kalaūn in 1289. The old town having been laid in ruins by these sieges, a new one was built about 5 miles inland on a spur of the Lebanon range. It was famous in the middle ages for its fruit and gardens, its commerce

and industries. The old harbour is small and shallow. Pop. 27,000.

**Tripoli** (Diatomite), a mineral substance employed in polishing metals, marble, glass, &c., so named because it was originally brought from Tripoli in Africa. It is a siliceous rock, composed of the siliceous frustules of Diatomaceæ. It is frequently soft, friable, and earthy, but now and then is rendered firmer and more solid, and even extremely hard, probably from impregnation with opal substance. The more dust-like varieties are called *Kieselguhr*, and are in much demand for the manufacture of Dynamite (q.v.). *Kieselguhr* has been met with in alluvial (generally lacustrine) deposits in many countries. It occurs in beds underneath peat in Britain, Norway, Germany, &c. Diatomaceous deposits are forming at the present day both in fresh water and in the sea: those which are worked for economic purposes ranging in age from Tertiary to recent times. Ehrenberg estimated that every cubic inch of Bilin Tripoli weighing 220 grains contained 41,000,000,000 of these minute water-weeds.

**Tripolis** ('three cities'), sometimes called Tripolitza, a town of Greece, capital of the Morea, now of Arcadia, 40 miles SW. of Corinth, in a plain 3000 feet above the sea. It is a comparatively modern place, and derives its name from being near the sites of the three ancient cities Tegea, Mantinea, and Pallantium. In 1821 it was stormed by the Greek insurgents, and in 1828 razed to the ground by the troops of Ibrahim Pasha. Pop. 14,000.

**Tripolje Culture.** See ART, p. 459.

**Tripes.** See CAMBRIDGE.

**Triptolemus**, a Greek culture-hero, associated with Eleusis and the introduction of agriculture.

**Triptych** (Gr. *tris*, 'thrice,' and *ptychō*, 'I fold'), a set of tablets consisting of three leaves, each painted with a distinct subject, but joined together by hinges, and capable of being folded so as to present a new face. The general character of such tablets has been explained under *DIPTYCH* (q.v.), the difference of name 'triptych,' 'polyptych,' being taken from the number of the leaves. In ecclesiastical use the diptych has been already explained as commonly meaning rather the register of names inscribed on the tablets than the tablets themselves. The triptych, on the contrary, generally speaking, contained sacred pictorial representations rather than written registers or records, and is extended to canvas pictures in three compartments. Famous triptychs are an altarpiece of the Van Eycks (q.v.) and the 'Descent from the Cross' by Rubens.

**Trireme** (Lat. *triremis*; Gr. *triērēs*), an ancient galley—especially a war-galley—having three banks of oars. Originally boats with one bank, then with other two banks of oars, were used. In the Persian and Peloponnesian wars triremes were the largest vessels employed; but at the time of Alexander we find that galleys with four and five banks had gradually come into favour. In the Punic wars the Carthaginians employed quinqueremes; and thenceforth the Romans constructed their war-vessels after the model of the Carthaginian quinquereme. At Actium Antony had nine and ten banked galleys. Under the empire the police of the seas was managed by smaller vessels, *liburnæ*; great war-ships were hardly required.

The banks of oars were elevated above each other, but not perpendicularly; the lowest rank of rowers having the shortest oars and easiest work. How the banks of rowers were arranged as to allow all to have a fair share of the work has never been satisfactorily explained. The trireme or quin-

quereme was also provided with a square sail, which was used when the wind was favourable for voyaging to relieve the labour of the rowers, but was not employed in action. In the earlier times victory depended more upon the number and valour of the soldiers on board than upon the skill of the seamen. Latterly the aim of each trireme was not as before to grapple with its opponent, but to dash with the greatest momentum possible with its beak against the enemy's vessel, and strike it amidship, or, at any rate, disable his banks of oars on one side. Fighting men were not so much wanted for these tactics. The crew then of an Athenian trireme consisted of about 200 men, of whom 20 might be sailors, nearly the same number marines, and the rest rowers. A contrivance for strengthening the prow of the trireme and increasing its efficiency as a ram gave the Syracusans their final victory over the Athenians in the harbour of Syracuse. The Romans preferred to grapple and fight hand to hand. See GALLEY.

**Trisagion**, or TRISHAGION (Gr. *tris*, 'thrice,' and *hagios*, 'holy'), one of the doxologies in use in the Greek Church which is repeated in the form of versicle and responses by the choir in certain parts of the liturgy. The words of the Trisagion are: 'O holy God, holy and mighty, holy and immortal, have mercy on us!' This doxology occurs in the Constantinopolitan and Syriac liturgies, in the Good Friday service of the 'adoration of the Cross,' and in the ferial prayers at Prime for penitential days.

**Trismegistus** (Gr., 'Thrice-greatest'), an epithet applied to the Egyptian Hermes; see HERMETIC BOOKS.

**Trismus Nascentium**. See TETANUS.

**Tristan**. See TRISTREM.

**Tristan da Cunha** (sometimes erroneously *Tristan d'Acunha*), an island in the South Atlantic Ocean, with two smaller ones adjoining, lies midway between the coast of South America and the Cape of Good Hope, in 37° 6' S. lat. It is about 21 miles in circumference, is rugged and precipitous, rising in a central conical mountain to 7640 feet. Discovered by the Portuguese in 1506, and named after the commander of the expedition, it was occupied by American sealers in 1790-1811. Formal possession was taken of the island in 1817 by a company of British artillery for the purpose of keeping a watch upon Napoleon, at that time a prisoner at St Helena. On the death of Napoleon in 1821 the soldiers were withdrawn, with the exception of a corporal Glass and two companions, who, with some whaling men, were the founders of the present settlement. The colony flourished, and in 1829 numbered 27 souls; in 1873 there were 80, with 600 cattle and 600 sheep. Nearly all the able-bodied men were drowned in December 1885 while attempting to board a vessel. In 1887 there were 97 persons, in 1903 only 75, the population having decreased through migrations to the Cape; in 1920, 130. During the American war the *Shenandoah* landed forty Federal prisoners here without providing for them. The settlement is in a fertile tract to the north-west, and is called Edinburgh. Property is practically held in common, and there is no strong drink and no crime, while the natives, notwithstanding in-breeding, are healthy and long-lived. They have cattle, geese, potatoes, and they catch fish. Removal of the population, or its surplus, to South Africa, has been thought of from time to time, as in 1926. Inaccessible Island, 20 miles distant, harboured two Germans of the name of Stoltenhoff, who underwent a kind of Robinson Crusoe experience there (1871-73). It has been suggested that it should be colonised from Tristan da Cunha. Nightingale Island lies 10 miles from

Inaccessible Island. Further off, to the SE., is Gough Island, or Diego Álvarez, uninhabited. See Mrs Barrow, *Three Years on Tristan da Cunha* (1910); Rogers, *An Outpost of the Atlantic* (1922); Mrs Rogers, *The Lonely Islands* (1926).

**Tristrem**, or TRISTAN, the hero of a Breton or Cornish romance, originally unconnected with the Round Table cycle, although later interwoven with it. Tristrem was the love-child of King Mark of Cornwall's sister and Roland of Ermonie, and at fifteen repaired to Cornwall, where he charmed the whole court by his minstrelsy. He slew Moraunt in mortal combat, and lay ill three years of the wounds received, but was borne to Ireland, and there cured by Ysolt or Ysonde, daughter of the queen. On his return to Cornwall he told his uncle of the marvellous beauty of the Irish princess, and was sent to solicit her hand for him in marriage. Tristrem escorted Ysonde on her voyage to England; but both unwittingly drank of a love-potion intended for Mark, and from that day to the day of their death no man or woman could come between their loves. Ysonde was married to the king of Cornwall, but by the help of her clever maid, Brengwain, had many a secret interview with her lover. Tristrem was banished from Cornwall, but again brought to his uncle's court, and again their inevitable loves began anew. Next he wandered to Spain, Ermonie, Brittany, and here married another Ysonde—her with the white hand, daughter of Duke Florentine—but he could not forget his love for Ysonde of Ireland. Grievously wounded in battle, he sent a messenger to bring her to him. 'If you bring her with you,' he charged him, 'hoist a white sail; if you bring her not, let your sail be black.' Soon the ship is sighted, and Tristrem asks eagerly what is the colour of her sail. It was white; but Ysonde of Brittany, her heart filled with bitter jealousy, told Tristrem the sail was black, whereupon the heart-sick lover sank back and died. Ysonde of Ireland threw herself in passionate despair upon his body, and died heart-broken beside him. King Mark subsequently learned the story of the love-potion, and buried the twain in one grave, planting over Ysonde a rose-bush, and over Tristrem a vine, which grew up so inextricably intertwined that no man could ever separate them.

This romantic story is beyond a doubt of Celtic origin, but its intrinsic beauty early carried it widely across western Europe. It had very probably a mythological origin, and it recalls in more than one point the legend of Theseus. The oldest poems on the subject, extant only in fragments, were written in French in the 12th century by Béroul and by Thomas. Thomas at least was almost certainly an Englishman, and a poet of genius. About the end of the 12th century Eilhard of Oberge composed his *Tristrant* (Strasb. 1877), the ultimate parent of many versions in later German *Volksbücher*. Gottfried of Strasburg's unfinished translation of Thomas, in almost 20,000 lines, belongs to the first quarter of the 13th century. Soon after Gottfried's death his fine poem was feebly continued by Ulrich of Türheim and Henry of Freiburg. The extant English poem, *Sir Tristrem*, dates from about the close of the 13th century. It was first edited by Sir Walter Scott in 1804; later by Eugen Kölbing (Heilbronn, 1882), and George P. M'Neill for the 'Scottish Text Society' (1886). Scott ascribed the authorship to Thomas the Rhymer (q.v.), and was followed by Mr M'Neill. In the 13th century also a Norse version was made, *Tristrams Saga ok Isondar* (edited by Eugen Kölbing, Heilbronn, 1878). We find allusions enough to the story in French *fabliaux*, in Dante, Petrarch, Boiardo, and Ariosto, in Chaucer, Lydgate, and Gower; in 1469 a prose romance on the subject

of Tristan, son of King Meliadus of Leonnois was printed at Rouen, and was soon translated into German. The Spanish romance of *Don Tristan of Leonis* appeared at Seville in 1528; the Italian, *I due Tristani*, at Venice in 1555. It also became associated with the romances of the Round Table, and we find it in its place in Sir Thomas Malory's famous composition of these, the *Morte Darthur*. Hans Sachs worked the subject into a tragedy, and in 1588 a long poem on the love of Tristan and Madonna Isotta was printed at Venice. In 1841 appeared Karl Immermann's unfinished *Tristan and Isolde*; Wagner's operatic poem was first produced in 1859. A later work is the tragedy by Ludwig Schneegans (1865). In modern English poetry we have Matthew Arnold's poem, *Tristram and Isolt*; 'The Last Tournament' in Tennyson's *Idylls of the King*, closely based on Malory; Swinburne's *Tristram of Lyonesse*; Masfield's play, *Tristan and Isolt*; and E. A. Robinson's *Tristram* (1927).

See editions of Thomas by Bédier (1902-5), of Bérout by Muret (1904, 1914); studies of the Tristram saga by Golther (1887), G. Paris (*Poemes et Legendes*, 1900), Block (*Neueren Sprachen*, 1908), Schoepperle (1913); the modern French translation of Thomas by Herbomez and Beaurieux (1912); *Hist. littéraire de la France*, vol. xxx. (1888); *Romania*, vols. xv. and xvi.; A. Bossert, *Tristram et Isolt* (1902); and books cited at THOMAS THE RHYMER, &c.

**Triticum.** See WHEAT, and COUCH-GRASS.

**Tritoma**, or FLAME-FLOWER. See KNIPHOFIA.

**Triton**, in Greek Mythology, a son of Poseidon and Amphitrite, who dwells with his parents in a golden palace at the bottom of the sea. He usually figures as an attendant on his father, a man in his upper parts with a dolphin's tail, and soothing the turbulent waves by blowing his shell-trumpet—his 'wreathed horn,' as Wordsworth calls it. The later poets speak of Tritons, in the plural, as a race of subordinate sea-deities, who are described by Pausanias as having sea-green hair and eyes, gills below the ears, human noses, broad mouths with the teeth of animals, scales on their bodies, and instead of feet a tail like that of a dolphin. Some have a dolphin's tail and horse's fore-feet (*Centauroid-tritons*).—In zoology the name is given to the Newt, and to a genus of Gasteropods.

**Triumfetta**, a tropical genus of Tiliaceæ, herbs and shrubs, with hooked fruits for animal-distribution, and often nectaries at the bases of the leaves. Some species (*T. semitriloba*, *T. cricarpa*) yield fibre, which is used for coffee bags.

**Triumph** (Lat. *triumphus*) was the name given in ancient Rome to the public honour bestowed on a general who had been successful in war. It consisted in a solemn procession along the *Via Sacra* up to the Capitol, where sacrifice was offered to Jupiter. The victor stood in a chariot, drawn by four horses—his captives marching before, his troops following behind.

The *ovation* (from *ovare*, 'to shout,' 'exalt'), or lesser triumph, differed from the greater chiefly in these respects, that the emperor entered the city on foot, clad in the simple *toga pretexta* of a magistrate, instead of the *toga picta* and the *tunica palmata* of the more highly honoured commander, that he bore no sceptre, was not preceded by the senate and a flourish of trumpets, nor followed by his victorious troops, but only by the equites and the populace. The ovation was granted when the success, though considerable, did not fulfil the conditions specified for a triumph, or if the conqueror had not been in supreme command. For triumphal arch, see ARCH.

**Triumvirate** (Lat., 'a union composed of three men') is the name given in Roman history to the private league entered into by Pompey, Crassus,

and Cæsar to carry out their own schemes of political aggrandisement, in spite of the opposition of the senate. The term is also applied to the division of government between Octavian (Augustus), Mark Antony, and Lepidus in the civil wars that followed the murder of Cæsar—an arrangement sanctioned, and therefore legalised by the senate.

**Trivandrum**, capital of Travancore (q.v.); pop. (1921) 72,784.

**Trivet** or TREVET, NICHOLAS (flor. 1300), an English Dominican friar, who wrote *Annales Sex Regum Angliæ*, covering the period 1136-1307, and other historical works.

**Trivium.** See ARTS.

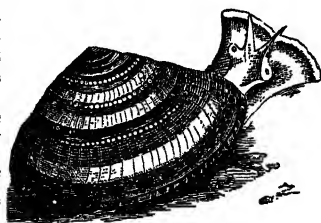

**Trnovo**, a town of Bulgaria, on the Jantra, 35 miles SSE. of Sistova, amidst strange limestone rocks. It became in 1235 the seat of the Bulgarian patriarch, and has more than once served as the capital. Dyeing is carried on, and silk and coarse cloth are manufactured. Pop. 13,000.

**Troad**, the district around Troy (q.v.).

**Trocar.** See CANNULA.

**Trochee**, in classical prosody a foot consisting of a long syllable followed by a short, extended in modern language to a stressed followed by an unstressed.

**Trochidæ**, a family of vegetarian gasteropods. The shell is conical, spiral, nacreous; the aperture is entire and closed by a thin horny operculum. In the genus *Trochus* the shells are top-shaped, and hence are popularly known as Top-shells. Many of the shells are extremely beautiful, and are used for adorning head-dresses, necklaces, &c., the outer layers being removed. The family includes a large number of British species, and a multitude of foreign and fossil forms. The Trochidæ are closely allied to the Turbinidæ.

Trochus.

**Trochilus.** See HUMMING-BIRD.

**Trochu**, LOUIS JULES, the defender of Paris, was born at Palais in Belle-Isle (Morbihan), 12th May 1815, and after the course at St Cyr entered the army at seventeen, and by his conduct and capacity rose rapidly in rank. He served as adjutant to Lamoricière, and to Bugeaud in Algeria; next to Saint-Arnaud and Canrobert in the Crimea, became in November 1854 general of brigade, and distinguished himself next year in the storming of the Malakoff. As general of division he fought at Solferino, and after the peace entered the Ministry of War, and was destined by Niel for his successor. But the unpalatable truths contained in his famous pamphlet, *L'armée Française en 1867*, in which he pointed out the rottenness of the imperial military system, and urged the adoption of Prussian methods, made him hateful to the court. At the outbreak of the 1870 war he received command of the 12th Territorial Division at Toulouse, and on the 17th August was named by the emperor governor of Paris, and after the proclamation of the republic became chief of the National Defence. He was cautious, timid, said the hotter spirits both within and without the circle of the doomed city; it is most probable that he saw only too well the hopelessness of his task. He laid down

his office as governor 22d January 1871, but remained president of the National Defence till 1872, and died 7th October 1896. Works in his own defence are *Pour la Vérité et pour la Justice* (1873) and *La Politique et le Siège de Paris* (1874). See his *Souvenirs Posthumes* (2 vols. 1896).

**Troctolite** (trout-stone), a variety of Gabbro (q.v.) composed almost entirely of white felspar (labradorite) and dark olivine. It is the 'Forellenstein' of the Germans.

**Troezen**, a very ancient Greek city, capital of the south-east district of Argolis. It was the birth-place of Theseus (q.v.).

**Troglodytes** (Gr. *Trōglodytai*, 'cave-dwellers'), the name given by the ancient Greeks to various tribes or races of uncivilised men, who dwelt either in natural caverns or in holes which they had dug for themselves in the earth. They are mentioned by Strabo as existing as far west as Mauretania, and as far east as the Caucasus; but perhaps the best-known Troglodytes of ancient times were those of southern Egypt and Ethiopia. It was reported that they could not speak articulately, but shrieked or screamed like the lower animals. The chief occupation of the Troglodytes was herding cattle, though we also read that they were hunters and robbers. They are likewise mentioned as serving among the light troops in the army of Xerxes. Their habits of life were rude and debased; their drink was a mixture of milk and blood; they had a community of wives; and they killed the old men when unfit to tend cattle. Troglodytes are mentioned by Herodotus, Aristotle, and Diodorus, and seem to have been found also in Mæsia. The prehistoric cave-dwellers of Europe and more recent cave-dwelling peoples are noticed at CAVE.

**Trogon** (*Trogonidae*), a family of birds of the order Picariæ, not very closely allied to any other group. They have the bill short, broad, notched or serrated, and with a wide gape; the feet small and weak, with the toes in pairs; but the first and second toes are turned backward, instead of the first and fourth—an arrangement unique among birds. The wings are short and somewhat pointed; and the tail is long and broad, often overhung by long tail-coverts. The plumage is soft, lax, and loosely attached to the very delicate skin; it is very beautifully coloured, some species being only excelled in brilliancy by the humming-birds. The females are less gorgeous than the males. The trogons inhabit the tropics of the old and new worlds; they are most numerous in South America, less so in the oriental region, and are represented in Africa by two species only. They are birds of moderate size, and sedentary and unsocial habits, inhabiting forests, where they sit motionless on branches, occasionally darting off to seize fruits or insects. They nestle in holes in decayed trees, laying two to four eggs, white or pale in colour. There are about fifty species, of which the most celebrated is the Quetzal, or Resplendent Trogon

The Quetzal (*Pharomacrus mocinno*).

(*Pharomacrus mocinno* or *Calurus resplendens*), whose plumage is of a magnificent golden green, the centre tail-coverts of the male being nearly three feet long, though the bird is only of the size of a magpie. It inhabits Central America: Guatemala especially is the 'Land of the Quetzal.' See Gould's *Monograph of the Trogonidae* (2d ed. 1875), and Brigham's *Guatemala* (1887) and for the significance of the Quetzal in political and religious symbolism, *Zeitsch. f. Ethnologie* (1909).

**Troilus and Cressida**. See TROY.

**Trois Rivières**. See THREE RIVERS (Quebec).

**Troitsk**, a town of Russia, on the Siberian side of the mountains, is 400 miles NE. of Orenburg, on the great road into Siberia; pop. 35,000.

**Troll**. See DEMONOLOGY.

**Trollhättan**, a village of Sweden, 9 miles S.W. of Venersborg, with famous waterfalls.

**Trollius**. See GLOBE-FLOWER.

**Trollope**, the name of a family which has produced several eminent English authors.—MRS FRANCES TROLLOPE was a novelist and miscellaneous writer. Born in 1780 at Stapleton, near Bristol, the daughter of the Rev. William Milton, and brought up at the vicarage of Heckfield, Hants, in 1809 she was married to Thomas Anthony Trollope, a barrister-at-law and fellow of New College. In 1829, her husband having fallen into very straitened circumstances, she went to America; and during a three years' residence in the United States she amassed the materials of her first book, *Domestic Manners of the Americans*, published in 1832. This work attracted great attention, and the severity of certain of its strictures was much resented by Americans. From this time forward the literary activity of Mrs Trollope was nearly uninterrupted; novels of society and impressions of travel make up the sum of her works. Of her novels the most successful is, perhaps, *The Widow Barnaby* (1839), with its sequel, *The Widow Married* (1840), followed by *The Barnabys in America*. Mrs Trollope was a woman of strong talent, and her 115 volumes are full of shrewd observation and true, if at times somewhat coarse, humour. They were popular in their day, and very well deserved their popularity; but they were soon well-nigh forgotten. During the life of her husband Mrs Trollope resided chiefly at Harrow. Latterly much of her time was passed in Italy with her eldest son; she died at Florence, 6th October 1863. See Life by her daughter (1895).

Her son, THOMAS ADOLPHUS TROLLOPE (29th April 1810–13th November 1892), was educated at Winchester and Oxford, and in 1841 settled in Italy. He is favourably known by his *Girlhood of Catherine de' Medici*, *A Decade of Italian Women*, and a number of novels such as *La Beata*, *Marietta*, *Lindisfarn Chase*, *Gemma*, *The Garstangs*, *The Dream Numbers*. He also wrote a *History of Florence*, the *Life of Pius IX.*, *Sketches of French History*, &c. His second wife, Mrs Frances Eleanor Trollope, wrote *Aunt Margaret's Trouble* (1866), *Black Spirits and White* (1877), *That Unfortunate Marriage* (1888), and, with her husband, *The Homes and Haunts of the Italian Poets* (1881). See his autobiographical *What I Remember* (3 vols. 1887–89).

The third son, ANTHONY TROLLOPE, in his time one of the most popular of novelists, was born 24th April 1815, and was educated at Winchester and Harrow. In 1841 he obtained a post as clerk to a surveyor of post-offices in Ireland. Here he acquired the fondness for hunting which never left him, married (1844), and began writing novels; and while filling responsible situations in the Post-office, he found, or made, leisure to amuse

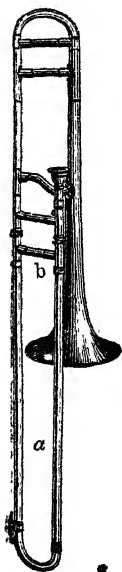

the public with a long series of novels, many of them of very remarkable merit. The *Kellys and the O'Kellys* (1848) was one of the first three novels he wrote. All three fell dead from the press, although they presented a graphic and accurate picture of the Irish life of the time. The first work which decisively drew attention, *The Warden* (1855), was followed by a continuation, *Barchester Towers*, which remains, perhaps, the cleverest of all his books. In rapid succession to these came *Doctor Thorne*, *The Bertrams*, *The Three Clerks*, *Castle Richmond*, *Framley Parsonage* (originally published in the *Cornhill Magazine*), *Orley Farm*, *The Small House at Allington* (contributed to the *Cornhill Magazine*), *Rachel Ray*, *Miss Mackenzie*, *Can You Forgive Her?* *The Claverings*, and *The Last Chronicle of Barset* (1867)—one of his best novels—besides many others. He was a zealous and valuable servant of the Post-office, and resigned his position as a surveyor (1867) three or four years only before he would have been entitled to a retiring pension, because he felt that his increasing literary work made it impossible for him, even with his extraordinarily unflagging industry, to discharge his official duties with efficiency. He wrote much for the magazines, and was the first editor of *St Paul's*; he once stood for parliament and was defeated. Post-office work had taken him to the West Indies, Egypt, and the United States; latterly he travelled in Australia and South Africa; so that he acquired materials for books on all these countries. Novels continued to be produced with astonishing regularity and frequency, according to a business-like method he has described in his autobiography. Amongst novels written subsequent to his resignation were *Phineas Finn* (1869), *Ralph the Heir*, *The Golden Lion of Granpère*, *Phineas Redux*, *John Caldigate*, *Ayala's Angel*, *The Fixed Period*, and *An Old Man's Love* (1884). Other works were a sketch of Thackeray (1879), a *Life of Cicero* (2 vols. 1880)—a task for which his powers were inadequate—and a short *Life of Palmerston* (1882). He died 6th December 1882. His interesting *Autobiography* (1883) was edited by his son, H. M. Trollope, author of novels and other works. See books by Escott (1913), and Sadleir (1927), the latter accompanying a revival of interest in Trollope.

**Tromba Marina**, so called from its resemblance in shape to a speaking-trumpet, and its trumpet-like compass and tone, was a musical instrument of the Viol (q.v.) class, much used by nuns (called therefore *Nonnengeige* in German). It had usually one string, and was played in harmonics with a heavy bow. The bridge was unsymmetrical.

**Trombone** (Ger. *Posaune*), a brass musical wind-instrument, whose title, originally Italian, signifies the great tromba or Trumpet (q.v.), to which instrument it forms the natural complement. It consists of a tube bent twice on itself, ending in a trumpet-shaped bell, and sounded by means of a cupped mouthpiece. The centre section (*a* in fig.) is double, the outer tube sliding on an inner one so as to permit of its being stretched to nearly double its own length. The performer,

instrument is provided with a jointed handle to enable the performer to reach the end of the slide. The notes of the trombone are not fixed like those of the valved instruments, but are made by the performer as in the case of the human voice or the violin. The seven positions of the slide allow the performer to alter the pitch of the instrument down to the extent of seven semitones, while the available harmonic scale in each position extends to about an octave (see HARMONICS). The total compass is therefore about  $2\frac{1}{2}$  octaves, and all the notes are of the same quality. There are three sizes of trombones in common use, the alto in E $\flat$  (on the lowest line of the treble clef), the tenor in B $\flat$ , and the bass in G or F. The trombone is of ancient but uncertain date; by the 14th century a brass instrument with a double slide was in use (see SACKBUT). The supposed discovery at Pompeii in 1738 of specimens made of bronze, with gold mouthpieces, is now quite discredited. Bach wrote for the trombone, but its general use declined in the 18th century, and was revived in the 19th. Mozart and Beethoven sometimes included it in their orchestra, and Schubert and Weber nearly always. The tone of the trombone is rich and impressive, especially when played softly, or in large numbers together in the open air. In military music it is unrivalled. Trombone bands have been formed in Germany.

**Tromp**, MARTIN HARPERTZHOON, a famous Dutch admiral, was born at Briel in 1597, went to sea as a child with his father, a commander in the Dutch navy, was captured off the coast of Guinea by an English cruiser, and compelled to serve over two years as a cabin-boy. In 1624 we find him in command of a Dutch frigate; in 1637 he was created lieutenant-admiral, with command of a squadron of eleven ships, with which he defeated a vastly superior Spanish fleet off Gravelines in February 1639. In the following October he defeated another fleet off the Downs, and captured thirteen richly laden galleons. But it was his conduct in the struggle with England that was to make the name of Tromp immortal. On May 19, 1652, with over forty ships, he encountered an English fleet of fifteen under Blake, and was worsted, with the loss of two ships. Tromp was for a while superseded in command by Ruyter and De Witt, but he was soon afterwards reinstated. On November 30, with eighty ships and a convoy of 300 merchantmen, he again encountered Blake in the Strait of Dover, and this time success was decidedly with the Dutch. The English fleet drew off, but it more than probably is a mere romance that Tromp now sailed up the Channel with a broom at his masthead, to denote that he had swept the enemy from the seas. At any rate that enemy was not long in returning. On the 18th of February 1653 Blake, together with Monk and Deane, engaged Tromp near Portland, and defeated him, though only after a contest memorable for its obstinacy. It lasted three days, at the close of which Blake had taken or destroyed nine ships of war and thirty merchantmen. Tromp fought with desperate courage, and brought off in safety the remainder of his convoy of 200 merchantmen. On June 2 and 3 following another terrific battle between Tromp and Deane took place off North Foreland, in which six Dutch vessels were captured, eleven sunk, and the remainder driven into Calais Roads. The final struggle of the war was his desperate battle with Monk, 31st July 1653, off the coast of Holland. The Dutch lost thirty men-of-war, but their greatest loss was the heroic Admiral Tromp, the victor in thirty-three sea-fights, killed by a bullet through the heart. He was buried at Delft. —His second son, CORNELIUS TROMP, was born at Rotterdam, 9th September 1629. His first service

Tenor Trombone.

while holding the mouthpiece with the left hand, moves the slide out and in with the right hand by means of the cross-piece, *b*. The bass form of the

was against the Algerine pirates. Next he served under Van Galen in the Mediterranean, and became rear-admiral after the battle off Leghorn in which Van Galen fell (13th March 1653). On June 3, 1665, he shared the disgrace of Opdam's defeat by the Duke of York at Solebay on the Suffolk coast, but next year had an ample share of the glory of Ruyter's four days' fight (June 1-4) off the Downs. Two months later he was deprived of his command by Ruyter for a breach of duty, the result of his over-eagerness to pursue an advantage, but was reinstated in 1673 by the stadhouder William, and covered himself anew with glory in the bloody battles against the combined English and French fleets, 7th and 14th June. In 1675 he visited England, and was created a baron by Charles II. The year after he aided the Danes in their struggle with Sweden, and after his return home was appointed, in room of the dead Ruyter, lieutenant admiral-general of the United Provinces. He died at Amsterdam, 29th May 1691, and was laid at Delft in his father's grave. See Jacob de Liefde, *Great Dutch Admirals* (Eng. trans. 1873).

**Trompe.** See BLOWING-MACHINES.

**Tromsø**, a town of Norway, capital of Troms (the north-west part of the kingdom), on the eastern shore of the low, fertile island of Tromsø, which is nearly 5 miles long, and about  $\frac{1}{2}$  mile broad; pop. (1920) 10,071.

**Tron** or TRONE weight, the most ancient system of weight used in Scotland, the *trone* (Gr. *trytanē*) being a heavy beam or balance set up in the market-place, and employed for the weighing of heavy wares and the punishment of offenders, who were nailed to it by the ear. The tron lb. contained 20 oz., but, from the custom of giving 'one in' to the score, was usually reckoned at 21 oz.; but it varied in the different market-towns between this and 28 oz. The later tron stone or standard weight contains 16 tron lb., each lb. 16 tron oz., and each tron oz. 16 drops; the tron lb. is estimated to be equivalent to 1·3747 lb. avoirdupois. The name survives in several Scottish churches.

**Trona.** See NATRON.

**Trondhjem** (also *Thronthjem*; Ger. *Drontheim*), on the south side of the long and narrow Trondhjem fjord, at the mouth of the little Nid River, and 250 miles N. of Oslo by rail. It is built on undulating slopes, and has regular and broad streets, the houses being mostly of wood, though the building of new wooden houses is now forbidden by law. The (fortified) harbour is capacious, deep, and safe, but is difficult of entry. The most interesting building in the city is the venerable cathedral, a cruciform church dating partly from the 13th century, of English-Norman architecture, and unquestionably the most interesting ecclesiastical edifice in Norway. A great fire in 1530 destroyed most of the church except the richly adorned octagonal choir (late Gothic). The church, since 1818 the place of coronation of Norwegian kings, has been carefully restored since 1880. Portions of an old archiepiscopal palace (Kongsgaard) also survive. The town is the main emporium of a wide district of country, and has a large trade by sea and land; the exports include copper ore, herrings and other fish, train-oil, timber, &c. The ancient capital of Norway, originally called Nidaros, Trondhjem was founded in 996 by Olaf Trygvason, and became in 1152 the seat of an archbishop. Its decline dates from the Reformation. It was taken by the Swedes after a siege of nine weeks, and has often been nearly destroyed by fire. Pop. (1920) 55,030.

**Troodos**, a mountain of Cyprus (q.v.).

**Troon**, a seaport and holiday centre, one of Ayr burghs, 6 miles N. by W. of Ayr and 33 SW. of Glasgow. The harbour, begun in 1808, is now owned by the L. M. & S. Railway Company. A fine parish church was opened in 1893. Troon has shipyards, several golf-courses, splendid sands, and good sea-bathing. Pop. 10,000.

**Troop**, in Cavalry, is the fourth part of a squadron, of which there are three in a British cavalry regiment. Each troop has a lieutenant or second-lieutenant in command, and comprises at war strength thirty-eight mounted non-commissioned officers and men.

**Troopial.** See TROUPIAL.

**Tropæolum**, a genus of plants forming the family Tropæolaceæ, by some united with Geraniaceæ. The species are mostly natives of South America, but several are found in Central America, and *C. crenatum* is endemic in Mexico. They are annual or perennial herbs of trailing or climbing habit, the leaves often peltately divided into several leaflets.

The genus comprises the Great Indian Cress, misnamed *Nasturtium* (q.v.), *T. majus*, and the Small Indian Cress (*T. minus*), which are familiar in nearly every garden, along with the Canary-bird Flower or Canary Creeper (*T. aduncum*, or *peregrinum*), and many brilliant perennial species not so generally cultivated in Britain. The best known of the perennials is the Flame-flowered *Nasturtium* (*T. speciosum*), which, introduced from its native country, Chile, in 1846, is now one of the most frequent and brilliant ornaments of cottage walls throughout Scotland, particularly in the highland or northern districts, and also in North Wales. It is the envy of southern tourists, who carry roots of the plant home with them in the hope of establishing it in their own gardens, but rarely succeed. It requires peculiar atmospheric conditions to induce it to grow and flower freely; moderate exposure to light, such as would be afforded by a west aspect, high atmospheric humidity and cool nights, with deep moist but well-drained soil, are essential to its healthy growth. It is easily propagated by its creeping and underground rhizomes. There are several other hardy and greenhouse perennials with tuberous roots in cultivation, all of a very ornamental character. The tubers of *T. tuberosum*, a native of Peru, are edible.

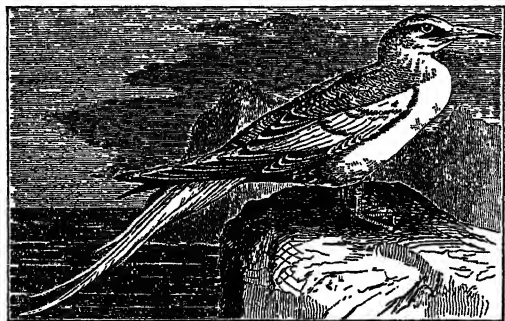

Canary Creeper  
(*Tropæolum peregrinum*).

**Trophonius**, in Greek legend, was the most skilful architect of his day, and was the son of Erginus, king of Orchomenus, or of Apollo. Along with his brother, Agamedes, he built the temple of Delphi and the treasury of King Hyrieus in Boeotia, which the two are said afterwards to have plundered. After his death he was worshipped as a hero, and had a celebrated oracle at Lebadeia (Livadia) in Boeotia. The votary who wished to enter the 'Cave of Trophonius,' in order to consult the oracle, after preparing himself for several days by purification and sacrifice, lay on his back, put his feet into the cave, and was violently pulled inside by some unseen force. Don Quixote once thought himself to have got there.

**Trophy** was a memorial of victory erected on the spot where the enemy had turned to flight. Among the Greeks (except the Macedonians, who erected none) one or two shields and helmets of the routed enemy, placed upon the trunk of a tree, served as the sign of victory. After a sea-fight the trophy consisted of the beaks and stern-ornaments of the captured vessels, set up on the nearest coast. It was considered wrong to destroy such a trophy, and equally wrong to repair it. In early times the Romans decorated the buildings at Rome with the spoils of the vanquished. Of this practice we have a familiar instance in the *rostra* or beaks set up in the forum. In later times pillars and triumphal arches (see ARCH) were employed.

**Tropic-birds** (*Phaethon*), a genus of inter-tropical pelagic birds, in a family by themselves. The bill is strong, pointed, serrated along the edges; the four toes are webbed; the tail is short save two greatly elongated median feathers. The legs are very short; the gait on land is shuffling; rising from level ground seems difficult. The flight is swift, with very rapid beats of the wings. The birds hover about ships or light on the rigging; they soar in circles, and plunge into the water from a great height. Sailors call them 'Boatswains.' They feed on fishes, cuttlefishes, and other open-sea animals. No nest is made, but a single egg, reddish-brown or buff with reddish-brown spots, is laid in a hole among rocks, occasionally in a tree,

Tropic-bird (*Phaethon aethereus*).

and both parents incubate. The Common Tropic-bird (*P. aethereus*) is about the size of a partridge, white, with curved lines of black on the back; some of the quill-feathers black, tipped with white. It is found in the Atlantic Ocean. In the Indian and Pacific Oceans another species, the Red-tailed Tropic-bird (*P. rubricauda* or *phanicurus*), appears, which is larger in size, of a deep roseate tinge, with red bill and the rectrices and long feathers of the tail red. The Yellow-billed Tropic-bird (*P. flavirostris* or *candidus*) is the smallest in size; it breeds in Bermuda, and occurs numerous in the South Atlantic, the Indian, and a great part of the Pacific Ocean.

**Tropics** (Gr. *tropē*, 'turning') are two parallels of latitude on the terrestrial globe, passing through the most northerly and southerly points on the earth's surface at which the sun can be vertically overhead at noon. The tropics include between them all points on the earth's surface at which the sun is ever vertical. The tropic north of the equator is called the Tropic of Cancer, because the sun at the summer solstice (when he is vertically over that tropic) enters the sign (not now the constellation) of Cancer; and the southern one is, for a similar reason, called the Tropic of Capricorn. Though usually said to be in 23½° N. and S. lat., the tropics are not fixed at a uniform distance from the equator, but the limits of their variation are extremely narrow.

**Tropidonotus**, a large cosmopolitan genus of snakes, including the grass snake. See SNAKES.

**Tropism**. See PLANTS (*Movements*).

**Troppau** (Czech *Opava*), a town of Czechoslovakia, till 1918-19 capital of Austrian Silesia, on the Oppa, a tributary of the Oder, 137 miles NE. of Vienna. It has an old town-hall, a library, and manufactures of cloth, beet-sugar, &c. Pop. (1920) 33,457.

**Trossachs**, a wooded defile of Perthshire, 8 miles W. by S. of Callander, which Scott's *Lady of the Lake* has made one of the places of pilgrimage of the world. It extends 1 mile eastward between Lochs Katrine and Achray, and to the north has Ben A'an (1851 feet), to the south-west Benvenue (2393 feet).

**Trotskoye**, new name of Gatchina (q.v.).

**Trotsky**, LEO DAVIDOVICH, Russian revolutionary, reputed to be a Jew originally called Bronstein or Braunstein, born in 1877 near Elisavetgrad, was sent to Siberia in 1901, took part in the 1905 revolution, was again sent to Siberia, escaped, and lived as a journalist in many countries. At first a Menshevik, he became a Bolshevik, and the Bolshevik revolution of 1917 made him People's Commissary for foreign affairs. Obligated to accept the treaty of Brest-Litovsk, he exchanged his post for that of war and marine, and wielded the force of Bolshevism (defensive and aggressive) against Russian 'Whites' (Koltchak, Denikin, &c.), and against Poland and other neighbours. Dissentions arose after Lenin's death, and in 1925 Trotsky was deprived of his commissaryship. While still retaining minor offices in the party organisation he attacked the other leaders. He wrote *A History of the Russian Revolution* (trans. 1919), and other works. See RUSSIA; and Max Eastman, *Trotsky* (1926).

**Trotternish**, the northern peninsular district of Skye (q.v.).

**Trotting**, a favourite American sport with a distinctive type of horse. Since early in the 19th century the trotting strains have been much improved by careful breeding, while skilful training has aided in their development. Indeed, it may be said that the trotter is the national horse of America, where it is considered the ideal animal for both business and pleasure. There are trotting strains elsewhere than in America—for instance, the Norfolk trotters in England and the Orloff trotters in Russia—but no other strain has attained the speed of the trotting-horse in America. The turf test of speed is the only one by which trotting strains can be judged, and trotting races are held in America for the purpose of applying this test, quite as much as to furnish sport to spectators. Compared with running races, even in America, trotting contests are not very popular. The trot and the amble or pace are kindred gaits, the latter being the faster. The trot is a diagonal and the

pace a lateral gait. In the trot the order of movement is left fore-foot, right hind-foot, right fore-foot, left hind-foot. Thus the left fore-foot and right hind-foot move in unison, striking the ground together; then in turn the right fore and left hind foot complete the movement. In the pace two feet are also moved simultaneously, but the two feet moved at once are on the same side. From the same strains of blood there frequently come both natural trotters and pacers. Though pacing is the faster gait, it is not considered desirable, and pacers are often converted into trotters by the use of heavy toe weights on the forward feet. A competent trainer by the use of these weights can change an inveterate pacer into a trotter. As the horse becomes used to the trot the weights are gradually reduced. The gait of even natural trotters is oftener than not helped by the use of toe weights.

The best strains of American trotters trace back to the thoroughbred gray stallion Messenger, imported from England in 1788 when he was eight years old. He was by Mambrino, first dam by Turk, second dam by Regulus, third dam by Starling, fourth dam by Fox, fifth dam by Bay Bolton, sixth dam by Duke of Newcastle's Turk, seventh dam by Ryerly Turk, eighth dam by Taffolet Barb, and ninth dam by Place's White Turk. Though this record shows that Messenger's pedigree goes back to the very beginning of the thoroughbreds, it is generally thought that he himself was not, strictly speaking, a thoroughbred. The more frequent the Messenger cross is found in the pedigree of a trotter, the more valuable the strain is thought to be. Messenger begot Mambrino, Mambrino begot Abdallah, and Abdallah begot Rysdyk's Hambletonian. Rysdyk's Hambletonian, foaled in 1849, was out of the Charles Kent mare by Bellfounder, a horse imported from England, and said to come of the strain of Norfolk trotters, and with two crosses on the dam's side tracing back to Messenger. Rysdyk's Hambletonian is considered by breeders to be the father of the American trotters.

The breeding of trotters has become in the United States and Canada a great industry.

The first trotting-race in America of which there is a record was at Harlem, N.Y., in 1806, when Yankee did a mile in 2 minutes 50 seconds. In Philadelphia in 1810 a Boston horse trotted a mile in 2 minutes 48½ seconds. The next race was in 1818, when the time was 3 minutes. There was nothing very wonderful about these performances, for horses in England had before then done as well, if not better. The time has since been gradually reduced. Peter Manning, in 1922, did a mile in 1 minute 56½ seconds at Lexington, Ky. With a running mate, Uhlan trotted a mile in 1 minute 54½ seconds in 1913. Long-distance trials are justly regarded as cruel and unprofitable.

Among pacers the best records are those of Star Pointer, which paced a mile, in 1897, in 1 minute 59¼ seconds, and Dan Patch, which did the same distance, at St Paul, Minnesota, in 1906, in 1 minute 55 seconds.

**Trotzendorf.** See FRIEDLAND (VALENTIN).

**Troubadours.** See PROVENÇAL.

**Trough, PNEUMATIC,** is a piece of chemical apparatus devised by Priestley, by means of which gases can be collected in vessels. It consists of a vessel of water, provided with a ledge or shelf at the depth of two or three inches from the top. The jars in which the gas is to be collected are filled with water, and placed with their mouths downward upon the shelf, which is kept a little under water, so as to prevent the entrance of air into the jars. When the edge of the jar is brought over the extremity of the tube carrying the gas, the

bubbles of gas rise, collect in the upper part of the jar, and displace the liquid. Other suitable liquids may be used.

**Trough-shell.** See MACTRA.

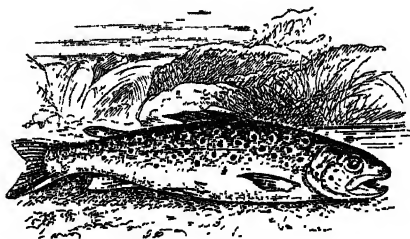

**Troopial** (*Icterus icterus*), a bird of the family of Hang-nests (q.v.), famous for its song, which rivals that of the Baltimore oriole. Members of the allied genus *Trupialis* are also called Troupials.

**Trousers.** See BREECHES.

**Trout** (*Salmo fario*). This familiar fish of our streams is widely distributed throughout Europe, and has proved itself a robust species when transported to distant lands. Living and thriving as it can under widely different conditions of life, the fish naturally assumes different appearances. So much is this the case that in systematic natural history the trout has been treated in different ways. Some naturalists have described a great many separate species of trout; others have concluded there is but one species, which is represented by many varieties or local races. The latter view was first expressed by Widegren in 1863, and it is the view to which later zoologists have returned after a period of over-differentiation which is well exemplified in Günther's *Catalogue of the Fishes of the British Museum in 1866* (vol. vi.). In the classification of the Salmonidae now accepted, the char is separated from the trout, and the splashing or smelt is excluded altogether.

The question comes to be whether or not the distinctions noted are sufficient to justify a separation into species. With regard to this it may be said that the more all kinds of trout are studied, the more clearly does it appear that the so-called separate species blend in the most perplexing manner, so that very many examples cannot be definitely assigned to this or that species, and that all of them can interbreed most freely, and also that when trout are moved from one locality to another they rather readily undergo change of appearance. A good example of this was obtained after typical small brook trout from Dorsetshire were introduced into certain New Zealand rivers. In their new surroundings they grew rapidly, took on a silvery appearance, and migrated to the sea. In a few years they were indistinguishable from pure sea-trout, and as a matter of fact, after careful examination of specimens sent to the British Museum, they were diagnosed as *Salmo trutta*. If, therefore, *Salmo fario* is to be regarded as a separate species from *Salmo trutta*, this was the evolution of a species in a remarkably short time. The more rational view is to regard all the trout as belonging to one plastic species.

Nevertheless, the sea-trout is such a well-defined fish, with such distinctive habits, that it is certainly convenient to regard it separately from the freshwater trout. It is variously called Sea-trout,

Common Trout.

Salmon-trout, or White Trout, and the reader will find it described in the article Salmon. For the Bull Trout, see under that head.

There remain, even in Britain, quite a number

of local races of trout which have formerly been classified as distinct species, and two or three of these approach very nearly to the sea-trout.

The typical *Salmo fario* is a well-proportioned fish, yet is not so fine in the lines as the salmon. The head is larger in proportion to the body, the eye is also larger, the gape, especially in young examples, considerably wider, the strong maxillary bone reaching to a point vertically below the back of the eye. The vomer bone, which runs along the roof of the mouth, carries a double row of teeth, which persist throughout life. The hind-part of the body is stout, and the scales, if the row be counted from the back of the adipose fin downwards and forwards to the lateral line, are usually fourteen to sixteen in number. The colour is brown on the back and yellow on the belly. The spots and markings on the body are subject to great variation, but red spots usually occur, and the young examples have the 'parr markings' common to young salmonidæ generally; dark-brown spots are also common. Every trout-angler knows how widely different trout from different localities may look when caught—the fish from the clear-water river, with its bright colouring and sharply contrasted markings; the fish from the peaty mountain tarn, with its dingy brown back and dirty-white belly. Even from different parts of the same hill loch, trout may be yellow, with red speckling, and as silvery as new shillings. This is so, for instance, in a small loch at a high elevation in the island of Raasay. Superficial differences such as these are due to varied bottom and to feeding. All intermediate conditions can also be obtained. In certain lochs, however, it seems likely that a silvery tendency in some of the trout is due to the importation of sea-trout fry.

*Salmo fario* can migrate to brackish water without inconvenience, and several cases are on record of examples being caught at sea. It frequents estuaries of rivers much more than most people suppose. Such fish grow rapidly on a diet of herring and other marine forms. An approximation to the appearance of sea-trout naturally results, and in this way have been described the Orkney Trout, *Salmo orcadensis* (Günther); the Estuary Trout or Slob Trout, *S. estuarius* (Knox), *S. gallivensis* (Günther). Then a form with blackish fins found in streams of Cornwall and Wales has been described as closely allied to the Orkney trout. It is called the Cornish Trout, *S. cornubiensis* (Walb) or *S. nigripinnis* (Günther). This, again, brings us to affinities with the famous *S. ferax* or Great Lake Trout, a variety which Highland gillies delight to describe as a separate species, but which is merely a large and old trout of cannibal habit which has gone to large and usually deep lakes for its food. Its dentition is usually formidable, and it fights the angler with great vigour. In colour it is usually very dark, owing, no doubt, to its adopted habitat. Specimens of 10 lb. to 15 lb. are not uncommon, and fish up to 32 lb. are on record in Ireland. Examples of the Orkney trout have on occasion run these weights close, the record Loch Stennis trout being a fine fish of 29½ lb. Another variety which must be mentioned is the Gillaroo Trout, found principally in Loughs Corrib, Mask, Derg, and Melvin in Ireland, and in the river Shannon. It usually frequents a rocky bottom, and feeds very largely on several kinds of water-snails, from which habit it apparently develops a greatly thickened muscular stomach. Hence the specific name given to it by Günther is *S. stomachicus*. In some of the Sutherlandshire lochs a variety of trout called a Gillaroo is also found, but in it the deep shape and muscular stomach of the typical Irish fish are not so noticeable. As showing that this thickened mus-

cular stomach cannot properly have specific value, it may be noted that if Gillaroos are transported to localities where they do not find their familiar molluscan food, the gizzard-like stomach disappears. With regard to *S. ferax*, it may be added that Dr Günther, in giving specific distinction, laid great stress on the preoperculum being crescent-shaped, the hinder and lower 'limbs' passing into each other without forming an angle. This feature is, however, by no means uncommon amongst ordinary brown trout. Other differences stated were in the number of the vertebræ and pyloric appendages—the latter a feature notoriously subject to great variation—while the common brown trout and the Gillaroo trout have both been shown to exhibit the number of vertebræ attributed to *S. ferax*. Further, it is remarkable that no one has ever described a young example of *S. ferax*. The reason undoubtedly is that young trout never show the characteristics of the *ferax*. To appreciate the haggard ugliness of this old lake-living trout, it is necessary to see him at the spawning season. The largest examples are no doubt past spawning, but those which do ascend streams for this purpose are so specially hag-like that one almost hesitates to handle them. They are probably quite as bad as pike for devouring young fish. Just as the land-locked salmon of Sweden and America make their feeding-places the large lakes of these countries, so our *ferax* establish themselves in our large and deep lochs. Large and old trout which have not the same access to these extensive feeding-places make their way to the sea.

A most beautiful variety of trout is found in Loch Croisaphuill, in Sutherland. This loch has very clear water covering a bottom of sand and light-coloured gravel. The fish are very shapely, and of a bright, silvery colour. Many other lochs, however, produce trout of great beauty.

The most famous trout of all is perhaps the Lochleven trout, which has received the specific name *S. levenensis*. It is a handsome fish, often very silvery, with numerous dark markings. The flesh is red, and the flavour of the fish is considered excellent. The feeding in the loch is rich, and consists not only of flies, but great numbers of blood-worm larvæ, fresh-water shrimps, and water-snails. No variety of trout is more extensively used for stocking purposes than the Lochleven. Like other trout, however, it is subject to considerable modification when transferred to other localities, and if the food of another locality is less rich, the fish sooner or later shows approximation to the appearance of the native trout. This is most marked where stocking is carried to excess, which is another way of saying that good development of trout in any water is in direct relation to the quantity of food present, and that the condition of trout and the size of trout may often be improved by reducing their number. At the same time, Lochlevens form excellent stock in most waters, and are greatly to be preferred to certain foreign varieties, notably Rainbow Trout, which is a native of California, but which seems to possess characteristics which render it unsuited for British lakes. The common experience after stocking with Rainbow fry is that in about two years the fish have unaccountably disappeared. Perhaps the best success which has attended the stocking with this fish has been in the river Tamar, in Devonshire, where the Rainbows are reported to have become well established. British trout have been acclimatised in the southern Australian states and New Zealand; the Californian Rainbow Trout also flourishes in these waters, and has a range extending into Queensland.

Trout generally spawn rather earlier than salmon, and their habit in spawning is similar. Those in

lakes ascend or descend streams connected with the lakes, but also to some extent spawn in the gravel at the margins. The Gillaroo trout are reported to spawn chiefly in the latter way.

To distinguish between a salmon parr or smolt and a trout is a matter of considerable importance in view of the law prohibiting the taking of the former. The so-called parr-marks or finger-marks on the young salmon are by no means peculiar to parr, but are more or less obvious on all young salmonidæ in Britain; indeed, the trout of certain localities seem to preserve these markings through life.

Two features which distinguish the salmon parr most clearly are the smallness of the gape and the slenderness of the caudal peduncle or 'small of the tail.' Other features are also present, but are less obvious to the angler, who has probably a single specimen to deal with at the river-side. The first may be defined most clearly by noticing the bone at the side and above the mouth—the maxillary bone. If the fish be held horizontally with the mouth shut, the angular termination of this bone will be, in the case of the salmon parr, directly below the centre of the eye. In the case of the trout it will be directly below the posterior edge of the eye. In the case of adult salmon this test does not apply. With regard to the other feature—the small of the tail—the test is difficult to apply to small fish, but is applicable throughout the life of both species. If the scales be counted in the row running downwards and forwards from the back of the adipose fin to the lateral line, it will be found that the salmon has eleven and sometimes twelve, while the trout has thirteen to sixteen.

A trout the size of a salmon parr may be a fairly old fish, in which case the tail will not be forked. In coloration the parr and the trout may be very much alike.

In the case of the smolts of sea-trout there is a bright silvery sheen similar to that seen in the salmon smolt, and the sea-trout smolt is very commonly rather larger than the salmon smolt. The fins are, however, a distinct yellow colour, and the adipose is usually tipped with bright orange colour. Hence these fishes are commonly called yellow fins. In the salmon parr the fins are dusky or dark, the ventral excepted, and the tail fin is always much forked.

With regard to the weight to which trout may attain in our islands, the record seems to have been made in Ireland, where a fish of 36 lb. was caught in Lough Corrib some years ago. The specimen is preserved in the Dublin Museum, and for a considerable time was regarded as a salmon. About the year 1880 or 1882 a trout of 49 lb. was reported as having been taken, but no trace of it seems to have been kept. Another Irish weight, which is still exceptional, and which in this case is certainly authentic, is a trout of 28½ lb. In Scotland a 35-lb. trout is reported to have been caught in the Pass of Brander by Mr Muir of Innistynich. Dr Almond of Loretto caught a 27½-lb. trout in Assynt; and another 27½-lb. trout was taken in the river Tay—a record amongst river-caught trout. The heavy trout of modern times seem to compare very unfavourably with these monsters.

In Scotland there is a close time for trout from and including 15th October to 28th February. In England no trout may be sold between 2d October and 1st February. In Ireland the close time for trout varies in different localities, and harmonises with the close time for salmon. The closing dates are contained in the period between 31st July and 2d November, the opening dates between 31st January and 30th April.

See works named at ANGLING and in Westwood and Satchell's *Bibliotheca Piscatoria* (1883; with supplement

by R. B. Marston, 1901); Livingstone Stone, *Domesticated Trout* (1877); the Marquis of Granby and others, *The Trout* (1898); C. Tate Regan, *British Fresh-water Fishes* (1911).

**Trouvère**, the name given in northern France to the same kind of courtly or polished poet who in southern France, &c., was called Troubadour (see PROVENÇAL). Like the latter, he was usually attended by a jongleur, whose business it was to accompany the songs which his master composed and sang. But the distinction was far from absolute. See CHANSONS DE GESTE, JONGLEURS, FRANCE (*Literature*), ROLAND.

**Trouville**, a popular French watering-place, in the dept. of Calvados, on the E. bank of the river Touques, at its mouth, about 10 miles S.W. of Honfleur. It was always famous for oysters, but on its fine sands and its nearness to Paris depends its modern importance. It was first brought to notice by Alexandre Dumas. Pop. 6000.—DEAUVILLE, opposite to Trouville, has risen to great repute as a fashionable summer resort for golfing, horse-racing, &c.; pop. 4000.

**Trover**, in the law of England, is an action brought to recover goods from a person to whom they do not belong, but who has in some way obtained possession of them. It was founded on the old fiction that the rightful owner had accidentally lost the goods, and the party in possession had found them, and would not give them up to such owner. It is practically an action to try the title to the goods, and therefore is of extensive application in the law of contracts, as well as other branches of law. The plaintiff, if successful, recovers the value of the goods as a satisfaction. The defendant is said to have illegally converted or appropriated the goods; it is by the conversion of the goods that the damage is done, and for this the remedy is given. See Bullen and Leake, *Precedents of Pleadings*.

**Trowbridge**, a market-town of Wiltshire, on a rocky hill above the small river Biss, 12½ miles by rail S.E. of Bath and 12 S.S.W. of Chippenham. A Norman castle at Court Hill has vanished. The fine Perpendicular church of St James (1475) has a spire 159 feet high; Crabbe the poet was rector from 1814 to 1832, and is buried in the chancel. A new town-hall, presented by W. R. Brown, was opened in 1889; and there are also a market-house, public gardens (1884), cottage hospital (1886), water-works (1873), &c. Trowbridge has been a seat of the woollen manufacture since Henry VIII's reign; and superfine broadcloth and kersey-mere are largely manufactured. Pop. 12,000.

**Troy**. 'The tale of Troy divine,' which forms the background of the *Iliad* of Homer, briefly told is that Paris (Alexander), son of Priam, king of Troy, carried off Helen, wife of Menelaus, king of Sparta; that the Achæan princes, under the command of Menelaus's brother, Agamemnon, king of Mycenæ, undertook to recover Helen; that the Achæans, having besieged Troy for nine years, eventually sacked the city and brought Helen home. These events were regarded as historical not only by the Greeks themselves, but by the moderns within quite recent times, and a date (1184 B.C.) was assigned with as much precision and confidence to the fall of Troy as to the fall of man. But the remarkable revolution in the views of scholars about mythology, which was begun by Lobeck (see MYTHOLOGY) in 1829, and by the brothers Grimm (q.v.), changed all that. Many of the incidents in the Trojan war were shown to be myths common to most Indo-European nations at least. The story of the *Iliad* reduced itself to 'the old fight between the night and the morning, the old story of the victory and death of the solar hero around the walls and

battlements of the sky.' And as late as 1875 it was finally said that 'to seek for fragments of history in either of these is like looking for gold in the rays of the sun' (Sayce, *Principles of Comparative Philology*, p. 311, note). The Troy and Mycenæ of Homer were regarded as the airy fabric of a poet's dream, when Dr Schliemann, who had begun his excavations in 1870, brought to light actual stone walls and battlements on the traditional site of Troy, and then proceeded to Mycenæ, where 'he dug up such masses of gold as even he, the millionaire, had perhaps never before seen upon one spot.' Guided by his simple faith that what Homer said was true, he continued his excavations until he had demonstrated, by 'the science of the spade,' 'the former power and splendour of every city which is mentioned in Homer as conspicuous for its wealth and sovereignty.' It was natural enough that in the first joy of discovery he should straightway call the palace he revealed at Troy 'Priam's Palace,' the entrance to the citadel 'the Scæan Gate,' and the golden relics 'Priam's Treasure.' The treasure consists of big diadems of gold, chains and pendants of gold, golden ear-rings, all packed in a silver jar, bars of silver, 8700 small gold rings, disks, buttons, and small bars of gold, silver vases, gold cups, electrum cups, silver daggers, &c. The whole of this treasure had been packed together and stowed away probably in a secret chamber constructed in the acropolis wall. It was also natural that these identifications (subsequently withdrawn by Schliemann himself) should be disputed. The question was set at rest by Dörpfeld, who continued the work after Schliemann's death. Schliemann had dug down through the remains of Homer's Troy (which he almost overlooked) to those of an earlier city. Naturally the culture of which he found evidence could not easily be made to square with the traditions that had come down to Homer, or with Schliemann's own finds at Mycenæ. The very site of Troy had been matter of dispute for 2000 years: tradition pointed unswervingly to the mound of Hissarlik; the learned unanimously (with the exception of Grote, who was in the right) declared that Hissarlik could not be the site. Schliemann and Dörpfeld excavated Hissarlik, and showed that it had been the site of nine successive settlements. On the top are the remains of (9) the Græco-Roman memorial town, Novum Ilium; below it the scanty ruins of (8) the Hellenistic Ilium, destroyed by Fimbria, a notable place of pilgrimage for its temple of Athena, and of (7) a village of classical Greek times, with objects of Danubian type. Then comes (6) Priam's city. Below it are (5, 4, 3) three small villages, (2) 'the burnt city,' and finally (1) the oldest city. These so-called cities are rather castles or fortified villages. The first city yielded principally pottery and stone implements. Metals were practically unknown to its inhabitants, who were plainly a settled pastoral and agricultural people, familiar with the art of weaving. Their hand-made open-fire pottery is decorated in straight lines and zigzags filled in with white chalk. The settlement had thin walls of small rough stones and clay. The date may be somewhere about the first half of the third millennium, B.C. The interval between its desertion and decay and the foundation of the next city must have been long, for a layer of earth 1 foot 9 inches deep intervenes between the debris of the first and the second or 'burnt city.' This city had rude Cyclopean walls, and a palace of 'North-Greek' type with a megaron. It enjoyed a long period of prosperity, for it outgrew its original walls, which to begin with enclosed a larger area than that of the first city. Not only the walls but the dwelling-houses were rebuilt more than once. The inhabitants were, however, still in

the early Bronze Age. The potter's wheel and the kiln were now regularly used. This, the city of Schliemann's great finds, was destroyed by fire. It is now recognised as approximately contemporary with the Third Early Minoan period in Crete (say 2500-2000 B.C.). The fifth city, with beginnings of Mycenaean culture, may be that destroyed by Hercules (q.v.). The sixth is much greater in extent. It had a wall of massive ashlar masonry with great towers, stone houses, and 'Mycenaean' pottery. It exhibits, in fact (with a difference), the culture of the Third Late Minoan age of Crete. Its date is the end of the Bronze Age, say 1500 or 1200 B.C. Now once more it is possible to believe that the story of Troy has a basis in history. The cause of its siege has been sought in the fact that it commanded the Hellespont trade-route, while the decay of the Hittite empire, with which Troy may have been allied, probably gave encouragement to the expanding Achæans.

See the articles CRETE, HOMER, MYCENÆ, SCHLIEMANN, VIRGIL; books by Schliemann, Dörpfeld, Schuchhardt, and Leaf.

THE LEGEND OF TROY.—The legend of descent from the exiled Trojans, so long a favourite notion of the Romans themselves, early took firm hold of the popular imagination in France and England, but it was not Virgil and Statius so much as the spurious histories of Dares the Phrygian and Dictys of Crete (q.v.) that supplied the threads from which was spun the mediæval tale of Troy divine. As early as the 2d century Philostratus (q.v.) in his dialogue the *Heroica* began the artistic elaboration of the theme, and we find traces of it in the Arthurian legends, the Fabliaux, and the like; another Greek work is the *Iliaka*, in hexameters, by Joannes Tzetzes, the 12th-century Byzantine grammarian; two Latin elegiac poems of the 12th century are extant, the first anonymous, the other by Simon Chèvre d'Or, canon of the abbey of St Victor in Paris; but it was c. 1160 that it took its final literary form in the *Roman de Troie* of Benoît de Sainte-More, a poem of about 30,000 lines, dedicated to the English queen Eleanor of Poitiers. The characters and incidents are transformed by the artist's touch, taking the colour of his own time, while entire episodes are freely invented—of which the finest, devoted to the loves of the faithless Briseida, daughter of Calchas, first with Troilus, next with Diomedes, furnished to Boccaccio the subject of his poem *Filosttrato*, on the loves of Troilus and Griseida. Of the *Filosttrato* Chaucer's 'litill tragedie' *Troilus and Cryseyde* was a free and largely expanded translation, although he speaks of himself as a translator out of Latin, and in two places quotes his author by the name of Lollius. Gower in his *Confessio Amantis* follows Chaucer, enumerating Troilus and Cressida among his illustrious lovers; and Henryson wrote a sequel. Benoît's work was much imitated; it was translated into German in the 12th century, and into Latin at Messina in the 13th by Guido delle Colonne, who did not name his source, and long passed as the author. This work had a wide popularity in English, Italian, French, and German translations. It was the origin of several English versions, including the alliterative *Geste Hystoriale of the Destruction of Troy*, the *Troy Book* attributed by its scribe to Barbour, and Lydgate's *Troy Book* (1412-50; printed by Pynson, 1513). Caxton's *Recuyell of the Historyes of Troye* (c. 1474), the first book printed in English, was a translation of Raoul Le Fevre's French version. The *Life and Death of Hector* was a modernisation of Lydgate by Thomas Heywood (1614). From Henslowe's Diary we find that Dekker and Chettle in 1559 prepared a *Troilus and Cressida*; Shakespeare (1609) followed Chaucer for the story, and Lydgate for

some of the details. The Troy legend kept its place throughout the middle ages in graver histories as well as in romances and mysteries, and it long continued to maintain a shadowy existence in chap-books. Brut, the eponymous Trojan hero who found his way to Britain, flourished in Geoffrey of Monmouth, Gaimar, Wace, Layamon, and long after these in English chronicles whether in verse or prose, and indeed in the 16th century Polydore Virgil was thought a fool and worse for doubting him.

See the introduction of Moland and D'Héricault to *Nouvelles Françaises en Prose du XIV<sup>e</sup> Siècle* (1858); Joly, *Benôit de Sainte-More et le Roman de Troie* (1870); W. Greif, *Die mittelalterlichen Bearbeitungen der Trojaner-sage* (Marb. 1886); Collilleux, *Dictys et Dares* (Gren. 1886); the admirable introduction to E. Gorra, *Testi inediti di storia Trojana* (Turin, 1887); Gordon, 'The Trojans in Britain' in *Essays and Studies*, vol. ix. (English Association); Milder, *Die Ilias* (1910). For the relation of Chaucer's to Boccaccio's poem, see W. M. Rossetti in Chaucer Society's publications for 1875.

**Troy**, capital of Rensselaer county, New York, on the east bank of the Hudson River, at the head of steamboat navigation, and 5 miles by rail above Albany, is built upon an alluvial plain 3 miles long and on the hills to the east (the southernmost known as Mount Ida). The most noticeable buildings are the marble court-house, the Troy Savings Bank building, including a fine music-hall, and several of the fifty churches. The city contains a high school, the Rensselaer polytechnic, and a Roman Catholic seminary. Iron and steel, cotton goods, shirts and collars, mathematical instruments, stoves, nails, machinery, horseshoes, &c., are manufactured. Steamers run to New York. Two bridges cross the Hudson to Watervliet (q.v.; formerly called West Troy). Troy was settled by the Dutch in 1659, and incorporated in 1816. Pop. (1850) 28,785; (1910) 76,813; (1920) 72,013.

**Troyes**, a town of France, the capital formerly of the province of Champagne and now of the department of Aube, on the left bank of the river Seine, 104 miles ESE. of Paris by rail. In spite of modernisations it is still an old-fashioned place, with many quaint timbered houses. The cathedral, a splendid specimen of Flamboyant Gothic (begun in 1208, and consecrated in 1429 in the presence of Jeanne d'Arc), with some beautiful stained glass, and the church of St Urbain (13th century), also with good stained glass, are especially noteworthy; other churches include those of Ste. Madeleine, St Jean-au-Marché, St Pantaléon (decorated with sculptures), and St Nicolas. The museum has a collection of sculptures of the Champagne school. Troyes carries on cotton, linen, and woollen manufactures, and, as the centre of a rich agricultural region, has a large transit trade. Pop. (1872) 38,113; (1921) 55,215. The capital of the Celtic Tricassii, Troyes was called by the Romans *Augustobona*, later *Civitas Tricassium*, and then *Trece*, whence the modern name. Under the Counts of Champagne (9th to 14th century) it rose to great importance, and its fairs standardised Troy-weight (q.v.); so late as the close of the 16th century Troyes had upwards of 60,000 inhabitants. Here the treaty was concluded (1420) between Henry V. of England and Charles VI. of France, and here arose a famous school of sculpture in the 16th century. See Boutiot's *Histoire de Troyes* (5 vols. 1870-80).

**Troyon**, CONSTANT (1810-65), French landscape painter, was born at Sévres. See the monograph on him by Dumesnil (1888).

**Troy-weight** seems to have taken its name from a weight used at the fair of *Troyes*, an important centre of commerce during the middle ages.

Like Cologne, Toulouse, and other towns, Troyes may have had its own special system of weights. A Troy pound (of what value is unknown) is first mentioned in Britain in 1414, long before which period the standard pound of 12 oz. as well as another pound of 12 oz. (the Tower pound) was in use. The term 'Troy' was first applied to the standard pound in 1495, but at the same time no change seems to have been made in its value, and it continued, as before, to be exclusively employed by the dealers in the precious metals, gems, and drugs. See POUND. The troy pound contains 12 oz., each ounce 20 pennyweights, and each pennyweight 24 grains; thus the pound contains 5760 grains, and is to the avoird. pound as 144 to 175; while the troy ounce is to the avoird. ounce as 192 to 175. (The apothecaries' oz. and lb. are now practically obsolete; drugs are bought and sold by avoirdupois, though compounded by apothecaries' weight.) The old English pound, to which the term Troy was afterwards applied, was doubtless the pound of silver; and the Tower pound of 12 oz. differed from it only by  $\frac{1}{4}$ ths of an ounce.

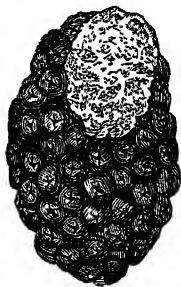

**Trozkoye**, a new name for Gatchina (q.v.).

**Truce**, a suspension of hostilities between two armies or states for a period specially agreed upon. During a truce it is dishonourable to occupy more advanced ground, or to resort to any act which would confer advantage. A truce requires ordinarily to be confirmed by the commander-in-chief to become binding. It is lawful to break it before the prescribed period on notice previously agreed on being given to the opposite party. This is called denouncing a truce. For the 'truce of God,' see GOD'S TRUCE.

**Truck-system** (English *truck*, Scots *trock*, French *troquer*, 'to barter') is the practice of paying workmen in goods instead of money. Where large undertakings are carried on at a distance from towns, it is almost necessary that employers should take steps to provide for a regular supply of provisions and other necessities, to be sold to their men. This form of trading is open to objection on many grounds. The profit to the employer is very doubtful, for the capital which he devotes to his shop might probably be used to greater advantage in his proper business; the men are liable to be defrauded in various ways, because they cannot bargain on equal terms with their employer. A colliery owner, for example, may set up a shop, and may refuse to employ any man who does not deal at the shop. He may supply goods of inferior quality, and dismiss any man who is bold enough to complain. He may make the advances frequently required by the improvident wage-earner, intimating at the same time that he expects the money to be spent at his shop and no other; the account may be further complicated by vexatious deductions of pay for sharpening tools, &c.; and the workman may submit to all these exactions, because there is the threat of dismissal in the background. The evils of the truck-system are known in many countries; Canadian lumbermen, Newfoundland fishermen, and German Socialist leaders have had to protest at various times against it. In England the Truck Act of 1831 (extended by the amending act of 1887 to all persons engaged in manual labour, except domestic servants), and the Truck Act of 1896, were intended to provide a remedy. Wages are directed to be paid in current coin; the employer cannot plead payment in goods as an answer to an action for wages, nor can he maintain an action for the price of goods supplied. He may supply medicine, medical attendance, fuel and tools for mining, provender for beasts, house accommodation, and victuals prepared under his own roof. Deductions of pay are strictly regulated

by the Act of 1887. These statutory rules are sometimes evaded; men who require advances of pay are too much at the mercy of employers to take advantage of the acts. The evils of the system are graphically described in Disraeli's *Sybil*. In 1853 Mr J. H. Burton was employed by the government to investigate the working of the system in Scotland. His report seems to indicate the failure of legislation to reach the abuses complained of; attempts to suppress a long-standing practice may even strengthen its hold. Combination and improved habits of thrift among workmen put an end to the system by making them less dependent on their employers. Employers who evade the law usually allege that they cannot help themselves. The rate of wages, they say, is fixed on the assumption that part will come back in the shape of profit on goods; if they give up the shop, they must pay lower wages, and this the men will not stand. For the English law relating to this subject, see Macdonell, *Law of Master and Servant*. See also CROOK (GEORGE).

**Truffle** (*Tuber*), a genus of fungi of the order Tuberales, division Ascomycetes; globose, or nearly so; of a fleshy substance, with a distinct skin, the whole substance pervaded by a network of serpentine veins, which are the *hymenium*, and bear the spore-cases in minute cavities. The species are not numerous; they are very generally diffused in temperate parts of the world; they are subterranean,

Truffle  
(*Tuber aestivum*).

often found at the depth of a foot or more in the soil, usually near the roots of trees, or rarely living on the surface. Some of them are amongst the most highly valued of esculent fungi. They are said to have a stimulating aphrodisiacal quality. The Common Truffle (*T. aestivum*) is of a black colour, and has a warty surface. It is the principal species sold in the English markets. It varies in size from that of a large plum to that of a large potato. On account of its agreeable flavour, it is used in the preparation of many dishes. It is common

in the central and southern parts of Europe, chiefly in loose soils, in woods and pastures, as in the chestnut woods of France and Italy. In England it occurs pretty abundantly in the downs of Wiltshire, Hampshire, and Kent. Truffles probably occur in many districts, but owing to their subterranean growth are unsuspected. In England, and also on the Continent in localities in which they are known to grow, trained dogs are employed to discover their whereabouts, and in France and Italy pigs are employed for the same purpose. The true Périgord Truffle, which is considered superior to the English, is *T. brumale*, var. *melanosporum*. The White Truffle of Germany, which also is found in England, is *Cheromyces albus*, of a genus closely allied to *Tuber*, but less esteemed in cookery than the common truffle. The Red Truffle of the Bath Market is *Melanogaster*, a genus of the allied order Hypogaei, and is not therefore a true truffle. The African truffles, species of *Terfezia* and *Tirmania*, somewhat inferior to it in quality, are in some parts of Algeria and Tunis an important food-supply for the people. In the south of France truffles are said to have been produced in woods which have been watered with water in which the parings of the truffle have been steeped. In Poitou the practice prevails of enclosing a space on the downs and sowing it with acorns. When the oaks are large enough to shade the ground, it is said there is

sure to be a crop of truffles. Light chalk soil appears to be preferred by truffles, and they are found most usually in beech, oak, birch, chestnut, hazel and hornbeam woods.

**Trujillo**, (1) a town of Spain (Lat. *Turgalium*), the birthplace of Pizarro, is in Cáceres province, 60 miles N.E. of Badajoz. It manufactures linen, leather, and pottery. Pop. 11,000.—(2) An episcopal city of Peru, capital of the dept. of Libertad. It was founded in 1535 by Pizarro, who named it after his Spanish birthplace, has walls raised in 1686 to keep out the filibusters, and contains a college, a theological seminary, and high school. In 1882 it was sacked by the Chilean troops. There are large sugar plantations in the neighbourhood. Its ports are Huanchaco and Salaverry. Pop. 25,000.—(3) A town of Honduras, on the north coast, with 2000 inhabitants, and an export trade in sarsaparilla, bananas, hides, mahogany, rubber, and cattle. The town dates from 1524. Its new port, Puerto Castilla, is five miles off. A railway from Trujillo to Juticalpa is in the course of construction.

**Trullan**, the name (derived from the dome-roofed hall—Gr. *trouillos*—of the palace in which the Fathers assembled) given to two church councils. The first Trullan Council (680) is the 6th œcumenical council, which condemned monophysitism. The second, called by Justinian in 692, established 102 canons for the discipline of the church, allowing the marriage of priests. This council, also called Quinisext, as being meant to supplement the 5th and 6th œcumenical councils, is not accepted by the Roman Church.

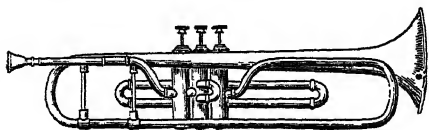

**Trumbull**, JONATHAN, an American patriot, was born at Lebanon, Connecticut, 12th October 1710, and graduated at Harvard in 1727. He was successively judge, deputy-governor, and governor (1769-83) of Connecticut, and took a very prominent part in forwarding the war of independence. Washington placed great reliance on him, and frequently consulted him: to this habit, and his phrase, often repeated when in doubt, 'Let us hear what Brother Jonathan says,' has been traced the name which stands (though not so generally now as 'Uncle Sam') for a personification of the United States as 'John Bull' does for England. Trumbull died 17th August 1785. There is a Life by I. W. Stuart (Hartford, 1857).—His son John (1756-1843) was eminent as a painter. His best works are several portraits of Washington and others, 'The Battle of Bunker Hill,' 'Death of Montgomery,' and four paintings in the capitol at Washington, representing the Declaration of Independence, the surrender of Burgoyne and of Cornwallis, and Washington's resignation. A gallery of his historical pictures, of considerable value for their portraits, &c., became the property of Yale College in return for an annuity of \$1000. See YALE UNIVERSITY.

**Trumpet**, an ancient wind-instrument (the curved *lituus* of the Romans), is formed of a long, narrow, straight tube, bent twice on itself, the last fifteen inches tapering into a bell, and sounded by means of a cupped mouthpiece (for figure of mouthpiece, see HORN). The simple form of the instrument has been used from 'time immemorial' as a military signalling instrument, being specially attached to the cavalry and artillery branches, while the Bugle (q.v.) served the infantry. For trumpeter, see BAND (MILITARY). From its power and brilliancy of tone it has also been a favourite instrument with many composers of orchestral music. The compass of the natural trumpet comprises the harmonic series (see HARMONICS) up to about G (first space above the treble clef), the fundamental tone being alterable by

means of crooks. Higher registered instruments, requiring great skill on the part of the performer, were in fairly common use from the 16th to the 18th century; Bach wrote trumpet parts up to D and E above the treble clef. A slide arrangement,

adapted from the trombone, invented some time during the 18th century and subsequently improved by the celebrated player Harper, gives most

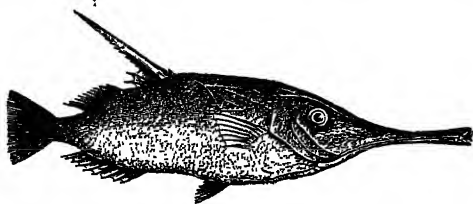

Valve Trumpet.

of the chromatic scale. A simpler form with three valves, brought out first by Stölzel in 1815, gives all the scale and is now generally used. The tone of the Cornet (q.v.) is inferior to that of the trumpet. Valve trumpet parts are always written in the key of C major, while the crooks generally used give the instrument a range of the following keys: F, E, Eb, D, C.

**Trumpeter** (*Psophia*), a genus of crane-like birds. Only half-a-dozen species are known. The Trumpeter (*P. crepitans*—the *Agami* of the Indians) is described by Schomburgk as occurring in large flocks throughout British Guiana, chiefly in damp forests near the coast. They are very easily tamed, and their flesh is palatable. The name trumpeter refers to the loud ventriloquistic call, with which the enormously developed wind-pipe has probably to do. One of the American swans, *Cygnus buccinator*, is also called Trumpeter.

**Trumpet-fish**, or **SNIFE-FISH** (*Centriscus*), a genus of fishes referred to the family *Fistulariæ*,

Trumpet-fish (*Centriscus scolopax*).

or to a special family *Centriscidæ*. The compressed and somewhat oblong body is covered with small spiny scales; the toothless mouth lies at the end of an elongated tubular snout; the second ray of the first dorsal fin is a strong toothed spine, and the ventral fins, which lie in a groove, are also serrated. The fish measures about 5 inches in length; its colours are rose or reddish green above, silvery beneath. It sometimes occurs on the south coast of Britain, and is common in the warmer European waters. It is sometimes called sea-snipe, and, as this suggests, is esteemed a delicacy, and is often to be seen in the markets of Italy. The name 'trumpeter' is also given to a well-flavoured Tasmanian and New Zealand fish (*Latris hecateia*), not far removed from the *Serranidæ* and *Perches*.

**Trumpet-flower**, the popular name of various plants which produce large trumpet-shaped flowers. The genera *Bignonia*, *Catalpa*, *Tecoma*,

all belonging to the *Bignoniaceæ*, and *Solandra*, belonging to *Solanaceæ*, are examples of the plants commonly named trumpet-flowers. Species are: *Bignonia capreolata* ('Cross-vine'), *Catalpa bignonioides* ('Indian Bean'), *C. cordifolia* ('Western Catalpa'), *Tecoma radicans* ('Trumpet Creeper'), all North American; *Catalpa Bungei* and *C. Kampferi*, *Tecoma grandiflora*, East Asiatic species. *Solandra grandiflora*, with gigantic flowers, seems to have a special liking for *Ficus mexicana*, from which tree its festoons can often be seen hanging down.

**Trunk-fish**, a name for the Coffer-fish (q.v.).

**Trunnion**. See GUN.

**Truro**, a city of Cornwall, of which it is considered the metropolis, though Bodmin is the county town, stands 12 miles NNE. of Falmouth and 54 W. of Plymouth, at the junction of the Allen and the Kenwyn, here met by a tidal inlet, the Truro River, whose banks present beautiful scenery, and which admits vessels of 100 tons to the quays of the town. The ancient Cornish bishopric of Truro was revived in 1876. The cathedral, which occupies the site of the 16th-century church of St Mary, was begun in 1880, and consecrated in 1887, but was not completely finished till 1910; it is a granite Early English structure, designed by J. L. Pearson, measures 275 feet by 111 across the transepts, and has a central tower 250 and two western towers 204 feet high. Other buildings are the Italian town-hall and market-house (1847); the Tudor public rooms (1868), with the county and Bishop Phillpott's libraries; the grammar-school (1546); and the Royal Cornwall Infirmary (1779). Foote, Bone, Martyn, and the Landers were natives, and Dr Wolcott practised here. A very ancient municipal borough, Truro returned two members to parliament from 1239 till 1885. Pop. (1921) 10,833.

**Truro**, a Nova Scotian iron and woollen manufacturing town, at the head of Cobequid Bay, 55 miles NNE. of Halifax, has an agricultural college; pop. (1921) 7562.

**Truss**. See HERNIA.

**Trust**, an arrangement by which property is handed to or vested in a person, in the trust or confidence that he will use and dispose of it for the benefit of another. At Rome such an arrangement was called a *Fidei-commissum* (q.v.), and at first the honour of the trustee was the only security for the performance of his duty; Augustus gave legal validity to trusts, and appointed a special prætor to enforce them. In England land was in early times frequently conveyed to persons in whom the owner had confidence, that they might hold it to the use of other persons indicated by him. The courts of law looked only to the legal title, and took no notice of the uses to which the land was held; but the Chancellor would compel a 'feoffee to uses' to do his duty. The use was turned into a legal estate by statute in 1536, but the equitable powers of the Chancery remained, and were freely used to enforce any trust, whether relating to land or to personal property. Trusts of land must be declared in writing, but this rule does not apply to trusts raised by implication or construction of law. Thus, if A purchases land with the money of B, he holds it as trustee for B, although there may be no written agreement between them. The person who holds property in trust is a *trustee*; the person for whose benefit he holds is called *cestui que trust* (he that has the benefit of the trust). In declaring a trust no particular words are necessary, but the intention of the party making it must be clear. Thus, in wills, a testator sometimes uses words which do not amount to an express trust, but speaks of his 'wish and desire,' or his 'confidence,'

that the executor or trustee shall do certain things. These are called in the law precatory trusts; they are enforced if no uncertainty exists as to the purposes or mode of carrying out the trust. But if a testator merely recommends an executor to 'consider certain persons,' 'to be kind to them,' or 'to do justice to them,' or 'to make ample provision for them,' &c., such expressions are treated as too vague to be binding, and therefore the executor may disregard them, or use his own discretion. A trustee's is not a compulsory office, but gratuitous, and therefore he need not accept the office unless he pleases. But if he once accepts he is not at liberty afterwards to renounce, unless the trust-deed contain a provision enabling him to do so, or the court for good reasons discharge him. A trustee cannot delegate the office to a third person, but continues personally bound to do his duty. Where there are several trustees appointed the office is considered joint, so that if one dies the survivors continue to exercise the office. As a general rule, all must join in doing any act; but if the trust is of a public nature a majority may bind the minority. Each trustee is liable only for his own acts or defaults, and this is so even though, for form's sake, he join his co-trustees in signing a receipt, if he can show that he never received the money in point of fact. Nevertheless when money lies in the hands of one trustee the others ought not to be satisfied with his mere statement that the money has been invested by him, but should see that it is actually done. Another rule is that a trustee is not allowed to make a gain of his office; and so jealous is an English court of this rule that trustees have sometimes been restrained by the court from shooting over the trust estate. A trustee is personally liable if he trade with the trust funds, or buy shares in a joint-stock bank; for, even though the trust-deed authorise this to be done, he will be liable to pay the debts of the trading concern, though far exceeding the amount of the trust funds. So, if a trustee is a solicitor, and does legal business for the estate, he will not be allowed to charge for his care and trouble, but at most will be allowed only the costs out of pocket. It is seldom, therefore, that a trustee can get any benefit to himself from the trust estate. Formerly if *cestui que trust* died without heirs land held in trust belonged to the trustee, but the rule has been altered by statute, and the escheat is now to the crown. It is the duty of a trustee to keep the trust funds safe; and if they consist of moneys, then he ought to invest them in government stock, and not let the money lie unproductive. He is not entitled to lend the money on personal security, or in the shares of any private company; but he may invest in mortgages, unless he is forbidden by the deed or will. If there is, therefore, no power to invest in mortgages, the trustee must invest in consols or in some other security authorised by the orders of the Supreme Court. The trustees, as a general rule, must pay interest whether they invest the funds or not (if they have had time to invest) to the *cestui que trust*; and they must account for all the profits they make with the trust funds, whether rightly or wrongfully. If a trustee has grossly misconducted himself as to the trust funds he will be charged 5 per cent. interest, and sometimes compound interest. A trustee is entitled to be indemnified for all the reasonable expenses or outlay attending the execution of the trust, but he must in general bear the loss of any mistake as to the law; but if there is any peculiar difficulty in carrying out the trust, he is entitled to take the opinion of, or even to throw the chief management upon, the Chancery Division of the High Court, as the only safe protection. When trustees are guilty of gross negligence, mismanagement, or misconduct

the Court will remove them and appoint others (see Lewin on Trusts). By the Trusts (Scotland) Act, 1921, which amends the law relating to trusts in Scotland, trustees under any trust may, unless specially prohibited by the constitution or terms of the trust, invest the trust funds in the purchase of government securities of the United Kingdom, or securities with parliamentary guarantee of interest; stock of India, colonial stock (subject to restrictions); Bank of England, London County Council or Metropolitan Water Board, county or town councils in Scotland (if redeemable) and of certain municipal corporations in Great Britain, and certain British railway securities; in loans on any of the foregoing, on real and heritable security in Great Britain, and on certain securities. The Public Trustee Act of 1906, empowering the State through an official Public Trustee to act as executor or trustee for any person who may desire it, came into force in 1908. See ASSOCIATIONS, TRUSTS, AND CARTELS.

**Trygon.** See STING RAY.

**Tryon, SIR GEORGE, K.C.B.** (1832-93), vice-admiral, entered the navy in 1848, was at Sebastopol, became captain in 1866, and admiral in 1884. He was commander-in-chief in the Mediterranean from 1891 till the disastrous collision (29th June 1893) off the coast of Syria, when his flagship, the *Victoria*, by his mistaken order, collided, capsized, and sank, with her commander and great part of her crew. While admiral on the Australian station he devised, in 1886, the scheme for a local auxiliary squadron, from which systems of naval defence in the colonies have developed. See Life by Penrose FitzGerald (1897).

**Trypanosomes**, flagellate protozoa (see INFUSORIA) parasitic in blood, sometimes causing disease. See SLEEPING-SICKNESS, TSETSE.

**Trypanosomiasis.** See TSETSE.

**Tsarskoye Selo** ('Imperial Town'), 15 miles S. of Petrograd, was an imperial residence, with two great palaces and parks; pop. 15,000.

**Tschaikowsky, PETER ILYITCH**, composer, was born 25th April (7th May) 1840, at the mining-town of Votkinsk in Vyatka, Russia. His father, a mining engineer in the imperial service, soon after became director of the technological institute at St Petersburg, whither the family removed in 1850. There Tschaikowsky studied law, and for three years was an official of the ministry of justice. He was a good amateur musician, with a taste for Italian opera, for Mozart, and for Glinka. When the Conservatorium was established by Rubinstein he became a student under Zarembo, and by Rubinstein's advice abandoned law (1863) for the profession of music. Nicholas Rubinstein (Anton's brother) then founded the Moscow Conservatorium, and Tschaikowsky was professor of composition and history there from 1866 to 1878. At Moscow he wrote a treatise on harmony, was music critic for two periodicals, and composed assiduously. His works were often slow to make their way, both with musicians and with the public. Some of his failures of this period ultimately gained favour. Others he burned or transformed into new shape. The Rubinsteins were too conservative to

approve of such works as the first symphony (1866), the B flat minor piano concerto (1874), or the string quartette in F (1874). Curiously enough, Tschaiakowsky was himself conservative in opera. Opera strongly attracted him, and he essayed it again and again, with limited success. *Oprichnik* (1874) and *Eugene Onegin* (1878) alone kept the stage. Music for an abandoned opera was turned into a symphonic poem, *Francesca da Rimini*. Other works of the Moscow period are the first three symphonies, *The Tempest* symphonic poem, the string quartets, much piano music, and songs, these last of inferior interest.

Tschaiakowsky was of a diffident, melancholy temperament. His music often expresses the deepest gloom and despair. He had already had to go abroad in 1876 to recover from a nervous breakdown, but in 1877 a climax came in a disastrous marriage, contracted in compassionate quixotry, which drove him after a few weeks to St Petersburg, where he fell seriously ill, and stood in the river in the hope of dying of exposure. Under the care of his brother Anatol he then went to Switzerland and Italy, and completed not only his popular but unequal *Eugene Onegin*, but one of his masterpieces, the fourth symphony. For a short time he resumed teaching at the Conservatorium, but he was enabled to resign his chair by the well-judged action of Mme. von Meek, a rich admirer of his music, whom he corresponded with, but never met. This lady made him a considerable money allowance until 1890, whereby he was able to give his main energy to composing. From this time his life was spent at St Petersburg, and afterwards near Klin, north-west of Moscow, with tours in Italy, America, England, and elsewhere. He wrote more operas and symphonic poems, orchestral suites, a second and third (unfinished) piano concerto, the 1812 overture (1880), those two light and delicate ballets *La Belle au Bois Dormant* and *Casse-Noisette*, and two of the greatest and most overwhelmingly tragic symphonies in all music, the fifth and the sixth or 'Pathetic.' The last-named was completed in August 1893. On the 25th of October (6th of November) he died of cholera at St Petersburg. Tschaiakowsky's music combines Italian melodic sensuousness (his favourite composer was Mozart) with a peculiar individual melancholy that almost amounts to hysteria. He is intensely human and intensely introspective. It is a curious paradox that while his operas fail by being too lyrical, his symphonies gain enormously by being dramatic, while his orchestration is always brilliant and highly coloured.

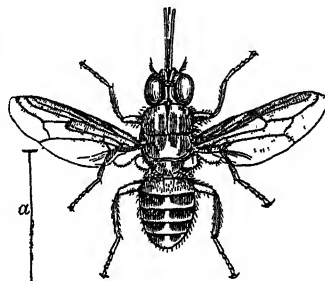

See his *Life and Letters* by his brother Modest Tschaiakowsky (1901; abridged translation by Mrs Newmarch, 1905); Mrs Rosa Newmarch, *Life and Works of Tschaiakowsky* (1900; ed. Evans, 1908); and the article in *Grove's Dictionary*.

**Tschudes**, a small branch of the Baltic or Western Finns, akin to the Esths, include the Votes in north-west Ingermanland, and the Vepsas near Lake Ladoga.

**Tschudi**, AEGIDIUS (1505-72), of Glarus, wrote the standard *Schweizerchronik*, which, as continued by Johannes von Müller, though it has been proved to contain baseless legends and fables, has great interest and literary merit, and has accurately preserved the text of many ancient documents which would otherwise have been lost.—To the same family belonged JOHANN JAKOB VON TSCHUDI (1818-89), the eminent traveller and naturalist, born at Glarus. After completing his studies at Leyden and Paris, he undertook (1838) a voyage round the world; but circumstances restricted his design to an investigation into the natural history and ethnography of Peru, where he remained for

five years. He settled in Austria, and from 1866 till 1883 was Swiss ambassador at Vienna. His writings comprise works on the batrachians, the *Fauna Peruana* (1844-47), on the Quichua language, on Peruvian antiquities, a Peruvian drama, and sketches of his travels in South America.

**Tsetse** (*Glossina morsitans*), a dipterous insect which is a terrible pest of some parts of South

Tsetse (*Glossina morsitans*):  
a, natural size.

Africa. It resembles the common house-fly in shape, and is of a brown colour, with four yellow bars across the abdomen. The wings in repose project considerably beyond the abdomen. It is remarkably alert, at least during the heat of the day, and dexterously avoids any attempt to catch

it with the hand. Its bite conveys the disease called Nagana to cattle, horses, goats, sheep, and other domesticated animals. The disease is due to a Protozoan parasite—a Trypanosome—which lives in the blood of the wild animals of the country. These wild animals are accustomed to the parasite, and appear to be unaffected by its presence; but its transference to new-comers is usually fatal. Smearing the cattle with unpleasant stuffs before they enter the often narrowly circumscribed 'fly-belt' seems to be sometimes an effective preventive, and other counteractives are being devised. *Glossina palpalis* is responsible, with *G. morsitans*, for disseminating the parasite (*Trypanosoma gambiense*) of Sleeping-sickness (q.v.), perhaps the most terrible of all human diseases.

**Tsi-nan**, capital of Shantung province, China, 100 miles from the Gulf of Pe-chi-li, manufactures silk and glass; pop. 250,000.

**Tsing-tao**, a treaty port of China, situated in an advantageous position on the peninsula which separates the bay of Kiao-chau from the Yellow Sea. It is frequently referred to as Kiao-chau (q.v.) though strictly Kiao-chau lies on the eastern side of the bay. Tsing-tao, from being a mere fishing village developed enormously under German control (1898-1914) and became of considerable strategical importance. Progress was continued under the Japanese, but since the resumption of Chinese control a relapse has threatened.

**Tsitsihar**, a town of Manchuria, on the Vladivostok branch of the Trans-Siberian Railway, 250 miles SW. of Aigun; pop. 30,000.

**Tsong-kha-pa**. See LAMAISM.

**Tsu**, a maritime town of Japan, 50 miles ESE. of Tōkyō, with many fine temples; pop. (1925) 52,536.

**Tsuga**, a genus of conifers, including the Douglas fir (*T. or Abies Douglasii*) and the hemlock spruce (*T. or Abies canadensis*). See FIR.

**Tsuruoka**, a town of the main island of Japan, 70 miles NE. of Niigata; pop. (1925) 31,830.

**Tsu-shima**, a Japanese island (two islands at high water), 40 miles long, dividing the Korean Strait into two channels. In the main channel on May 27-28, 1905, the Russian Baltic fleet was annihilated by Togo.

**Tuam**, a town of Galway, 130 miles NW. of Dublin, is the seat of a Roman Catholic archbishop and of an Anglican bishop; pop. 3000.

**Tuamotu.** See LOW ARCHIPELAGO; POLYNESIA, &c.

**Tuareg,** or TUARIK. See TOUAREG.

**Tuat.** See TOUAT.

**Tuatara.** See SPHENODON.

**Tuba** (the straight trumpet of the Romans), a name sometimes given to the larger members of the Saxhorn (q.v.) family, but usually confined to the Bass Tuba, the lowest-toned brass instrument in the modern orchestra. It was created in 1835 by Wieprecht and Moritz, and first used to any extent by Wagner. The tone is broad, and the compass, with the use of 3 or 4 valves, extends from F an octave below the bass clef to F above the bass clef.

**Tube.** See PIPES.

**Tuber,** a thick and fleshy subterranean stem, filled with starchy matter, which serves as a store of food material for the plant, and especially as a stock in trade for the young plants which often grow from the buds of the tuber to begin life upon. These buds, together with the minute scales in whose axils they occur, show that tubers are not Roots (q.v.). The true roots arise from the tubers. The potato is the most familiar example. The buds in this case are called 'eyes.' If they are cut off the tuber and set in the ground they grow into new plants. This is the method adopted by gardeners for the propagation of the potato plant. It has been observed that the ordinary aerial buds show a tendency, occasionally, to become tuberous. This is taken advantage of by gardeners, who, by surrounding the lower part of the stem with earth, cause the buried buds, which would normally grow into branches, to become tubers. The Jerusalem artichoke (*Helianthus tuberosus*) is another common tuber. Many use the word, not as defined above but generally, for any swollen plant structure (stem or root) which serves as a storehouse of reserve material. The subterranean fructifications of a group of fungi, the Tuberaceæ or Truffles (q.v.) are called tubers.

**Tubercle.**—*Historical.*—The word tubercle was first applied to the small nodules which occur in the lung and elsewhere in the disease tuberculosis, or consumption, by Franciscus Sylvius (1614-72). So constant are these nodules, and so characteristic of the disease, that the term has come to be applied to such lesions only as they occur in this particular disease, the disease itself being known as tuberculosis. The adjective tubercular or tuberculous is employed to signify belonging to the disease tuberculosis. To the causal germ of the disease the name tubercle bacillus or *Bacillus tuberculosis* is given.

At first 'tubercles' were regarded as being enlargements of minute glands. Baillie (1761-1823) was one of the first to object to this view, and to regard the condition as a 'new formation' in the cellular tissue between the lung air-cells. Knowledge regarding tubercle was greatly advanced by Bayle and Laennec in the early years of the 19th century. Rudolf Virchow (1865) was the first to describe the microscopic appearance of the tubercle nodule as a cell aggregation, but he regarded the condition as a tumour formation, including it among the granulomata, or tumours composed of granulation tissue. In 1865 Villemin discovered that tuberculosis was inoculable into rabbits, and the term 'infective granuloma' was used to characterise the condition. In 1876 Ziegler showed that the microscopic appearances of the disease were exactly those found in inflammation generally; and in 1882 Koch discovered the irritant which produced the peculiar type of inflammation characteristic of tuberculosis.

The term 'struma' was applied by Celsus, who lived at the commencement of the Christian era,

to enlarged glands in the neck, a condition undoubtedly, in a majority of cases, due to tuberculosis. Scrofula (from *scrofa*, a pig) was a term applied first by certain Roman writers to a similar enlargement of such glands of an extreme degree, the origin of the term being the pig-like expression of individuals suffering from the disease. Both these terms have been dropped from general use, since it has been recognised that the conditions they stand for are merely special manifestations of tuberculosis.

*Causation.*—The organism now universally recognised as the cause of tuberculosis (*Bacillus tuberculosis*) was discovered by Robert Koch sometime during the year 1881. The announcement of this discovery was made at a meeting of the Physiological Society of Berlin University on 25th March 1882. So complete and thorough had been Koch's work that he was able at that meeting to show that the germ described by him fulfilled all the postulates laid down by himself at a later date as requiring proof if an organism is to be causally related to a disease. (See GERM THEORY.)

This organism, as it occurs in cultures and in its lesions, is usually rod-shaped, although occasionally long branching forms are found. It varies much in length, being usually one ten-thousandth to one five-thousandth of an inch long. It is slender (one sixty-thousandth of an inch in breadth), and may be straight or slightly curved. It has no capacity for individual movement, and occurs chiefly in masses. It is composed of protein substance, with fatty material, and salts of sodium, potassium, calcium, and magnesium. It is a difficult organism to stain, the staining fluid requiring the assistance of heat and some mordant, such as carbolic acid, but once stained it resists the decolorising actions of reagents such as acids and alcohol. It stains irregularly, some portions of the germ being more deeply stained than others (fig. 1).

Calmette and his co-workers have demonstrated (1927) that material extracted from tuberculous lesions after being passed through a fine porcelain filter is still infective for animals such as guinea pigs. This would indicate that a form of the bacillus, possibly a spore, belongs to the filterable (ultra-microscopic) group of organisms.

The tubercle bacillus is cultivated with considerable difficulty on artificial media. It will grow most readily on blood serum and on egg media, also upon ordinary media, such as meat extract, agar-agar, and potato, to which glycerine has been added. Growth takes place very slowly after a culture-tube has been inoculated, none being visible for ten to fourteen days.

The usual method of staining is by means of carbol-fuchsin, heating the stain until it steams. The section, or film, is then treated with acid spirit in order to take the stain out of everything except the organism. Methylene-blue is usually employed as a counterstain.

On artificial media, such as egg, the organism grows as a thin, white, pale yellow or pink film with a wrinkled surface. Raised nodules of growth develop here and there with rough, irregular sur-

Fig. 1.—Tubercle Bacilli in phthisical expectoration (× about 1500 diameters):  
a, bacilli; b, catarrhal cells.  
(After Crookshank.)

faces. The germ will only grow in the presence of oxygen.

**Resistance of the Germ.**—The tubercle bacillus is a relatively resistant germ. This power it owes in large measure to the fatty material incorporated in its substance. Dried sputum, if kept in the dark, remains capable of producing infection for six to eight months. This point is of great importance in relation to the dissemination of the disease by dust. The organism has been found alive after several weeks in a putrefying fluid. Raising the temperature of a fluid in which the germ is to 100° C. (i.e. the boiling-point of water) will rapidly kill the organism. Hence the boiling of milk, even for a very short time, will render it innocuous from this point of view. On the other hand, in the dry condition the organism will resist a temperature of 100° C. for an hour. At a temperature of 60° C. in a fluid the germ is killed in fifteen to twenty minutes. This fact is the foundation for the process of the Pasteurisation of milk. At the same time, it should be remembered that the lid of the vessel must be closed if this temperature is to be effective, and no solid masses or clots must be present. To destroy sputum or other infectious material it must be left in contact with carbolic or lysol 5 per cent. for twenty-four hours in order to ensure proper penetration of the antiseptic. It should be remembered that one of the most effective agents for destroying the tubercle bacillus (as well as other germs) is sunlight. Cultures of the germ are killed within two hours by exposure to the direct rays of the sun.

**Types of the Germ.**—The germ varies somewhat in its characters, according to the source from which it has been obtained. Certain types can be distinguished: (1) A human type, which is obtained from the majority of lesions in the human subject (practically all cases of pulmonary tuberculosis), and occasionally from animals such as the pig. This type grows more readily than does the bovine type upon artificial media. (2) A bovine type, which is obtained from cases of the disease in cows, horses, pigs, cats, &c., and is not infrequently found in the human subject, especially in young children in tubercular glands, intestinal and bone tuberculosis. This type tends to be shorter and thicker than the human type; it grows much less readily upon artificial media, and it produces a much more rapidly spreading disease in the rabbit. (3) An avian type, which is found in birds, and occasionally in pigs, and, very occasionally, in man. (4) A type found in fishes and other cold-blooded animals. These types are fairly constant in their characters, and have up to the present time resisted all attempts at transformation into other types.

**Portals of Entrance.**—The tubercle bacillus may enter the body by one of three paths: (1) the respiratory tract, including the nose, tonsils, windpipe, and bronchial tubes; (2) the intestinal canal; (3) the skin. By far the commonest path of entrance is the respiratory tract, the organism being inhaled in the form of infected dust from rooms or the street, or in the form of spray directly from a coughing consumptive. Owing to the fact that a large percentage of milking cows suffer from tuberculosis, milk is not infrequently the means of introducing the germ into the intestine. In the bowel itself ulceration may be caused, or the germ may be absorbed, and affect first the glands of the abdominal cavity. This mode of infection occurs chiefly in children. The skin is infected only in rare instances, such as in the case of veterinary surgeons, doctors or attendants in consumptive hospitals.

The tubercle bacillus occurs in its lesions in variable numbers. In some cases of rapidly progressive type the number may be very large. It is estimated

that a consumptive may expectorate as many as three million tubercle bacilli in twenty-four hours. As a rule, however, the organisms occur in the tissues, and in the spit in small numbers.

**Toxins.**—The tubercle bacillus in producing its poisonous and destructive effects acts largely

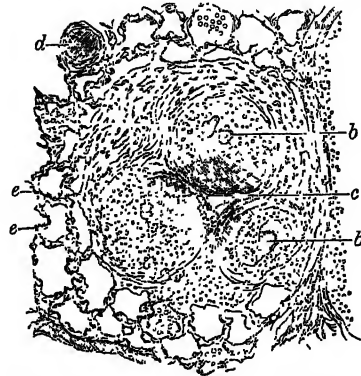

Fig. 2.—Tubercle of Lung ( $\times 50$  diams.):

bb, giant cells; c, centre of tubercle beginning to caseate; d, branch of pulmonary artery; e, alveolar framework of lung. (After Hamilton.)

through the medium of a toxin which it secretes. This poison occurs within the body of the germ; also, to a lesser extent, in the medium in which it is growing. The toxin is extracted from the germ and employed in the form of what is called tuberculin both as a test for the existence of tuberculosis and in the treatment of the disease.

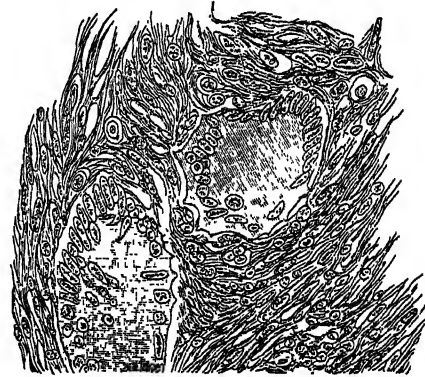

Fig. 3.—Giant Cells from Tubercle of Lung (460 diams.). The peripheral arrangement of the nuclei is well seen, as also the reticular meshwork external to the cell. (After Wilson Fox.)

**Lesions produced in the Tissues.**—When tubercle bacilli are introduced into the tissues of the animal body they are attacked by the phagocytic cells from the blood and from neighbouring parts. Owing to its resistant character it takes some time for cells to destroy the germ; hence the cells tend to become aggregated together into masses round the bacilli. This cell aggregation, which is the 'tubercle' or tubercle follicle previously mentioned, has a very constant and characteristic appearance under the microscope. It is built up of two main types of cells (figs. 2 and 3):

(1) Large branched or spindle-shaped cells which arise chiefly from the fixed connective-tissue cell by a process of proliferation. These cells occur towards the centre of the follicle. Many of them contain more than one nucleus, and one or more in each follicle are exceptionally large, containing

20-40 nuclei. These are known as 'giant' cells. These giant-cells, first described by Rokitsanski (1855), are very characteristic of the disease tuberculosis. The nuclei are arranged in a circle, or part of a circle, at the periphery of the cell. In the centre is a clear, finely granular area.

(2) At the periphery of the tubercle, outside the area of epithelioid cells, is a zone of small, round cells with dark-staining nuclei, which resemble the small leucocytes of the blood. These originate in part from the blood, in part from connective-tissue cells, and are known as lymphocytes. Tubercle nodules are often massed together, the individual follicles being separated by strands of fibrous tissue. Under the influence of the poison liberated by the tubercle bacillus the cells frequently die, undergoing necrosis of a special type, which from its naked-eye appearance is known as 'caseation.' As the result of this change the cells lose their identity, cease to stain, and break down, to form a granular, structureless debris. Tubercle bacilli are found in tuberculous tissue usually only in small numbers, occurring within the cells, or, more commonly, in the necrotic caseous areas. So constant and characteristic are the above microscopic appearances that on finding them the observer can without hesitation say that living tubercle bacilli are, or have been, in that particular tissue. A point of interest is that the tubercle follicle does not contain vessels (a fact observed first by William Stark, 1788).

The above cellular changes are found in tuberculous disease wherever it occurs throughout the body—whether in bone, brain, lung, skin, or intestine. If the lesion be near one of the surfaces of the body—e.g. skin or internal surfaces, such as the intestine air-passage—the dead, caseous material is discharged, and a cavity, or ulcer, results. When this is the case other germs infect the raw surface, grow upon it, and so add their injurious effects to those of the tubercle bacillus.

To the unaided eye these tubercles appear, when composed of living cells, as minute gray areas. When they have undergone the caseous change, they show in their centre small opaque white or yellow spots. The resemblance between tubercles of this kind and millet-seed was observed by Manget in 1700; hence the use of the term miliary tuberculosis, where the disease takes the form of a dissemination of small tubercles through an organ or through all the organs of the body. Frequently larger nodules are formed from the coalescence of a number of tubercles. In the lung, in addition to the formation of tubercles there is always a filling up of the air-sacs with cells and exudate. Such consolidated areas undergo, just as the tubercles do, a necrotic, caseous change. The term 'caseous' was given, as indicated above, because of the resemblance of the necrotic material to dry cream-cheese. The term was first applied to tuberculous lesions by Baillie. Calcification may occur in old caseous areas.

**Mode of Spread.**—Having started at one particular point in the body—lung, tonsils, intestine, skin, &c.—the disease tends to spread in various ways: (1) by continuity of tissue, creeping from one part to another; (2) by the lymphatic vessels, through organisms being absorbed by the lymph and carried to other parts of the lymphatic system—thus it is that after starting at some point the nearest lymphatic glands soon become enlarged and tuberculous; (3) by the blood-vessels, the organisms gaining access to the interior of the blood-vessel, usually owing to a focus becoming adherent to and discharging itself into a thin-walled vessel such as a vein—when this occurs the disease spreads itself throughout the body, miliary nodules being found in all the internal organs; (4) spread may also occur, in the case of the lung, by

the air-passages, owing to infected material being coughed up and then inhaled into other portions of the same lung or into the other lung. In the case of the urinary tract, spread may take place from kidney to bladder by way of the ureter.

As previously stated, the lesion when it reaches a surface ulcerates. Thus tubercle foci in the lung become connected with, and eventually open into, air-passages, discharging by this means their caseous material. It is in this way that lung-cavities form.

### Tuberculin. See TUBERCULOSIS.

**Tuberculosis**, or **PHTHISIS**, popularly known as consumption or decline, has been known from the very earliest times. Babylonian records depict a condition recognisable as such, but we owe the first description of the disease to Hippocrates (460 B.C.), and little was added to this for many centuries. From these remote times consumption has been the most wide-spread and prevalent disease among mankind, and has been named the great white plague. The term consumption is generally used by the laity to indicate pulmonary tuberculosis (*phthisis pulmonalis*), a process of destruction of the lungs, of varying intensity and rapidity, combined with progressive symptoms and emaciation, but tuberculosis is really a disease which may affect any system in the body. It is essentially a wasting disease and very frequently a fatal one, and was well termed by Bunyan 'Captain of the Men of Death.' Towards the end of last century it was estimated that one-seventh of the total deaths in Europe was due to consumption.

**Distribution.**—No country or people is exempt, though the distribution is not equal. In all latitudes, altitudes, and climates tuberculosis is rife, especially in lowlands and temperate zones. It is less frequent in high lands and those exposed to great cold, and probably in tropical countries, though in these last the disease is more acute and rapid. One factor which appears to exercise an important influence upon its prevalence is the dampness of the soil, and various observers, both in this country and in America, testify that its incidence bears a direct ratio to the degree of moisture in the soil. Contrariwise, its comparative rarity in high altitudes is due to the dryness and purity of the atmosphere. While all races suffer from consumption, natives and aborigines are particularly liable to infection, and contract a virulent and rapid type of the disease.

Though clinically consumption has been well known from ancient times, and its symptoms recognised and studied, its cause has been a subject of discussion and diverse opinions throughout. It is interesting to note that even in the time of Hippocrates it was regarded as contagious, a view shared later by Galen, and still later by Sylvius (1614-72), who classified the disease in three forms, viz. nodules, enlarged lymph glands, and scrofula. To Laennec is due the modern view of the essential unity of tuberculosis; he contended that small granular masses in the lung, termed Tubercle (q.v.), were the cause of consumption, and his paper, published in 1819, showed him to be far ahead of his day as an accurate observer. He laid the foundation of the accurate clinical teaching of to-day. Virchow and others held that scrofula and tuberculosis were distinct diseases, that tubercles did not explain all cases, and propounded the view that consumption was the result of a chronic inflammatory and exudative change in the lungs.

The discovery by Koch in 1882 of the specific organism, *Bacillus Tuberculosis*, which he believed to be present in all cases of tuberculosis, definitely

settled the question of the cause of the disease, though it did not silence for a considerable time the contending views previously held. Koch satisfied himself that the bacillus was present in all cases of open (active) tuberculosis, that the inoculation of animals with the infected sputum caused the disease in them, that the bacilli obtained from these animals could be grown on artificial media, and that the bacilli so grown produced tuberculosis in turn when injected into animals.

The *tubercle bacillus* is a minute rod-like structure, easily demonstrated in the sputum of consumptive patients by suitable staining, and readily cultured on artificial media. All Koch's assertions have been abundantly confirmed, both clinically and experimentally, and have profoundly modified former teaching.

But though the bacillus is recognised as the actual cause of the disease, there are many other factors which have a very important bearing upon its incidence. It is no longer seriously contended by authoritative observers that Heredity (q.v.) *per se* transmits tuberculosis, it has not been proved that the actual disease has been transmitted from mother to unborn child, but it can be maintained on surer grounds that there is present in many families a predisposition or Diathesis (q.v.) which is transmitted from one generation to another. This is really to be regarded as a lessening of resistance to consumption. Even in conceding this there is a possibility of a fallacy as to whether this diathesis is a cause or an effect. Since it is now universally admitted that, in almost all cases, tuberculous infection occurs in childhood, it is possible that the symptoms of this infection may be in many instances wrongly interpreted as a disposition to and not as the disease itself.

It is popularly believed that the marriage of near relatives results in tuberculous children, but beyond the fact that such marriages increase the liability to predisposition when any family weakness exists, there is no evidence in favour of this view.

*Age and Sex* have a very pronounced influence upon the distribution of consumption. The disease is decidedly more common amongst males than females, except between the ages of five and twenty years, when more females die of it than males. Though infection takes place in childhood, consumption most frequently manifests itself between adolescence and thirty years, while more than half the total deaths occur between twenty and fifty years. The maximum takes place in men between forty-five and fifty-five years. In England the deaths from all forms of tuberculosis in 1925 were 40,387, in Scotland 5390. In infancy up to about two years of age 90 per cent. of the deaths from tuberculosis are due to tuberculosis of other systems, and only 10 per cent. to pulmonary tuberculosis, but after adolescence these figures are reversed, and nearly 90 per cent. of the deaths are from pulmonary tuberculosis.

*Density of Population* certainly plays a part upon the frequency of consumption, and statistics show that the frequency as well as the mortality of the disease is much greater in large towns, and more especially in the poorer and most overcrowded parts of these towns, while in rural districts the death-rate is comparatively low. Where there is overcrowding this factor never exists alone; we have also *bad housing* and general *insanitary conditions*. All large cities can show tenements, and even whole streets, where consumption is practically endemic, and where there are cases in nearly every household. It is generally found that such areas are air-blocked, back-to-back houses, frequently in *culs-de-sac*; insufficient ventilation, lack

of sunshine, damp, and dirt, all tend to create these nests of consumption. Add to these conditions the poverty and malnutrition which are only too common in such surroundings and there is an ideal soil for it to flourish in. Another contributory factor is *occupation*; many callings show a very high mortality-rate from tuberculosis; sedentary employees, e.g. tailors, clerks, seamstresses, are particularly prone to fall victims. In this connection, however, it must be recognised that certain occupations attract a less robust type of individual, and again their working environment is not infrequently ill-ventilated and insanitary. Other trades particularly liable to infection are those in which there is inhalation of dust particles, e.g. stone-cutting, knife-grinding, and metal-polishing. The constant irritation of fine metallic dust causes chronic changes in the delicate structures lining the bronchial passages and air-cells, and may prepare the way for ultimate infection. Coal-miners, though constantly exposed to fine carbon dust, are found to be less liable to consumption than the general population.

Individual *habits*, carelessness in observing rules of health, uncleanness, alcoholism, exposure, all predispose to infection by lowering the resistance. Another frequent cause of infection or lighting up of old infection is the occurrence of other diseases, e.g. pleurisy, influenza; after epidemics of the latter there has generally been found an increase in the number of cases of consumption. Even in the presence of these contributory factors and despite the fact that consumption is infectious, it requires contact of an intimate nature to bring about infection. The most frequent, as well as the most dangerous, source of infection is the *sputum* or expectoration of consumptive patients. This adheres to bed-clothes, carpets, clothing, wall-papers, &c., dries and mingles with dust, and in this form is readily inhaled, thus carrying the specific organism to the air passages. More massive and much more dangerous infection may take place when the patient is too weak or careless to restrain his cough and the expired air contains moisture to which numerous tubercle bacilli adhere. Another proved mode of spread of the disease, especially in children, is milk from cows with tuberculous udders, and to this is attributable the extreme frequency of abdominal consumption in young children, caused by the bovine type of the bacillus. The flesh and internal organs of such animals slaughtered provide another means of entry when consumed. We see then that infection may be air-borne, or food-borne; there is another though much less common channel of entry, through wounds in the skin.

The symptoms of consumption cannot be fully discussed in the present article. As seen in advanced cases, they are pretty generally appreciated by the non-professional eye; but at first they are treacherous, and frequently remain undetected. The early symptoms vary much. There may be nothing but a gradual loss of strength, it may be of flesh; there may be a slight discharge of blood from the throat or chest; there may be a more or less persistent, tickling cough; there may be breathlessness, with or without pain in the chest; or there may be little save an increased tendency to take cold easily, with but tardy power of throwing it off. Or, again, the slow beginnings may be expressed by a gradually progressing pallor, and, in the female, by diminution or cessation of the menstrual discharge. Any of those conditions, especially when they show themselves in the adolescent or young adult, are to be viewed with suspicion, and regarded as a sure indication that medical help is necessary. The more experience physicians have in the treatment of consumption, the stronger becomes

the conviction that many lives might be saved if only an opportunity were afforded of arresting the disease at an early stage. It is peculiarly at this point that the greatest skill and prudence are required from the physician. The appreciation of the signs which indicate the presence of consumption, both at this early stage and later, must be left in his hands, and cannot, of course, be treated of here. The later symptoms of consumption are better defined, and are, unhappily, too well known. They are, more particularly, cough, expectoration of a more or less thick, opaque substance, of varying colour, from whitish-gray to green, sometimes of blood, shortness of breath, pain in the chest, gradually advancing emaciation and loss of weight and strength, profuse sweating, especially in sleep, feverishness, diarrhoea. As the disease advances further there frequently occur swelling of the feet and sores about the mouth. Accompanying these symptoms, grave changes occur within the lungs. These are appreciated with ease by the trained observer. It should be added that all the above-mentioned symptoms must not be looked for in every case of consumption. The type varies endlessly, and some cases run towards a fatal issue with relatively few signs or symptoms, while anatomically the disease is the same. Consumption is generally a long-standing chronic disease, and it may be many years before the fatal termination ensues; but, on the other hand, there are cases which run a very brief course, with rapid destruction of the lung and symptoms of acute disease. This condition is popularly known as Galloping Consumption.

*Curability of Consumption.*—Until comparatively recently, a diagnosis of consumption was invariably regarded as a death warrant, and patients were treated on hothouse-plant principles while awaiting the fatal issue. Now opinion has swung round to the opposite extreme, and the public are apt to regard all cases of the disease as curable, while the patient himself cherishes the idea of recovery (*spes phthisica*) even to the penultimate stages of his malady. That consumption is an eminently curable disease is now generally accepted, and cases in an early stage treated on sound lines have every chance of recovery, while in a certain number of more advanced cases an arrest of the disease occurs, and in all cases life may be considerably prolonged and symptoms ameliorated.

Since about 1890, both medical and public interest in consumption have become much more vital and better informed. Hitherto it had been regarded as a problem which admitted of no solution save the fatal termination, and public health authorities were apathetic and inert. It may be justly asserted that the awakening of the public conscience to the possibility of taking practical action against the ravages of tuberculosis, and the origin of the modern anti-tuberculosis campaign, date from the founding of the Victoria Dispensary for Consumption, at Edinburgh in 1887, by Sir Robert Philip. This was the first unit in what is now known as the Edinburgh Anti-Tuberculosis System; it was designed not only to treat patients, but to educate them in hygienic methods of living and in preventing the spread of the disease. This voluntary educative work ultimately led to the voluntary notification of tuberculosis in 1909, and since that year the public health authorities have taken a very active part in all anti-tuberculosis measures. The information gained through the tuberculosis dispensary regarding the prevalence of consumption and its important relation to inadequate and insanitary housing conditions was instrumental in causing the public health authorities to adopt first voluntary and later (1912) compulsory notification of all cases of consumption. This

showed where, and under what conditions, consumption was most frequently found, and provided a starting-point for more vigorous public-health action.

The treatment of consumption is one of the most complicated problems which the physician has to face. In its wide sense, it involves a consideration of some of the largest questions relating to social and individual hygiene. From the prophylactic point of view, it includes the study of all points bearing on the causation of consumption. Only thus can the attempt be made to cope effectively with the evil on the large scale. A knowledge of the dependence of consumption on overcrowding, vitiated air, improper ventilation, and other insanitary conditions has led the responsible authorities to adopt and enforce regulations to remedy the evil. Within recent years much has doubtless been effected in this direction. The legislature has taken in hand several departments of this work; and employers, in many instances, have shown a proper interest in the welfare of their employees. But more remains to be done. There is need of increased popular instruction, so that working-people and others may themselves appreciate the dangers which they run by neglect of simple precautions. The danger of phthisical expectoration as a means of transmission has been already alluded to. Such sputum should therefore, whenever possible, be destroyed by burning, or rendered innocuous by scalding or other satisfactory method. Indiscriminate spitting in public places should be forbidden. The value of spitting-flasks as a means of lessening the risk of infection should be impressed upon consumptive patients with expectation.

*Treatment.*—In consumption, perhaps more than any other disease, preventive treatment is of paramount importance. Public health measures in the direction of notification, segregation of advanced cases, sanitary housing, provision of open spaces, all play a very important part in raising the general health of the community and thus increasing the individual's resistance to consumption. But individual preventive treatment can do more, especially where there is a family predisposition, or exposure to infection exists. All measures tending to place the body in as fit a state as possible should be encouraged. Chief among these is abundant fresh air, both in living and sleeping rooms by day and night; regular hours of sleep, sufficient nutritious food, and suitable clothing are also of prime importance. Exercise should be regular and systematic; cold baths followed by brisk friction of the skin all aid in giving that tone to the body which is its best protection against infection. If, despite such measures, symptoms of consumption appear and persist, no time should be lost in seeking medical advice.

When a definite diagnosis of consumption has been made, treatment, based on *defensive* and *offensive* methods, should be adopted. In carrying out the *former*, an attempt must be made to improve the general condition, so that effective resistance may be offered to the invasion of the bacillus. What is chiefly needed is a readjustment of the patient's life on physiological lines. This includes: (1) *Access to fresh air and sunlight.* There should be the fullest exposure to the influence of fresh air. During the day the patient should rest outside on a couch or reclining-chair. If he have to be indoors, he should be similarly resting close to the widely open window. By night he should be placed in proximity to the open window. The arrangement must be maintained more or less completely in all weathers. The patient comes quickly to value, and indeed enjoy, the treatment. Bodily warmth is readily

maintained by means of woollen clothing and wraps. In many cases complete rest is desirable at first. (2) *Regulated activity.* With advancing improvement, measured activity in the open air is permitted. The amount, which should be carefully regulated by the physician, will depend on the patient's state from time to time. It is gauged chiefly by his temperature and circulation. Fatigue must be scrupulously avoided. (3) *Suitable dietary.* An extra full dietary is needful. Under the older system of residence in warm rooms this was not easily managed. If the other conditions (1) and (2) have been attended to, appetite returns wonderfully. Digestive disabilities disappear. It is commonly best to have three good meals a day—at two of which meat should be given. Milk should be drunk freely at meal-times. Butter, cream, cheese, cod-liver oil, glycerine are all serviceable. The details of the dietary depend on the patient's state. (4) *Skin hygiene.* Over-clothing must be avoided. The dress should be warm, but light and loose; chest protectors and rolls of wadding are vicious. The skin should be treated in more delicate patients by daily sponging, and in stronger patients by actual bathing. The bath should be short, and followed by dry rubbing. The results obtained by such treatment are remarkable. The patient's appearance, appetite, digestion, weight, circulation, and temperature improve, and the symptoms of disease lessen, and in many cases disappear entirely.

These measures may be carried out anywhere under competent medical advice. They are carried out still more effectively in a sanatorium, where the patient may be taken more thoroughly in hand and taught how to arrange his life on physiological lines. In the selection of a sanatorium, it is the experience of the physician and the thoroughness of régime, rather than the loudness of advertisement, which should be looked to. A small sanatorium is frequently to be preferred to the larger institutions.

*Climate.*—Exaggerated value has been placed upon the benefit to be gained by residence in certain climates. Except from the point of view that in many cases a change of air may give a decided impetus to improvement, it cannot be said that any climate has proved to be curative in itself, and the medical view now generally held is that a patient should be treated as near his own home as is consistent with obtaining suitable conditions, since on recovery he will likely have to reside and work in that locality. It cannot be denied that many patients do extremely well in high altitudes, e.g. Switzerland (Davos, Montana, Arosa), California, the uplands of South Africa. Dry, warm climates, as in Egypt, and sea voyages have also their advocates. In all instances the opinion of an experienced medical man, with special knowledge of consumption, should be taken before undergoing the fatigue and expense of foreign treatment. Advanced cases should never be encouraged to make long and exhausting journeys, which can only end in disappointment.

*Offensive treatment* has been based largely upon the supposition that certain drugs inimicable to the tubercle bacillus in the laboratory would be equally so if introduced into the system. This may hold true, if there were any means of bringing such drugs into contact with the organisms in sufficient strength without injuring the tissues. Different methods have been tried; the wearing of respirators impregnated with creosote, terebene, menthol, &c., was at one time a popular expedient, but has fallen into disuse, partly because of the mechanical impediment offered by such apparatus to free breathing, and also to the serious doubt of any appreciable quantity of the antiseptic reaching

the diseased portions of the lungs. For the latter reason also, the administration of such drugs by the mouth, by injections into the trachea, or the veins, has been largely dropped. Within the last few years, however, there has been a revival of the intra-venous method, especially in Denmark, where injections of *sancrocrisin* (a solution containing gold) has been used, and this has been favourably reported upon. The method has been fairly extensively tried in this country with much less encouraging results, and as there are very considerable risks in applying it, it is not likely to be persisted with.

The most hopeful line of treatment so far lies in the use of *tuberculin*. There are many forms of this, but all have a common origin, viz. they are extracts of the bacilli, grown on artificial media, with the soluble products of the bacilli. In some tuberculins the bacilli are pulverised, and in others they are employed in suspension. They are injected subcutaneously in very dilute solutions, or administered in the form of an ointment rubbed into the skin. Tuberculin is a potent drug and has to be employed with great care, and in carefully selected cases. In a considerable proportion of such cases the results are entirely satisfactory, but in many others it has no beneficial effect, and may even be harmful if persisted in. Tuberculin is also of value in the diagnosis of tuberculosis when there is doubt as to its presence, and is employed for this purpose both in human beings and in cattle.

For a number of years Professor Calmette of Paris has used a weak tuberculin (B.C.G.), prepared from an a-virulent strain of tubercle bacillus, to inoculate infants a few days after birth. The object aimed at is to immunise the child before there is any possibility of infection; a large number of infants have been so treated, and Calmette reports most favourably upon the method, but it is too early yet for a decided opinion to be formed as to its effect in lessening the danger of infection. In any case one would expect considerable opposition to its use in this country. It cannot yet be claimed that any form of tuberculin provides a specific cure for consumption, though whether its failure is due to its preparation or to the method of application is uncertain. It however offers the most hopeful line of treatment yet known, and many observers are carrying out research in this direction. Each case of consumption provides its own individual problem, and calls for all the resource of the physician.

*Consumption of the Lower Animals.*—Consumption in domesticated animals is not uncommon, and is most prevalent among cattle. It is due to a distinct type of the tubercle bacillus, which is called the bovine type. The symptoms of the disease and the pathological changes in the different organs show marked similarity to those met with in the human form of the disease. The fact that consumption in cattle can be readily diagnosed by subcutaneous injection of tuberculin has led to its extensive use by veterinary surgeons, and one of the most hopeful directions of anti-tuberculosis effort has taken the form of the creation of tuberculin tested herds of cattle, which provide a tubercle-free milk. Horses and dogs are rarely affected, but pigs and poultry are very susceptible.

**Tuberoze** (*Polianthes*), a genus of plants of the family Amaryllidaceæ, having a funnel-shaped perianth, with six-parted limb, stamens inserted in the tube of the corolla, a superior capsule, and flat seeds. The Common Tuberoze (*P. tuberosa*) has rounded bulbous roots; a cylindrical, upright, unbranched stem, 3 or 4 feet high; both root-leaves and stem-leaves sword-shaped, and very acute; flowers spiked and somewhat aggregated, large,

pure white, the tube a little in-curved. The plant grows well in the south of Europe, but only bears

Double Tuberose  
(*Polianthus tuberosa*).

the open air in more northern climates during summer. The roots are a considerable article of export from the south to the north of Europe. The plant is in high esteem for the beauty and fragrance of its flowers, the odour of which is most powerful after sunset, and has been known to cause headache and asphyxia in a room. The fading flowers emit, in certain states of the atmosphere, an electric light and sparks. The flowers yield an essential oil, which is used by perfumers. The native country of the tuberose is Mexico. The tuberose has been known in Europe for about three centuries. There are double and single flowered forms in cultivation, the former being the more highly esteemed. They are very extensively grown by British and American florists, who, by planting the roots successively, manage to keep up a supply of flowers at all seasons.

Of the double-flowered form there are several varieties, known in commerce as the Double African, the Double American, the Double Italian, and the Pearl. The last named, being less in stature than the others, is preferred.

**Tubes.** See PIPES.

**Tübingen**, an important town of Württemberg (Schwarzvald), 20 miles SW. of Stuttgart, stands on a ridge between the Neckar and the Ammer, in a beautiful and fertile district. Tübingen is an old place, irregularly built, with steep and narrow streets in the main; but the suburbs, especially round about the new university buildings and the railway station, have wide and spacious streets. Book-printing, bookselling, making of chemicals and surgical and physical instruments, milling, dyeing, and trading in field-produce, wine, hops, and fruits form the principal sources of employment, besides education. Tübingen has three Protestant churches (one, the Stiftskirche, dating from 1469-83, and containing the graves of twelve princes of Württemberg) and one Catholic church. Its university, founded in 1477 by Eberhard im Bart, afterwards first Duke of Württemberg, soon became a distinguished seat of learning, enjoyed for a time the presence of Reuchlin and Melancthon, and continued to flourish long after the Reformation had firmly established itself. The Thirty Years' War, however, fatally checked its prosperity; and it was not till the early part of the 19th century that it began to reacquire a reputation. Under Baur (q.v.) it became celebrated as headquarters of the historico-philosophical theology known as the 'Tübingen School,' which has profoundly influenced the study of church history. Its medical faculty is of late distinguished. The university library is located in Duke Ulrich's *Schloss*, on the hill above the town, dating from 1535. Connected with the university are an anatomical and physical institute, a botanical garden, a chemical laboratory, &c. There is a Protestant seminary and a Catholic one, in which university lectures are given and theological students reside. Uhland long lived here. Pop. (1880) 11,708; (1900) 15,338; (1925) 21,207.

**Tubuai.** See AUSTRAL ISLANDS.

**Tuckahoe**, or INDIAN BREAD (*Pachyma Cocos*), an underground fungus growing as a saprophyte on the roots of the trees in the southern United States. It is edible, but tasteless.

**Tucker**, ABRAHAM, was born in London, September 2, 1705, studied at Merton College, Oxford, and entered the Inner Temple, but being rich and unambitious settled down to the quiet domestic happiness of the country gentleman's life, on the estate of Betchworth near Dorking, which he bought in 1727. He died November 20, 1774. All his life long a student of ethical questions, he began about 1756 the preparation of his great work, *The Light of Nature Pursued* (1768-78). Of its seven volumes only three were published in his lifetime, under the name of 'Edward Search, Esq.' Not a regular systematic treatise, but a series of disquisitions on metaphysics, theology, morals, it shows originality, ingenuity of illustration, and solidity of understanding. The standard edition is that edited, with a life, by the author's grandson, Sir Henry Mildmay (1805).

**Tucson**, capital of Pima county, Arizona, on the Santa Cruz River, 978 miles by rail SE. of San Francisco, with a university and some trade in wool, hides, stock, and gold. Founded by the Jesuits in 1560, it was the capital of Arizona from 1867 to 1877. Pop. 20,000.

**Tucum**, a fibre got from the bark of several Brazilian palms, *Astrocaryum Tucuma*, *A. Ayri*, and *A. vulgare*. It is woolly, extremely fine, but very strong.

**Tucumán**, a north-central province of the Argentine Republic, with an area of 10,422 sq. m. and a pop. of 400,000. It enjoys a delightful climate, and in the east is very fertile; in the west the country rises to the picturesque Sierra de Aconquija. By far the most important industry is sugar, of which the province produces some 300,000 tons annually. About 80 per cent. of the acreage and capital devoted to sugar in Argentina is located here. The Córdoba and Rosario Railway affords good communications.—The capital, Tucumán, on the Río Sil, 3 miles from the mountains and 723 miles by rail NW. of Buenos Aires, contains some handsome public and private buildings, a normal school, and several saw and flour mills and breweries. In the neighbourhood are orange-groves, sugar-plantations, and distilleries. The town is the seat of a university, which was founded in 1912. The climate is hot and somewhat unhealthy, owing to the marshes which cause the dreaded fever (*chucho*). Tucumán was founded in 1564; and here in 1812 Belgrano defeated the Spanish forces, and in 1816 a congress of deputies from the various provinces proclaimed the independence of the La Plata states. Pop. 100,000.

**Tudela**, a city in the Spanish province of Navarre, on the left bank of the Ebro, which is here crossed by a bridge of seventeen arches, 46 miles by rail NW. of Saragossa. Tudela is the seat of a bishop, has a Romanesque cathedral, and manufactures of woollens, silk, soap, earthenware. Pop. 10,000. It was the birthplace of the great traveller, Benjamin of Tudela (q.v.).

**Tudor**, the surname of a family of Welsh extraction which occupied the throne of England from 1485 to 1603. In the Welsh language Tewdr is the equivalent of Theodore. Owen Tudor (died 1461), the first of the race conspicuous in history, claimed descent from Cadwallader, and was certainly of very ancient family. He fought at Agincourt, became squire to Henry V. and Henry VI. His dancing at some court pageant is said to have first ingratiated him with Catharine of Valois, widow of Henry V., who appointed him to the office of Clerk of the Household, and before long entered

into either an illicit connection or a private marriage with him. The indignation of the public at this step obliged the queen to take refuge in a convent at Bermondsey, where she died (1437); and Tudor was sent to Newgate, but succeeded in escaping, and in obtaining two audiences of the young king, Henry VI., who afforded him protection and conferred on him the lieutenancy of Denbigh. He fought for the Lancastrians in the Wars of the Roses, was taken prisoner at Mortimer's Cross, and beheaded. Two sons had been born to him by the queen. On the elder, Edmond, the king bestowed the earldom of Richmond, and on the younger, Jasper, the earldom of Pembroke. The Earl of Richmond married Margaret, daughter and heiress of John Beaufort, Earl of Somerset, whose father was an illegitimate son of John of Gaunt; and his son ascended the throne of England as Henry VII. (q.v.).

See also the articles on Henry VIII., Mary, Elizabeth, Edward VI.; and A. D. Innes, *Ten Tudor Statesmen*, and *England under the Tudors* (1906).

**Tudor Style**, in Architecture, a rather indefinite term applied to the Late Perpendicular (q.v.), and the transition from that to Elizabethan (q.v.). See also FAN-TRACERY.

**Tuesday**. See TYR.

**Tuff**, or VOLCANIC TUFF, in Geology, the name given to the comminuted rock-debris ejected from a volcanic orifice. The term is usually restricted to the finer kinds of volcanic detritus, or to fragmental igneous rocks in which such fine-grained materials predominate. Thus some tuffs may be described as masses of finely comminuted debris through which are scattered, more or less abundantly, lapilli and angular or subangular blocks of volcanic or other rocks. Other tuffs may consist wholly of very fine-grained materials or of the most impalpable volcanic dust. Most tuffs, whether deposited on a land-surface or accumulated under water, are stratified. Subaqueous tuffs shade off gradually into ordinary aqueous rocks. Thus we have *tuffaceous sandstones* and *tuffaceous shales*, made up of mixtures of volcanic detritus and the ordinary products of aqueous erosion; and many of these rocks are fossiliferous. Subaerial tuffs, likewise, not infrequently contain relics of land plants and animals. Many varieties of tuff are known by special names. Thus *trachyte-tuffs*, *basalt-tuffs*, &c. are rocks composed essentially of the debris of *trachyte*, or of *basalt*, &c. *Pumice-tuff* consists mainly of pumiceous materials—*Trass* being the name given to a variety of pumice-tuff met with in the Eifel. *Peperino* is an earthy granular tuff, containing abundant crystals of various volcanic minerals, which is well developed in the Alban Hills near Rome. *Palagonite-tuff* is fine-grained, consisting of hydrated fragments of sideromelan, a variety of basalt glass.

**Tugela**, a river of Natal (q.v.) forming part of the northern frontier and running SE. into the Indian Ocean. In the Transvaal war Buller was defeated in an attempt to cross at Colenso on 15th December 1899; crossed twice, but had twice to recross (Spion Kop, Vaal Krantz); and was only finally successful in forcing the passage on 22d February 1900, so as to push on to the relief of Ladysmith (28th).

**Tugendbund** ('league of virtue'), a Prussian patriotic union founded at Königsberg in 1808, ostensibly for the promotion of social and other reforms, actually aimed at throwing off the French yoke; it was dissolved under pressure from Napoleon in 1809.

**Tuggurt**. See TOUGGOURT.

**Tughina**, BENDERY, or BENDER, a strongly fortified town in Bessarabia, on the Dniester, 82 miles NW. of Odessa; pop. 36,400, including many Armenians, Tatars, Moldavians, and Jews. In 1770 the Russians captured the place, which was restored to the Turks in 1774, but was again stormed by the Russians in 1789, 1806, and 1811. In 1812, with Bessarabia, the town was ceded to Russia, and in 1918 became Rumanian. In 1709–12 Charles XII. of Sweden lived at Varnitza, near Tughina.

**Tuileries**, PALACE OF THE, built on the site of an ancient pleasure-house called the *Hôtel des Tuileries*, on account of its being built in a locality outside the city where there were several tile-works (*tuileries*). Francis I. bought this property from the Sieur de Villeroy, as a present to his mother, the Duchess of Angoulême. It was afterwards chosen by Catharine de' Medici as the site of a new palace instead of that of Tournelles, and the building was begun in 1564. The palace was burned by the Commune in 1871, and all that remained, save two wings leading to the Louvre, finally removed in 1883. Gardens now occupy most of the site. See PARIS, p. 762.

**Tuke**, a family of Yorkshire Quakers, well-known as early tea-merchants, but—especially William (1732–1822)—chiefly remembered for their work in connection with the improvement they effected in lunatic management in England.

**Tula**, an ancient and important manufacturing town of central Russia, capital of a government on the Upa, an affluent of the Oka, 110 miles S. of Moscow by rail. Its churches, its arsenal, museum, and government offices, and the ancient Kremlin are the principal buildings. The principal industries are in iron and steel goods, especially the firearms of the great government gun-factory. Cutlery, locks, *samovars* or tea-urns, mathematical instruments, harmoniums, and bells are made; the Niello-work (q.v.) of Tula is famous; and dyeing, soapmaking, &c. occupy many of the 123,000 inhabitants.

**Tulare Lake**. See CALIFORNIA.

**Tulcea**, a Rumanian port in the Dobrudja, just where the Danube divides into its three main branches. There is a trade in grain and fish. Pop. 24,000.

**Tulchan Bishops**, a term of contempt given to the titular bishops in Scotland, who in 1572 agreed to hold office, letting all the revenues of their charge, except a miserable pittance, be absorbed by the nobles as lay patrons. 'Tulchan' was a calf's skin stuffed with straw, used to induce a cow to give her milk freely.

**Tuldja**. See TULCEA.

**Tulip** (*Tulipa*), a genus of plants of the family Liliaceæ, having an inferior bell-shaped perianth, of six distinct segments, without nectaries, a sessile three-lobed stigma, a three-cornered capsule, and flat seeds. The bulb is fleshy and covered with a brown skin. The tulips are mostly natives of the warmer parts of Asia. The name is derived through French and Italian from the Turkish *tulband*, Persian *dulband*, originally a Hindustani word, 'a turban.' The Garden Tulip (*T. Gesneriana*) is a collective species, consisting of plants whose wild ancestors cannot be traced. Apparently a native of the Levant, it was seen at Augsburg by Conrad Gesner in 1559, and rapidly spread throughout all parts of Europe. It is from 18 inches to 2 feet high, with a smooth stem, bearing one erect, large flower; the leaves ovate-lanceolate, glaucous, and smooth. The varieties in cultivation are innumerable. The tulip mania of the 17th century in Holland was the most remarkable of its kind that has ever occurred in horticultural or perhaps any

other kind of commerce. The tulip is still most sedulously cultivated in Holland, especially at Haarlem, whence bulbs are largely exported; but attention is almost exclusively devoted to the cheaper varieties, which are used in hundreds or thousands for the purposes of decoration in gardens and rooms throughout winter and spring. The purely florists' varieties, which gave rise to the tulip mania, are not suited for this purpose. Tulips succeed best in a light, dry, and somewhat sandy soil. Bulbs are planted in the end of October, or beginning of November, and the flowers are produced early in summer. Beds of choice tulips are protected in spring by hoops and mats; and in the flowering season an awning of thin canvas is spread over them, which greatly prolongs the duration of their beauty, as they are soon spoiled by exposure to strong sunshine. Tulips are propagated by offset bulbs, and new varieties are raised from seed. Another species of tulip cultivated in gardens is the Sweet-scented Tulip, or Van Thol Tulip (*T. suaveolens*), which has yellow or red flowers, inferior to those of the common garden tulip in beauty, but prized for their fragrance, and for appearing earlier in the season. It is often cultivated in pots in windows. It is a native of the south of Russia. The Wild Tulip (*T. sylvestris*), a native of Greece and Sicily, is common in the woods and vineyards of Germany and the south of Europe, and has been found as an escape in England. It has a slender stem, narrow lanceolate leaves, and a somewhat drooping, fragrant, yellow flower. It develops offset bulbs at the end of fibres thrown out from the root, at some distance from the parent plant. Its bulbs are eaten in Siberia, although bitterness and acidity characterise all the bulbs of this genus. See Jacob, *Tulips* (1912).

#### **Tulip Tree.** See LIRIODENDRON.

**Tull, JETHRO** (1674-1741), a great agricultural reformer and author, was the son of a Berkshire landlord, and in Berkshire invented a drill, introduced a method of pulverising the soil, and wrote, in *Horse-hoeing Husbandry*, 'on the principles of tillage' in 1733. He had to face an incredible amount of opposition and vituperation at the hands of labourers, farmers, and authors; but his work was ere long recognised as epoch-making.

**Tullamore**, chief town of King's County in Ireland, is on the Grand Canal, 59 miles WSW. of Dublin; pop. 5000.

**Tulle**, capital of the French dept. of Corrèze, at the confluence of Solane and Corrèze, 61 miles ENE. of Périgueux, and the seat of a bishop (since 1817). Small-arms and perfumery are manufactured; the thin open silk or cotton network fabric called *tulle* is no longer made here, but mostly at Sankt Gallen and other Swiss towns. Pop. 15,000.

**Tulloch, JOHN**, an eminent Scottish divine, was born at Bridge of Earn, in Perthshire, June 1, 1823, studied at St Andrews and Edinburgh, and was licensed to preach in 1844. Next year he accepted the charge of St Paul's at Dundee, in 1849 was presented to Kettins in Forfarshire, and was appointed in 1854 principal and primarius professor of Divinity in St Mary's College, St Andrews. Appointed in 1859 one of the Queen's chaplains, he became senior principal at St Andrews in 1860, deputy-clerk of the General Assembly in 1862, Clerk in 1875, and Moderator in 1878, and died at Torquay, February 13, 1886. From an early age he contributed to the magazines—*North British Review*, *British Quarterly*, and later the *Contemporary Review* and *Fraser's Magazine*, of which last he was for some time editor. His first book was the second Burnett prize essay on *Theism* (1855), and this was followed by *Leaders of the*

*Reformation* (1859), *English Protestants and their Leaders* (1861), *Beginning Life* (addressed to young men, 1862), *The Christ of the Gospels and of Modern Criticism*—an answer to Renan (1864), *Rational Theology and Christian Philosophy in the Seventeenth Century*—altogether an admirable work, discussing with equal sympathy and insight the Falkland group and the Christian Platonists (2 vols. 1872), *Facts of Religion and Life* (sermons, 1876), *Pascal* in Blackwood's 'Foreign Classics' (1876), *The Christian Doctrine of Sin*—the Croall Lectures at Edinburgh (1877), *Modern Theories in Philosophy and Religion* (1884), and *Movements of Religious Thought in Britain during the Nineteenth Century* (1885). Tulloch was a fearless Liberal alike in politics and theology. His conception of an Established Church involved the idea of a comprehensiveness and tolerance unusual to Presbyterian theology, and he laboured throughout life to lay down the sure foundations on which a rational yet reverent Christianity might be firmly built, which should be distinguished by its inwardness and spiritual elevation rather than by the rigidity of its definitions. His strong and earnest religious convictions, large-hearted benevolence, catholic sympathy and broad culture, noble presence and impressive oratory made him conspicuous. See Memoir by Mrs Oliphant (1888).

**Tulsa**, capital of Tulsa county, Oklahoma, on the Arkansas River, 14 miles NE. of Sapulpa. It is in the centre of a rich agricultural and mineral country. Huge quantities of oil are produced, and have been the cause of the rapid growth of population. There are some manufactures, and a university is located here. Pop. (1900) 1390; (1910) 18,182; (1920) 72,075.

**Tulsī Dās** (1532-1623), the greatest of the Hindi poets, whose principal achievement was the rehandling of the Sanskrit epic *Rāmāyana*. See INDIA, p. 102.

**Tumbarumba**, on the upper Murray River, in New South Wales, site of a great dam begun in 1919.

**Tumble-weed**, a name given to several plants, chiefly Chenopodiaceæ, Amarantaceæ, and Crucifere, introduced from the plains of southern Russia and tropical and temperate America into the agricultural districts of many countries, where they often prove absolutely pernicious. In autumn their dry stems break off just above the ground, and the least wind will then send the plant, full of ripe seeds, whirling over the ground, often getting entangled with other plants of the same nature and forming thus rolling masses of immense size. *Corispermum* (Bug-weed), *Cycloloma* (Winged Pig-weed), *Salsola Kali* (Russian Thistle), *Sisymbrium altissimum* (Tumble Mustard), *Amarantus albus* (Tumble weed par excellence), are but a few of these unwelcome visitors.

#### **Tummel.** See RANNOCH.

**Tumour** (Lat. *tumor*, 'a swelling') is the term applied in medicine to new formations characterised generally by their 'independent growth and almost independent life, so little do they appear to concern themselves with the interest of the body as a whole;' 'their tendency to continuous growth;' and 'the tenacity with which they maintain their hold upon the individual, rarely disappearing or even diminishing in size.' They are thus separated on the one hand from simple hypertrophy of organs, normally present, and on the other from inflammatory swellings, and the enlargements associated with syphilis, tubercle, glanders, &c. Many cysts, however, though grouped with tumours, are merely enlargements of normal cavities (see CYST).

The most important division of tumours is that into *innocent* or *benign* and *malignant* tumours. The malignant tumours tend (1) to grow continu-

ously into the tissues surrounding them, irrespective of the natural boundary lines between different structures; (2) to recur after removal; (3) to cause secondary growths of the same nature in the neighbouring lymphatic glands, (4) and in distant parts of the body. Malignant tumours of different structures and in different organs possess these characters in varying degrees, and may not manifest them all; but if malignant at all they are dangerous, and certain sooner or later, if unchecked, to destroy life. Innocent tumours, on the other hand, are sharply marked off from the surrounding tissues, tend to grow by pushing aside, rather than by invading adjacent structures, do not return after removal, and do not lead to the occurrence of similar growths in other parts, though several or even many of them may be present in the same patient. They may cause death by interfering, on account of their situation, with the function of important organs, by becoming the seat of ulceration and hæmorrhage, &c.; but they have not the intrinsic dangers of the other group.

With regard to the causes of tumours little is known. In some cases they can be traced to the effects of injury or of long-continued irritation of a part, though the reason why they should so arise in a particular individual is often inexplicable; in some cases heredity seems to be an important factor in their occurrence. But 'in the large majority of cases they are formed without any apparent cause.' The organs most frequently affected are the womb and the female breast; hence they are on the whole more common in the female sex. But some organs common to both sexes are affected almost exclusively in males (e.g. the lip by cancer).

With regard to treatment, simple tumours demand removal, generally speaking, only when they give rise to discomfort or disfigurement; malignant tumours should be removed at the earliest possible moment. With few exceptions a cutting operation passing wide of the tumour is the only method for complete removal of the latter.

The solid simple tumours resemble more or less closely the fully developed structures of the body, generally of the part in which they grow, and are classified accordingly. The most important groups are the fatty tumours (lipoma), the most frequent of all; the fibrous (fibroma); the cartilaginous (enchondroma); the bony (exostosis); the vascular (Nævus, q.v.); the warty (papilloma); and the glandular (adenoma). The malignant tumours are either aberrant developments of epithelium (carcinoma; see CANCER), or resemble imperfectly developed connective tissues (see SARCOMA).

**Tumult.** See RIOT.

**Tumulus.** See BURIAL, BARROW, CAIRN.

**Tun,** an obsolete liquid measure of capacity; in old ale and beer measure, 216 gallons; in old wine measure, 252 gallons. As a tun of water weighs a little more than 2000 lb., probably the ton weight (see TON) was taken from the tun measure.

**Tuna.** See TUNNY.

**Tunbridge.** See TONBRIDGE.

**Tunbridge Wells,** a charming inland watering-place of Kent, on the border of Sussex, 5 miles S. of Tonbridge and 34½ SSE. of London. It occupies the head and slopes of one of the valleys of the Weald, and has in general a south-west aspect, commanding very fine views. The chalybeate waters, situated at the end of a parade called the 'Pantiles,' were discovered by Lord North in 1606, and patronised in 1630 by Henrietta Maria. Puritans also resorted hither, and to them the place owes such names as Mounts Ephraim and Sion; whilst among later visitors have been Cath-

arine of Braganza, Evelyn, Queen Anne, 'Beau' Nash, Richard Cumberland, Dr Johnson, Richard-son, Garriek, Chatham, and Queen Victoria. There are a breezy common, a church (1685) long said to be in two counties and three parishes, a public hall (1870), a pump-room (1877), a friendly societies' hall (1878), and a considerable trade in 'Tunbridge ware' (see TONBRIDGE). The season lasts from July to September. Tunbridge Wells was incorporated as a municipal borough in 1889. Pop. (1851) 10,587; of extended area (1921) 35,568.

**Tundra,** the vast plains which border on the Arctic Ocean. See DESERT, SIBERIA.

**Tung-oil,** or WOOD-OIL, got from the nuts of various species of Aleurites (*A. Fordii*, *A. cordata*, *A. montana*) in China, Japan, and elsewhere, is used for varnishing, stiffening fabrics, waterproofing wood, and many other purposes. See VARNISH. For *A. moluccana* or *triloba* see CANDLENUT.

**Tungsten** (sym. W; atom. number 74; atom. wt. 184), a rare metal, chiefly derived from Wolfram (whence the symbol W), which is a tungstate of iron and manganese, and likewise found in Scheelite, which is a tungstate of calcium. The metal (Swed. *tung-sten*, 'heavy stone') is obtained either as a dark-gray powder or in heavy iron-gray bars, which are very hard and difficult of fusion, and have a specific gravity of 19.1. Aqua regia and nitric acid convert it into tungstic acid. Tungsten forms with oxygen a dioxide (WO<sub>2</sub>), and an acid oxide (tungstic anhydride, WO<sub>3</sub>). Various tungstates have been formed and examined. The tungstate of sodium serves as a means of preventing mouslin, &c., from bursting out in a flame when brought in contact with fire. Wolfram metal and ferro-tungsten are now largely employed for filament electric lamps and to harden steel (see IRON AND STEEL), as in armour plates, gun-forgings and rifling, tungsten steel, fine tool steel, high-speed steel, and drill steel.

**Tunguses,** an ethnographic group of the Ural-Altaic family; see SIBERIA. The term Tungus is preferred by ethnologists for the human type more commonly called Mongol, with yellowish skin, coarse black straight hair (little on face or body), broad head, broad flat face, prominent cheek-bones, broad nostrils, and 'Mongol' (or 'Tungus') eyes.

**Tun-huan or Tung-hwang** (also known as 'Sha-chou,' 'city of sands'), a square-walled town in a prosperous oasis of the Chinese province of Kan-su, situated about 95° E. and 40° N. at the intersection of important trade-routes and an ancient Chinese wall. About 10 m. to the SE is the famous 'Cave of the Thousand Buddhas,' which consists of over 500 temples and grottos cut out of and extending along a stretch of solid rock of about 1 mile in length. These caves (still resorted to for worship) are filled with Buddhist frescoes and statuary, while a great library, that had been walled up there some 900 years, was discovered (1906-8) by Sir Aurel Stein (q.v.). Many extremely valuable MSS. in Chinese, Sanskrit, Central-Asian Brahmi, Sogdian, Manichean-Turkish, Uigur, Tibetan, &c., were found, also paintings on silk (dating from the T'ang dynasty), embroideries, tapestries, &c. A Chinese MS. (probably translated from Pahlavi) is a Manichean treatise purporting to be addressed by Mani to Addas, one of his principal missionaries (see MANICHEANS, and the books there cited). The MSS., mostly Buddhist literature, belong probably to the 9th and 10th centuries, when Tun-huan was under the domination of Tibet.

See *Ruins of Desert Cathay* (1914) and other works by Stein; Pelliot, *Les Grottes de Touen-houang* (1920).

**Tunic** (Lat. *tunica*), the Roman equivalent of the Greek *chiton*, the chief under-garment of Greeks and Romans of both sexes. In its ordinary form it consisted of a plain woollen shirt, girdled round the loins and reaching to about the knees, with two short sleeves covering the upper part of the arm. Over this loose outside draperies in various forms were worn, as the Greek *palium* and the Roman *toga*. The women's tunics (Lat. *stola*) were usually longer and looser than those of men, and were fastened under the bosom instead of round the loins.

**Tunicata**, or UROCHORDATA, a class of remarkable animals, many of which are popularly known as Ascidiæ (q.v.) or sea-squirts. As is explained in the article on Ascidiæ, the Tunicates are now regarded as occupying a lowly place among vertebrate or chordate animals. This is proved by the characteristics of the larval forms, and also by three or four genera—e.g. Appendicularia (q.v.)—which retain throughout life the vertebrate characteristics which the great majority lose in the degeneracy of their adult life. The class includes three orders—(1) Larvacea, of which Appendicularia is type; (2) Ascidiacea, or Ascidiæ; and (3) Thaliacea, free-swimming forms—*Salpa* (q.v.) and *Doliolum*.

See W. A. Herdman, 'Tunicata,' *Challenger Reports*, vi. 1882; xiv. 1886, &c.

**Tuning-fork**, a contrivance for regulating the pitch of the voice or of a musical instrument. It consists of two prongs of steel springing from a handle, and so adjusted as to produce a fixed note when struck. Piano-tuners and choir-leaders require tuning-forks tuned to C, while violin and banjo-players require forks tuned to A and G respectively, on account of the original tuning of the strings. In full orchestras, the oboe gives A to the strings. There are forks which are capable of adjustment to different standards of Pitch (q.v.) by means of a movable brass slider fitted with a screw. Tuning-forks are much used in experiments on Sound (q.v.).

**Tuning-pipes**, with riveted reeds, are made frequently in sets for string players unable to tune without them; e.g. violin players would require a set tuned G, D, A, E.

**Tunis**, or TUNISIA (Fr. *Tunisie*), a French protectorate of North Africa, bounded on the N. and E. by the Mediterranean, on the SE. by Tripoli, on the SW. by the Sahara, on the W. by Algeria. The area has been estimated at about 48,300 sq. m. Numerous bays and arms of the sea indent the coast, and branches and spurs of the Atlas (q.v.) range with an extreme elevation of 6500 feet, penetrate the interior. The country, indeed, is mostly high ground, especially in the north and north-east, while the central region is occupied by a tableland; there are desert steppes, seldom visited by rain, in the south, and a belt of fertile land lies along the eastern coast. The south contains shallow salt-lakes (*shotts*), the largest being Shott Kebir (Shott el Jerid), but the only river of any importance is the Mejerda, 300 miles long, which rises in Algeria and flows into the sea at Porto Farina. The climate is pleasant during the spring and autumn at the coast, but hot during the summer, and very hot in the interior during most of the year. The winter is the rainy season. Winds are generally variable and frequent, especially in the summer. The flora of northern Tunis resembles that of southern Europe, and flowers, especially those from which perfumes are extracted, grow luxuriantly, while there are dense oak and cork-oak forests which are very valuable; in this respect southern Tunis belongs more to the Sahara (q.v.), and the southern part of the plateau is covered with esparto grass. Game—wild pigs, wild

goats, gazelles and other antelopes, also hares, partridges, &c.—is fairly plentiful; hyenas and jackals are found, and most of the domesticated animals are kept.

According to the census of 1926 the population of Tunis was as follows:

French (excluding army of occupation) ..	71,020	
Italians .....	89,216	
Maltese .....	8,306	
Spaniards, Greeks, &c. ....	4,049	
		173,281
Arabs and Berbers .....	1,982,184	
Jews .....	54,248	
		1,986,427
		2,159,708

The European population has increased enormously since 1881, when there were less than 1000 French in the country. The Arab population dates from the great immigrations of the 7th and 8th centuries; and the Jewish population from those of the 15th and 16th centuries (chiefly from Spain and Portugal). The capital is Tunis, with population of 185,996, including 79,136 Europeans. Other towns are Sfax (27,723), Sousse or Susa (21,298), Bizerta (20,593), Kairouan or Kairwan (18,527). The Arabs are Mohammedans under the Sheikh-ul-Islam, and speak Arabic, while the Europeans are mostly Roman Catholics under the Archbishop of Carthage, but the Greek Church has some adherents. There is a Mohammedan university in the capital, and throughout the country a large number of schools (public and private), some of which receive government grants.

The Bey of Tunis is the nominal ruler of the country, but actually the control is in the hands of a French Resident-General, who is responsible to the French Foreign Office. In 1922 a Grand Council was established (presided over by the Resident-General, who is also Minister for Foreign Affairs), consisting of eight French and three Tunisians. The governors of the 19 districts into which the country is divided are French, but natives fill the subordinate posts. There are French and Tunisian courts of justice, the latter dealing with cases in which solely natives are concerned. The French army of occupation consists of some 25,000 of all ranks. The financial position is favourable.

Agriculture is very important, the most fertile ground being found in the valleys in the north and north-west. Over 1½ million acres are sown with wheat, and over 1½ million with barley, and oats are also grown. There are over 16 million olive-trees, mostly on the south-eastern littoral (known as the Sahel), and the cultivation of the vine is rapidly becoming very profitable, but fruits generally (oranges, lemons, &c.) and vegetables abound in the coast regions. Among the southern oases there are over 2 million date-palms. Good and abundant pasturage is found in the central tableland. Tunis is rich in minerals, especially phosphates; iron, lead, zinc, and marble are also found. Hot springs, some of which were utilised by the Romans, are scattered over the country, and are now used considerably for irrigation. Various native industries are carried on, such as the manufacture of carpets, rugs, leather, woollen fabrics, pottery, &c. The fisheries (especially tunny) are important. Trade is in a flourishing condition, though imports still exceed exports in value. The principal imports are textile goods (largely from Great Britain), colonial wares, machinery, and the principal exports cereals, minerals, metals, olive-oil. The bulk of the trade is done with France. There are over 1500 miles of railway, broad and narrow gauge, while the telegraph and road systems are both good.

Gafsa (Lat. *Capsa*) gives its name to the Upper Palæolithic Capsian culture, the parent of the Euro-

pean Aurignacian (see STONE AGE). Many important Roman antiquarian remains, including aqueducts that are still used, are to be found in Tunis. For the early history see CARTHAGE. In the 7th century A.D. the Arabs invaded Tunis; Mohammedanism, adopted by the Berbers, practically entirely superseded Christianity, and in 670 the sacred city of Kairouan was founded. Up to the 16th century the country was ruled successively by the dynasties of the Aghlabites, Fatimites, Almohades, and Hafsites. Important events in this period are the Norman occupation (from Sicily) of Sfax and Tripoli (1148-60) by Roger II. (q.v.); the invasion of Tunis by Louis IX. during the seventh Crusade, and his death there in 1270; the unsuccessful attack by the Duc de Bourbon in 1390. Threats of Turkish occupation led to the intervention in 1535 of Charles V., who released many thousands of Christian slaves, but in 1575 Sinan Pasha brought the country completely under the Ottoman power, giving it a new constitution. The government was invested in a Turkish pasha as governor, with a council composed of the principal officers of the Turkish troops and the commander of the Janizaries. But in a few years a military mutiny overturned matters, and a dey, with limited authority, was raised to power; the chief executive functions were retained by the council, a bey being put at the head of the revenue and taxation departments. By slow degrees this officer so extended his influence and authority that at last Murad Bey succeeded in making the office hereditary; his family governed Tunis for a century till 1702, enlarging their borders by conquests on land and greatly increasing their own and the country's opulence by piracy, directed against the Christian powers by sea (see BARBARY, CORSAIRS). St Vincent de Paul, for instance, was taken prisoner and sold into slavery at Tunis, while the destruction in 1655 of the piratical fleet in Porto Farina by Blake was an audacious and memorable act.

In 1702 the last of the deys absorbed the beyship, and in 1705 the present dynasty of deys, founded by Hussein ben Ali, a native of Crete, was established. In the 18th century, after a series of reverses, Tunis became tributary to Algeria, but at the beginning of the next century the country became again virtually independent, the Turkish suzerainty being merely nominal. Internal administration, however, was not satisfactory, and Britain, France, and Italy began to show a rivalry of interest in the country. In 1881 France invaded Tunis, under the pretext of chastising the Kroumir tribes which had been making incursions into Algeria; this invasion resulted in the signing of a treaty (1881, confirmed by convention 1883), placing the country practically under French protection, under which it has made excellent progress, though the protectorate was not at first established without some disturbance and bloodshed. This occupation is one of the most successful and important that France has undertaken; it gives her an important coast-line, the use of many and secure harbours, and makes her the mistress of North Africa, besides, to a certain degree, lessening the strategic importance of Gibraltar and Malta. During the latter part of the Great War, Tunisian troops were employed in France.

See Tissot, *Exploration scientifique de la Tunisie* (1884-88); Graham and Ashbee, *Travels in Tunisia* (with bibliography, 1887-90); Mercier, *Histoire de l'Afrique septentrionale* (1891); Playfair in Murray's *Handbook* (1895); the Government publication, *La Tunisie* (1896); Lapie, *Les Civilisations tunisiennes* (1897); Sir H. Johnston, *Colonisation of Africa* (1899); Gept, *La Tunisie économique* (1910); Fribourg, *L'Afrique latine* (1922); general works in Eng. by Broadley (1882), Vivian (1899), Douglas (1923); in Ger. by Hesse-Warteg

(1882; trans. 1899), Schonfeld (1902); in Fr. by Faucon (1893), Besnier (1904), Loth (1907), Lanessan (1917), Saurin (1918). See also ALGERIA, CARTHAGE, FRANCE (p. 809), SAHARA, TRIPOLI.

TUNIS, the capital, is situated on rising ground on the inner side of a small lagoon (El Bahira) near the south-west extremity of the Bay of Tunis, an inlet of the Mediterranean Sea. The native and European sections of the town are kept quite separate. In the former, the streets are narrow, dirty, and sometimes unpaved, but the picturesque bazaars (*souks*) are well supplied with oriental goods, fruits, &c. There are about 50 mosques, many of them splendidly decorated, but entrance is forbidden to Christians. Some of the mosques have schools attached, and the Great Mosque has a university. The palace of the bey contains some admirable plaster work, tiles and other Moorish decorations, and the view from the roof is superb. The citadel, the old slave prison, is now used as barracks. The European town is well laid out, and contains the Roman Catholic cathedral, the Residency, the Municipal Theatre, Municipal Park, the School of Agriculture, &c. There are banks, hospitals, and various charitable and religious institutions. The port of Tunis, where harbour works have been constructed, is in direct communication with the sea at La Goulette (Goletta) by a canal 7 miles long, 93 feet wide, and 21 feet deep, dredged in the lagoon. Shipping and trade are important, and there are manufactures of cloth, olive oil, pottery, leather, &c. About two miles away is the Bardo, a former palace of the bey, containing the Alaoui museum, with a splendid collection of Punic, Libyan, Roman, and Arabian antiquities; there is also some fine decorative carving. Carthage (q.v.) is some 8 miles to the NE. of Tunis. The climate is on the whole pleasant, but the winds are apt to be unreliable. Pop. (1926) 185,996, including 27,922 French, and 44,076 Italians.

Tunis (anc. *Thines* or *Tounès*) is a more ancient town than Carthage, but was supplanted by it, and only regained its importance with the Arab domination (though at first Kairouan was considered the capital). The town was in the hands of the Spaniards 1535-74.

**Tunkers** (Ger. *tunken*, 'to dip'), DUNKERS, or DUNKARDS, a religious sect found chiefly in Pennsylvania, Maryland, Virginia, Ohio, Indiana, Illinois, Iowa, Missouri, Nebraska, and Kansas. In 1908, the corporate and official title was changed from 'German Baptist Brethren' to 'Church of the Brethren.' The sect had its birth in 1708 in Germany, being indeed a child of the Pietist movement of the 17th century; but between 1719 and 1729 all the members, harassed and persecuted at home, had, on Penn's old invitation, removed to Pennsylvania under the leadership of Alexander Mack (1679-1735) and Peter Becker; they settled about Germantown and Philadelphia, whence they gradually spread southward and westward. Shortly after arrival in America, a few under Conrad Beissel seceded and formed the sect of the Seventh Day Baptists. In their creed the Brethren are thoroughly evangelical and strictly orthodox. Baptism they administer by trine immersion (hence their name), and only to adults. Love-feasts are held in each congregation twice a year, preceded by washing of feet, and followed by the giving of the right hand of fellowship and the kiss of charity (women with women, and men with men), and then by the communion. Each congregation is independent, and elects its own deacons, ministers, and elders or bishops; the latter, who preside over the congregations, are chosen (generally by seniority) from among the ministers (who

are authorised to baptise, marry, and preach). Ministers are supported by the church if they are poor or are sent out as missionaries, but as a rule no salaries are paid. There is an annual conference to which each congregation and each district (or group of congregations) send delegates. Other customs of the sect that deserve notice are their plain and generally uniform dress, their avoidance of litigation, of war, and of any active share in politics; they take no oaths, and so may not join (or if converts remain members of) any secret society. The stories of their celibacy or discouragement of marriage are without foundation. They anoint the sick with oil, are total abstainers, and discourage the use of tobacco. Most of the Brethren are engaged in farming. In 1882 a serious split occurred in the sect, arising (amongst other things) from differences of opinion on the numerous educational and Sunday school activities which received a great impetus in the seventies, and on the missionary work, begun in 1876, which extended later to Scandinavia, France, Switzerland, India, China. The Progressives, or radicals, seeking to accommodate the old traditions and customs to new circumstances, and the Old Order, or ultra-conservatives, rejoicing in isolation and admitting of no change at all, broke away from the Conservatives or main body, which strove to pursue a middle course. The Conservatives now number some 60,000 communicants, the Progressives 8000, and the Old Order 4000. The two former have colleges, and produce various publications. The Progressives advocate administrative independence of each congregation from the decisions of the annual conference.

See Gillin, *The Dunkers* (1906), and Histories in Eng. by Brumbaugh (1899), Falkenstein (1901).

**Tunnage and Poundage**, certain duties on wine and other merchandise, which began to be levied in England in the reign of Edward II. They were at first granted to the crown by the vote of parliament for a limited number of years, and renewed on their expiry. The object of these imposts was said to be that the king might have ready money in case of a sudden emergency demanding it for the defence of the realm and the guarding of the sea. Originally fluctuating in amount, tunnage (less correctly *tonnage*) and poundage came to be fixed at 3s. on every tun of wine, and 5 per cent. on all goods imported. In the reign of Henry V. they were first conferred on the king for life; and the same course being followed with his successors, the sovereign began gradually to consider them as his proper right and inheritance, and the vote of parliament as but a formality expressive of the popular recognition of his prerogative. Though these duties were not voted to Henry VIII. until the sixth year of his reign, he, notwithstanding, levied them from the date of his accession. It was, in fact, usual to levy these duties during the period intervening between a sovereign's accession and his first parliament, and this was done by Charles I., as by his predecessors. The Commons, however, in Charles's first parliament accorded these imposts not for life, but for a year only; and the House of Lords objecting to this departure from previous usages, and rejecting the bill, it was attempted to levy tunnage and poundage by the royal authority alone, a proceeding which repeatedly roused the opposition of the Commons. Charles was in 1641 induced to renounce the power of levying these or any other imposts without parliamentary sanction. Charles II. and James II. obtained grants of tunnage and poundage for life, but William III. only for limited periods; and by three statutes of Anne and George I. these imposts were made perpetual, and mortgaged for the public debt. The Customs

Consolidation Act in 1787 swept away tunnage and poundage, and similar charges, and substituted a new and single duty on each article. See CUSTOMS DUTIES.

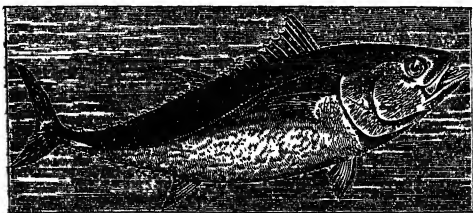

**Tunnel**, an arched passage driven through an elevation, or mountain, or under a river, or at deep levels in cities for underground railways. They may be divided into land and subaqueous tunnels, and according to their purpose into railway or canal tunnels, tunnels for sewage, water-supply, &c. Tunnels have been in use from an early period in history, notable ancient ones being those under the Pyramids (q.v.), that for draining Lake Fucina (q.v.), and the Cloaca Maxima (q.v.). But it is since the 16th century that they have been most largely used. From the difficulties and uncertainty connected with their construction, they have proved to be the most costly part of the work in making canals and railways. In making a tunnel through an elevation of moderate height, the nature of the material to be excavated is first ascertained by vertical shafts at different points in its length. Some of these are temporary, others are permanent, and serve for ventilation when the tunnel is completed. These shafts must not be less than 9 feet in diameter, so as to admit of lowering and raising men and the material excavated, fixing of pumps, &c. Temporary shafts are simply lined with timber poling boards; permanent shafts are lined with brickwork as the work of sinking progresses. When the shafts have been completed, the work of excavating the tunnel can be started; each shaft provides two working faces from which excavation and lining work, if necessary, can be carried on. Thus, if there were five intermediate shafts, there would be twelve working faces, including the two at the tunnel ends; this enables the work to be carried through much more expeditiously than would be possible if the two end faces were alone available. In excavating the tunnel the usual procedure is first of all to drive a top or bottom heading right through from end to end; these headings are about 6 or 7 feet high and 3 or 4 feet wide; in soft ground, clay, or loose rock they require careful timbering at the top and sides. When the heading is completed, and any necessary adjustments in the centre line have been made, the work of excavating the tunnel to its full dimensions and of lining it with brickwork—except in the case of hard rock—is carried out in short 'lengths' of 5 or 6 yards by working forward from each of the two working faces of each shaft and from the two tunnel ends. The mining gangs excavate and timber a length, then directly their work is finished the bricklayer gangs proceed to put in the brickwork lining, withdrawing as the brickwork lining progresses the greater part of the timber to be used over again in another length by the miners. Sometimes the driving of the headings is omitted, and the tunnel is excavated to its full dimensions at one stage in the usual series of 'lengths.' Tunnels through lofty mountains, or below rivers or arms of the sea, can only be worked from the two ends, vertical shafts being impossible, and from the experience gained in recent years in tunnels of great length, and with improved boring and drilling machinery driven by compressed air, combined with the use of more powerful blasting materials, it is probable that where the conditions are suitable the older methods of constructing tunnels from vertical shafts will be abandoned, the comparative progress under equal conditions being in favour of the newer machinery by as much as three and four to one. Important departments of the work of tunnel-making have been already discussed in the articles *Blasting* (q.v.) and *Boring* (q.v.); see also *MINING*, *AQUEDUCT*, *PNEUMATIC DESPATCH*,

**RAILWAYS.** The construction of deep-level underground electric railways in London and in other great cities has been made possible by the development of the so-called 'Greathead Shield' method of working. By the use of this shield excavation can be carried out in material heavily charged with water, and at the same time the risk of settlement of the ground and of damage to buildings on the surface can be considerably obviated. Compressed air—at any suitable pressure—is delivered at the working face, and by means of air-locks the working face can be isolated from the rest of the excavated and lined tunnel; the lining of such tunnels is built up of cast-iron rings, each ring being made of a series of segments bolted together to make a complete ring. This method of construction was first adopted in the Blackwall tunnel under the Thames, constructed in 1891-97 by the London County Council at a cost of £1,500,000.

The longest in the world are the tunnels under the Simplon (12½ miles), the St Gotthard (9½ miles), the Lötschberg, the Mont Cenis, and the Arlberg, noticed under their several heads, as are also the other more important tunnels (see HOOSAC MOUNTAIN, ST CLAIR, &c.). The longest canal tunnels in England are the Marsden, on the Huddersfield Canal (5280 yards; opened 1798), and the Sapperton, on the Thames and Liverpool (4300 yards; 1790). The longest railway tunnels are the Severn tunnel (7665 yards; 1886), the Dore and Padley (6200 yards; 1892), the Stanbridge (5342 yards; 1839), and the Woodhead (5297 yards; 1867).

For full details of the construction of the Blackwall tunnel and of the London tube railways, see the *Proceedings of the Institution of Civil Engineers* (London, vols. 122, 123, 130, 133, 136, 139, 156).

**TUNNY.** The tunnies belong to the mackerel family, or Scombridae, and have somewhat the appearance of gigantic mackerel. There are several genera and species. The Common Tunny (*Thunnus thynnus*; *Thynnus vulgaris* of Cuvier, *Oreynus thynnus* of Günther) is the *thynnus* of the ancients. It is a large fish, reaching 9 feet in length, and 1000 lb. in weight. A remarkable fact

The Common Tunny.

is that the temperature of the brownish muscles is 10°-12° C. above that of the surrounding water—an approach to being warm-blooded. It occasionally occurs on the British coasts, but is particularly abundant in the Mediterranean. It has a large mouth with small teeth; two dorsal fins, the first elongated and reaching nearly to the second, which is shorter; behind the second dorsal and anal are eight or nine finlets like those of the mackerel. There is a keel on each side of the free portion of the tail, and the tail fin is crescentic. There are small scales all over the body, but they are larger in the anterior part, where they form a well-defined corselet. An air-bladder is present. The tunnies approach the coasts in summer, chiefly for the purpose of spawning, and it is at this time that the fishery is carried on. Like the mackerel, the fish are gregarious and migratory, but it is untrue that they all leave the Mediterranean in

autumn, as was formerly supposed. The Phœnicians established a tunny fishery at a very early period on the coast of Spain, and the tunny appears on Phœnician medals of Cádiz and Carteia. Salted tunny was much esteemed by the Romans, and was called *Saltamentum Sardicum*. The tunny is generally captured by means of nets arranged in a funnel-like form, the fish entering the wide mouth of the funnel and being gradually driven to the narrow end, where they are killed by lances and harpoons. The line of nets is often more than a quarter of a mile long. The principal fisheries at the present day are at Cádiz, the Gulf of Lions, Corsica, Sardinia, Sicily, Tunis, and in the Black Sea. At Tunis most of the fish are cut up and preserved in olive-oil, and exported in tins; others are salted and sent to Malta and Sicily, but fetch only half the price of those in oil. The common tunny also occurs on the western side of the Atlantic, from the Caribbean Sea to Newfoundland. The Longfinned Tunny (*Thunnus germon*) is distinguished by the great length of the pectoral fins; it is scaled all over, and the corselet is ill-defined. It is much smaller than the common tunny, seldom reaching 3 feet in length. It is caught by long and strong 'whiffing' lines trailed from a boat, the fishery being principally carried on in the south part of the Bay of Biscay. A few stragglers have been caught on the coasts of Devon and Cornwall, but its ordinary range is from the Bay of Biscay to the Cape of Good Hope. The Bonito (q.v.; *Thunnus pelamys*) has no scales at all on its body except in the corselet. *Pelamys sarda* has very fine scales on the posterior part of the body, and a small corselet. Several species are called albacore and tuna, including the longfinned tunny, germon, or alalunga, abundant at certain seasons on the Californian coast. A few other species of these genera occur in the Pacific and Indian Oceans.

**Tunstall**, part (since 1910) of the county borough and (since 1918) of the parliamentary borough of Stoke-on-Trent. It has a town-hall (1884), manufactures of earthenware and iron, and neighbouring collieries.

**Tunstall**, CUTHBERT, was born at Hackforth in Yorkshire in 1474, brother of the Sir Brian Tunstall who fell at Flodden. He was educated at Oxford, Cambridge, and Padua, and became in turn Rector of Stanhope, Archdeacon of Chester, Rector of Harrow-on-the-Hill, Master of the Rolls, Dean of Salisbury (1519), Bishop of London (1522) and of Durham (1530). In 1516 he went on an embassy to Charles V. at Brussels, and there formed a fast friendship with Erasmus. Between 1516 and 1530 he was often employed on embassies to France and Germany, and in 1527 he had accompanied Wolsey on his magnificent embassy to France. He accepted the Royal Supremacy, but took alarm at the sweeping measures of reform under Edward VI., and was at length in 1552 deprived, through the influence of Northumberland, who coveted the wealth of the see. The accession of Mary restored the bishop, but under his mild rule not a single victim died for heresy throughout the diocese. On Elizabeth's accession he refused to take the oath of supremacy and was deprived, September 29, 1559. About six weeks after he died at Lambeth in the house of Archbishop Parker, and was buried in the chancel of Lambeth church. Tunstall was a ripe scholar and an admirable man, but left little beyond a defence of transubstantiation and a number of Latin prayers. He was uncle to the famous apostle Bernard Gilpin.

**Tupelo**, a name given to several trees of the Cornaceæ, genus *Nyssa*, natives chiefly of the

southern parts of the United States, having simple alternate leaves, mostly entire, greenish inconspicuous flowers at the ends of long stalks, the fruit a drupe. *N. sylvatica* attains a height of 60 to 70 feet. It is often called Black Gum Tree or Pepperidge. *N. aquatica*, the Tupelo Gum or Large Tupelo, is a lofty and beautiful tree, remarkable for the extraordinary enlargement of the base of the trunk, which is sometimes 8 or 9 feet in diameter, whilst at no great height the diameter diminishes to 15 or 20 inches. The fruit resembles a small olive, and is preserved in the same way by the French settlers in America. *N. Ogeche*, the Ogeechee Lime or Sour Gum Tree, is a small tree, of which the fruit is very acid, and is used like that of the lime. *N. sinensis* is a recently discovered Chinese species. The wood of all the species is peculiarly curled in the grain, rendering the fibre very tenacious and difficult to split, and is in request for making naves of wheels, latters' blocks, &c., but is not otherwise valuable.

**Tupi**, a tribe of South American Indians originally inhabiting the northern tributaries of the La Plata, followed the coast north to the mouths of the Amazon, whence they were driven by the Portuguese in the 16th century to the upper reaches in the interior. The Tupi are strongly built, practise agriculture to some extent, cultivate a few industries, but live chiefly by hunting and fishing. Some of them have adopted Christianity, but most of them practise a form of nature worship. They are very closely allied to the Guaraní (q.v.). See BRAZIL, p. 409.

**Tupper**, MARTIN FARQUHAR, D.C.L., F.R.S., poet and inventor, was born at Marylebone, 17th July 1810. His father, an eminent London surgeon, who twice refused a baronetcy, came of a family, originally German, which since 1550 had been settled in Guernsey. Martin was educated at the Charterhouse and under five private tutors, and at nineteen went up to Christ Church, Oxford. A stammer hindered him from taking orders, so, after graduating in 1831, he entered Lincoln's Inn, and in 1835 was called to the bar. But a single will and marriage settlement was his first and last exploit in the way of law; he had found his vocation in a life of authorship. Its chief events were his election to the Royal Society (1845), two visits to America (1851, 1876), and a series of English and Scotch readings from his own works. Of those works, forty in number, one, *Proverbial Philosophy* (3 series, 1838-67), brought him and his publisher, Hatchards, a profit of 'something like £10,000 apiece.' His inventions were not such successes (safety horseshoes, glass screw-tops to bottles, steam-vessels with the paddles inside, &c.). A friend 'whose ambition it was to be Tupper's Boswell' predeceased him; but from his own huge 'archives' he compiled *My Life as an Author* (1886)—a curious self-study of a poet. He died at Albury, his Surrey home, on 29th November 1889.

**Turanian**, a philological term apt to be misleading and now going out of use. Originally the word *Turan*, meaning 'not Iran,' was used by the Sassanian kings of Persia for those parts of their empire outside of Iran (q.v.), and the Persians still know Turkestan under this name. Hence in philology 'Turanian' came to be used for the non-Aryan languages (see ARYANS, &c.) of those regions—languages of the Ural-Altaic or Finno-Tatar group (see ASIA). But the term was extended sometimes so as to include the Dravidian tongues of India, also of the agglutinative type (see PHILOLOGY, p. 100); thus erroneously suggesting affinity between non-Aryan and non-Semitic groups of languages which are probably quite unconnected.

**Turbary**, in law, is a right to go upon the soil of another, dig turf, and carry it away.

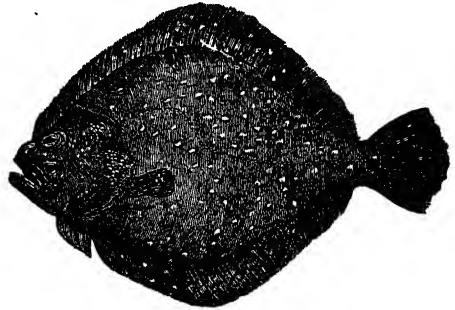

**Turbellarian**. See PLANARIAN.

**Turberville**, GEORGE (1540?-1610?), poet and secretary to Sir Thomas Randolph (q.v.), whom he accompanied to Russia, wrote epigrams, songs, sonnets, poems on Russia (1568), *The Booke of Faulconrie* (1575), *The Noble Art of Venerie* (1576), and translations from the Italian poets. His father was an inhabitant of Whitchurch in Dorset, and spelt his name Turbervile.

**Turbine**. See STEAM-TURBINE, WATER (Water-power), SHIPBUILDING.

**Turbinella**. See CHANK-SHELL.

**Turbot** (*Psetta maxima*), one of the Pleuronectidæ or Flat-fishes. The genus *Psetta*, includes the turbot and brill, having the eyes on the left side, which is uppermost; the mouth is terminal and large; the shape rhomboidal; the lateral line has a semicircular curve above the pectoral fin. The dorsal fin commences on the snout in front of the eyes, and its rays like those of the ventral are branched. The turbot is distinguished from the brill by the fact that it has no scales, but on the upper side bony plates in the skin from which blunt tubercles project: it is also broader in proportion than the brill. The adult turbot is about 2 feet long, and it has been known to reach a weight of more than 30 lb. It feeds principally on other fishes, but also on crustaceans,

Turbot (*Psetta maxima*).

molluscs, and echinoderms. It occurs on sandy ground all round the British and Irish coasts, becoming rarer towards the north. The largest supply comes from the North Sea. It breeds in summer: the eggs are very small and are buoyant or pelagic. Buckland calculated the number of eggs in a single female at over fourteen millions. The young, unlike those of other flat-fishes, are provided with an air-bladder, and continue to swim at the surface during their metamorphosis. At this period of life they approach the shores, and are found in harbours and bays. After the metamorphosis the young fish remain in shallow water, where also larger specimens occur in summer-time. Owing to its predaceous habits and large mouth, the turbot is caught on hooks as well as by the trawl. The range of the turbot extends along the coasts of France and in the Mediterranean as far as the Adriatic. Like the sole, it is entirely absent from the American coast, though the name 'turbot' is applied to species of *Paralichthys* and *Reinhardtius*. A relative of the turbot, *Lophopsetta maculata*, found on the coasts of New England and New York, is of little value as food from the extreme thinness of the body, to which it owes its common name of 'window-pane.' It rarely exceeds a pound or two in weight.

**Turcomans**. See TURKESTAN.

**Turcos**, a popular name for the *Tirailleurs Algériens*, a body of native Algerian troops recruited for the French service.

**Turdidae.** See THRUSH.

**Turenne**, HENRI DE LA TOUR D'AUVERGNE, VICOMTE DE, one of France's military heroes, was the second son of the Duke of Bouillon and Elizabeth of Nassau, daughter of William (I.) of Orange, and was born at Sedan, 11th September 1611. Brought up in the Reformed faith, he was sent, on the death of his father in 1623, to Holland, where, under his uncle, the celebrated Maurice (q.v.), he was initiated into the art of war. Returning to France in 1630, he was favourably received by Richelieu, who at once gave him a commission. During the alliance of France with the Protestants in the Thirty Years' War he fought with distinction (part of the time under Bernhard of Weimar), and helped to bring about the capture of Landrecies, Manbeuge, and Breisach. The victory of Casale in the Italian campaign of the following year added to his laurels, and in 1641 he was entrusted with the supreme command. The rapid conquest of Roussillon from the Spaniards in 1642 was rewarded in 1644 with the baton of a marshal of France and the chief command on the Rhine. Condé's arrival transferred him for a time to a subordinate position; and his restoration to supreme command was followed by the commission of a strategic error for which he was severely punished by the Imperialist general Count Mercy, who completely routed him at Marienthal, 5th May 1645; but on August 3 of the same year this disgrace was amply avenged by Condé at Nördlingen; and Turenne gloriously concluded France's share in the war by the reconquest of the Trèves electorate, by the conquest of Bavaria (1646-47) with the Swedes, and by a successful campaign in Flanders.

In the civil wars of the Fronde (q.v.) Turenne joined the party of the *frondeurs*, moved by his passion for the Duchess of Longueville; but after being defeated at Rethel (December 15, 1650) he withdrew to Flanders, returning on Mazarin's retirement. On the minister's return Turenne joined his party, while Condé deserted to the *frondeurs*, and the two greatest generals of the period were for the first time pitted against each other. Turenne triumphed over his former chief at Gien and the Faubourg St Antoine (1652), and ultimately forced him to retire from France; after which he subdued the revolted cities, crossed the northern frontier, and conquered much of the Spanish Netherlands. His defeat of Condé at the Dunes (1658), with the help of Cromwell's 6000, closed their long struggle. In 1660 Turenne was created Marshal-general of France, and in 1668 he became a Catholic from loyalty. His next campaign in Holland was triumphant (1672), and the year after he held his ground against both the Imperialist Montecuculi and the Elector of Brandenburg. In 1674 he dashed across the Rhine, defeated the Duke of Lorraine at Sinsheim, next mercilessly ravaged the Palatinate, crushed Brandenburg at Colmar, laid waste Alsace, and then advanced into the heart of Germany again to meet a worthy antagonist in Montecuculi. But their famous four months' passage of strategy was left unfinished, Turenne being killed by a cannonball while reconnoitring at Sasbach, 27th July 1675. His remains, entombed at Saint Denis, were respected at the Revolution, and were placed by Napoleon under the dome of the Invalides.

<sup>†</sup>Turenne left *Mémoires* (published 1732); and there are lives by Ramsay (Paris, 1738), Ragueneau (1738), Dury (5th ed. 1889), Hozier (Lond. 1885); and works on his strategy and tactics by Neuber (Vienna, 1869), Roy (Paris, 1884), and Choppin (Paris, 1876 and 1888). See also Picavet, *Les dernières années de Turenne*.

**Turf.** See PEAT, BETTING, HORSERACING.

**Turfan**, an important city and a fertile oasis in Chinese Turkestan (part of which is sometimes named after it), situated about 89° E. and 43° N. on the southern slope of the Tian-shan mountains and on a tributary of the Tarim River. Cotton, maize, and fruit are produced, but constant irrigation is necessary. Twentieth-century investigation has brought to light many Buddhist MSS. written in Uigur, Chinese, and Tibetan, Manichæan and Nestorian texts written in early Turki and Sogdian, while many Buddhist shrines and temples, with frescoes, sculptures, &c., have been discovered. This would suggest the great importance and prosperity of Turfan during the Middle Ages, reaching its highest point probably in the 11th century, when Manichæans and Buddhists lived apparently on good terms together. Pop. 20,000. See MANICHÆUS, TOKHARISH.

**Turgenev**, IVAN SERGEEVICH (whose family name is represented by spellings as various as *Tourghénieff*, *Turgenjew*, *Turgenief*), one of the greatest of Russian novelists, and the first to make the life of Russia familiar to western Europe, was born the son of a noble and wealthy family at Orel, 9th November 1818, and educated at Moscow, St Petersburg, and Berlin. For about a year he held a post in a government office (1840-41), but retired voluntarily into private life, subsequently living on his estate in Orel, at St Petersburg, or abroad. He became known as a poet in 1843; but his *Annals of a Sportsman* (1846) made him famous—especially for his singularly vivid pictures of the life of the serf and his powerful impeachment of the evils of serfdom. His outspoken liberalism in a *Letter on Gogol* (1852) led to a short imprisonment and his seclusion on his own estate till 1855. Thereafter he lived mainly in Baden-Baden (till 1871) and Paris—where he was a member of the most brilliant literary circles—with short summer visits to Russia. He died at Paris 3d September 1883; and his body was taken to Russia and buried at St Petersburg on the 9th October. A careful rather than a facile writer, Turgenev was a prolific author; though none of his novels is long (many of the most striking extend to only thirty or forty pages), and all are very slight in plot. In *Rudin* (1855), *A Nest of Nobles* (1858), and *Helene* (1860; trans. as *On the Eve*) he depicts scenes and characters from the period of enthusiastic dreaming and theorising; in *Fathers and Sons* (1861), *Smoke* (1867), and *Virgin Soil* (1876) he deals with the period of practical reform and the triumph of Slavophil ideas. But in the latter series he shows himself suspicious of a movement carried through on lines he, an admirer of the methods of western Europe, did not sympathise with, and he dwells too exclusively on the errors and extravagances of the new ideas, caricaturing Young Russia in a manner that gave much offence and led to the author's being regarded as reactionary. His freshness, noble realism, and poetic insight are somewhat impaired by increasing pessimism and hopelessness: the really good men are mostly fools, and progress leads but to evil continually. His accuracy of observation, variety of interests, and width of sympathy are everywhere visible; he is a master in the art of character-sketching; and his style is singularly finished and perfect. Even in France he was by many regarded as the greatest novelist of his time. He left several collections of epic and lyric poems and a series of dramas. In person Turgenev was exceptionally tall and strongly built, with a majestic bearing; his hair and full beard were in his later years silver-white. He was a magnificent talker in several tongues; some of his novels he wrote in French. He had

read much English literature and paid several short visits to England.

The novels of Turgenev have been translated into English by C. Garnet (15 vols. 1894-99) and others; see the general books cited at RUSSIA (*Literature*); there are studies in English by E. Garnet (1917), Yarmolinsky (1927), in French by Delines (1883), Haumant (1906), in German by Zabel (1884); see also books on Turgenev and Tolstoy by Kühnemann (in German, 1893), and Lloyd (in English, 1910).

**Turgot**, ANNE ROBERT JACQUES, an eminent French statesman, born at Paris, May 10, 1727, was descended from one of the most ancient families of Normandy. His father held the highest municipal offices at Paris. In his boyhood Turgot was shy, over-sensitive, and awkward; and these failings were aggravated by the harshness of his mother. Being a younger son, he was educated for the church; but soon after attaining to manhood he resolved to abandon the ecclesiastical for the legal profession; 'he could not consent,' he said, 'to wear a mask all his life.' At an early age he had joined the ranks of the philosophic party, who were rapidly imbuing the opinion of France and of Europe with new ideas. Even before he left the Sorbonne, where he had a distinguished career, he wrote essays which gave him a place among the most enlightened students of history of his time. After holding some legal appointments of subordinate importance Turgot was appointed to the office of Intendant of Limoges in 1761. Though more than once invited to more attractive positions, he filled the post for thirteen years, eagerly and resolutely striving to apply to his province the principles of justice and progress, which he loved. The Limoges was in a very low condition when he entered on his functions. In many ways it was merely a sample of the prevalent state of things all over France before the Revolution; in some respects it was worse than other districts. The soil was not fertile, and the natural defects of the soil were made unspeakably worse by a system of government which was irrational and unjust to a degree almost inconceivable. The people were poor, rude, immoral, and superstitious, the victims from time immemorial of ignorance, degradation, and oppression. Turgot introduced a better administration of imposts, and succeeded in abolishing the method of repairing roads and bridges by compulsory labour. He introduced the cultivation of the potato into the Limoges, overcoming the prejudices of the inhabitants by using it at his own table. In 1770 he had to meet a famine, which lasted two years and reduced the people to the severest straits. It should be said that the central government, of which Turgot was the representative, readily supported him in his schemes as far as it was able; and he also received cordial assistance from the rural priests in reaching the minds of the people. The evils with which he had to contend were rooted in the social and political system of France, especially in the overgrown privileged classes, which, as intendant, he was powerless really to change.

On the accession of Louis XVI. in 1774 Turgot had a brief opportunity of attempting the regeneration of France on a wider scale. He was first appointed minister of Marine, and soon afterwards controller-general of Finance, at that period the most important department of government. His rise was hailed with joy by his friends Voltaire, Condorcet, and other chiefs of the school of progress; it was fervently hoped that by a philosopher in power great things would be accomplished. In his letter to the young king he adopted as the principles of his administration that there should be 'no bankruptcy, no augmentation of imposts, no loans;' and he at once entered upon a comprehen-

sive scheme of reform. He reduced the expenditure, augmented the public revenue without imposing new taxes, and introduced exactness of payments and fidelity to engagements into all his financial operations. He sought to break down that immunity from taxation which had been enjoyed by the privileged classes, and so effect a better distribution of the burdens of government. He established free trade in grain throughout the interior of the kingdom of France, and in every way sought to remove the fiscal barriers which prevented free intercourse between the various provinces of the country. He also issued an edict to abolish the exclusive privileges of the *jurandes* or trade corporations, maintaining that the free right of labour was the first and most sacred right of humanity. It need not be said that these efforts towards a more economical, efficient, and equitable administration brought him into antagonism with all the privileged orders of France. Courtiers, nobles, prelates, farmers of revenue, financiers, and the members of the trade corporations alike saw their selfish interests menaced by the innovations of the new minister, and they combined for his overthrow. Louis XVI. was too weak to resist such pressure. He had not been in full sympathy with the philosophic minister. He complained that his controller-general never went to mass. Turgot was too austere, reserved, and perhaps also too inflexible and doctrinaire; and it was certainly a tactical mistake to unite against himself so many enemies. He attempted too many reforms during the short time he was in power. It may be that he lectured the king too severely on his duty as ruler. Yet Louis greatly esteemed his minister. He had once sadly observed, 'It is only M. Turgot and I who love the people.' The end was that Turgot was dismissed after holding office for twenty months, and France drifted rapidly into the great catastrophe of 1789. He retired quietly into private life, where he occupied himself with literature and science till his death from gout, March 8, 1781.

The efforts of Turgot towards a reform of the French political system have a profound and pathetic significance. By reason of his integrity, zeal for the public good, and administrative intelligence, Turgot was the best man to undertake the regeneration of France. 'He has,' Malesherbes said, 'the head of Bacon and the heart of L'Hôpital.' In practical affairs he was the fittest and most capable representative of the new ideas; and it was natural that Voltaire and other chiefs of the new school should lament his failure as a misfortune that touched them most nearly. It really meant that the hope of a reasonable and temperate change had passed away, through the weakness of the king and the folly and selfishness of the privileged classes. 'The part of the sages was played out; room was now for the men of destiny.'

Turgot's most important work was his *Réflexions sur la Formation et la Distribution des Richesses* (1766). It is the highest development of the Physiocratic school, with its excellences and also some of its characteristic errors, as that agriculture is alone productive, and that there should be only one tax, that on land; and it largely anticipates the teaching of Adam Smith. See POLITICAL ECONOMY.

Masson, 1888); W. Walker Stephens, *The Life and Writings of Turgot* (1895); Whyte, *Great Statesmen* (1910).

**Turin** (anc. *Augusta Taurinorum*; Ital. *Torino*), a city of Northern Italy, formerly capital of

Piedmont and of the kingdom of Sardinia, and for a time (1860-65) of the kingdom of Italy, is situated in a beautiful plain bounded by mountains, near the confluence of the Po and the Dora Riparia, 54 miles from the Cenis tunnel by rail, and 80 miles NW. of Genoa. It stands at the meeting-point of several great roads through the Alps, and strategically has been of great importance. At present it is an important railway centre. Really a very ancient city, it has a very modern appearance: ancient moats and fortifications have been removed, and the place is famed for its handsome streets which intersect at right-angles, its squares and gardens, and for its fine view of the Alps. Some of the largest squares are Piazza San Carlo, Piazza Castello, Piazza Vittorio Emanuele, Piazza Carlo Felice, &c. Among the numerous churches are the cathedral of San Giovanni, a cruciform Renaissance edifice, built in 1492-98 on the site of a 7th-century church (it contains the famous 'Sudario' said to be the shroud in which Jesus' body was wrapped); San Filippo Neri, the finest church in Turin, rebuilt by the Sicilian Juvara (1685-1736); La Consolata, containing several striking statues and a wonder-working Madonna; La Gran Madre di Dio; San Lorenzo with a dome by Guarini (1624-83), &c. On the summit of a hill near the town is La Superga, a splendid basilica, raised by Victor Amadeus II. in 1717-31 to fulfil a vow, and now the mausoleum of the House of Savoy; its terrace, reached by a cable railway, is a favourite resort for the enjoyment of a glorious view. Among the 'palaces' must be noticed the royal palace designed by Castellamonte, rather poor in outward appearance but containing a fine collection of armour, MSS., and drawings; the Castello del Valentino, partly in the French style (1633); the Palazzo Madama; the Palazzo Carignano, by Guarini, with the theatre of the same name opposite to it; the town-hall; the university, with a valuable library (many of its volumes and MSS. burnt with the building in 1906); the Accademia delle Scienze, once the Jesuit college, containing the museum (important especially for its Egyptian collection) and the picture-gallery; the seminary; the hospital of San Giovanni. The private palaces are numerous and vast, but not in a noble style of architecture. The most important modern building is the so-called Mole Antonelliana, called after its architect, built in 1863-88, with a dome and a lofty spire 510 feet high. The number of statues is exceptionally great, and many of them are fine. Among famous natives were Gioberti, Cesare Balbo, Cavour, Marochetti, d'Azeglio, and the French mathematician Lagrange. The manufactures of Turin, which in Italy is second only to Milan as a manufacturing town, consist of motor-cars (especially the famous Fiat cars, the name being an abbreviation of *Fabbrica Italiana Automobili Torino*), cotton, woollen, and silk fabrics, carpets, velvet hats, paper, iron, pottery, leather, glass, dresses, gloves, bijouterie, furniture, wax matches, tobacco, and liqueurs. Pop. (1700) 40,000; (1800) 42,000; (1881) 233,134; (1901) 335,656; (1911) 427,462; (1921) 502,274. Turin was originally inhabited by the Taurini, a tribe of Ligurians. It is first mentioned in history in the time of Hannibal, by whom it was taken and sacked on his descent into Italy. Turin became a Roman colony under Augustus, and its rectangular plan, which seems so modern, is simply due to the prolongation of the old Roman street-lines in the various extensions of the town from 1600 onwards. The north and east gates still exist, with the two lofty towers which flanked them, and considerable remains of the Roman theatre have also been excavated. On the fall of the empire it passed to the Lombards, and became the capital of one of the thirty Lombard duchies. Charlemagne made it

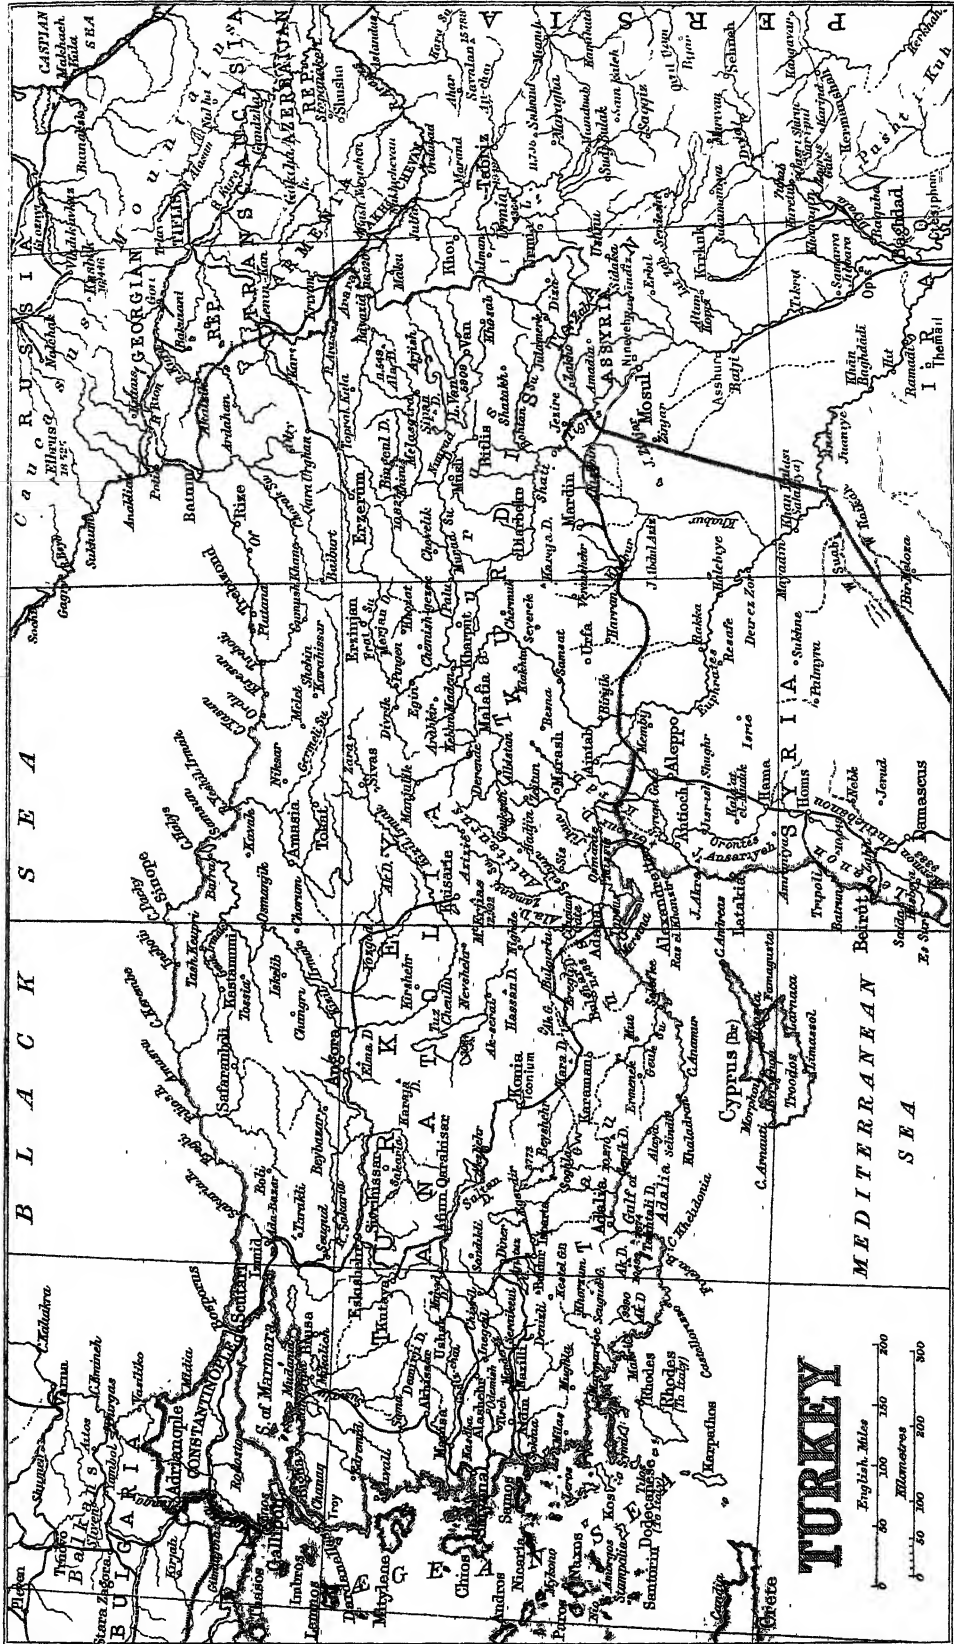

the residence of the Duke of Susa, whose line ruled till 1045, when the house of Savoy succeeded it. It was taken by the French in 1536, and was held by them until 1662. They once more took it in 1640; and in 1796 it was dismantled, and in 1800 united to the French Republic with the name of the department of the Po. In 1814 it was restored to the house of Savoy. See works by Cibrario (1847), Promis (1869), Borbonese (1884), and Toesca (1911).

**Turina**, JOAQUÍN, Spanish composer, pianist and conductor, was born at Seville in 1882, began the study of music early, and later studied with Moszkowski and d'Indy at Paris. He has written operas, *La Procesión del Rocío* and other symphonic poems, chamber music, songs, and pianoforte works, most of which reflect the gay colouring and fresh vigour of Andalusia. In 1917 he published an *Encyclopædia of Music*.

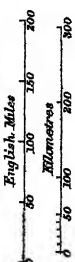

**Turkestan**, 'the country of the Turks,' called by the Persians *Turan* (see **TURANIAN**), has come to be applied to an extensive region of central Asia, bounded on the north by Siberia, on the east by Mongolia, on the south by Tibet, Kashmir, Afghanistan, and Persia, on the west by the Caspian Sea and Russia in Europe. It is divided generally and politically into Western or Russian Turkestan and Eastern or Chinese Turkestan, the former implying, geographically, Russian Central Asia, and the latter the province of Sin-Kiang. The Kirghiz Steppes, sometimes taken as interposing between Siberia and Turkestan, are here regarded as part of the latter. A lofty tableland, the Pamir (q.v.) separates the rivers eastward to the desert of Gobi from those which run into the Sea of Aral.

**WESTERN TURKESTAN.**—*Physical Features.*—Western Turkestan, or simply Turkestan, consists of the great hollow depression of the Caspian and Aral Seas, which occupies its west and centre, of the plain round Lake Balkhash on the east, of the Kirghiz Steppes to the SW. of Siberia, and of the hilly and well-watered districts formed by the ramifications of the western Tian-shan Mountains and the northern Hindu Kush, which frequently rise to over 20,000 feet. The plains are composed of deserts of loose shifting sand, interspersed with oases where a subsoil of clay renders the formation of lakelets of rain possible; and of strips of fertile land along the banks of rivers, with occasional tracts clad with coarse thin grass. The eastern districts abound in valleys of remarkable fertility. There is but little doubt that many changes have taken place in the surface of Turkestan, and that, for example, the united Caspian and Aral Seas originally extended over a vast region to the north-east; they were connected with Lake Balkhash, and, by means of the river Ob, with the Arctic Ocean. The process of subsidence is still continuing. The climate varies on the plains from extreme cold to burning heat; in the eastern highlands, although the cold is almost as intense in winter, the heat of summer is much less. The principal rivers are the Syr-Daria (see **JAKARTES**) and Amu-Daria (see **OXUS**), which flow into the Sea of Aral; the Zarafshan, Murghab, Chu, Sary Su terminate in the flat country in central Turkestan. The Kirghiz Steppes are drained by the Tobol, Ishim, and Irtysh rivers, all tributaries of the Ob, while the Ural and Ili rivers flow into the Caspian Sea and Lake Balkhash respectively. For the fauna and flora, see **ASIA**, pp. 497, 498. About half the area of Turkestan is desert land, and only a small proportion of the remainder can be used for arable. Irrigation is practised fairly extensively, but, with the necessary capital, much more land could be used than is so at present. In the south cotton is the principal crop, and the cotton-seed-oil

and silk industries are important. Wheat, barley, rye, oats, rice, fruit, and vegetables are grown, Ferghana in the SE. being the most fertile region. Coal and other minerals are found, but are not worked to anything like their full extent; salt is abundant, large tracts of desert being strongly impregnated and even crusted over with it. Breeding of horses, sheep, and other domestic animals is carried on to a great extent, especially in the Kirghiz Steppes, where camels are used; lamb-skins are valuable. Manufacturing industry is also considerable, the produce consisting of cotton, silk, linen, and woollen goods, shagreen (superior to that manufactured in Europe) and other kinds of leather, paper made of raw silk, carpets, rugs, and a few sabres, knives, and rifles. Raw cotton, wool, and hides are exported. The Central Asia Railway extends from Krasnovodsk on the eastern shore of the Caspian Sea, south-east to Poltaratsk, Merv, north-east to Leninsk, Bokhara, east to Samarkand, Khokand, to Andijan, the main line being built 1880-88, a distance of some 1270 miles. Branches go from Merv and Bokhara south to Kushk and Termez respectively on the Afghan frontier, and a line north to Tashkent branches off between Samarkand and Khokand. The Tashkent-Orenburg (and thence to Samara and the European railway net-work) line of some 1150 miles distance was finished in 1905. Various extensions have been proposed. Though the railways were originally planned primarily for military purposes, business and trade have since developed very considerably. The building of the lines was troublesome in many parts, owing to the drifting sand, and transport is still a difficult problem, though road-construction and air services have been taken in hand.

*Area and Population.*—Up to the Russian Revolution of 1917 the political divisions of Russian Central Asia, with estimated areas and populations, were as follows (though accurate figures have never been obtainable):

	Area in sq. m.	Pop. (1915).
Steppes, comprising the governments of Akmoinsk, Semipalatinsk, Turgai, Uralsk .....	710,905	4,017,200
Turkestan, comprising the governments of Ferghana, Samarkand, Syr-Daria, Semirychensk .....	420,807	6,684,400
Trans-Caspian Province .....	235,120	552,500
Bokhara } (semi independent).....	88,000	1,250,000
Khiva }	24,000	646,000
TOTAL....	1,473,832	13,150,100

There are separate articles on most of these territories. The name 'Turkestan' was here applied to a political division, but for purposes of exploitation and administration (such as the construction of railways, irrigation works, &c.) the general government of 'Turkestan' included also the Trans-Caspian Province, Bokhara, and Khiva (but not the Steppes). After the Revolution the boundaries were altered, and a complete reorganisation took place (see *History*), and in 1925 the estimated areas and populations were as follows (though the delimitation of the frontiers was incomplete):

	Area in sq. m.	Pop.
Kirghiz-Cossack Region, comprising the Steppes, part of Turkestan proper (to the E. and SE.), and part of the Trans-Caspian Province	1,228,792	6,409,500
Turkmenistan, comprising part of the Trans-Caspian Province, and the western parts of Bokhara and Khiva.....	178,756	965,500
Uzbekistan, comprising the eastern parts of Bokhara and Khiva, and part of Turkestan proper (to the W.).....	71,346	4,000,000
TOTAL....	1,478,894	11,375,000

The Cossack (till 1925 Kirghiz) republic is an autonomous republic forming part of Russia proper (capital Ksyl-Orda). The name Kirghiz republic was in 1925 transferred to what had been the Kara-Kirghiz, in the extreme SE., an autonomous republic from 1926 (capital Pishpek). The Kara-Kalpak autonomous territory round the SE. of the Sea of Aral was set up in 1924 (capital Turtkul). Turkmenistan and Uzbekistan (the latter containing the autonomous republic of Tajikistan on the extreme S.) are themselves constituent members (since May 1925) of the Union of Soviet Socialist Republics. The principal towns of Turkmenistan, are the capital, Leninsk (Charjui), Karichi, Poltaratsk (Ashkhabad), Merv; of Uzbekistan, the capital, Samarkand (101,000), Tashkent (245,000), Khokand (120,980), Andijan (79,730), Bokhara (75,000), Namangan (70,500), Khiva. The administrative divisions were made on the basis of the ethnographical distribution, and Kirghiz predominate in the Cossack republic, Kara-Kirghiz in the Kirghiz, Turkomans, Uzbeks, Kara-Kalpaks, and Tajiks predominate in the respective territories named after them. There are also numbers of Russians, Cossacks, Persians, Afghans, Jews, &c. The Kirghiz lead largely a nomadic life, but the Uzbeks, when settled in towns, are designated 'Sarts'. There are separate articles on these peoples (see also TURANIAN), the majority of whom belong to the Turkish race (see TURKS), are Turkish-speaking, and are Sunnite Mohammedans. Education is in a very elementary state.

*History.*—Turkestan has played an important part in Asiatic history from the very earliest times. The contests between the Iranian and Turanian races occupy a prominent place in Firdausi's sketch of the semi-mythical traditions of Persia; and the earliest light of history shows us Bactriana (Balkh) and Sogdiana (Bokhara) as well cultivated and populous countries, generally attached to the old Persian empire, and inhabited by Persians, to whom most of the prominent cities of Turkestan owe their origin. With Persia, Turkestan passed into the hands of the Macedonians, who made Bactria an independent Greek kingdom, while the rest was in possession of the Parthians or 'Wanderers.' Under the Sassanides the Persian boundary was again advanced to the Jaxartes; but the gradual gathering of Turkish tribes from the north-east on the right bank of that river led to a constant state of warfare on the frontier, which ultimately resulted in the occupation of *Mavera-ul-neher* ('the country between the rivers'—i.e. the Oxus and Jaxartes) and of Kharism (Khiva) by the invaders. In the 8th century of the Christian era the Arabs possessed themselves of Turkestan, and during the decline of the khalifate it became the seat of various minor dynasties, as the Samani in *Mavera-ul-neher*, and the shahs of Kharism. After a brief union with the Seljuk empire in Persia it was mostly united to Kharism, and along with it overrun by the Mongol hordes under Genghis Khan (q.v.), on whose death it became one of the four divisions of his vast empire, and was allotted to his second son Jagatai—after whom was named the Turkish dialect formerly spoken in Persia and all over the East. On the decline of Jagatai's dynasty Timür (see TAMERLANE) rose to supreme authority in Turkestan, and in the course of a thirty-five years' reign made it the centre of an immense empire, which stretched from the Hellespont to the frontiers of China, and from Moscow to the Ganges. This period was the golden age of Turkestan; its powerful monarch was never weary of adorning its cities with the spoils of victory; colonies of learned men, skilled artisans, and all whose knowledge or abilities could be of service to his subjects, were either transferred

to Turkestan from the countries he had conquered or induced by the most munificent offers to settle there; under him and his more immediate successors Samarkand became a focus of enlightenment and learning. The Chinese historians say that when 'the Yuan (i.e. Mongol dynasty) son-in-law' Timūr had become King of Samarkand, he sent his son Sha-ha-lu (Shah Rokh) to occupy Herat, who was not on good terms with his nephew Ha-li (son of Miran Shah). But after the death of Shah Rokh, Timūr's youngest son, the empire was split up into numerous fragments; and after a time a new dynasty snatched Persia from Timūr's family, while the Uzbeks, under Sheibani Khan, drove them (1500) from the country north of the Amu-Daria; one of the expelled princes, Bāber Mirza, who had ruled in Ferghana (the south half of Khokand), subsequently founding the 'Great Mogul' empire in India (1519-26); the Chinese make no mention of Ferghana (Pa-han-na) so late as this. The Uzbek empire generally included Badakhshan, Herat, and Meshed; but these were lost on its division, in 1658, into various independent khanates. Khiva was conquered by Nadir Shah in 1740, and Bokhara, which had been conquered by the Uzbeks in 1505, was limited to the north bank of the Amu-Daria; but the Kirghiz of the Little Horde restored the independence of Khiva, which they ruled till 1792, when the Uzbeks regained possession; and Shah Murad (1806-22) effectually gave back its former extensive sway to the Bokhariot sceptre. Khokand, after emancipating itself from the authority of Sheibani's successors, was incorporated with Bokhara, but afterwards united with the states of Eastern Turkestan.

Subsequent history of Turkestan records a series of wars between Bokhara and Khokand, and Bokhara and Khiva, in which the Bokhariots had generally the advantage, owing to the aid of the Turkomans of the southern desert; the raids of the Turkomans along the northern frontier of Persia; the advance of the Afghans from the south-east; and the progress of Russian conquest from the north and west. In 1849 the Afghans invaded the south-eastern part of Turkestan for the recovery of possessions they claimed north of the Hindu Kush. In 1850 they took Balkh and Khulm, and in 1859 Kunduz, Badakhshan at the same time submitting to pay a large tribute. In 1860 the Persians marched against the Turkomans, but were defeated, and lost 15,000 men and 30 guns. In 1865 a more successful expedition proceeded against Sarakhs. Elsewhere the Russians bade fair soon to absorb all that remained of independent Turkestan; in 1864 they took Tashkent and Khokand. A struggle followed with Bokhara; on the 20th May 1866 was fought the important battle of Irjar, when the emir had to flee for his life. In 1868 the Russians, 8000 men, again advanced. The troops of the emir, 40,000 men, took to flight; and a treaty was concluded by which Bokhara transferred Samarkand to Russia, and in 1873 Bokhara became practically a Russian dependency. The same year a Russian expedition was sent against Khiva; a great part of Khivan territory north of the Amu-Daria was ceded to the conquerors, and after a fierce struggle in 1875 and 1876 with the warlike inhabitants of Khokand, Russia formally annexed the whole. In 1879 the Russians unsuccessfully attacked the Akhal Tekke Turkomans living on the southern edge of the Kara Kum desert, between the Caspian and Merv; but in 1880-81, under Skobelev, they completely subjected the Tekkes, and Merv became Russian. In 1885 a long talked of commission, English and Russian, was appointed to delimit the frontier in dispute between Afghanistan and Turkestan,

especially in the Steppe region between Merv and Herat, and ultimately Penjdeh and Pul-i-Khatun were left to Russia, and Maruchak and Zulfiyar to Afghanistan (q.v.).

After the Russian Revolution of 1917 various political parties, notably the Bolsheviks, the advanced Kirghiz, and the liberal Bokhariots, contended for power. The Khan of Khiva and the Emir of Bokhara were deposed in 1919 and 1920 respectively, and Soviet republics established, and in the latter year the Kirghiz (afterwards Cossack) Republic (at first confined to the Steppes) was set up. In the confusion which followed, Enver Pasha put himself at the head of guerilla bands, and worked against both Moscow and Angora, but was assassinated at Bokhara in 1922. In 1924 a commission appointed by the Union Central Executive Committee created the Turkmenistan and Uzbekistan republics. The political situation, however, is uncertain.

Graham, *Through Russian Central Asia* (1916); Christie, *Through Khiva to Golden Samarkand* (1925); books on Bokhara by Vambéry (1877), Olafsen (1911), on Merv by O'Donovan (1882); works on Turkestan in German by von Schwarz (1900), in French by Krafft (1901), Voeikov (1914); see also TAMERLANE.

EASTERN TURKESTAN is now known as the Sin-Kiang or New Dominion, includes Kulja and Kashgaria, and is regarded as a separate province of China. Towards the east it sinks to the desert plain of the Gobi, round the western bay of which it forms a vast crescent-shaped oasis from 4000 to 5000 feet in elevation, drained by the tributaries of the Tarim. The Tarim basin is surrounded by lofty mountain ranges, which rise in places to some 25,000 feet, the Altyn Tagh in the SE., the Kuen Lun in the S., the Kara Koram in the SW., while from the Pamir in the W. there extends to the NE. the Tian-shan, which separates Kulja from the rest of the province. There are great extremes of temperature. The Takla Makan, a stretch of arid sandy desert, interposes between the Tarim and the western Altyn Tagh, but to the north of the Tarim there are fertile oases. This river flows eastward and empties itself in the Lob-nor, after a course of 1500 miles. The Lob-nor, a lake, or rather series of lakes and marshes, inhabited by a curious people probably of Aryan descent, was first visited by Prjevalsky in 1877. The region around it is very desolate and unattractive. (See ASIA, p. 492.) Canals ramify through the country, sometimes crossing one another at three levels, but large areas are very unproductive. The people are mainly Turkis (called Sarts by the Russians)—a mixture of Tajiks with their conquerors, the Uzbeks, and are Turkish-speaking Moslems of the Sunni sect. The Chinese proper are very much in the minority. The general level of education is low. Agriculture is practised, and with irrigation, the production of cotton (already considerable) would assume enormous importance, while much silk is grown; the country is rich in minerals—gold, silver, copper, iron, coal; there are good oil-fields, and jade is worked, but everything is still very undeveloped. The inhabitants are skilful in making gold and silver stuffs, carpets, and linen, woollen, cotton, and silk goods. The governor resides at Urumsai, the capital, and there is a British representative at Kashgar (q.v.); other important towns are Yarkand, Kulja or Ili, and Khotan. Area estimated at 550,340 sq. m., and population from 1,200,000 to 2,000,000. Excavations and discoveries by Sven Hedin (q.v.), Sir

M. A. Stein (q.v.), and others have illustrated the close Buddhist connection between India and China *via* Turkestan during the first millennium A.D. (see TUN-HUAN, TURFAN), while an Indo-European language (see PHILOLOGY, p. 100) was discovered and named Tokharish (q.v.). Little, however, is known of Eastern Turkestan, except from Chinese sources, previous to its conquest by Genghis Khan. After the decay of his empire into petty states, among which were Kashgar, Yarkand, Aksu, and Khotan, the chiefs of these were constantly quarrelling with each other, till several of the leaders, with the Yarkand prince at their head, invited the Chinese to take possession of the country, which had long been subject to Eleuth or Kalmuck exactions, and in 1753 it became a province of China. In 1864, however, a mutiny among the Chinese troops induced the dispossessed native chiefs to stir up a Mohammedan insurrection. They invited a Khokand prince, Buzurg Khan, to assume the government; and he, through his lieutenant Yakoub Beg, dispersed the Chinese garrison. But the lieutenant soon superseded him, and became sole emir under the title of Atalik Ghazi. He possessed civil as well as military capacity, and raised the country to a state of considerable prosperity. From 1869 he successfully resisted the encroachments of Russia, but in 1876 the Chinese again advanced, defeated him, and retook their old province in 1877. Kulja, taken by the Russians from the rebels against Chinese authority in 1871, was retained by Russia in spite of the Chinese protests. In 1881, however, Chinese persistence carried the point, and Kulja was restored to China. After the establishment of the republic in 1912, the inhabitants were granted a status as one of the 'Five Races'—Chinese, Manchu, Mongol, Tibetan, and Musulman—with representation on the flag accordingly. A treaty of commerce was signed with Russia in 1924.

See Prijevalsky, *From Kulja across the Tien Shan* (1879); Lansdell, *Chinese Central Asia* (1893); Deasy, *In Tibet and Chinese Tartary* (1901); Church, *Chinese Turkestan* (1901); S. Hedin, *Central Asia* (1903); Huntington, *Pulse of Asia* (1908); various books by M. A. Stein, including *Ruins of Desert Cathay* (1912); E. C. and P. M. Sykes, *Deserts and Oases of Central Asia* (1920); Etherton, *In the Heart of Asia* (1925); Skrine, *Chinese Central Asia* (1926).

**Turkey. Area.**—The national territories of the Republic of Turkey are defined by the Treaty of Lausanne (24th July 1923) with the Western Powers, by that of Kars (16th October 1921) with the Soviet Federation as to the Caucasian frontier, and by that of Angora (June 1926) with Great Britain as to Mosul. Thereunder Turkey includes: (1) Eastern Thrace, within a line from the mouth of the river Resvaya to include Adrianople and a *tête de pont* on the western bank of the river Maritsa, down the Maritsa so as to include Dédéagach; (2) Constantinople and the Straits, with Imbros and Tenedos; (3) Asia Minor, within a line from the Black Sea, excluding Batum but including Kars and Ardahan, to the old Ottoman-Persian frontier and new frontiers with Iraq (Mesopotamia), excluding Mosul, and with Syria from the Tigris to the Gulf of Alexandretta. The total area is about 494,538 square miles.

Turkey in Europe is now only the Thracian Chersonese, an isthmus of low-lying littoral with small decayed ports, fertile but unfarmed uplands in the east, mountains with forests in the west. It has been almost depopulated by expulsions during the recent series of wars and by subsequent deportations under peace treaties. Turkey in Asia covers Asia Minor with its considerable coastal cities and cultivated areas round them; in the

interior, tablelands long denuded and lately devastated by war, rising to mountain ranges rich in unexploited mineral resources and still forested in the north and south. The territory as a whole is rich in economic possibilities, but will have to be repopulated.

**Population.**—The population is estimated at as much as over 13,000,000 and as low as 7,000,000. War has reduced the Moslem population by probably not less than a million, while policy has reduced the Christians by probably twice as much. Estimates of the present proportions of the various races are scarcely reliable enough to reproduce. But it may be safely stated that the indigenous Greeks in Thrace, Pontus, and Anatolia, and the indigenous Armenians of greater and lesser Armenia no longer exist as racial factors, while the Kurds, the only race that still shares this territory with the Turks, have been much reduced. In Constantinople there is still a considerable Greek, Armenian, and Jewish element—though all these and the foreign colonies in that city are much reduced and still declining. In fact the first stage of converting this territory from one shared between several races into a national territory of the Turks has been rapidly traversed. The Turkish race, though of Mongolian origin, has, by long miscegenation with Caucasians and Europeans and with the indigenous Greeks, Armenians, and Phrygians of Asia Minor, acquired the type and temperament of an East European community. Now that its oriental colour, its Levantine corruption, and its Byzantine constitution are all disappearing it is emerging as a 'white' race of essentially European mentality and type.

**Government.**—The present republican constitution is based on the 'Fundamental Law' voted by the Grand National Assembly of Angora, 20th January 1921, which vested all sovereignty in the people and all executive authority in the Assembly. The Assembly was elected for two years, the government being entrusted to commissars (*vekil*). A new constitutional law of 20th April 1924 declared Turkey a republic, and remodelled the constitution on rather more conventional lines. Executive power is still vested nominally in the Assembly, but is exercised through an elected president and a council of ministers appointed by him. The president's term of office coincides with that of the Assembly, over which he presides, both being elected for four years and re-eligible. He takes no part in debate, and has no powers of veto or dissolution. The present president being Ghazi Mustafa Kemal, the hero of the national renaissance, his personal power is very great, and he has been able to suppress all opposition in the Assembly.

The only surviving restriction on Turkish sovereignty is the demilitarisation of zones on the western frontier and on the Straits, under the Treaty of Lausanne and its annexed conventions; which, however, does not exclude the right of garrisoning Constantinople. The autonomous privileges of the 'millets,' or Christian communities, and the extra-territorial privileges of the foreign colonies in their judicial and commercial capitulations, were all finally abolished by the Treaty of Lausanne, after being first abolished by the Ottoman Porte in September 1914. The International Board of Health and foreign post-offices have similarly been abolished. Turkey merely undertook in return to engage European legal counsellors and medical advisers to assist in the work of reorganising the judicial and sanitary administrations.

Under the fundamental law Turkey is divided into sixty-two vilayets, subdivided into *cazas*, and again into *nahies*. At the head of the vilayet is the *vali*—a sort of prefect—with an elected council;

the caza is a mere group of nahies; the nahié is a commune with an elected council.

**Religion.**—The religion of the republic and of most of the people is Islam. But instead of these Moslems—Turkish, Arnavut, Kurd, Circassian, &c.—being a ruling class in the leading country within the Islamic State, as they were under the Ottoman khalifate until 1924, they are now members of a disestablished religious community under a republic of rationalist tendencies. The khalif, and the Ulema or superior priesthood, as well as the Der-vishes or monastic orders, have all been suppressed (1926), and there remain only Imams or parish priests. The charitable foundations or Wakf, which included a large part of the land of the country, have been secularised. Similarly the political and judicial autonomies of the Christian communities (millet) have been suppressed; but they are not restricted in the exercise of their religions.

**Justice.**—The jurisprudence of the Ottoman empire was drawn from a variety of sources—the Sheriat or Islamic religious law and the canon law of the Christian communities, these being followed in matters of status, succession, &c.; the statute law, embodied in edicts of the sultan, and a variety of codes, mostly from French models, but including the Mejlé or civil code, a modernisation of Islamic principles, these being followed in matters civil and criminal; the laws of the foreign colonies, applicable in civil and criminal matters as between foreigners under the capitulations. For the administration of this motley jurisprudence there was a medley of religious courts (Islamic and Christian), Ottoman courts, Mixed Tribunals for Ottomans and foreigners, and Consular Courts for foreigners. This has all been swept away by the Turkish republic in virtue of the Treaty of Lausanne. New civil, criminal, and commercial codes and codes of procedure have been introduced which are of wholly European origin. The Sheri courts have been abolished (8th April 1924), as have the Christian, Consular, and Mixed courts. The present system is simplicity itself, consisting of *Juges de paix* sitting singly, with limited but summary criminal and civil jurisdiction; *Tribunaux de base* of a president and two assessors with wider powers; and *Cours d'assise* of president and four assessors. There is no appeal, but a Court of Cassation. In recent crises special courts have been constituted. The Ottoman system of jurisprudence and judicatures is still maintained in the mandated territories of Iraq, Palestine, and Syria, where it is being slowly moulded to modern and local requirements.

**Education.**—Elementary education is in principle obligatory from the age of 7 to 16, under the law of 6th October 1913. Denominational schools, Islamic and other, were abolished by the law of 3d March 1924. There are primary, secondary, 'preparatory,' and some high schools (lycées); also some training schools and technical schools, and a University of Constantinople (founded in 1900), with many women students. The schools of the foreign communities—among which are notable the American (Robert) college for boys and another for girls—are subject to supervision by the Ministry of Education.

**Language, &c.**—The official language is Turkish. It is still generally written in Arabic script, but in 1926 the Latin character was adopted for official correspondence. Turkish is an agglutinative Turanian language akin to Hungarian. The metric system of weights and measures, introduced in 1889 and generally imposed in 1915, has not yet wholly superseded local systems. The confusion of calendars has been somewhat simplified by adoption of the Gregorian calendar from 1st January 1926 (1342 in the Hegira calendar).

**Productions, &c.**—(1) Agriculture is still the principal industry, and as yet primitive, though modern machinery is now not unknown. Its products are tobacco (Samsun and Smyrna), mohair, figs, silk, olives (Aidin), skins and hides, wool, gums, and opium (Konia and Kara-lissar). About seventeen million acres are under forest. There were in 1926 over twelve million sheep, ten million goats, five million cattle, one million asses and mules, and half a million horses.

(2) Mineral resources are still little exploited. There is chrome, silver, zinc, manganese, copper, borax, meerschaum, emery, asphalt, coal, lignite, salt, mercury, arsenic, and iron—mostly in central Anatolia.

(3) Industries are still undeveloped, and have suffered from the destruction of Smyrna in 1923 and the deportation of Greeks and Armenians. Carpet-weaving is little above half pre-war production; fig-packing, one-third. Efforts are being made to restart cotton-spinning and to start sugar factories. Sixty new factories of different kinds have been built since 1923.

**Commerce.**—Imports in 1924 were in millions of pounds Turkish, £T194, and in 1925 £T242, while exports for the same years were £T159 and £T193. The chief imports were cotton goods, £T74; cereals, £T22; metals, £T21; colonial goods, £T20; woollens, £T17. The principal importers in order were: Italy, £T43; Great Britain, £T37; Germany, £T27; France, £T26; United States, £T19. Exporters: Italy, £T50; Germany, £T17; United States, £T25; France, £T24; Great Britain, £T17. Trade with Great Britain shows a steady decline since the foundation of the republic.

**Railways, Shipping.**—The railway mileage (1926) was 2173. The Oriental railway (208 m.) connects Constantinople with Adrianople and Europe. The Anatolian railway (643 m.) connects Constantinople with Angora and Konia. The Bagdad railway (393 m.) continues from Konia to Nisibin in Iraq. There are also Smyrna-Aidin (376 m.), Smyrna-Kassaba (440 m.), and Mudania-Brusa (26 m.) railways. Under construction are Samsun-Sivas, Sivas-Angora, Samsun-Diarbekir, Trebizond-Erzurum, &c. There were in 1925 139 vessels of 129,443 tons under the Turkish merchant flag.

**Defence.**—During the campaigns of 1922 the national army reached a maximum strength of 200,000. On a peace footing it musters 120,000, composed of two classes of conscripts—men aged 22 and 23. It is organised in nine army corps—eighteen infantry and three cavalry divisions. It is relatively well disciplined and equipped. The navy is under reorganisation and will comprise the battle-cruiser *Yavuz* (*Goeben*), an old battle-ship *Tourgout Reis*, the light cruisers *Hamidieh* and *Medjidieh*, eight gunboats, three destroyers, and six torpedo boats, all old. The air service is still in embryo.

**Finance.**—The finance of the Ottoman empire was for the most part controlled by a foreign receivership—the Council of the Debt—under the Decree of Mouharrem (20th December 1881) in the interests of the foreign bondholders. The Turkish republic has, however, not maintained this system, in spite of foreign protests, and continues to appropriate the revenues assigned to service of the debt under the Ottoman empire. The debt was, by the Treaty of Lausanne, apportioned among the succession states, Turkey being charged with 62·25 per cent. of debt incurred prior to October 1912 and 76·54 per cent. of subsequent debt. The total Turkish debt is £T82,000,000 and the annual budget charge about £T10,000,000. The other more important items of budget expenditure (in £T millions) are: defence 58; finance, pensions, &c. 27; public works 22; police 9; education 6;

health 3; public security 4; refugees 2.6. The budget, previously in deficit, is balanced for 1927-28 at revenue £T189 millions; expenditure £T188.7 millions. Revenue is raised from land, property, income and profits, consumption, live-stock, monopolies, customs, &c. The Imperial Ottoman Bank has been gradually replaced as government bank (1917-26) by the Ottoman National Credit Bank, with a capital of £T4,000,000. The metal currency is on a gold standard with the piastre as unit, subdivided into 40 paras; 100 piastres = £T1 (one Turkish pound), and £T11 = £10. The paper currency was depreciated to about 12 per cent. of its nominal value, but the issue of a new currency was begun in 1927.

*History.*—The Osmānlis or Ottoman Turks, who trace their descent from a small clan of the Oighours, were pressed forward from their old camping-ground in Khorāsān by the advance of the Mongols, and, coming to Armenia early in the 13th century, were fortunate enough to assist the Seljūk sultan of Iconium at a critical moment in his resistance to the Mongol avalanche, for which service they were rewarded with lands in Asia Minor. Ertoghrlul, the leader of the 400 horsemen who had thus come to the rescue of the Seljūks at the battle of Angora, was allowed to pasture his flocks and pitch his tents in the province anciently known as Phrygia Epictetus (thereafter called Sultanöni), on the borders of the Byzantine province of Bithynia, and made the city of Sugut (Thebasion) his headquarters. When in the 14th century the Seljūk sultanate disintegrated it was replaced by an Ottoman sultanate, so called from the European corruption of Osmān or Othmān, son of Ertoghrlul, born at Sugut in 1258. Osmān may be considered the first of the long line of thirty-five Ottoman sultans which may be conveniently classified as follows: Five great sultans who built up the empire in Asia, the fifth being Mohammed I., the Restorer (1413-21), after the irruption of Tīmūr; five even greater sultans who built up the empire in Europe, ending with Suleiman the Magnificent (1520-66); twenty unimportant sultans, of whom ten covered the period of the Ottoman dominance up to the second siege of Vienna (1683), and ten the period of decline ending with Mahmūd the Reformer, 1808-39; five sultans of the reconstructed empire ending with Abdul-Hamid II., the Damned, 1876-1908. The two sultans that followed the revolution (1908) do not count. Osmān, who reigned from 1301 to 1326, waged a guerilla war on the Byzantine empire, captured many fortresses, pushed his conquests to the verge of the Hellespont, and took Brusa the capital of Bithynia. His son, Orkhān (1326-59), reduced Nicæa (1330) and Mysia (1336). Thus in two generations the little clan of nomads had possessed themselves of the whole north-west corner of Asia Minor, and obtained the command of the eastern shores of the Bosphorus and Propontis. It was Orkhān and his brother, 'Alā-ed-dīn, who organised the State, and created the famous corps of janizaries (*Yeni cheri*, 'new soldiery') recruited from Christian children, educated as Moslems, and carefully trained and disciplined. Deprived of all ties of kinship, but encouraged by every inducement to zeal and devotedness, this brotherhood became one of the most devoted and most fanatical instruments of imperial ambition ever devised. Later, their peculiar recruitment having become obsolete, this military corps and civil service degenerated into a business corporation, without military or civil value and with every social vice. So that their suppression became as indispensable as that of their confreres the Mamelukes in Egypt with which it was almost contemporary (1826) (See JANIZARIES, MAMELUKES.) Besides these professional soldiers and civil

servants, the Turks developed out of their primitive tribal and class organisation a very efficient feudal system under bairakdars and timariots. Their government as a whole compared so favourably with the corrupt and cruel régime of the Byzantine empire and Ottoman efficiency and economy was such a contrast to Byzantine extortion and extravagance that even the Greek cities and communities of Asia Minor welcomed conquest by the Turks. While Constantinople itself for long before its final conquest was tributary to the Turks, and was defended by Turkish corps of 'Gasmons' and 'Turcopouls.'

Nevertheless such was the prestige of Constantinople and such the predominance of Greek civilisation in the Near East that the Ottoman empire would never have replaced or, rather, revitalised the Byzantine empire but for the overthrow of the Greeks by the Latin capture of Constantinople in the fourth crusade (1203). The revived Greek empire of Paleologoi and Cantacuzenoi was a feeble affair. Even so the Turks only attempted its final overthrow after it had been isolated for years.

In 1358 the Turks took Gallipoli, and a few years later Adrianople and Philippopolis. Murād I.—the first 'Amurath' of European writers (1359-89)—in 1364 decisively routed the united Serbians, Hungarians, and Vlachs on the banks of the Maritsa. In 1375 he received the homage of the despot of Serbia and of the kral of Bulgaria. The Balkan Peninsula was thereafter a Turkish possession, with the exception of the territory immediately surrounding Constantinople. Twice again the Christians endeavoured to turn back the wave of Moslem conquest. Lazarus the Serbian in 1389 led a great army against the Turks, but was severely defeated in the battle of Kossovo, followed by the assassination of Murād I. by the Serbian Milosh Kobilovich. His successor, Bayezid I. (Bajazet, 1389-1402), surnamed *Yilderim*, or 'Thunderbolt,' annexed the remainder of the Seljūki states of Asia Minor, and established the Ottoman power in Europe at Nikopolis (1396). The invasion of Tīmūr (Tamerlane) interrupted the victorious course of the Ottoman arms, then, apparently, on the eve of the capture of Constantinople. The Tatar hordes overran Asia Minor, and totally defeated the Turks near Angora, in 1402. The sultan was taken prisoner, and died in captivity eight months later. Tīmūr reinstated the Seljūk principalities in Asia Minor and the Christian principalities of Eastern Europe, and the Ottoman empire seemed to have found an early end. But the vitality of its civil and military system and the vigour of its new sultan, Mohammed I., the Restorer (1413-21), had soon rehabilitated it. The capital was transferred from Brusa to Adrianople, which in a few years quite outshone the isolated and decadent Constantinople. Under the next sultan, Murād II. (1421-51), the Turks successfully staved off a strong counter-attack of the Balkan Christians led by the Hungarians under Hunyadi, which for a time recovered Serbia and Wallachia under the Treaty of Szegedin (1443). But a decisive defeat of the Christians at Varna (1444) definitely decided Ottoman domination in Eastern Europe.

Murād's long reign of thirty years was glorious, and this sultan was as virtuous as victorious. Murād's successor, Mohammed II., the Conqueror (1451-81), reigned also thirty years, but he was as cruel and unscrupulous as he was conspicuously able. The great event of his reign was the siege and capture of Constantinople (29th May 1453), whereby the miserable remnant of the Byzantine empire was extinguished for ever, and the Turks obtained that commanding position on the Bosphorus which has contributed more than anything else,

directly and indirectly, to the maintenance of their empire. In the north the progress of Ottoman conquest was arrested by the heroic defence of Belgrade in 1456 by Hunyadi and John Capistran, and by the subsequent resistance of Hunyadi's successor, Matthias Corvinus. In the west Scanderbeg for a while kept the Turks back in Albania. But they conquered the Crimea (1475) and even menaced Venice (1477) and Rhodes. They annexed Greece and most of the Aegean islands, and later planted their foot on Italian soil by the capture of Otranto in 1480. The long reign of Mohammed's son, Bayezid II. (1481-1512), was marked by no great conquests. But Bayezid's son, Selim I., the Grim (1512-20), incorporated Kurdistan and Diarbekr in the Turkish empire, annexed Syria and Egypt, overthrowing the Mamelukes and ousting the last Abbasid Khalif. The title of khalif, the relics of the Prophet, and the possession of the Holy Cities secured to the Ottoman sultan the hegemony of the Islamic State and the headship of the Moslem world. Under Selim's son, Suleiman the Magnificent, the Ottoman empire, by virtue of Constantinople the culture centre and commercial capital of the Near East—of the khalifate the governmental sanction of Islam—of conquest over Greeks and Latins—and of a civil government that was the envy of Europe, reached its apogee. Suleiman conquered Belgrade, and, after a heroic siege, reduced (1522) the rocky stronghold of the Knights of St John at Rhodes. In 1526 the sultan crushed the Hungarians on the field of Mohács. Buda and Pesth fell, and Hungary became an Ottoman province for a century and a half. In 1529, after laying the country waste, the sultan attacked Vienna, which withstood a furious siege for eighteen days. Eight years later Suleiman led his ninth campaign in the north, and compelled the emperor to sue for peace, the Archduke Ferdinand agreeing to pay a heavy tribute to his lord the sultan, who retained the whole of Hungary and Transylvania. Suleiman can claim to be 'The Magnificent' in an age of magnificence like that of Charles V., Henry VIII., Francis I., and Leo X. Splendour was a new achievement of the Turks, and not without its dangers. A less dangerous development was the new Ottoman sea-power. In the age of Doria and Drake the Turkish admirals Dragut and Barbarossa commanded the Mediterranean, drove the Spaniards from the Barbary States, and defeated the fleets of pope, emperor, and doge at Prevesa (1538). Another experiment that proved less successful was that Suleiman married and made Roxelana empress. Her intrigues in favour of her own sons caused the deaths of several suitable successors, and dealt the first and a deadly blow to the empire by bringing to the throne Selim the Sot (1566-74).

In Selim's name Sinan Pasha subdued Arabia in 1570, and Cyprus was conquered in 1571; but these successes were outweighed by the utter defeat of the Turkish fleet by Don John of Austria, 7th October 1571, off Lepanto, which first broke the spell of Turkish prestige at sea. During this reign occurred the first collision of the Turks with the Russians. The connection of the Don and Volga by a canal was a useful project involving the possession of Astrakhan; but the Turks were heavily defeated in an attack on that town, and the project was abandoned. On the other hand, Tunis was taken from the Spaniards in 1574. The reign of Selim's son, Murad III. (1574-95), is chiefly notable for the reception of the first English embassy to Turkey in 1589, sent by Elizabeth to seek an alliance against Philip II. of Spain. Georgia was conquered from Persia in the east, and on the Danube war was waged with varying success, with

Turkish prestige generally on the wane. Of the succeeding sultans Murad IV. (1623-40) alone revived prestige in campaigns against Persia and in the conquest of Bagdad (1638). Later and lastly, Crete and the Venetian islands were annexed (1645). But the empire, though still forceful at the circumference, was already feeble at the centre. Palace government and seraglio intrigues had replaced the personal autocracy and the professional civil service. The army was still formidable, and justice not yet corrupt; but the Byzantine poison had already done its deadly work on the sound system of the Ottoman régime. It was found necessary to have recourse to the governing talents of the *rayah* races—especially of Greeks and of Moslemised Europeans. The Köpreli family, as viziers, carried the empire through the critical period of the first serious defeats on the European frontier by John Sobieski. Defeats at Choczim (1673), Lemberg (1674), Vienna (1682), Mohács (1686), and Zenta (1697), followed by the treaties of Karlowitz (1699), and Passarowitz (1718), ended Ottoman rule over Hungary, Transylvania, and Podolia, while the Venetians conquered the Peloponnese and bombarded Athens. The Turkish tide had turned to the ebb.

The long chapter of Russian ambitions and aggressions begins with the 18th century. The invasion of Moldavia (1711) by Peter the Great was disastrous, but the Russian advance was renewed with the seizure of Azov and Oczakov (1736). The Morea was recovered (1715), and Belgrade lost and won again (1730-54). Campaigns against Austria and Russia, sometimes in coalition, continued throughout the century, until the French revolution turned the attention of these empires westward. The Treaty of Jassy (1792), confirming the Treaty of Kainarji (1774), fixed the empire's boundaries at the Sava, the Dniester, and the Black Sea, and terminated Anglo-Russian schemes for a restoration of the Greek empire and Austro-Russian schemes for partition of the Ottoman empire.

Selim III. (1789-1807) profited by the respite to try a reform of the empire. But the attempt to repress the janizaries and feudatories cost him his life. The French invasion of Egypt brought Turkey into alliance with Great Britain, and gave British policy its traditional trend towards reforming and reinforcing the Ottoman empire as the best means of preventing an occupation of Constantinople by one of its rivals—especially Russia. Mahmud II., the Reformer, after an initial failure that would have cost him his life had there been any other male heir, succeeded in reconstructing the empire, and in reducing first the Greeks, who had monopolised its administration, and then the janizaries to impotence by massacres *en masse*. On the other hand his effort to crush the new Greek nationalist movement in the Morea, in alliance with a new oriental military power, Egypt, was frustrated by the Powers at Navarino (1827). Another war with Russia brought a Russian army to the walls of Constantinople, and a series of wars with Egypt brought an Egyptian army to the Straits. On both occasions the empire was saved by the jealousies of the great Powers, and principally by British sea-power. Its administration, which during the Napoleonic epoch had been under French influence, came very much under British influence as exercised by Stratford Canning, the Great Elchi. The end of Mahmud's reign found Algiers a French protectorate (1830), Greece a new nationalist state (1828), Egypt *de facto* the same, Albania, Arabia, Serbia, and Wallachia all well on the road to independence. Abdul-Mejid (1839-61), under British guidance, inaugurated constitutional reforms on paper (the *Tanzimat*), and endeavoured

to counter the Russian claim to protect Ottoman Christians, by a policy of religious and racial equality intolerable to the Turkish ruling race and incompatible with the system of the Islamic State. Russian imperialism, convinced of the hopeless decadence of the empire, and failing to detach the British from its support by proposals for partition of the 'Sick Man's' estates, came into collision with Great Britain, France, and Turkey in the Crimean war (1853-55). The Treaty of Paris (1856) restored to Turkey the command of both sides of the lower Danube, excluded the tsar from his assumed protectorate over the Danubian principalities, and closed the Black Sea against all ships of war. In return, under pressure of British policy, proclamation was made (Hattı-Humayun) of the equality of all races and religions and the establishment of general civil rights and governmental reforms. Any chance this policy may have had was cancelled by the reckless recourse of the Palace to the resources of European credit opened to the reformed empire. Senseless extravagance and cynical corruption accumulated a burden of unprofitable debt, whose charges crushed the contributor, and whose growth made bankruptcy and a foreign financial control inevitable when repudiation was reached in 1875. Consequently Islamic intolerance and Turkish independence were alike in revolt against a régime so provocative of both ideals. While the nationalist movements of Eastern Europe relentlessly pursued their course, massacre of Christians in Lebanon and at Damascus provoked western intervention in 1860. The nominally subject peoples of Moldavia and Wallachia ventured to unite themselves into the one state of Rumania; and in 1866 the empire, becoming more and more enfeebled through its corrupt administration, had to look on while the Rumanians expelled their ruler, and, in the hope of securing western support, chose Prince Charles of Hohenzollern to be hereditary prince of the united principalities. The rebellion of Crete in 1866 was ultimately suppressed in 1868, but Serbia, already autonomous within her own frontiers, demanded the removal of the Turkish garrisons still maintained in certain Serbian fortresses; and in 1867 Turkey saw herself compelled to make this concession. Egypt bought its formal release from all but the most shadowy suzerainty, and the sultan, refusing any more dignified or definite title to its pasha, accorded Ismail the Persian title of Khedive (q.v.). The 'integrity of the Ottoman empire' secured by the Treaty of Paris at the cost of the Crimean war, was the integrity of snow in summer, and the treaty itself was badly torn when Russia profited by the war between France and Germany to repudiate the restriction on its naval armaments in the Black Sea. In the early 'seventies the empire, menaced by Russian invasion and by foreign financial control, had to face the outbreak of insurrection among the Serbs and Bulgars. The Bulgar rising was repressed by brutalities that, exploited by the eloquence of Mr Gladstone in the Midlothian campaign, detached the majority of the British electorate from its traditional policy of supporting Turkey. Abdul-Aziz (1861-75), whose extravagance had brought the empire to ruin, was deposed by a *coup d'état* of the army; and his nephew, Murâd V., son of Abdul-Mejid, who succeeded him, was destined in turn to make way for his brother, Abdul-Hamid II., in August of the same year. In June Serbia declared war, and Montenegro followed her example. Before the end of the year the Serbians were utterly defeated, in spite of the help of many Russian volunteers; but the state of affairs in the Turkish provinces seemed to call for a conference of the Great Powers at Constantinople. The proposals then made for

the better government of the Christian subjects of Turkey were rejected by Abdul-Hamid, who, posing as a reformer, effectively choked the conference at with constitutional cream by proclaiming parliamentary government for the whole empire in the constitution of 1876. The conference, checkmated, dispersed, and Abdul-Hamid closed the chambers. Russia then assumed the task of imposing the reform proposals of the Powers on the sultan, and declared war (1877). Both in Armenia and Bulgaria the opening of the campaign was favourable to Russian arms, but later the Turks rallied and seriously checked the triumphant progress of the invaders. Even after the Russian forces had been greatly augmented the Turks resisted energetically. Kars, besieged for several months, held out till the middle of November; Erzerum did not surrender until after the armistice had been concluded. Osman Pasha, who established himself in Plevna early in July, repelled with brilliant success repeated and determined assaults from a besieging army of Russians and Rumanians until the 10th December, when he surrendered. Desperate fighting in the Shipka Pass had moreover failed to expel the Russians from their position in the Balkans. The victorious Muscovites occupied Adrianople in January 1878; in March the 'preliminary treaty' of San Stefano was signed, by which the greater part of Roumelia, including Macedonia, was assigned to a greater Bulgaria under Russian protection. Constantinople, the Tsargrad of the Slavs, seemed about to become the southern capital of a great north and south Slav federation. But such a settlement of the eastern question was a challenge to the traditional foreign policy of Great Britain that British imperialism, then in its first youth under the imaginative inspiration of Disraeli, could not brook. Jingoism was born of the crisis with its music-hall refrain of 'Russians shall not have Constantinople.' The British fleet appeared off San Stefano. The treaty was referred to an international congress at Berlin, which eventually settled the eastern question for a generation in the Treaty of Berlin (1878). Therein the imperialist ambitions of the Powers were met at some cost to the nationalist aspirations of the Balkan peoples. Thus the independence of Serbia and Rumania was recognised, but Rumanian Bessarabia was acquired by Russia, and Serb Bosnia and Herzegovina were put under Austrian tutelage. Bulgaria had to give back Macedonia to the empire and accept Ottoman suzerainty over eastern Roumelia. Greece was to have Thessaly, but not Greek Macedonia, Crete, or Epirus. All of these frustrations of nationalism in favour of imperialism were in due course corrected by circumstances, though some only in recent years. In return for this rehabilitation the Ottoman empire once more pledged itself to introduce internal reforms. Disraeli, however, with characteristic cynicism, had, before the congress, concluded a secret convention, taking Cyprus in pledge for the execution of this promise. Abdul-Hamid probably considered a Greek island a cheap price to pay for being rid of Anglo-Saxon altruism, for the scheme of reforms exhaustively elaborated for Roumelia was pigeon-holed, while those for Anatolia were never even put on paper. The Turkish reforming statesman, Midhat, was exiled on a false charge of having murdered Abdul-Aziz and was done to death in Arabia, his constitution was finally suspended, and the empire entered on its last phase of government by palace camarilla and espionage. By playing off one Great Power and one Balkan people against another, Abdul-Hamid managed for a time to keep in check both imperialist and nationalist menaces in Europe and Asia; but not daring to organise a fleet lest it lead a revolt, he lost the African pre-

vinces. France annexed Tunis in 1881, and in 1882 Great Britain occupied Egypt. But his method of dealing with the Armenian nationalist aspirations, which won him the title of the 'Red Sultan,' are now seen in the light of later and even more lurid massacres to have been not personal to himself but a phase in the conflict between Turks and Armenians for a national territory in Anatolia. For after the special engagements entered into by the British in the Treaty of Berlin the Armenians considered it safe to take their turn in the eastward extension of the nationalist movement. But there was to be no Navarino or Shipka for the Armenians. As Lord Salisbury observed, 'The British fleet cannot cross the Taurus'; while Russia, which had fought for the south Slavs, and already regretted it, considered that its hold on the Caucasus would be endangered by the establishment of a national state in its neighbourhood. The Armenians were accordingly left to their fate. When in 1894 Turks and Kurds began massacring Armenians at Sassun and in 1895-96 throughout Asia Minor, the protests of the Western Powers only exposed their impotence; while Tsarism was undoubtedly an accomplice. Finally a 'frame up' by Russian Armenians, who seized the Ottoman Bank in Pera and then were allowed to escape, prepared foreign opinion for a massacre at Constantinople. And though the 'butchers' bill' of these massacres, about a quarter of a million, was small compared to that of massacres by Young Turks during the Great War, the impression was far greater. Thereafter the British left the policy of maintaining and modernising the Ottoman empire to the Germans, and tended to favour partition. So when Greek nationalist expansion in Crete (1897) caused a war with Turkey in Thessaly and disastrous Greek defeats, Greece was saved from dismemberment by the Powers and got off with a small war indemnity of four million; while in spite of this defeat Crete obtained, under the high commissionership of Prince George, an autonomy which was obviously only an antechamber to an assimilation with Greece. Meantime the restlessness of the Arabs and Arnauts was causing repeated guerilla in the Yemen and in Albania. But the real focus of nationalist forces and of imperialist frictions was Macedonia. For this province excited the land-hunger of all the neighbouring new nationalist states, and was honey-combed with their secret conspiracies and campaigns. While the eastward pressure of the Austrian empire and the southerly penetration of the Russian empire there found both an objective and an impact. At last the ceaseless guerilla of the Macedonia 'Tcheti,' of Wallachs, Arnauts, Greeks, Serbs, and Bulgars, campaigning for their respective national causes, and the increasing risk that this guerilla would lead to a Balkan war between their natural protectors, and that again to a European war between their imperial patrons, compelled an expression of pacifist public opinion through the concert of Europe. A whole series of arrangements and agreements, of which the most important was the Mürzsteg programme, was attempted with a view to pacifying Macedonia under international police. And the steady growth of this intervention was viewed with increasing indignation by the Turks, whose inarticulate inertia under the evils of Hamidianism had caused the Powers to form much too low an estimate of their surviving vitality. It was the meeting between King Edward and the tsar at Reval in 1903, interpreted in Turkey as the prelude to an Anglo-Russian partition, that created a coalition of all the still forcible factors among the Turks for such a reconstruction of the empire as would give it a new lease of life; since it was clear that the diplomacy and despotism of

Abdul-Hamid were now ruinous to the empire's interests. But there was no open opportunity for reform—because since 1876 the Turkish reformers had been driven underground or overseas. There were, however, two strong currents for reform, one filtering underground through the secret organisation of the Bektasli dervishes and professing a curious combination of French modernism and Islamic mysticism, the other being the organisations of Young Turks in Paris with rationalist and republican programmes. Both these movements were helpless against the sultan's government by espionage so long as the army remained loyal to him as padishah and khalif. But when the Young Turkish officers, educated at the Pankaldi school and in foreign missions, recognised that essential military reforms were only realisable through revolt, the revolution became practicable. The 'Committee of Union and Progress' established itself in Salonika in 1906, and within two years had secretly and successfully organised the Macedonian military revolt of July 1908. Hamidianism in Macedonia had three supports—the garrisons of Anatolian Turks, who as Moslems hated all Christians; the Albanians, who as Bekjis (village watchmen) and brigands 'policed' Macedonia; and the 'Tcheti,' or professional propagandists of the rival Christian races, who hated and harassed one another even more than they did the Turks. The programme of the Committee did at first provide a common ground upon which all these rivals could fraternise in revolt against an odious governmental system. The Albanians had been alienated by the sultan's attacks on their tribal liberties and license; the Christians were ready to ally themselves with their enemies for the overthrow of Abdul the Damned; while an appeal to the Turkish troops to rise in defence of Islam against Western intrusion obscured in their simple minds the fact that they were mutinying against their padishah. Bodies of Turkish troops marching from Monastir through the highlands of Macedonia under Niazi and Enver, after deposing their superior officers, were acclaimed everywhere by the Christians. The constitution of 1876 was proclaimed (23d July) at Ferizovitch on the Albanian border and accepted the following day by the sultan, who always knew when he was beaten. As usual on such occasions there ensued a millennial fraternisation of all races, rivals, and religions that so impressed the foreign Powers that they too accepted the revolution as a permanent reconstruction, instead of what it was—merely a preliminary repudiation of Hamidianism. And this had a first effect favourable to the Young Turks in that it terminated any arrangements for internationalising Macedonia. The further effects were less favourable in that all those governments who had claims, either nationalist or imperialist, on the 'Sick Man's' inheritance, began to try to cash what they could of those claims while they could. Thus Austria annexed the hitherto 'protected' states of Bosnia and Hercegovina; and Bulgaria, with Austrian approval, denounced Ottoman sovereignty and declared itself a kingdom (Oct. 1908). The Young Turks retaliated spiritedly with a trade boycott, but had to be content with indemnities.

The policy of the Young Turk Committee was at first to remain at Salonika and thence enforce reconstruction, leaving the actual execution to the parliament at Constantinople. Accordingly, a protégé of the British, the aged Kiamil Pasha, was allowed to form a 'Liberal' government, with a programme of reconstruction on a federal basis with local autonomies. Such a policy was very satisfactory to the subject-races represented in the Liberal party, but very suspect to the Turko-Jew Radicals of the Committee, who saw in a centralised and corporate empire the only escape from a renewal of disintegration or a relapse into despotism. Already

reaction was active in the form of the Mohammedi Conservatives, who were organising an opposition of Hodjas, Softas, and Moslems generally against a reconstruction, and in favour of a restoration of Hamidianism; which conflict between the Liberal chamber and the Radical Committee represented a rivalry between the British and German patrons of the revolution. For the revolution had restored to the British that paramountcy in the empire that they had lost to the Germans. Kaiser Wilhelm II. had personally promoted various enterprises—for example, the Bagdad (q.v.) railway—which had made Germany predominant, both politically and economically. Turkey in Europe had become an Austrian sphere of influence, Turkey in Asia a Prussian protectorate. The Turkish army was managed by German officers, and the country was becoming mortgaged to German bankers. This German control was threatened by the overthrow of Abdul-Hamid. But the British, supposing that the Liberals represented in Turkey the moderate masses, and seeing in federalism the best basis of reconstruction, came into opposition with the Committee, who after the elections of 1908 had come into conflict with the federalists. The Committee then decided to assert their authority, and appointed as vizier their own associate, Hilmi, thus assuming the responsibility for ruling the empire; which conjuncture Abdul-Hamid considered favourable for a reactionary *coup d'état*. His agents among the Softas had succeeded in seducing from their allegiance to the Committee the Macedonian regiments that had been sent to garrison Constantinople. The cry of these mutineers was 'the Sultan and the Sheriat,' but palace gold had contributed considerably to their reactionary fanaticism. They murdered many of their Young Turk officers, invaded parliament, and proclaimed the constitution at an end. As this reaction found considerable support in Great Britain, it enabled Germany to recover its influence by establishing close co-operation with the Committee for the restoration of the constitution. A revolutionary army under Mahmud Shefket—the 'Army of Liberty'—was transported from Salonika to Constantinople with surprising expedition, and overcame the resistance of the reactionary regiments with no less surprising ease (April 1909). Abdul-Hamid was deposed, and despatched into exile at Salonika. Thereafter the Committee took no more chances with constitutional government. Mohamed Reshad, Abdul-Hamid's long-suffering brother, was proclaimed sultan as Mohamed V., but there was never any question of his being allowed to rule. The Committee transferred their organisation to Constantinople, and made no further concealment of their being the real rulers. The revolution that had started as a reconstruction of the Ottoman empire was thus rapidly converted into a renaissance of the Turkish race, and, as such, was bound to come into collision with the other races of the empire. And hardly had the Young Turks dealt with reaction than they were faced with another raid from abroad. On the flimsiest of pretexts an Italian army seized Benghazi, and Tripoli was annexed to Italy. A desultory warfare, disgraced by great cruelty, dragged on in the interior between the Italians and the Senussi (q.v.), the latter ably assisted by Enver and other Turks, until the outbreak of the Balkan wars caused a peace to be patched up in the (first) Treaty of Lausanne (1912). Although the Powers were successful in insulating this Turco-Italian war in Africa, yet it necessarily contributed to breaking up the superficial coalition of races and religions in the Young Turk revolution. There was probably never any real possibility at this period of Moslem and rayah working together as Ottoman citizens in a recon-

structed constitutional empire. For the subject-races of the Ottoman empire were in too close contact with their kinsmen in the neighbouring nations, while the Turks were too much imbued with the temperament of a ruling class and with the traditions of Moslem authority to accept a position of equality with the subject-races. Among the Balkan nations negotiations for a coalition against Turkey and a partition of the European provinces had begun as early as 1910. Even so, the race-hatred between Slavs and Greeks would have prevented any effective coalition but for the centralising and coercive policy of the Young Turks. Even more intolerant of any federal freedom than Abdul-Hamid himself, they soon found themselves at war with the tribal liberties of Albania and of Arabia. Nor were they any more tolerant of the efforts of the Ottoman Greeks to exploit Greek political talents for getting control of the parliamentary machine. The Committee's efforts to arrange the elections antagonised all factions; and, most fatal of all, they temporarily lost control of the army. They were succeeded (June 1912) by a ministry of Old Turks, with a policy of general pacification which the Committee tried to combat by provocation of every kind. The Young Turks began to work for war. One of them, who was envoy in Montenegro, even presented an unauthorised ultimatum. As, in the course of the previous year, the Balkan States had arranged their military coalition for a partition of European Turkey, war was very shortly declared against the empire by Greece, Bulgaria, Serbia, and Montenegro, all supported by Russia. And as the Turkish revolution had not had time to reconstruct the army, as the measures that it had taken, like the admission of Christians to its ranks, had only tended to disorganise and demoralise it further, and as the position in Macedonia was one of great strategic weakness, the collapse of the Turkish resistance in that province under the converging attack of Greeks, Serbs, and Bulgars was inevitable. It was not long before the Turkish troops were everywhere defeated in open field and driven from one stronghold to another, their most remote refuges, Yanina and Sentari, not being captured until the spring of 1913. In Thrace the Bulgar armies marching on Constantinople drove the Turks before them behind the lines of Chatalja. But the Bulgars could not carry the defences of the capital by a *coup de main*, and knew that Russia would not allow them to occupy it. Moreover their real political objective was not Constantinople but Salonika. So an armistice was concluded (25th Nov. 1912), and the Powers endeavoured to arrange peace terms. The Committee of Union and Progress was in favour of prosecuting the war, while the Old Turk ministry under Kiamil was pacific. This ministry decided (22d January 1913) to accept the Powers' proposals in respect of Thrace and the Aegean Islands. But on the following day the Committee effected a *coup d'état*, in the course of which Nazim, the minister of war, was shot. A triumvirate of Enver, Talaat, and Djemal then seized power, and Mahmud Shefket became grand vizier. Hostilities in Thrace were renewed; but the Turkish naval and military offensives were repulsed, and Adrianople surrendered (25th March). The Young Turks then themselves invited the mediation of the Powers, who summoned the belligerents to a conference in London and put before them terms of peace. These Bulgaria and Turkey were ready to accept; but Greece and Serbia, not being so exhausted and being engaged in entrenching themselves in Macedonia to the exclusion of Bulgaria, procrastinated. Under pressure from the British government the Treaty of London was at last signed

(13th May 1913), under which the boundary of the Ottoman empire in Europe was put back to a line across Thrace from Enos to Midia. In spite of this formal and fair settlement the second Balkan war then broke out in Macedonia in a dispute over its partition between a coalition of the Greeks and Serbs as against the Bulgars. This war only indirectly concerned the Turks in that it enabled the Committee to tear up the Treaty of London almost before the ink was dry. For the Bulgars, defeated in Macedonia and driven back upon Sofia, had withdrawn the bulk of their forces from their new territory in Thrace. In July the Turkish army under Enver re-occupied Adrianople, sweeping out not only the Bulgar garrisons but the whole indigenous Bulgar population. Bulgaria, after a vain appeal to the Powers to maintain the Treaty of London, made the best terms it could with Turkey in the Treaty of Constantinople (29th September), renouncing Thrace and Adrianople, and retaining only the coastal strip of western Thrace and Dedeagach. This victory of the Young Turk triumvirate—Enver, Talaat, and Djemal—which controlled Constantinople in 1913, implied a victory of German over British influence in the future policies of the empire. Which change coinciding as it did with the crisis of the Great War had consequences very formidable for Europe and fatal to the empire itself. Before the end of 1913 a German military mission was in executive control of the Turkish army, and a British naval mission in no way counterbalanced its influence. Moreover a military alliance was arranged between Germany and the Committee triumvirate early in 1914, and an outbreak of general war made a declaration of Turkey on the side of Germany inevitable unless the Committee were overthrown by a *coup d'état* and Constantinople overawed by a naval *coup de main*. When, however, early in August 1914 the German warships *Goeben* and *Breslau* evaded the British fleet and entered the Bosphorus, the Committee had little difficulty in forcing their belligerent policy on the Ottoman cabinet and capital. Turkey's objective in entering the war against the Allies was the recovery of Egypt, which was supposed to be ready to rise against the British occupation. Preparations were made in Syria for the invasion of Egypt, and a claim to Egypt as an integral part of the Ottoman empire was formulated (2d October 1914). War was declared (5th November 1914), and Djemal himself led an army against the Suez Canal (January 1915). The attack on the canal was repulsed, and was followed by a British counter-stroke against Constantinople. But a bombardment of the Dardanelles defences in the autumn by the Allied fleet had led to such a fortifying of Gallipoli and the Straits that, defended by the flower of the Turkish army under German guidance, the assaults of the Allied forces, naval and military, proved unable to force the Straits. After a preliminary failure of the Allied fleets to pass the Straits early in March, the attempt being more nearly successful than was at the time supposed, large British and some French military forces landed on Gallipoli in April, and during May, June, and July of 1915 maintained assaults on the Turkish defences. By October the attempt had been abandoned, and during December the British forces were withdrawn. Owing partly to this failure and partly to the secret understanding between Great Britain and Russia as to the latter's right to annex Constantinople, confirmed in an agreement of 18th March 1915, the Greeks, and for a time the Rumanians, remained neutral, while Bulgaria joined the Central Powers. Thereafter the elimination of Serbia and the release of the Turkish forces from the defence of the Straits, led to a

Turco-German offensive disastrous to the British campaign in Mesopotamia and disturbing to the Allied cause in Persia and Central Asia. The capitulation of Kut was the acme of the Turks advantage on this southern front; while on the northern front their campaigns against the Russian forces in the Armenian highlands were on the whole disadvantageous to them. But the Russian revolution and retirement in 1917 brought relief to the Turkish armies, thereby enabled to overrun Transcaucasia and even occupy the Caspian littoral north of the range. Meantime the Young Turks eliminated Armenian nationalism by mass massacres unprecedented in modern times. In the south, however, a general rising in Arabia and an advance into Syria of the British forces in Egypt drove the Turks out of Mesopotamia, Syria, Arabia, and the greater part of Palestine. By that time Turkey was entirely exhausted by its efforts and eager for peace at any price. The collapse of Bulgaria (August 1918) caused at once a complete capitulation on the part of Turkey in the armistice of Mudros. And in view of the secret treaties of partition between the Allies, concluded during the war, it looked as though not only the Ottoman empire would be dissolved, but that even the Turkish race would be disintegrated among Allied protectorates. However, the renunciation by the Russian revolutionaries of their rights over Constantinople, and the preoccupation of the Allied Powers with the resettlement of western Europe, gave the Turks a respite which that still vigorous race turned to great advantage. The Young Turk triumvirate and the C.U.P. had of course fallen and fled, their place being taken by anglophil and Old Turk ministries. Constantinople, though not at first formally occupied by the Allies, became a base for their operations against the Russian revolution, in the Ukraine, Transcaucasia, and Central Asia. Great Britain, now predominant, began to pursue a policy of substituting Greek power over the Straits and Aegean littoral in preference to the policy of partitioning the empire into protectorates under the Powers. This pro-Greek proclivity rapidly became a policy of using Greek military and naval forces against the growing resistance of the Turks to disintegration and subjection. Which resistance had found a leader in Mustafa Kemal, a Salonika soldier-reformer, whose services in the Army of Liberty in Gallipoli and in Asia Minor had made him a national hero, though he had been hitherto kept in the background by the triumvirate. When in May 1919 Greek troops disembarked at Smyrna, Mustafa Kemal, as governor of Erzerum, was disembarking at Samsun to start a military adventure and a national movement unexampled for sheer audacity. The British at that time covered Constantinople with their fleet, and controlled the sultanate, the khilafate, and the cabinet. The Greeks with a strong force held Smyrna and the surrounding country. The Italians held Adalia, the French Cilicia, and the British Transcaucasia. British agents in Asia Minor and foreign diplomats at Versailles were busy preparing and planning a division of Asia Minor into Kurdish, Turkish, and Armenian autonomies, Greek annexations, and imperialist spheres of influence. Undismayed, the Turks collected an army and convened a nationalist congress, first at Erzerum then at Sivas, which repudiated the Constantinople government and proclaimed (28th January 1920) the 'National Pact,' claiming Constantinople, Smyrna, and even Adrianople as within the territory of the Turkish nation. Constantinople followed this strong lead by the reopening of parliament and by replacing the Old Turkish cabinet by Young Turks. In the course of the winter of 1919-20 the authority of the sultan's

government at Constantinople was confined to the Allied lines, while the national government, under Mustafa Kemal at Angora, was accepted by all Anatolia and most of Thrace. In February 1920 the British announced that Constantinople might become the capital of the Turkish nation, if the Turks would renounce Smyrna and Adrianople. But the only effect of this was that Constantinople became more and more nationalist, until in March it was occupied by the Allies and the leading nationalists were deported to Malta. An Old Turk cabinet was put in office, and the sultan-caliph was made to outlaw the nationalists. In June appeared the Treaty of Sévres, which assigned to Greece all Thrace up to the Constantinople lines and Smyrna with its hinterland, created Arab, Armenian, and Kurdish autonomous states, internationalised Constantinople and the Straits, and subjected the Turkish nation to the same military restrictions as other enemy countries. The Turks replied by taking the field both at Angora and Adrianople in alliance with the new Soviet state. The Armenian and Kurdish autonomous faded away, and the Italians found themselves hard pressed in Adalia, the French in Cilicia. Then the Greeks were launched against the Turks. One Greek army cleared the Smyrna region; another, landing at Mudania, took Brusa; and a third covered Adrianople and Thrace. In August the Constantinople cabinet accepted the Treaty of Sévres. But this, the last of the peace treaties, was the first to be abrogated—in fact, it was never enforced. The renaissance of the Turkish nation and its military resistance, hopeless as they seemed, had very swiftly exposed the weaknesses of their overwhelming opponents. The Greek armies in Asia Minor, though apparently the mandatories of the victorious Allies, had not the support either of the French or the Italian governments. The policy of the Treaty of Sévres, which converted the Aegean into a Greek lake, and clearly contemplated the restoration of a Greek empire at Constantinople, represented merely the alliance between Mr Lloyd George and M. Venizelos. First, the Italians, realising that their own imperial ambitions in Asia Minor were impracticable, began to support the Turkish nationalists. Then the French, recognising that their position as mandatories for Syria was imperilled by an Anglo-Greek and an Anglo-Arab association on either side of them, also entered into relations with Angora. The Soviet Federation, having cleared its territories in the Ukraine and Crimea of the last of the White invasions, began again to advance in the Caucasus, and the Armenian, Georgian, and Tatar states there passed from British to Russian protection.

The internationalist and imperialist front having been thus broken up, the struggle became a direct race war between Turks and Greeks. In the spring of 1921 the Greeks began pressing for a final military decision, which ended in their repulse on the Sakkaria and their retirement to positions covering Eski Shehir and Brusa. The French thereupon concluded a formal convention with Angora, while the British vainly tried to make peace between Greeks who believed that the restoration of the Greek empire was within their grasp, and Turks embittered by the devastation of their homelands. In 1922 the Greeks, realising that a conquest of Anatolia was impossible, concentrated on Thrace and on the conversion of the Allied occupation of Constantinople into a Greek occupation. But their attempt to enter Constantinople was frustrated by the Allied garrison; while the Turks, breaking through their demoralised and defeated fronts in Anatolia, drove them back upon Smyrna and the Straits. Smyrna was evacuated and burnt by the Turks, enraged at the part this Greek city

had played in the wasting of Turkish territory. As the victorious Turkish armies advanced up to the British outposts covering Constantinople, pressed between them, and penetrated the city itself with their agents, war between the Turks and the British became imminent. But the British empire was in no mood for further warfare, and its rulers were not unanimous as to the pro-Greek policy that had been pursued. The Coalition government of Mr Lloyd George was overthrown in favour of a pro-Turk Conservative ministry. King Constantine of Greece was for the second time deposed, and the armies of Mustafa Kemal were appeased, in an armistice concluded at Mudania, 11th October 1922, by a promise of an early evacuation of Constantinople. On this basis the Turks, now masters of the situation, agreed to come into conference at Lausanne, where, after prolonged negotiations and one complete rupture for several months, a treaty was eventually signed which terminated an empire that, as Roman, Byzantine, Latin, Greek, and Ottoman, had subsisted for fifteen hundred years (24th July 1923). Under this treaty the Turkish nation recovered Constantinople, Adrianople, and Thrace, Smyrna, and Anatolia, Kurdistan and Greater Armenia, in unrestricted sovereignty with a southern frontier following the frontier assigned to Syria and Iraq in the Treaty of Sévres as modified by the Franco-Turkish agreement of 19th October 1921. The eastern frontier was much that of the defunct empire with an accession of territory about Kars and Ardahan obtained by the Treaty of Kars (Oct. 1921) from the Soviet Federation. The international control of Constantinople and the Straits was renounced by the British in return for the right of sending a restricted tonnage of cruisers through to the Black Sea. Turkey recovered two islands covering the Dardanelles, the other Aegean islands remaining Greek with the exception of the islands of Rhodes and the Dodecanese retained by the Italians, and Cyprus, definitely annexed by Great Britain early in the war. Arrangements were made for apportioning the Ottoman debt, but foreign financial control in Turkish territory, though apparently sustained in principle, has been suspended in practice. But the most important innovation in the treaty was the sanction it gave to the Turkish policy of expelling all non-Turkish elements from the national territories. Under the provisions for 'exchange of populations' as elaborated in a subsequent special convention (23d January 1923), the indigenous Greek populations of Thrace and Asia Minor were expelled and exchanged against those Turkish populations in Macedonia and Thessaly that had come under Greek sovereignty. The Greek population of Constantinople was excluded from this, but was in part nevertheless expelled under various pretexts, while the Orthodox patriarchate of Constantinople was deprived of its political position, and with the other Christian churches was disestablished. Having thus secured relief from the Christian international institutions of the empire which had survived five hundred years of Ottoman rule, the Turkish nationalists turned their attention to its Islamic institutions, which they now realised were scarcely less incompatible with their ideal of converting Turkey into a national state on Western lines. The sultan, Mohammed VI., who had succeeded in 1918, having become a mere agent of the Allied occupation, had fled from Constantinople before it was surrendered to the Turks. His successor, Abdul-Mejid, was not invested with the sultanate, but merely with the khalifate in virtue of election by the new national assembly at Angora (18th November 1922). On 2d October 1923 the Allies evacuated Constantinople, and on the 29th the Turkish state was declared a republic under the

presidency of Mustafa Kemal—a presidency little short of personal government. The curious experiment with the khalifate did not last long, and on 3d March 1924 the khalifate was abolished; while the Orthodox patriarch, persisting in asserting his ancient authority, was summarily deported. Constantinople ceased to be the capital of Eastern Christianity as it had ceased to be the citadel of Islam. It also ceased to be the commercial centre of the Near East; for it had owed this position not only to its geographical situation, but also to the international régime maintained there for a thousand years by Byzantine and Ottoman rulers. These extra-territorial privileges, originally granted by Greek emperors to Italian commercial colonies, and augmented by Ottoman emperors in favour of the colonies and commerce of Western peoples, had developed until Constantinople was in practice, if not in principle, internationalised. This whole international régime of commercial and judicial capitulations disappeared with the Treaty of Lausanne, as also did most of the Greek, Armenian, and foreign commercial communities. At the same time, the Turks, rightly recognising that their new national government would, if it were transferred to Constantinople, be exposed to corruption in that Byzantine and Levantine milieu and to coercion by British or Russian sea-power, decided that the capital of the new nation should remain at Angora. The result of this has been a complete suspension of vitality in Constantinople, and a loss of business good-will to the otherwise admirable moral and social revolution effected by Angora. This revolution has rebuilt from the foundations not only the political and judicial institutions of the country, but has remodelled its fundamental legal and social ideas and has carried its reconstruction into the most intimate domestic details and personal habits. Only a few examples can here be cited to illustrate this sudden conversion of a ruling class within the Islamic State into a republic based on European social contracts. The foundations of the Islamic State in the Koran and Sheriat have been swept away and Islam reduced to no more than a religious creed subordinated to a constitutional government. Even the Mejlé, the Ottoman civil code, which adapted the jurisprudence of the Islamic State to modern requirements, has been replaced by a new code adopted bodily from a Swiss model. A successful campaign against the characteristic costumes of the East has coerced the individual Turk into an outward conformity with this revolution; which has also been brought home to him by such innovations as the complete emancipation of and equal rights for women. In short, so far as Turkey is concerned, the changeless East has undergone a change even more sudden and sensational than that experienced by other Eastern communities that have come into contact with the eastward tide of European nationalism and socialism.

The intransigent nationalism of the Turks was not long in involving them in a collision with the only race that still shared with them their national territories—the Kurds. A nationalist movement among the Kurdish tribes in 1925 that took the form of a reaction in favour of Islamic institutions as against nationalist ideas was crushed so completely as to render a revival of trouble from this source unlikely in the near future. At the same time a peaceful settlement, largely effected through the mediation of the League of Nations, of the dispute with Great Britain over Mosul, gave some practical proof of the effective entry of Turkey into the community of civilisation.

*Literature.*—Turkish poetry is closely modelled upon the Persian style with which the Ottomans became familiar during their association with the Seljûks (q.v.), who had become deeply imbued with Iranian ideas in their long residence among the Persians. Like the Seljûks, the Osmanlis assimilated the literature of the people they subdued. Firdausi and Nizâmî had already written their masterpieces before the name of Ottoman was heard, and at the time of their settlement in Asia Minor Sa'dî and Jelâl-ed-dîn Rûmî were attracting the admiration of the eastern world. The latter was a resident at Iconium (Köniya), the Seljûk capital, and his mystical verses or *mesnevis* impressed their character upon the whole literature of the new power then rising in Anatolia. Ottoman poetry is full of the subtle esoteric ideas which are characteristic of its Persian exemplars. Its long metrical romances, while apparently treating of the loves of Leylî and Mejnûn, of Khusrav and Shirîn, or of Joseph and Zuleykha, are really occupied with the deeper thoughts of the longing of the soul for God, the yearning of the heart for heavenly wisdom, the struggle between human passion and the endeavour towards divine serenity. The short odes or *ghazels*, the most characteristic of Ottoman poetic forms, 'though outwardly mere voluptuous songs, are in reality the outpourings of hearts drunken with the love of God.' Nor is the mystic spirit the sole gift of Persia to the Turkish poet. He has also borrowed the history and mythology of his predecessors, and, instead of the deeds of the old Turkish chiefs and the cult of the gods of the Caspian nomads, he celebrates the prowess of Persian heroes, of Rustem and Jemshîd, Kay-Khusrev and Ferîdûn, and the loves and tragedies of Leylî and Shirîn and other Persian heroines. And the Ottoman poet followed the forms as well as the ideas of his Iranian masters, such as the *kastîda* or Arabian lyric, adopted by the Persians, in which the second hemistichs rhyme throughout the whole length of the composition; the Persian *mesnevi*, or rhymed couplet; and the *ghazel* or sonnet of the East. In all these the Persian love of playing upon words, far-fetched conceits, and extreme elaboration of metaphor is not merely emulated but exaggerated to intolerable excess: the grace of expression and finish of the form alone redeem the artificiality of the style and thought. Turkish poetry, it must be admitted, is lamentably unreal: it lacks warmth, and earnestness, and sincerity. It is throughout essentially a court poetry, mannered and insincere. There is nothing robust or healthy about it. There is nothing strong or masculine in its love or its patriotism. Throughout we trace the effects of an artificial town life, where genius is cramped in convention, and poetic art is no longer an inspiration, but a cast from the face of the dead.

Ottoman poetry begins soon after the establishment of the Ottoman empire. Already in the beginning of the 15th century Ahmed Dâ'i's 'gay and flowing songs of love and wine' delighted the court of Prince Süleymân at Adrianople, and poems had been indited by Ghâzi Fâzil, who had crossed the Hellespont on a raft with that prince on the night when the Osmanlis gained their first foothold in Europe. To write poetry soon became part of the accomplishments of kings and courtiers. Of the thirty-four sultans of Turkey twenty-one were poets of a sort, and Amurath the Great (Murâd II.), Mohammed the Conqueror, and Selîm I. (the Grim) were accounted bards of repute. The unhappy Prince Jem was especially noted for his poetic talent; and from Murâd II. to Murâd IV. (1421-1623) twelve successive sultans left poems which have come down to us. Generals and ministers followed the imperial example. The grand vezir Mahmûd Pasha (d. 1474), the conqueror of Negroponte, delighted in the composition of *ghazels*, and Kemâl Pasha Zâda (d. 1534), as he rode to the conquest of Egypt with the Sultan Selîm the Grim, beguiled the way with recitations of the leading events of Egyptian history in choice Turkish verse. He was the author of the *Nigârîstân*, a poem modelled on the *Gâlîstân* or 'Rose-Garden' of Sa'dî.

The greater poets of Turkey, however, were not high dignitaries, but sons of mechanics, cutlers, saddlers, shoemakers; few were of rank or wealth. Their numbers and their merits rise and fall as the tide of Turkish conquest flows and ebbs. It is ever in a period of strong national feeling that the poetry of a people is called forth; and it was in the golden prime of Sultan Süleymân, when the confines of the kingdom were at their broadest, when the name and fame of the Ottoman empire stood higher than ever before or since, that the opportunity of Turkish poetry arrived, and with it came the masters of the art. To the age of Süleymân and his predecessor Selîm belong Mesîhî (d. 1512), Lâmi'î (d. 1531), Ghazâlî (d. 1534), Fuzûlî (d. 1562), Fazlî (d. 1563), and Bâkî (d. 1600). The best Turkish poetry is chiefly included in this epoch, which partly corresponds in time with our Elizabethan era. Lâmi'î's works, to which Von Hammer devoted 174 pages of his great History, include poems on old Persian romances, besides a multitude of *ghazels* and other short pieces. Fuzûlî, on the whole the greatest of Turkish poets, in spite of his provincial idiom, is best known by his *Leylî and Mejnûn* and his charming odes. Bâkî, the most famous of Turkish lyricists, was the friend of four successive sultans, filled some high offices of state, and received the unhesitating homage of all the poets of his day and the admiration of all succeeding generations. His famous elegy on Süleymân the Great is unsurpassed in Ottoman literature. The appreciation of nature which is shown in such poems as Mesîhî's 'Ode to Spring' and Bâkî's and Lâmi'î's odes to 'Autumn,' and which is characteristic of their period, forms one of the best features of Turkish poetry. Their love-songs, on the other hand, are disappointingly stilted and artificial; and it is singular that, in spite of their military renown, the Turks have no martial poetry of the old time: there is hardly a respectable war-song in the whole range of mediæval Ottoman literature.

The classical period of Ottoman poetry, which began with the 16th century, did not end with the glorious reign of Süleymân the Great (d. 1566). Neftî of Erzerûm (d. 1635), the most renowned of Turkish satirists, wrote in the time of Murâd IV.; Nabî (d. 1712) wrote thousands of couplets of a didactic tendency; and Nedîm (d. c. 1727), perhaps the most finished and certainly the most blithe of

Turkish singers, belongs to the time of Ahmed III. He was the last of the old classical school of Ottoman poets, though Sheykh Ghâlib (d. 1795), the author of 'Beauty and Love' (*Husn-u-Ashk*), was little inferior to any of the older writers.

Turkish prose-writers have been and are very numerous, though here again originality is lacking, and their activity has been chiefly displayed in translations from the Persian and Arabic. One of their earliest works is the well-known *History of the Forty Vezirs*, a collection of old folk-stories, written in the first half of the 15th century, and now translated by E. J. W. Gibb. The collections of stories centring round the Khodja Nasreddin have also become well known in Europe in various translations as especially characteristic of Turkish humour. Sinân Pasha, the vizier of Mohammed the Conqueror, was the first prose stylist of merit. Sa'd-ed-dîn, the historian, in spite of his elaborate style and alliteration, was a writer of conspicuous ability, and Na'ima, his successor, is as vigorous and direct as Sa'd-ed-dîn is circumlocutory and ornate. The *Tâj-et-Tevârikh* of the former goes down to 1520, and Na'ima's history covers the ground from 1591 to 1659. Evliya the traveller, and Hâjî Khalîfa, an encyclopædic writer on history and bibliography, are among the best-known Turkish authors.

The Europeanisation of the Ottoman empire early in the 19th century was accompanied by a transfer of its literary allegiance from Persia to Paris. In its first phase this literary renaissance was exotic, the best exponents of this phase being Shînasi Effendi, poet and prose-writer. Later this movement towards European models became associated in the middle of the last century with the revival of Turkish race feeling, the precursor of the national renaissance in this century. Among writers of this school were Zia Bey, essayist and poet; Jevdet Pasha, a historian; Ekrem Bey, a poet; Hamîd Bey, a dramatist; Wasîf, a poet, who wrote in Stambouli dialect; and last, but not least, Kemal Bey, who covered the whole field of literary expression, and was the originator of the Young Turk movement. A body of novelists and of literary critics also developed, among the former Sezai Bey, Hussein Rahmî, Ahmed Rasim, and Aliyê Hanum; among the latter Muallim Nâji and Ebuzziya Tewfik. The purification of the language from Persian forms and Arabic words was furthered by the Turkish dictionary of Ahmed Vefik, and later by the association known as Yeni-Kalemier ('new pens'). The national renaissance and the feverish years of warfare that followed the Great War have naturally produced a promising output of prose and poetry. But as to which of the younger writers can be placed among the first poets and prose-writers of the Turkish race it is still too soon to judge. The one exception perhaps is Halidê Hanum, the heroine of the nationalist warfare, whose novels will always be associated with that heroic struggle.

The best English works are Sir James W. Redhouse's *History, System, and Varieties of Turkish Poetry* (1878) and E. J. W. Gibb's *Ottoman Poetry* (5 vols. 1900-8). See also Von Hammer-Purgstall's *Geschichte der Osmanischen Dichtkunst* (Pesth, 1836); G. Jacob's *Türkische Literaturgeschichte* (1900-8) and *Türkische Volksliteratur* (1901). For English students, Redhouse and Wells have compiled the best Turkish dictionaries and grammars. Sami's *Dictionnaire Turco-Français et Français-Turc* (1883) is summary but convenient.

**Turkey** (*Meleagris*), a genus of gallinaceous birds in the sub-family Meleagrinae of the pheasant family, Phasianidae. There has been strange confusion in regard to its names, for 'turkey' and Meleagris both belonged originally to the guinea-fowl. The name 'turkey' has nothing to do with the country of that name; it probably refers to the

utterance of the call 'turk, turk.' The domesticated turkey is derived from the American *Meleagris gallopavo*, and was established in Europe by 1530. The American wild species is represented by three geographical races, once extending from southern Canada to Mexico, distinguished by having the main tail feathers and their upper coverts tipped with white, buff, and chestnut respectively. It is maintained by some authorities that the taller, blacker, harder Norfolk breed of British poultry-yards is derived from the northern American race (*M. americana*), and the more variegated Cambridgeshire breed from the southern American race (*M. mexicana*). But the northern, the Mexican, and a third race are to be included in one wild species *M. gallopavo*, which is to be distinguished from the very different *M. ocellata* of Yucatán, British Honduras, and Guatemala, a gorgeous bird approaching a peacock in its splendour.

The reddish head and neck of the common turkey are almost bare of feathers, but covered with a warty wrinkled skin. On the head of both sexes there are livid wattles, and above the bill a conical fleshy caruncle, pendent ordinarily, erected during excitement; and the larger male is marked by a bunch of long black feather-bristles hanging down on the chest, and by a stout spur on the instep. The strong curved bill is red, and so are the legs; the tail is broad and rounded, and is raised and expanded by the strutting turkey-cock. He also trails his wings on the ground as he utters his loud 'gobble.' Most of the feathers are coppery-bronze, with a sheen of gold and purplish-green, and with black markings; the pinions are brown barred with white; the tail is black and brown with a dark broad band near the posterior margin. The other species, *M. ocellata*, which has not been domesticated, has a blue caruncle with a red tip, and, at the ends of the tail feathers, brilliant eye-like markings of green-blue margined with copper.

The wild turkey used to be incredibly common over nearly one-half of the United States, but it has paid for its palatability, and is now sadly restricted. Dr Hornaday doubts if even one flock exists in the north anywhere west of Pennsylvania. It is still to be found in some of the open forests of Virginia and Florida, and there are flocks in Texas and Oklahoma. Of recent years there has been an invigoration of the wild stock in some of its old haunts, a welcome turn of the tide. Mr Archibald Rintledge reports (1926) the presence of wild flocks of two dozen or more in some parts of Pennsylvania.
